(B) The operator shall report CO_2 emissions for the report year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(C) Operators who add CEMS under this article are subject to specifications in WCI.23(d)(1)-(5), if applicable.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CO_2 emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) Calculation Methodology 1 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high heating value between 975 and 1,150 Btu per cubic foot. Otherwise, Calculation Methodology 1 may be used for any type of fuel for which a default CO_2 emission factor and a default high heat value for the fuel is specified in Table 20-1.

(2) Calculation Methodology 2 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high heating value between 975 and 1,150 Btu per cubic foot. Otherwise, Calculation Methodology 2 may be used for any type of fuel combusted for which a default CO_2 emission factor for the fuel is specified in Table 20-1 or 20-2.
(3) Calculation Methodology 3 may be used for a unit of any size combusting any type of fuel, except when the use of Calculation Methodology 4 is required.
(4) Calculation Methodology 4 may be used for a unit of any size combusting any type of fuel, and must be used for either of the following conditions:

(i) A combustion unit with a CEMS that is required by any federal, state, provincial, or local regulation.

(ii) A municipal solid waste combustion unit that is subject to the verification requirements of WCI.8.

(f) Biogenic CO_2 emissions. The operator that combusts fuels or fuel mixtures that contain biomass shall determine the biomass-derived portion of CO_2 emissions using ASTM D6866-06a, as specified in this paragraph. This procedure is not required for fuels that contain less than 5 percent biomass by weight or for waste-derived fuels that are less than 30 percent biomass by weight on an annual basis.

(1) The operator shall conduct ASTM D6866-06a analysis at least every three months, and shall collect each gas sample for analysis during normal operating conditions over at least 24 consecutive hours.
(2) The operator shall divide total CO_2 emissions between biomass-derived emissions and non-biomass-derived emissions using the average proportionalities of the samples analyzed.
(3) If there is a common fuel source to multiple units at the facility, the operator may elect to conduct ASTM D6866-06a testing for one of the units.

§ WCI.24 Calculation of CH_4 and N_2O Emissions

Calculate the annual CH_4 and N_2O mass emissions from stationary fuel combustion sources using the procedures in paragraph (a), (b), or (c), as appropriate.

(a) If the heat content of the fuel is measured, calculate CH_4 and N_2O emissions the following Equation 20-7:

$$CH_4 \ or \ N_2O = \sum_{1}^{n} Fuel_P \times HHV_P \times EF \times 0.001 \qquad \textbf{Equation 20-7}$$

Where:

CH_4 or N_2O	=	Combustion emissions from specific fuel type, metric tons CH_4 or N_2O per year.
n	=	Period/frequency of heat content measurements over the year (e.g. monthly n = 12).
$Fuel_P$	=	Mass or volume of fuel combusted for the measurement period specified by fuel type, units of mass or volume per unit time.

HHV_P	=	High heat value measured for the measurement period specified by fuel type, MMBtu per unit mass or volume.
EF	=	Default CH_4 or N_2O emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(b) If the heat content of the fuel is not measured, calculate CH_4 and N_2O emissions using the following equation:

$$CH_4 \ or \ N_2O = \sum_{1}^{n} Fuel \times HHV_D \times EF \times 0.001$$ **Equation 20-8**

Where:

CH_4 or N_2O	=	CH_4 or N_2O emissions from a specific fuel type, metric tons CH_4 or N_2O per year.
Fuel	=	Mass or volume of fuel combusted specified by fuel type, unit of mass or volume per year.
HHV_D	=	Default high heat value specified by fuel type provided in Table 20-3, MMBtu per unit of mass or volume.
EF	=	Default emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(c) For municipal solid waste combustion, use Equation 20-9 of this section to estimate CH_4 and N_2O emissions:

$$CH_4 \ or \ N_2O = Steam \times B \times EF \times 0.001$$ **Equation 20-9**

Where:

CH_4 or N_2O	=	Annual CH_4 or N_2O emissions from the combustion of a municipal solid waste (metric tons).
Steam	=	Total mass of steam generated by MSW combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's maximum rated heat input capacity to its design rated steam output (mmBtu/lb steam).
EF	=	Fuel-specific emission factor for CH_4 or N_2O, from Table WCI.20-3 of this subpart (kg CH_4 or N_2O per mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(d) The operator may elect to calculate CH_4 and N_2O emissions using source-specific emission factors derived from source tests conducted at least annually under the supervision of (*jurisdiction*). Upon approval of a source test plan, the source test procedures in that plan shall be repeated in each future year to update the source specific emission factors annually.

§ WCI.25 Sampling, Analysis, and Measurement Requirements

(a) Fuel Sampling Requirements. Fuel sampling must be conducted at the frequency specified in paragraph (a) (1) through (a)(4) of this section.

(1) At receipt of each new fuel shipment or delivery or on a monthly basis for middle distillates (diesel, gasoline, fuel oil, kerosene), residual oil, liquid waste-derived fuels, and LPG (ethane, propane, isobutene, n-Butane, unspecified LPG);
(2) Monthly for natural gas, associated gas, and mixtures of low Btu gas.
(3) Monthly for gases derived from biomass including landfill gas and biogas from wastewater treatment or agricultural processes.
(4) Monthly for solid fuels, as specified below:

(A) The monthly solid fuel sample shall be a composite sample of weekly samples.
(B) The solid fuel shall be sampled at a location after all fuel treatment operations and the samples shall be representative of the fuel chemical and physical characteristics immediately prior to combustion.
(C) Each weekly sub-sample shall be collected at a time (day and hour) of the week when the fuel consumption rate is representative and unbiased.
(D) Four weekly samples (or a sample collected during each week of operation during the month) of equal mass shall be combined to form the monthly composite sample.
(E) The monthly composite sample shall be homogenized and well mixed prior to withdrawal of a sample for analysis.
(F) One in twelve composite samples shall be randomly selected for additional analysis of its discreet constituent samples. This information will be used to monitor the homogeneity of the composite.

(b) Fuel Consumption Monitoring Requirements.

(1) Facilities that are subject to the verification requirements of WCI.8 must determine annual fuel consumption by direct measurement.
(2) Facilities that are not subject the verification requirements of WCI.8 may determine consumption on the basis of recorded fuel purchase or sales invoices measuring any stock change (measured in million Btu, gallons, million standard cubic feet, short tons or bone dry short, tons) using the following equation:

Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End

(3) Fuel consumption measured in Btu values shall be converted to the required metrics of mass or volume using heat content values that are either provided by the supplier, measured by the facility, or provided in Table 20-1.

(c) Fuel Heat Content Monitoring Requirements. High heat values shall be determined using one of the following methods:

(1) For gases, use ASTM D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), GPA Standard 2261-00 "Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography." The operator may alternatively elect to use on-line instrumentation that determines heating value accurate to

within ± 5.0 percent. Where existing on-line instrumentation provides only low heating value, the operator shall convert the value to high heating value as specified in section 95125(c)(1)(C).

(2) For middle distillates and oil, or liquid waste-derived fuels, use ASTM D240-02 (Reapproved 2007), ASTM D240-87 (Reapproved 1991), ASTM D4809-00 (Reapproved 2005).

(3) For solid biomass-derived fuels use ASTM D5865-07a.

(4) For waste-derived fuels use ASTM D5865-07a or ASTM D5468-02 (Reapproved 2007). Operators who combust waste-derived fuels that are partly but not pure biomass shall determine the biomass-derived portion of CO_2 emissions using the method specified in section WCI.23(f), if applicable

(d) Fuel Carbon Content Monitoring Requirements. Fuel carbon contents should be monitored in the following manner.

(1) For coal and coke, solid biomass-derived fuels, and waste-derived fuels; use ASTM 5373-02 (Reapproved 2007).

(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) "Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2002).

(3) For gaseous fuels, use ASTM D1945-03 or ASTM D1946-90 (Reapproved 2006).

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type				
Fuel Type	**Carbon Content**	**High Heat Value**	**CO_2 Emission Factor**	**CO_2 Emission Factor**
Coal and Coke	**kg C / MMBtu**	**MMBtu / Short Ton**	**kg CO_2 / Short Ton**	**kg CO_2 / MMBtu**
Anthracite	28.26	25.09	2,597.94	103.54
Bituminous	25.49	24.93	2,328.35	93.40
Sub-bituminous	26.48	17.25	1,673.64	97.02
Lignite	26.30	14.21	1,369.32	96.36
Unspecified (Residential/Commercial)	26.00	22.24	2,118.67	95.26
Unspecified (Industrial Coking)	25.56	26.28	2,461.17	93.65
Unspecified (Other Industrial)	25.63	22.18	2,082.89	93.91
Unspecified (Electric Power)	25.76	19.97	1,884.86	94.38
Coke	27.85	24.80	2,530.65	102.04
Natural Gas (By Heat Content)	**kg C / MMBtu**	**Btu / Standard cubic foot**	**kg CO_2 / Standard cubic ft.**	**kg CO_2 / MMBtu**
975 to 1,000 Btu / Standard cubic foot	14.73	n/a	n/a	53.97
1000 to 1,025 Btu / Std cubic foot	14.43	n/a	n/a	52.87
1025 to 1,050 Btu / Std cubic foot	14.47	n/a	n/a	53.02
1050 to 1,075 Btu / Std cubic foot	14.58	n/a	n/a	53.42
1075 to 1,100 Btu / Std cubic foot	14.65	n/a	n/a	53.68
Greater than 1,100 Btu / Std cubic foot	14.92	n/a	n/a	54.67
Unspecified (Weighted U.S. Average)	14.47	1,027	0.0544	53.02

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type (continued)				
Petroleum Products	**kg C / MMBtu**	**MMBtu / Barrel**	**kg CO_2 / gallon**	**kg CO_2 / MMBtu**
Asphalt & Road Oil	20.62	6.636	11.94	75.55

ATTACHMENT 3: REFINERY FUEL GAS COMBUSTION

§ WCI.30 REFINERY FUEL GAS COMBUSTION

WCI.31 Source Category Definition

This source category consists of any combustion device that is located at a petroleum refinery and that combusts refinery fuel gas, still gas, flexigas, or associated gas.

WCI.32 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the emissions data report shall include the following information at the facility level:

(a) Annual CO_2, CH_4, and N_2O emissions from refinery fuel gas combustion in metric tons.

(b) Annual fuel consumption in units of million standard cubic feet or cubic meters.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average high heating value of each fuel, if used to compute CO_2 emissions.

WCI.33 Calculation of Greenhouse Gas Emissions

(a) Calculation of CO_2 Emissions. Owners and operators shall calculate daily CO_2 emissions for each fuel gas system using any of the methods specified in paragraphs (a)(1) through (a)(5) of this section. Calculate the total annual CO_2 emissions from combustion of all fuel gas by summing the CO_2 emissions from each fuel gas system.

(1) Use a CEMS that complies with the provisions in section WCI.23(d).

(2) Calculate CO_2 emissions from each refinery fuel gas system and flexigas system using measured carbon content and molecular weight of the gas and Equation 30-1.

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times \frac{MW}{MVC} \times 3.664 \times 0.001 \qquad \textbf{Equation 30-1}$$

Where:

CO_2 = Carbon dioxide emissions, metric tons/year.
$Fuel_i$ = Daily refinery fuel or flexigas combusted (scf).
CC_i = Daily sample of carbon content of the fuel (kg C/kg fuel).
MW = Daily sample of molecular weight of fuel.
MVC = Molar volume conversion factor (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere, or 836 scf/kg-mole for STP of 60°F and 1 atmosphere).
3.664 = Conversion factor for carbon to carbon dioxide.
0.001 = Conversion factor for kg to metric tons.
n = Number of days in a year.

(A) For refinery fuel gas, the daily carbon content shall be determined a minimum of 3 times a day (once every 8 hours) using on-line instrumentation or discrete laboratory analysis using the methods specified in WCI.34.

(B) For flexigas, the daily carbon content shall be determined once per day using the methods specified in WCI.34.

(3) Calculate CO_2 emissions from each fuel gas system and flexigas system using Equation 30-2 and a daily average high heating value that is monitored using a continuous on-line instrument.

$$CO_2 = \sum_{i=1}^{n} HHV_i \times Fuel_i \times EF_{CO2,i} \times 0.000001 \qquad \textbf{Equation 30-2}$$

Where:

CO_2	=	CO_2 emissions resulting from the combustion of fuel gas from an individual fuel gas system (metric tons/yr).
HHV_i	=	Daily average high heating value of fuel gas, derived from a continuous analyzer and integrated over a 24-hour period (Btu/scf).
$Fuel_i$	=	Daily fuel consumption from all fuel combustion units burning gas from the system (scf/d).
$EF_{CO2,i}$	=	Daily CO_2 emission factor for an individual fuel gas system, developed using Equation 30-3 (metric tons CO_2/MM Btu).
0.000001	=	Conversion factor for Btu to MMBtu.
n	=	Number of days per year.

$$EF_{CO2,i} = CC/HHV \times MW/MVC \times 3.664 \times 1000 \qquad \textbf{Equation 30-3}$$

Where:

$EF_{CO2,i}$	=	Daily CO_2 emission factor for an individual fuel gas system (metric tons CO_2/MMBtu).
CC	=	Daily sample of gas carbon content for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (kg carbon/kg fuel).
HHV	=	Daily sample of gas high heating value for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (Btu/scf).
MW	=	Refinery fuel A molecular weight (kg/kg-mole).
MVC	=	Molar volume conversion (849.5 scf/ kg-mole, for STP of 20°C and 1 atmosphere, or 836 scf/kg-mole for STP of 60°F and 1 atmosphere).
3.664	=	Conversion factor for carbon to carbon dioxide.
1000	=	Conversion factor for kg/Btu to metric tons/MMBtu.

(A) For Equation 30-3, the carbon content shall be determined once per day by on-line instrumentation or by laboratory analysis of a representative sample using the methods specified in WCI.34. The HHV shall be determined from either the same sample used to conduct the carbon analysis or from on-line instrumentation using the hourly average value that coincides with the same hour in which the carbon content was determined.

(B) For facilities that meet the definition of a small refiner in WCI.10, the emissions measurements and calculations for Equation 30-2 and 30-3 may be conducted weekly.

(4) For associated gas, low Btu gas, or other fossil fuels; follow the requirements for general stationary source combustion sources in WCI .23(b) or (c), as appropriate for each fuel.

(5) Where individual fuels are mixed prior to combustion, the operator may choose to calculate CO_2 emissions for each fuel prior to mixing instead of using the methods in paragraphs (a)(1), (a)(2), or (a)(3) of this section. In this case, the operator must determine the fuel flow rate and appropriate fuel specific parameters (e.g. carbon content, HHV) of each fuel stream prior to mixing, calculate CO_2 emissions for each fuel stream, and sum the emissions of the individual fuel streams to determine total CO_2 emissions from the mixture. CO_2 emissions for each fuel stream must be estimated using the following methods:

(A) For natural gas and associated gas, use the appropriate methodology specified in section WCI.23(b) or (c).

(B) For refinery fuel gas and flexigas, use the methodology in either paragraph (a)(2) or (a)(3) of this section.

(C) For low Btu gas, use the methodology in paragraph (a)(2) of this section.

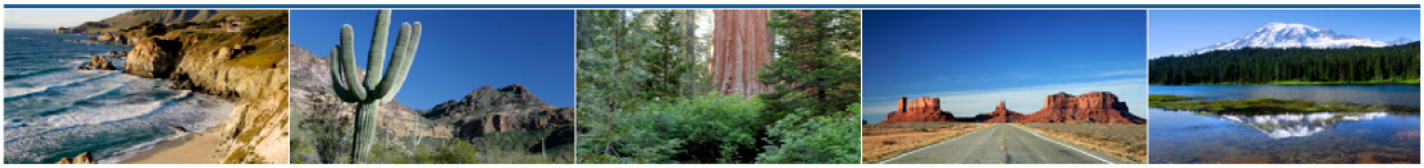
(b) Calculation of CH_4 and N_2O Emissions. Owners and operators shall use the methods specified in section WCI.24 to calculate the annual CH_4 and N_2O emissions.

WCI.34 Sampling, Analysis, and Measurement Requirements

(a) Measure the fuel consumption rate daily using methods specified in WCI.25(b).

(b) Measure the carbon content for fuel gas and flexigas using either ASTM D1945-03 or ASTM D1946-90 (Reapproved 2006).

(c) Measure high heating value using the monitoring requirements specified in WCI.25(c) for gaseous fuels.



ATTACHMENT 4: ELECTRICITY GENERATION

§ WCI.40 ELECTRICITY GENERATION

WCI.41 Source Category Definition

An electricity generator is any combustion device that combusts solid, liquid, or gaseous fuel for the purpose of producing electricity either for sale or for use onsite. This source category excludes cogeneration units subject to WCI.50.

WCI.42 Greenhouse Gas Reporting Requirements

For each facility, the emissions data report shall include the following information:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil fuels, reported by fuel type.
(2) Total CO_2 emissions for all biomass fuels combined.
(3) Total CH_4 emissions for fuels combined.
(4) Total N_2O emissions for all fuels combined.

(b) Annual fuel consumption:

(1) For gases, report in units of million standard cubic feet or cubic meters.
(2) For liquids, report in units of gallons or liters.
(3) For non-biomass solids, report in units of short tons or metric tons.
(4) For biomass-derived solid fuels, report in units of bone dry short tons or bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions as specified in WCI.44.

(d) Average high heating value of each fuel, if used to compute CO_2 emissions as specified WCI.44.

(e) The nameplate generating capacity in megawatts and net power generated in the reporting year in megawatt hours.

(f) Process CO_2 emissions from acid gas scrubbers and acid gas reagent.

(g) Fugitive emissions of HFC from cooling units that support power generation.

(h) Fugitive CO_2 emissions from geothermal facilities.

(i) Fugitive CO_2 emissions from coal storage at coal-fired electricity generating facilities shall be reported as specified in section WCI.100.

WCI.43 Calculation of Greenhouse Gas Emissions

(a) Calculation of CO_2 Emissions. Operators shall use CEMS to measure CO_2 emissions if required to operate a CEMS by any other federal, state, provincial, or local regulation. Operators not required to operate a CEMS by another regulation may use either CEMS or the calculation methods specified in paragraphs (a)(1) through (a)(7). Operators using CEMS to determine CO_2 emissions shall comply with the provisions in section WCI.23(d).

(1) Natural Gas. For electric generating units combusting natural gas, use one of the following methods:

(A) If the high heat value is greater than or equal to 975 and less than or equal to 1,100 Btu/scf use either:

i. The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or
ii. The measured heat content of the fuel and the calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(B) If the high heat value is less than 975 or greater than 1,100 Btu/scf, use the measured carbon content of the fuel and the calculation methodology 3 in section WCI.23(c).

(2) Coal or Petroleum Coke. For electric generating units combusting coal or petroleum coke, use the measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c).

(3) Middle Distillates, Gasoline, Residual Oil, or Liquid Petroleum Gases. For electric generating units combusting middle distillates (such as diesel, fuel oil, or kerosene), gasoline, residual oil, or LPG (such as ethane, propane, isobutene, n-butane, or unspecified LPG), use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or
(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(4) Refinery Fuel Gas, Flexigas, or Associated Gas. For electric generating units combusting refinery fuel gas, flexigas, or associated gas, use the methods specified in section WCI.30.

(5) Landfill Gas, Biogas, or Biomass. For electric generating units combusting landfill gas, biogas, or biomass, use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or
(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(6) Municipal Solid Waste. Electric generating units combusting municipal solid waste, may use the measured steam generated, the default carbon content emission factor in Table 20-1, and the calculation methodology in section WCI.23(b)(2) provided the facility is not subject to the verification requirements of WCI.8. If the facility is subject to the

verification requirements of WCI.8, the operator shall use CEMS to measure CO_2 emissions in accordance with WCI.23(d).

(7) Start-up Fuels. The operators of generating facilities that primarily combust biomass-derived fuels but combust fossil fuels during start-up, shut-down, or malfunction operating periods only, shall calculate CO_2 emissions from fossil fuel combustion using one of the following methods:

(A) The default emission factors from Tables 20-1 and 20-2 and calculation methodology 1 provided in section WCI.23(a);
(B) The measured heat content of the fuel and calculation methodology 2 provided in section WCI.23(b);
(C) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or
(D) For combustion of refinery fuel gas, the measured heat content and carbon content of the fuel, and the calculation methodology provided in section WCI.30.

(8) Co-fired Electricity Generating Units. For electricity generating units that combust more than one type of fuel, the operator shall calculate CO_2 emissions as follows.

(A) For co-fired electricity generators that burn only fossil fuels, CO_2 emissions shall be determined using one of the following methods:

i. A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method need not report emissions separately for each fossil fuel.
ii. For units not equipped with a continuous emission system, calculate the CO2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(4) of this section.

(B) For co-fired electricity generators that burn biomass-derived fuel with a fossil fuel, CO_2 emissions shall be determined using one of the following methods:

i. A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method shall determine the portion of the total CO_2 emissions attributable to the biomass-derived fuel and portion of the total CO_2 emissions attributable to the fossil fuel using the methods specified in section WCI.23(d)(4).
ii. For units not equipped with a continuous emission system, calculate the CO_2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(7) of this section.

(b) Calculation of CH_4 and N_2O Emissions. Operators of electricity generating units shall use the methods specified in section WCI.24 to calculate the annual CH_4 and N_2O emissions. For coal combustion, use the default CH_4 emission factor of 1g of CH_4/mmBtu.

(c) Calculation of CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall calculate the annual CO_2 emissions from these processes using Equation 40-1 if these emissions are not already captured in CO_2 emissions determined using a continuous emissions monitoring system.

$$CO_2 = S \times R \times \left(CO_{2\,MW} / Sorbent_{MW} \right) \qquad \textbf{Equation 40-1}$$

Where:

CO_2 = CO_2 emitted from sorbent for the report year, metric tons;
S = Limestone or other sorbent used in the report year, metric tons;
R = Ratio of moles of CO_2 released upon capture of one mole of acid gas;
$CO_{2\ MW}$ = Molecular weight of carbon dioxide (44);
$Sorbent_{MW}$ = Molecular weight of sorbent (if calcium carbonate, 100).

(d) Calculating Fugitive HFC Emissions from Cooling Units. Operators of electricity generating facilities shall calculate fugitive HFC emissions for each HFC compound used in cooling units that support power generation or are used in heat transfers to cool stack gases using either the methodology in paragraph (d)(1) or (d)(2). The Operator is not required to report GHG emissions from air or water cooling systems or condensers that do not contain HFCs.

(1) Use Equation 40-2 to calculate annual HFC emissions:

$$HFC = HFC_{inventory} + HFC_{purchases/acquisitions} - HFC_{sales/disbursements} + HFC_{\Delta capacity}$$ **Equation 40-2**

Where:

HFC = Annual fugitive HFC emission, metric tons;
$HFC_{inventory}$ = The difference between the quantity of HFC in storage at the beginning of the year and the quantity in storage at the end of the year. Stored HFC includes HFC contained in cylinders (such as 115-pound storage cylinders), gas carts, and other storage containers. It does not include HFC gas held in operating equipment. The change in inventory will be negative if the quantity of HFC in storage increases over the course of the year.
$HFC_{purchases/acquisitions}$ = The sum of all HFC acquired from other entities during the year either in storage containers or in equipment.
$HFC_{sales/disbursements}$ = The sum of all the HFC sold or otherwise transferred offsite to other entities during the year either in storage containers or in equipment.
$HFC_{\Delta capacity}$ = The net change in the total nameplate capacity (i.e. the full and proper charge) of the cooling equipment). The net change in capacity will be negative if the total nameplate capacity at the end of the year is less than the total nameplate capacity at the beginning of the year.

(2) Use service logs to document HFC usage and emissions from each cooling unit. Service logs should document all maintenance and service performed on the unit during the report year, including the quantity of HFCs added to or removed from the unit, and include a record at the beginning and end of each report year. The operator may use service log information along with the following simplified material balance equations to quantify fugitive HFCs from unit installation, servicing, and retirement, as applicable. The operator shall include the sum of HFC emissions from the applicable equations in the greenhouse gas emissions data report.

$$HFC_{Install} = R_{new} - C_{new}$$
$$HFC_{Service} = R_{recharge} - R_{Recover}$$
$$HFC_{Retire} = C_{retire} - R_{retire}$$

Where:

$HFC_{Install}$	=	HFC emitted during initial charging/installation of the unit, kilograms;
$HFC_{Service}$	=	HFC emitted during use and servicing of the unit for the report year, kilograms;
HFC_{Retire}	=	HFC emitted during the removal from service/retirement of the unit, kilograms;
R_{new}	=	HFC used to fill new unit (omit if unit was pre-charged by the manufacturer), kilograms;
C_{new}	=	Nameplate capacity of new unit (omit if unit was pre-charged by the manufacturer), kilograms;
$R_{recharge}$	=	HFC used to recharge the unit during maintenance and service, kilograms;
$R_{recover}$	=	HFC recovered from the unit during maintenance and service, kilograms;
C_{retire}	=	Nameplate capacity of the retired unit, kilograms; and
R_{retire}	=	HFC recovered from the retired unit, kilograms.

(e) Fugitive CO_2 Emissions from Geothermal Facilities. Operators of geothermal electricity generating facilities shall calculate the fugitive CO_2 emissions using one of the following methods:

(1) Calculate the fugitive CO_2 emissions using Equation 40-3:

$$CO_2 = 7.53 \times Heat \times 0.001$$ **Equation 40-3**

Where:

CO_2	=	CO_2 emissions, metric tons per year;
7.53	=	Default fugitive CO_2 emission factor for geothermal facilities, kg per mmBtu; and
Heat	=	Heat taken from geothermal steam and/or fluid, mmBtu/yr.

(2) Calculate CO_2 emissions using [*insert jurisdiction*] approved source specific emission factor.

WCI.44 Sampling, Analysis, and Measurement Requirements

(a) CO_2, CH_4 and N_2O Emissions from Fuel Combustion. Operators using CEMS to estimate CO_2 emissions from fuel combustion shall comply with the requirements in section WCI.23(d). Operators using methods other than CEMS shall comply with the applicable fuel sampling, fuel consumption monitoring, heat content monitoring, and carbon content monitoring specified in section WCI.25.

(b) CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall measure the

amount of limestone or other sorbent used during the reporting year using methods that comply with the measurement accuracy provisions in WCI.2(g).

(c) CO_2 Emissions from Geothermal Facilities. Operators of geothermal facilities shall measure the heat recovered from geothermal steam. If using source specific emission factor instead of the default factor, the operator shall conduct an annual test of the CO_2 emission rate using a method approved by [*insert jurisdiction*]. The operator shall submit a test plan to the [*insert jurisdiction*] for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [*insert jurisdiction*].-

ATTACHMENT 5: CEMENT MANUFACTURING

§ WCI.90 CEMENT MANUFACTURING

§ WCI.91 Source Category Definition

Cement manufacturing is comprised of all processes that are used to manufacture Portland, natural, masonry, pozzolanic, or other hydraulic cements.

§ WCI.92 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2, CH_4, and N_2O in metric tons.

(b) CO_2 process emissions from calcination (metric tons) and the following information:

(1) Clinker emission factor (kg CO_2/metric ton clinker).
(A) Quantity of clinker produced (metric tons).
(B) Total lime (CaO) content of clinker (wt. fraction).
(C) Total magnesium Oxide (MgO) content of clinker (wt. fraction).
(D) Uncalcined CaO (wt. fraction).
(E) Uncalcined MgO (wt. fraction).

(2) Cement kiln dust (CKD) emission factor (kg CO_2/metric ton CKD discarded).
(A) Plant specific CKD calcination rate (unitless ratio).
(B) Quantity of CKD discarded (metric tons).

(c) CO_2 process emissions from organic carbon oxidation (metric tons) and the following information:

(A) Amount of raw material consumed in the report year (metric tons).
(B) Organic carbon content of raw material (wt. fraction).

(d) CO_2, CH_4, and N_2O emissions from fuel combustion in all kilns combined, following the calculation methods and reporting requirements specified in WCI.93(c) (metric tons).

(e) CO_2, CH_4, and N_2O emissions from all other fuel combustion units combined (kilns excluded), following the calculation methods and reporting requirements specified in WCI.20 (metric tons).

(f) If a continuous emissions monitor is used to measure CO_2 emissions from kilns, then the requirements of paragraphs (b), (c), and (d) of this section do not apply for CO_2. Cement plants that measure CO_2 emissions using CEMS shall report fuel usage by fuel type for kilns.

(g) Operators of cement plants shall also comply with the reporting requirements for any other applicable source category listed at WCI.1(a), including but not limited to the following:

(1) Coal fuel storage as specified in WCI.100.

(2) Electricity generating as specified in WCI.40.
(3) Cogeneration systems as specified in WCI.50.

§ WCI.93 Calculation of Greenhouse Gas Emissions From Kilns

(a) Determine CO_2 emissions as specified under either paragraph (a)(1) or (a)(2) of this section.

(1) Use a continuous emissions monitoring system (CEMS) as specified in WCI.23(d).
(2) Calculate the sum of CO_2 process emissions from kilns and CO_2 fuel combustion emissions from kilns using the calculation methodologies specified in paragraph (b) and (c) of this section.

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions as the sum of emissions from calcination, using the method specified in paragraph (b)(1) of this section; and from organic carbon oxidation, using the method specified in paragraph (b)(2) of this section (Equation 90-0).

$$CO_2\ process = CO_2\ calcination + CO_2\ raw\ material$$ **Equation 90-0**

(1) <u>Calcination Emissions</u>. Calculate CO_2 process emissions from calcination using Equation 90-1 and a plant-specific clinker emission factor and a plant-specific cement kiln dust (CKD) emission factor as specified in this section.

$$CO_{2-C} = \sum_{i=1}^{12} [(Cli) \times (EF_{Cli})] + [(Q_{CKD}) \times (EF_{CKD})]$$ **Equation 90-1**

Where:

CO_{2-C} = CO_2 emissions from calcination, metric tones.
Cli = Monthly quantity of clinker produced, metric tons.
EF_{Cli} = Monthly clinker emission factor, metric tons CO_2/metric ton clinker computed as specified in paragraph (b)(1)(A) of this section.
Q_{CKD} = Monthly quantity CKD discarded (i.e., not recycled to the kiln), metric tons.
EF_{CKD} = Monthly CKD emission factor, computed as specified in paragraph (b)(1)(B) of this section.

(A) Monthly Clinker Emission Factor. Calculate a monthly plant-specific clinker emission factor (EF_{Cli}) for each report year based on the percent of measured CaO and MgO content in the clinker and using Equation 90-2.

$$EF_{Cli} = [(CaO\ content - uncalcined\ CaO) \times Molecular\ ratio\ of\ CO_2/CaO] + [(MgO\ Content - uncalcined\ MgO) \times Molecular\ ratio\ of\ CO_2/MgO]$$ **Equation 90-2**

Where:

CaO Content (by weight) = Total CaO content of Clinker (including calcined and uncalcined) (wt. fraction).
Non-carbonate CaO (by weight) = Uncalcined CaO of Clinker (wt. fraction).

Molecular ratio of CO_2/CaO = 0.785.
MgO Content (by weight) = Total MgO content of Clinker (including calcined and uncalcined) (wt. fraction).
Non-carbonate MgO = Uncalcined MgO of Clinker (wt. fraction).
Molecular ratio of CO_2/MgO = 1.092.

(B) Monthly CKD Emission Factor. If CKD is generated and not recycled back to the kiln, then calculate a monthly plant-specific CKD emission factor. The CKD emission factor shall be calculated using Equation 90-3 and a plant-specific CKD calcination rate as specified in Equation 90-4.

$$EF_{CKD} = \frac{\frac{EF_{Cli}}{1 + EF_{Cli}} \times d}{1 - \left(\frac{EF_{Cli}}{1 + EF_{Cli}} \times d\right)} \qquad \textbf{Equation 90-3}$$

Where:

EF_{CKD} = Monthly CKD emission factor, kg CO_2/metric ton CKD discarded.
EF_{Cli} = Clinker emission factor, determined according to Equation 90-2.
d = CKD calcination rate, determined according to Equation 90-4.

$$d = 1 - \frac{fCO_{2CKD} \times (1 - fCO_{2RM})}{(1 - fCO_{2CKD}) \times fCO_{2RM}} \qquad \textbf{Equation 90-4}$$

Where:

d = CKD calcination rate (unitless ratio).
fCO_{2CKD} = Weight fraction of carbonate CO_2 in the CKD.
fCO_{2RM} = Weight fraction of carbonate CO_2 in the raw material.

(2) Organic Carbon Oxidation Emissions. Calculate CO_2 process emissions from the total organic content in raw materials by using Equation 90-5.

$$CO_{2-RM} = TOC_{RM} \times RM \times 3.664 \qquad \textbf{Equation 90-5}$$

Where:

CO_{2-RM} = CO_2 emissions from raw material oxidation, metric tons.
TOC_{RM} = Total organic carbon content in raw material (wt. fraction), measured using the method in WCI.94(c) or using a default of 0.002 (0.2%).
RM = Amount of raw material consumed (metric tons/yr).
3.664 = The CO_2 to carbon molar ratio.

(c) Fuel Combustion Emissions in Kilns. Calculate CO_2, CH_4, and N_2O emissions from stationary fuel combustion following the calculation methods specified in WCI.20. Cement plants that combust pure biomass-derived fuels and combust fossil fuels only during periods of start-up, shut-down, or malfunction may report CO_2 emissions from fossil fuels using the emission factor methodology in WCI.23(a). "Pure" means that the biomass-derived fuels account for 97 percent of the total amount of carbon in the fuels burned.

§ WCI.94 Sampling, Analysis, and Measurement Requirements

Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the cement industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.

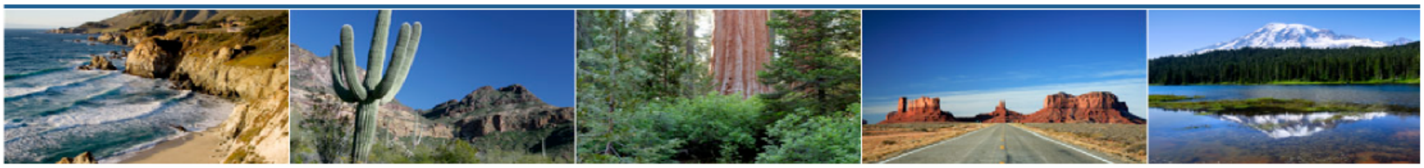
(a) Determine the plant-specific weight fractions of CaO, MgO, uncalcined CaO, and uncalcined MgO in clinker from each kiln using *(method to be determined).* Determine the weight fraction of carbonate CO_2 in the CKD and the weight fraction of carbonate CO_2 in the raw material. The monitoring must be conducted monthly for each kiln from a clinker sample drawn from bulk clinker storage.

(b) If not using the default value of 0.002 for TOC_{RM} in Equation 90-5, the total organic carbon contents of raw materials must be determined annually *[monthly?]* using ASTM Method C114-07. The analysis must be conducted on sample material drawn from bulk raw material storage for each category of raw material.

(c) The quantity of clinker produced must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(d) The quantity of CKD discarded must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(e) The quantity of raw materials consumed (i.e. limestone, sand, shale, iron oxide, and alumina) must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.



ATTACHMENT 6: COAL STORAGE

§ WCI.100 COAL STORAGE

§ WCI.101 Source Category Definition

Coal storage piles are located at any facilities that combust coal. Coal storage piles release fugitive CH_4 emissions. Within natural coal deposits, CH_4 is either trapped under pressure within porous void spaces or adsorbed to the coal. Coal mining, post-mining activities, and coal-handling activities release pressurized CH_4 to the atmosphere; adsorbed CH_4 is also released until the CH_4 coal reaches equilibrium with the surrounding atmospheric conditions.

§ WCI.102 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

  (1) Total CH_4 emissions.

(b) Annual coal purchases in tons.

(c) Source of coal purchases:

  (1) Coal basin.
  (2) State/province.
  (3) Coal mine type (surface or underground).

§ WCI.103 Calculation of CH_4 Emissions

Note that this methodology for calculation of methane emissions uses emission factors for post-mining operations including all processes occurring after mining at the coal deposit and prior to combustion (e.g., preparation, handling, processing, transportation, storage, etc.) even though coal storage piles are only a subset of the overall post-mining operations. This follows the approach in the California Climate Action Registry, attributing all post-mining fugitive methane emissions to the facility combusting the coal, which is ultimately responsible for the coal having been processed and delivered to the facility. The Reporting Subcommittee is considering whether to require reporting of these emissions as indicated below, and whether to include these emissions in the total emissions of the coal-combusting facility. Stakeholder comment is requested.

Canadian-specific default fugitive methane emissions (i.e., a Canadian version of Table 100-1) will be developed.

Calculate fugitive CH_4 emissions from coal storage piles using the following equation:

$$CH_4 = \sum_i \left(PC \times EF\right) \times 0.04228 / 2,204.6$$ **Equation 100-1**

Where:

CH_4	=	Fugitive emissions from coal storage piles for each coal category *i*, metric tons CH_4 per year.
PC	=	Purchased coal, tons per year.
EF	=	Default CH_4 emission factor specified by location and mine type that coal originated from provided in Table 100-1, scf CH_4 per ton of coal.
0.04228	=	Methane conversion factor to convert scf to lbs.
2,204.6	=	Factor to convert lbs to metric tons.

Table 100-1 provides default CH_4 emission factors for U.S. post-mining operations.

These post-mining operation emission factors were used to estimate emissions from coal storage piles in the CARB rule.

The uncertainty associated with the U.S.-specific emission factors in Table 100-1 emission factors is unknown. Emission factors from U.S. underground mining activities were developed from mine-level emissions measurements; however, the surface mining and post-mining activity emission factors were estimated based upon an average in situ CH_4 content of 32.5%.

Canada-specific coal storage pile or post-mining operation emission factors could not be identified. The Canada National Inventory contains Canada-specific emission factors for coal production from underground and surface mines. Post-mining operations are included within these emission factors, but are not specifically disaggregated.

§ WCI.105 Sampling, Analysis, and Measurement Requirements

(a) Fuel Consumption Monitoring Requirements.

(1) Facilities may determine consumption on the basis of recorded fuel purchase or sales invoices measuring any stock change (short tons) using the following equation:

Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End

Table 100-1. U.S. Default Fugitive Methane Emission Factors from Post-Mining Coal Storage and Handling (CH_4 ft^3 per Short Ton)

Coal Origin		Coal Mine Type	
Coal Basin	**States**	**Surface Post-Mining Factors**	**Underground Post-Mining Factors**
Northern Appalachia	Maryland, Ohio, Pennsylvania, West Virginia North	19.3	45.0
Central Appalachia (WV)	Tennessee, West Virginia South	8.1	44.5
Central Appalachia (VA)	Virginia	8.1	129.7
Central Appalachia (E KY)	East Kentucky	8.1	20.0
Warrior	Alabama, Mississippi	10.0	86.7
Illinois	Illinois, Indiana, Kentucky West	11.1	20.9
Rockies (Piceance Basin)	Arizona, California, Colorado, New Mexico, Utah	10.8	63.8
Rockies (Uinta Basin)		5.2	32.3
Rockies (San Juan Basin)		2.4	34.1
Rockies (Green River Basin)		10.8	80.3
Rockies (Raton Basin)		10.8	41.6
N. Great Plains	Montana, North Dakota, Wyoming	1.8	5.1
West Interior (Forest City, Cherokee Basins)	Arkansas, Iowa, Kansas, Louisiana, Missouri, Oklahoma, Texas	11.1	20.9
West Interior (Arkoma Basin)		24.2	107.6
West Interior (Gulf Coast Basin)		10.8	41.6
Northwest (AK)	Alaska	1.8	52.0
Northwest (WA)	Washington	1.8	18.9

ATTACHMENT 7: HYDROGEN PRODUCTION

§ WCI.130 HYDROGEN PRODUCTION

§ WCI.131 Source Category Definition

A hydrogen production process produces hydrogen gas by steam hydrocarbon reforming, partial oxidation of hydrocarbons, or other transformation of hydrocarbon feedstock. The hydrogen produced may be either transferred offsite or used onsite at petrochemical, ammonia production, refineries, and other plants.

§ WCI.132 Greenhouse Gas Reporting Requirements

For each facility, the annual emissions report must contain the following information:

(a) Process CO_2 Emissions. The CO_2 process emissions from the hydrogen produced process.

(b) Feedstock Consumption. Annual feedstock consumption by feedstock type (including petroleum coke) reported in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

(c) Production. Annual hydrogen produced.

(d) Stationary Combustion Units. Report CO_2, N_2O, and CH_4 emissions as specified in WCI.20.

§ WCI.133 Calculation of Greenhouse Gas Emissions

The owner or operator shall calculate and report CO_2 process emissions using the methods in paragraphs (a) or (b) of this section.

(a) Continuous Emission Monitoring Systems. The owner or operator may calculate CO_2 process emissions using CEMS. The owner or operator must comply with the requirements in section WCI.20.

(b) Feedstock Material Balance. The owner or operator may calculate CO_2 process emissions using the following method. The factor S shall be used only for CO_2 and/or CH_4 emissions that are calculated and reported using applicable methods specified in this regulation. For example, carbon species in uncoverted feedstock contained in PSA off-gas and hydrogen plant product that is diverted to fuel gas systems, fed to downstream units, or diverted to flare may be included in the factor S provided the CO_2 and/or CH_4 emissions are reported using other methods in this regulation.

$$CO_2(Feedstock) = \sum_{i=1}^{n} \sum_{j=1}^{y} \left[\left(FS_j * CF_j \right) - S_j \right] * 3.664 * 0.001 \qquad \textbf{Equation 130-1}$$

Where:

CO_2 (Feedstock)	=	CO_2 emitted from feedstock (metric tons/year).
n	=	Days of operation per year.
FS_j	=	Feedstock b consumption rate (scf/day).
CF_j	=	Carbon content of feedstock j (kg C/scf feedstock).
y	=	Total number of feedstocks.
S_j	=	Carbon accounted for elsewhere (kg C/day).
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

WCI.134 Sampling, Analysis, and Measurement Requirements

(a) Owners or operators using CEMS to estimate CO_2 emissions shall comply with the monitoring requirements in section WCI.20.

(b) Owners or operators using the method in section WCI.103 (b) shall perform the following monitoring:

(1) The owner or operator shall measure the feedstock consumption rate daily using methods that comply with the measurement accuracy provisions in WCI.2(g).
(2) The owner or operator shall collect samples of each feedstock consumed and analyze each sample for carbon content using the methods specified in WCI.25(d). For natural gas feedstock not mixed with another feedstock prior to consumption, samples shall be collected and analyzed once per month. For all other feedstocks, samples shall be collected and analyzed daily. The samples shall be collected from a location in the feedstock handling system that provides samples representative of the feedstock consumed in the hydrogen production process.
(3) Owners or operators shall measure the hydrogen produced daily using methods that comply with the measurement accuracy provisions in WCI.2(g).
(4) Owners or operators shall measure the CO_2 and CO collected daily using methods that comply with the measurement accuracy provisions in WCI.2(g).

ATTACHMENT 8: IRON AND STEEL MANUFACTURING

§ WCI.150 IRON AND STEEL MANUFACTURING

§ WCI.151 Source Category Definition

Iron and steel manufacturing comprises four categories: primary facilities that produce both iron and steel, secondary steelmaking facilities, iron production facilities, and offsite production of metallurgical coke. These processes may occur together in an "integrated" facility or they may occur in separate offsite facilities.

§ WCI.152 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2 and CH_4 in metric tons at the facility level.

(b) CO_2 and CH_4 emissions from coke production (metric tons) and the following information:

(1) Quantity of coking coal consumed in coke production (metric tons)
(2) Quantity of other process materials (e.g., natural gas, fuel oil, etc.) consumed in coke production (metric tons)
(3) Quantity of blast furnace gas consumed in coke production (metric tons)
(4) Quantity of coke produced (metric tons)
(5) Quantity of coke oven gas transferred offsite (metric tons)
(6) Quantity of other coke oven by-products (e.g., coal tar, light oil, coke breeze, etc.) transferred offsite (metric tons)
(7) Carbon content of material inputs and outputs listed in (b)(1) through (b)(6) (metric tons of C per unit of material)

(c) CO_2 and CH_4 emissions from iron and steel production (metric tons) and the following information:

(1) Quantity of coke consumed in iron and steel production (excluding sinter production) (metric tons)
(2) Quantity of on-site coke oven by-products (e.g., coal tar, light oil, coke breeze, etc.) consumed in blast furnace (metric tons)
(3) Quantity of coal directly injected into blast furnace (metric tons)
(4) Quantity of limestone directly injected into blast furnace (metric tons)
(5) Quantity of dolomite directly injected into blast furnace (metric tons)
(6) Quantity of carbon electrodes consumed in EAFs (metric tons)
(7) Quantity of other carbonaceous or process material (e.g., sinter, waste plastic, etc.) consumed in iron and steel production (metric tons)
(8) Quantity of coke oven gas consume in blast furnace (metric tons)
(9) Quantity of steel produced (metric tons)
(10) Quantity of iron production not converted to steel (metric tons)

(11) Quantity of blast furnace gas transferred offsite (metric tons)
(12) Carbon content of material inputs and outputs listed in (c)(1) through (c)(11) (metric tons of C per unit of material)

(d) Process CO_2 and CH_4 emissions from sinter production (metric tons) and the following information:

(1) Quantity of coke breeze (purchased and produced on-site) used for sinter production (metric tons)
(2) Quantity of coke oven gas consumed in blast furnace in sinter production (metric tons)
(3) Quantity of blast furnace gas consumed in sinter production (metric tons)
(4) Quantity of other process materials (e.g., natural gas, fuel oil, etc.) consumed in sinter production (metric tons)
(5) Quantity of sinter off gas transferred offsite (metric tons)
(6) Carbon content of material inputs and outputs listed in (d)(1) through (d)(5) (metric tons of C per unit of material)

(e) Process CO_2 and CH_4 emissions from direct reduced iron production (metric tons) and the following information:

(1) Energy from natural gas used in direct reduced iron production (gigajoules [GJ])
(2) Energy from coke breeze used in direct reduced iron production (GJ)
(3) Energy from metallurgical coke used in direct reduced iron production (GJ)
(4) Carbon of material inputs listed in (e)(1) through (e)(3) (metric tons of C per GJ)

§ WCI.153 Calculation of CO_2 Emissions

(a) Process CO_2 emissions. Determine process CO_2 emissions as specified under either paragraph (1) or (2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).
(2) Calculation methodologies specified in paragraph (b) of this section.

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions using the following mass balance approach:

(1) Calculate the coke production CO_2 (either within integrated facilities or at offsite facilities) emissions using Equation 150-1 (if applicable):

$$E_{coke} = \left[(CC \times C_{CC}) + \sum_a (PM_a \times C_a) + (BG \times C_{BG}) - (CO \times C_{CO}) - (COG \times C_{COG}) - \sum_b (COB_b \times C_b) \right] \times 3.664$$

Equation 150-1

Where:

E_{coke}	=	Emissions of CO_2 from coke production (metric tons);
CC	=	Quantity of coking coal (metric tons);
PM_a	=	Quantity of other process material *a* (not included as separate terms), such as natural gas or fuel oil (metric tons);

BG	=	Quantity of blast furnace gas consumed in coke ovens (metric tons);
CO	=	Quantity of coke produced (metric tons)
COG	=	Quantity of coke oven gas transferred offsite (metric tons);
COB_b	=	Quantity of coke oven by-product *b* transferred offsite (metric tons);
C_x	=	Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664	=	Conversion factor from metric tons of C to metric tons of CO_2.

(2) Calculate the iron and steel production CO_2 emissions using Equation 150-2:

$$E_{iron,steel} = \Big[(CO \times C_{CO}) + \sum_a (COB_a \times C_a) + (CI \times C_{CI}) + (L \times C_L) + (D \times C_D) + (CE \times C_{CE}) + \sum_b (O_b \times C_b) + (COG \times C_{COG}) - (S \times C_S) - (IP \times C_{IP}) - (BG \times C_{BG})\Big] \times 3.664$$

Equation 150-2

Where:

$E_{iron,steel}$	=	Emissions of CO_2 from iron and steel production (metric tons);
CO	=	Quantity of coke consumed (excluding sinter production) (metric tons);
COB_a	=	Quantity of coke oven by-product *a* consumed in blast furnace (metric tons);
CI	=	Quantity of coal directly injected into blast furnace (metric tons);
L	=	Quantity of limestone consumed (metric tons);
D	=	Quantity of dolomite consumed (metric tons);
CE	=	Quantity of carbon electrodes consumed in EAFs (metric tons);
O_b	=	Quantity of other carbonaceous and process material *b*, such as sinter or waste plastic (metric tons);
COG	=	Quantity of coke oven gas consumed in blast furnace (metric tons);
S	=	Quantity of steel produced (metric tons);
IP	=	Quantity of iron production not converted to steel (metric tons);
BG	=	Quantity of blast furnace gas transferred offsite (metric tons);
C_x	=	Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664	=	Conversion factor from metric tons of C to metric tons of CO_2.

(3) Calculate the sinter production CO_2 emissions using Equation 150-3 (if applicable):

$$E_{sinter} = \Big[(CBR \times C_{CBR}) + (COG \times C_{COG}) + (BG \times C_{BG}) + \sum_a (PM_a \times C_a) - (SOG \times C_{SOG})\Big] \times 3.664$$

Equation 150-3

Where:

E_{sinter} = Emissions of CO_2 from sinter production (metric tons);
CBR = Quantity of purchased and onsite produced coke breeze used for sinter production (metric tons);
COG = Quantity of coke oven gas consumed in blast furnace for sinter production (metric tons);
BG = Quantity of blast furnace gas consumed for sinter production (metric tons);
PM_a = Quantity of other process material *a* consumed for sinter production (not included as separate terms), such as natural gas or fuel oil (metric tons);
SOG = Quantity of sinter off gas transferred offsite (metric tons);
C_x = Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664 = Conversion factor from metric tons of C to metric tons of CO_2.

(4) Calculate the direct reduced iron production CO_2 emissions using Equation 150-4 (if applicable):

$$E_{DRI} = [(DRI_{NG} \times C_{NG}) + (DRI_{BZ} \times C_{BZ}) + (DRI_{CK} \times C_{CK})] \times 3.664$$

Equation 150-4

Where:

E_{DRI} = Emissions of CO_2 from direct reduced iron production (metric tons);
DRI_{NG} = Energy from natural gas used in direct reduced iron production (GJ);
DRI_{BZ} = Energy from coke breeze used in direct reduced iron production (GJ);
DRI_{CK} = Energy from metallurgical coke used in direct reduced iron production (GJ);
C_{NG} = Carbon content of natural gas (metric ton C/GJ);
C_{BZ} = Carbon content of coke breeze (metric ton C/GJ);
C_{CK} = Carbon content of metallurgical coke (metric ton C/GJ);
3.664 = Conversion factor from metric tons of C to metric tons of CO_2.

(5) Calculate the total CO_2 emissions using Equation 150-5:

$$E_{CO2} = E_{coke} + E_{iron,steel} + E_{sinter} + E_{DRI}$$

Equation 150-5

Where:

E_{CO2} = Total CO_2 emissions (metric tons);
E_{coke} = Emissions from coke production (metric tons);
$E_{iron,steel}$ = Emissions from iron and steel production (metric tons);
E_{sinter} = Emissions from sinter production (metric tons);
E_{DRI} = Emissions from direct reduced iron production (metric tons).

§ WCI.154 Calculation of CH_4 Emissions

(a) Process CH_4 emissions. Determine process CH_4 emissions as specified under paragraph (1) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).

§ WCI.155 Sampling, Analysis, and Measurement Requirements

Measurements of carbon contents of the material balance input, output, and by-product materials shall be conducted as described below.

Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the iron and steel industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.

(b) Fuel Carbon Content Requirements. Fuel carbon contents should be monitored in the following manner (from § WCI.25):

(1) For coal and coke, solid biomass-derived fuels, and waste-derived fuels; use ASTM 5373-02 (Reapproved 2007).
(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) "Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2002).
(3) For gaseous fuels, use ASTM D1945-03 or ASTM D1946-90 (Reapproved 2006).

(c) By-Product Carbon Content Requirements. Carbon contents of by-products (e.g., blast furnace gas, coke oven gas, coal tar, light oil, coke breeze, sinter off gas, etc.) from all iron and steel production processes should be monitored in the following manner:

(1) [Methodology to be determined.]

(d) Flux Carbon Content Requirements. Carbon contents of fluxes (i.e., limestone and dolomite) from all iron and steel production processes should be monitored in the following manner:

(1) For limestone and dolomite, use ASTM C25-06.

(e) Electrode Carbon Content Requirements. Carbon contents of carbon electrodes used in electric arc furnaces (EAFs) should be monitored in the following manner:

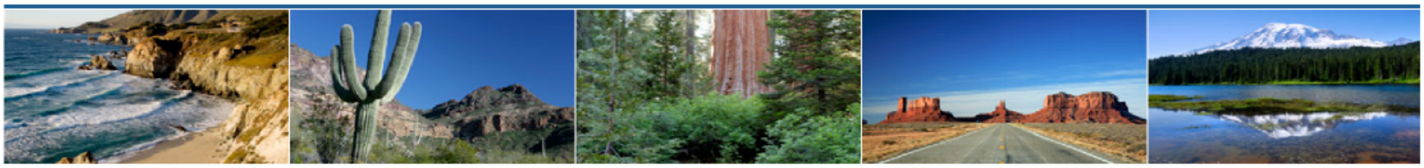
(1) [Methodology to be determined.]

(f) Finished Product Carbon Content Requirements. Carbon contents of finished products (i.e., steel, iron not converted to steel, and direct reduced iron) from all iron and steel production processes should be monitored in the following manner:

   (1) For iron and steel, use ASTM E1019-08 or ASTM E351-93.

(g) Quantity Measurement Requirements. The quantities of process inputs, outputs, and by-products must be determined using the following methods:

   (1) For solid process inputs, outputs, and by-products, quantities must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.
   (2) For liquid process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes.
   (3) For gaseous process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes.



ATTACHMENT 9: LIME MANUFACTURING

§ WCI.170 LIME MANUFACTURING

§ WCI.171 Source Category Definition

Lime manufacturing is comprised of all processes that are used to manufacture quick lime (i.e. calcium oxide or calcium-magnesium oxide). Lime is produced via the calcination of limestone or other highly calcareous materials such as dolomite, aragonite, chalk, coral, marble, and shell.

§ WCI.172 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2, CH_4, and N_2O in metric tons.

(b) CO_2 process emissions from quick lime production (metric tons) and the following information:

(1) Quick lime emission factor (kg CO_2/metric ton quick lime).
(A) Quantity of quick lime produced (metric tons).
(B) Total Calcium Oxide (CaO) content of quick lime (weight fraction).
(C) Total Magnesium Oxide (MgO) content of quick lime (weight fraction).
(D) Uncalcined CaO (weight fraction).
(E) Uncalcined MgO (weight fraction).

(2) Lime kiln dust (LKD) emission factor (kg CO_2/metric ton LKD).
(A) Quantity of LKD discarded (metric tons).
(B) Total Calcium Oxide (CaO) content of LKD (weight fraction).
(C) Total Magnesium Oxide (MgO) content of LKD (weight fraction).
(D) Uncalcined CaO content of LKD (weight fraction).
(E) Uncalcined MgO content of LKD (weight fraction).

(c) CO_2, CH_4, and N_2O emissions from fuel combustion in all kilns combined, following the calculation methods and reporting requirements specified in WCI.173(c) (metric tons).

(d) CO_2, CH_4, and N_2O emissions from all other fuel combustion units combined (kilns excluded), following the calculation methods and reporting requirements specified in WCI.20 (metric tons).

(e) If a continuous emissions monitor is used to measure CO_2 emissions from kilns, then the requirements of paragraphs (b) and (c) of this section do not apply for CO_2. Lime plants that measure CO_2 emissions using CEMS shall report fuel usage by fuel type for kilns.

(f) Operators of lime plants shall also comply with the reporting requirements for any other applicable source category listed at WCI.1(a), including but not limited to the following:

(1) Coal fuel storage as specified in WCI.100.

(2) Electricity generating as specified in WCI.40.

(3) Cogeneration systems as specified in WCI.XX.

§ WCI.173 Calculation of greenhouse Gas Emissions from Kilns

(a) Determine process CO_2 emissions as specified under either paragraph (a)(1) or (a)(2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).

(2) Calculate the sum of CO_2 process emissions from kilns and CO_2 fuel combustion emissions from kilns using the calculation methodologies specified in paragraph (b) and (c) of this section**.**

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions as the sum of emissions from quick lime production, using the method specified in paragraph (b)(1) of this section.

(1) CO_2 Process Emissions. Calculate CO_2 emissions from quick lime production from each kiln using Equation 170-1 and a plant-specific quick lime emission factor and a plant-specific lime kiln dust (LKD) emission factor as specified in this section.

$$CO_2 = \sum_{I=1}^{12} [(QL) \times (EF_{QL})] + [(LKD) \times (EF_{LKD})]$$ **Equation 170-1**

Where:

CO_2	=	CO_2 emissions in metric tones/yr.
QL	=	Monthly Quantity of quick lime produced, metric tons.
EF_{QL}	=	Monthly Quick lime emission factor, metric tons CO_2/metric ton quick lime computed as specified in paragraph (b)(1)(A) of this section.
LKD	=	Monthly Quantity LKD discarded (i.e., not recycled to the kiln), metric tons.
EF_{LKD}	=	Monthly LKD emission factor, computed as specified in paragraph (b)(1)(B) of this section.

(A) Monthly Quick Lime Emission Factor. Calculate a plant-specific quick lime emission factor _(EF_{QL}) for each kiln and month based on the percent of measured CaO and MgO content in quick lime and using Equation 170-2.

$$EF_{QL} = [(CaO\ content - uncalcined\ \ CaO) \times Molecular\ ratio\ of\ CO_2 / CaO] + [(MgO\ Content - uncalcined\ \ MgO) \times Molecular\ ratio\ of\ CO_2 / MgO]$$ **Equation 170-2**

Where:

CaO Content (by weight)	=	Total CaO content of Quick Lime, including calcined and uncalcined (weight fraction).
Uncalcined CaO (by weight)	=	Uncalcined CaO content of Quick Lime (weight fraction).
Molecular ratio of CO_2/CaO	=	0.785.
MgO Content (by weight)	=	Total MgO content of Quick Lime, including calcined and uncalcined (weight fraction).
Uncalcined MgO	=	Uncalcined MgO content of Quick Lime (weight fraction).
Molecular ratio of CO_2/MgO	=	1.092.

(B) Monthly LKD Emission Factor. If LKD is generated and not recycled back to the kiln, then calculate a plant-specific LKD emission factor for each kiln and month. The LKD emission factor shall be calculated using Equation 170-3.

$$EF_{LKD} = [(CaO\ content - uncalcined\ \ CaO) \times Molecular\ ratio\ of\ CO_2 / CaO] + [(MgO\ Content - uncalcined\ \ MgO) \times Molecular\ ratio\ of\ CO_2 / MgO]$$

Equation 170-3

Where:

EF_{LKD}	=	LKD emission factor.
CaO Content (by weight)	=	Total CaO content of LKD, including calcined and uncalcined (weight fraction).
Uncalcined CaO (by weight)	=	Uncalcined CaO content of LKD (weight fraction).
Molecular ratio of CO_2/CaO	=	0.785.
MgO Content (by weight)	=	Total MgO content of LKD, including calcined and uncalcined (weight fraction).
Uncalcined MgO	=	Uncalcined MgO content of LKD (weight fraction).
Molecular ratio of CO_2/MgO	=	1.092.

(c) Fuel Combustion Emissions in Kilns. Calculate CO_2, CH_4, and N_2O emissions from stationary fuel combustion emissions following the calculation methods specified in WCI.20. Operators of lime manufacturing plants that primarily combust biomass-derived fuels and combust fossil fuels only during periods of start-up, shut-down, or malfunction may report CO_2 emissions from fossil fuels using the emission factor methodology in WCI.23(a). "Pure" means that the biomass-derived fuels account for 97 percent of the total amount of carbon in the fuels burned.

§ WCI.174 Sampling, Analysis, and Measurement Requirements

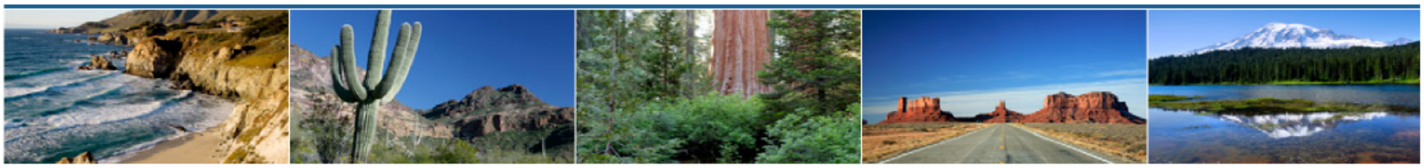
Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the lime industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement *procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.*

(a) Determine the plant-specific weight fractions of CaO, MgO, uncalcined CaO, and uncalcined MgO in quick lime from each kiln using (method to be determined). Determine the plant-specific fraction of CaO, MgO, uncalcined CaO, and uncalcined MgO in LKD not recycled to the kiln using (method to be determined). The monitoring must be conducted monthly for each kiln from samples drawn from bulk storage.

(b) The quantity of quick lime produced must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(c) The quantity of LKD discarded must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(d) The quantity of raw materials consumed (i.e. limestone, dolomite, aragonite, chalk, coral, marble, and shell.) must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.



ATTACHMENT 10: PETROLEUM REFINERIES

§ WCI.200 PETROLEUM REFINERIES

§ WCI.201 Source Category Definition

A petroleum refinery consists of all processes used to produce gasoline, aromatics, kerosene, distillate fuel oils, residual fuel oils, lubricants, asphalt, or other products through distillation of petroleum or through redistillation, cracking, rearrangement or reforming of unfinished petroleum derivatives.

WCI.202 Greenhouse Gas Reporting Requirements

The annual emissions report must contain the following information reported at the facility level:

(a) Catalyst Regeneration. Report CO_2 emissions.

(b) Process Vents. Report CO_2, N_2O, and CH_4 emissions.

(c) Asphalt Production. Report CO_2 and CH_4 emissions.

(d) Sulfur Recovery. Report CO_2 emissions.

(e) Stationary Combustion Units Other than Flares and Control Devices. Report CO_2, N_2O, and CH_4 emissions as specified in WCI.23.

(f) Flares and Other Control Devices. Report CO_2, N_2O, and CH_4 emissions.

(g) Above-Ground Storage Tanks. Report CH_4 emissions.

(h) Wastewater Treatment. Report CH_4 and N_2O emissions.

(i) Oil-Water Separators. Report CH_4 emissions.

(j) Equipment Leaks. Report CH_4 emissions.

(k) Feedstock Consumption: Report feedstock consumption by type for all feedstocks which result in GHG emissions in the reporting year (including petroleum coke) in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

(l) Fuel Consumption: Report fuel consumption by fuel type consumed in the reporting year in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

WCI.203 Calculation of Greenhouse Gas Emissions

The operator shall calculate GHG emissions using the methods in paragraphs (a) through (i) of this section.

(a) Catalyst Regeneration. For units equipped with CEMS, operators shall calculate CO_2 process emissions resulting from catalyst regeneration using CEMS in accordance with WCI.20. In

the absence of CEMS data, the operator shall use the methods in paragraphs (a)(1) through (a)(3).

(1) The operator shall calculate process CO_2 emissions from the continuous regeneration of catalyst material in fluid catalytic cracking units (FCCU) and fluid cokers using Equations 200-1, 200-2, and 200-3.

$$CO_2 = \sum_{d=1}^{n} CR_d \times CF \times 3.664 \times 0.001$$ **Equation 200-1**

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
n	=	number of days of operation in the report year
CR_d	=	daily average coke burn rate (kg/day)
CF	=	carbon fraction in coke burned
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

$$CR_d = \left[\sum_{i=1}^{n} [K_1 Q_r \times (\%CO_2 + \%CO) + K_2 Q_a - K_3 Q_r \times [\%CO/2 + \%CO_2 + \%O_2] + K_3 Q_{oxy} \times (\%O_{oxy})]_i \right] / n$$

Equation 200-2

Where:

CR_d	=	daily average coke burn rate (kg/day or lb/day)
K_1, K_2, K_3	=	material balance and conversion factors (K_1, K_2, and K_3 from Table 200-1
n	=	number of hours per day
Q_r	=	volumetric flow rate of exhaust gas before entering the emission control system (dscm/min or dscf/min)
Q_a	=	volumetric flow rate of air to regenerator as determined from control room instrumentation (dscm/min or dscf/min)
$\%CO_2$	=	CO_2 concentration in regenerator exhaust, percent by volume – dry basis
%CO	=	CO concentration in regenerator exhaust, percent by volume – dry basis
$\%O_2$	=	O_2 concentration in regenerator exhaust, percent by volume – dry basis
Q_{oxy}	=	volumetric flow rate of O_2 enriched air to regenerator as determined from control room instrumentation (dscm/min or dscf/min)
$\%O_{xy}$	=	O_2 concentration in O_2 enriched air stream inlet to regenerator, percent by volume – dry basis

$$Q_r = (79 \times Q_a + (100 - \%Q_{xy}) \times Q_{oxy}) / (100 - \%CO_2 - \%CO - \%O_2)$$ **Equation 200-3**

Where:

Q_r	=	volumetric flow rate of exhaust gas from regenerator before entering the emission control system (dscm/min or dscf/min)
Q_a	=	volumetric flow rate of air to regenerator, as determined from control room instrumentation (dscm/min or dscf/min)
$\%Q_{xy}$	=	oxygen concentration in oxygen enriched air stream, percent by volume – dry basis
Q_{oxy}	=	volumetric flow rate of O_2 enriched air to regenerator as determined from catalytic cracking unit control room instrumentation (dscm/min or dscf/min)
$\%CO_2$	=	carbon dioxide concentration in regenerator exhaust, percent by volume – dry basis
%CO	=	CO concentration in regenerator exhaust, percent by volume – dry basis. When no auxiliary fuel is burned and a continuous CO monitor is not required, assume %CO to be zero
$\%O_2$	=	O_2 concentration in regenerator exhaust, percent by volume – dry basis

(2) The operator shall calculate process CO_2 emissions resulting from periodic catalyst regeneration using Equation 200-4.

$$CO_2 = \sum_{i=1}^{n} CRR \times \left(CF_{spent} - CF_{regen}\right)_i \times 3.664 \times 0.001 \qquad \textbf{Equation 200-4}$$

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
CRR	=	mass of catalyst regenerated (mass/regeneration cycle)
CF_{spent}	=	weight fraction carbon on spent catalyst
CF_{regen}	=	weight fraction carbon on regenerated catalyst (default = 0)
n	=	number of regeneration cycles
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

(3) The operator shall calculate process CO_2 emissions resulting from continuous catalyst regeneration in operations other than FCCUs and fluid cokers (e.g. catalytic reforming) using Equation 200-5.

$$CO_2 = CC_{irc} \times (CF_{spent} - CF_{regen}) \times H \times 3.664 \qquad \textbf{Equation 200-5}$$

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
CC_{irc}	=	average catalyst regeneration rate (metric tons/hr)
CF_{spent}	=	weight carbon fraction on spent catalyst
CF_{regen}	=	weight carbon fraction on regenerated catalyst (default = 0)
H	=	hours regenerator was operational (hr/yr)
3.664	=	ratio of molecular weights, CO_2 to carbon

(b) Process Vents. Except for process emissions reported under other requirements of this regulation, the operator shall calculate process emissions of CO_2, CH_4, and N_2O from process vents using Equation 200-6.

Equation 200-6

$$E_x = \sum_{i=1}^{n} VR_i \times F_{xi} \times (MW_x / MVC) \times VT_i \times 0.001$$

Where:

E_x	=	emissions of x (metric tons/yr), where x = CO_2, N_2O, or CH_4
VR_i	=	vent rate for venting event i (scf/unit time)
F_{xi}	=	molar fraction of x in vent gas stream during event i
MW_x	=	molecular weight of x (kg/kg-mole)
MVC	=	molar volume conversion (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole for STP of 60°F, and 1 atmosphere)
VT_i	=	time duration of venting event i
n	=	number of venting events
0.001	=	conversion factor – kg to metric tons

(c) Asphalt Production. The operator shall calculate CO_2 and CH_4 process emissions from asphalt blowing activities using Equations 200-7 and 200-8.

$$CH_4 = (M_A \times EF \times MW_{CH4} / MVC) \times (1 - DE) \times 0.001$$

Equation 200-7

Where:

CH_4	=	CH_4 emissions (metric tons/yr)
M_A	=	mass of asphalt blown (10^3 bbl/yr)
EF	=	emission factor (EF = 2,555 scf $CH_4/10^3$ bbl)
MW_{CH4}	=	CH_4 molecular weight (16.04 kg/kg-mole)
MVC	=	molar volume conversion factor (849.5 scf/kg- mole, for STP of 20°C and 1 atmosphere)
DE	=	control measure destruction efficiency (DE = 98% expressed as 0.98)
0.001	=	conversion factor – kg to metric tons

$$CO_2 = (M_A \times EF \times MW_{CH4} / MVC) \times DE \times 2.743 \times 0.001$$

Equation 200-8

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
M_A	=	mass of asphalt blown (10^3 bbl/yr)
EF	=	emission factor (EF = 2,555 scf $CH_4/10^3$ bbl)
MW_{CH4}	=	CH_4 molecular weight (16.04 kg/kg-mole)
MVC	=	molar volume conversion factor (849.5 scf/kg mole, for STP of 20°C and 1 atmosphere)
DE	=	control measure destruction efficiency (DE = 98% expressed as 0.98)

2.743 = CH_4 to CO_2 conversion factor
0.001 = conversion factor – kg to metric tons

(d) Sulfur Recovery. The operator shall calculate CO_2 process emissions from sulfur recovery units (SRUs) using Equation 200-9. For the molecular fraction (MF) of CO_2 in the sour gas, use either a default factor of 0.20 or a source specific molecular fraction value approved by [*insert jurisdiction*] and derived from source tests conducted at least once per calendar year under the supervision of [*insert jurisdiction*].

$$CO_2 = FR \times MW_{CO2} / MVC \times MF \times 0.001$$ **Equation 200-9**

Where:

CO_2	=	emissions of CO_2 (metric tons/yr)
FR	=	volumetric flow rate of acid gas to SRU (scf/year)
MW_{CO2}	=	molecular weight of CO_2 (44 kg/kg-mole)
MVC	=	molar volume conversion (849.5 scf/ kg-mole, for STP of 20°C and 1 atmosphere or 836 scf/kg-mole, for STP of 60°F, and 1 atmosphere)
MF	=	molecular fraction (%) of CO_2 in sour gas (default MF = 20% expressed as 0.20)
0.001	=	conversion factor – kg to metric tons

(e) Flares and Other Control Devices.

(1) The operator shall calculate and report CO_2, CH_4 and N_2O emissions resulting from the combustion of flare pilot and purge gas using the appropriate method(s) specified in sections WCI.20.

(2) The operator shall calculate and report CO_2 emissions resulting from the combustion of hydrocarbons routed to flares for destruction using Equation 200-10.

$$CO_2 = RFI \times EF_{NMHC} \times CF_{NMHC} \times 3.664 \times 0.001$$ **Equation 200-10**

Where:

CO_2	=	CO_2 emissions (metric tons/year)
RFT	=	refinery feed input (m^3/yr)
EF_{NMHC}	=	non-methane hydrocarbon emission factor (EF_{NMHC} = 0.002 kg/m^3 throughput)
CF_{NMHC}	=	conversion factor – NMHC to carbon (CF_{NMHC}= 0.6)
3.664	=	ratio of molecular weights, CO_2 to carbon 0.001 = conversion factor – kg to metric tons

(3) The operator who uses methods other than flares (e.g. incineration, combustion as a supplemental fuel in heaters or boilers) to destroy low Btu gases (e.g. coker flue gas, gases from vapor recovery systems, casing vents and product storage tanks) shall calculate CO_2 emissions using Equation 200-11. The operator shall determine CC_A and MW_A quarterly using methods specified in section WCI.20 and use the annual average values of CC_A and MW_A to calculate CO_2 emissions.

$$CO_2 = GV_A \times CC_A \times MW_A / MVC \times 3.664 \times 0.001$$ **Equation 200-11**

Where:

CO_2	=	CO_2 emissions (metric tons/year)
GV_A	=	volume of gas A destroyed annually (scf/year)
CC_A	=	carbon content of gas A (kg C/kg fuel)
MW_A	=	molecular weight of gas A
MVC	=	molar volume conversion factor (849.5 scf/kg- mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole, for STP of 60°F, and 1 atmosphere)
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

(f) Storage Tanks. For above-ground storage tanks containing crude oil, asphalt, naphtha, and distillate oils that are not equipped with vapor recovery technology, the operator shall calculate CH_4 emissions using the U.S. EPA TANKS Model (Version 4.09D). For crude oil, naphtha, and distillate oils, use the default chemical databases for crude oil (RVP 5), distillate fuel oil No. 2, and jet naphtha (JP4), respectively. For asphalt, use the data in Table 200-4 to create an asphalt chemical database. The annual throughput for each storage tank must be distributed equally across the twelve months of the year and the single-component liquid option selected. The total VOC emission values generated by the model shall be converted to methane emissions using:

(1) A default conversion factor of 0.6 (CH_4 = 0.6 * VOC); or
(2) Species specific conversion factors determined by storage tank headspace vapor analysis using a sampling and analysis methodology approved by [*insert jurisdiction*].

(g) Wastewater Treatment.

(1) The operator shall calculate CH_4 emissions from wastewater treatment using Equation 200-12.

$$CH_4 = [(Q \times COD_{qave}) - S] \times B \times MCF \times 0.001$$ **Equation 200-12**

Where:

CH_4	=	emission of methane (tons/yr)
Q	=	volume of wastewater treated (m^3/yr)
COD_{qave}	=	average of quarterly determinations of chemical oxygen demand of the wastewater (kg/m^3)
S	=	organic component removed as sludge (kg COD/yr)
B	=	methane generation capacity (B = 0.25 kg CH_4/kg COD)
MCF	=	methane conversion factor for anaerobic decay (0-1.0) from Table 200-2
0.001	=	conversion factor – kg to metric tons

(2) The operator shall calculate N_2O emissions from wastewater treatment using Equation 200-13.

$$N_2O = Q \times N_{qave} \times EF_{N2O} \times 1.571 \times 0.001$$ **Equation 200-13**

Where:

N_2O = emissions of N_2O (metric tons/yr)
Q = volume of wastewater treated (m^3/yr)
N_{qave} = average of quarterly determinations of N in effluent (kg N/m^3)
EF_{N2O} = emission factor for N_2O from discharged wastewater (0.005 kg N_2O-N/kg N)
1.571 = conversion factor – kg N_2O-N to kg N_2O
0.001 = conversion factor – kg to metric tons

(h) Oil-Water Separators. The operator shall calculate CH_4 emissions from oil-water separators using Equation 200-14.

$$CH_4 = EF_{sep} \times V_{water} \times CF_{NMHC} \times 0.001$$ **Equation 200-14**

Where:

CH_4 = emission of methane (tons/yr)
EF_{sep} = NMHC (non methane hydrocarbon) emission factor (kg/m^3) from Table 200-3.
V_{water} = volume of waste water treated by the separator (m^3/yr)
CF_{NMHC} = NMHC to CH_4 conversion factor (CF_{NMHC} = 0.6)
0.001 = conversion factor – kg to metric tons

(i) Equipment leaks. The operator shall calculate CH_4 emissions for all components in natural gas, refinery fuel gas, and PSA off-gas systems as follows:

(1) Components shall be identified as one of the following classification types: valve, pump seal, connector, flange, open-ended line. Operators shall use the Component Identification and Counting Methodology and screening methods found in Method 3 in CAPCOA (1999), which is incorporated by reference in WCI.6. Operators shall measure and record emissions using instrumentation capable of detecting methane.

(2) The VOC emissions shall be calculated using the following methods:

(A) For components where the measured screening value (SV) is indistinguishable from zero when corrected for background, operators shall calculate VOC emissions using Equation 200-15:

$$E_{VOC-0} = \sum_{i=1}^{6} CC_i \times ZF_{i0} \times t$$ **Equation 200-15**

Where:

E_{VOC-0} = zero component VOC emission (kg/screening period)
i = component type (1 = valve, 2 = pump seal, 3 = other, 4 = connector, 5 = flange, 6 = open-ended line)
CC_i = number of i components where SV = 0
ZF_{i0} = zero VOC emission factor (kg/hr) for component i from Table 200-5
t = time (hours) since last screening

(B) For leaking components, operators shall calculate VOC emissions using the following methods:

(i) For screening values between background and 9,999 ppmv, the operator shall calculate the VOC emissions using Equation 200-16.

$$E_{VOCL-C} = \sum_{i=1}^{6} \sum_{n=1}^{n} \left(\sigma_i \times SV_n^{\beta i} \right) \times t \qquad \textbf{Equation 200-16}$$

Where:

E_{VOCL-C}	=	leaking components VOC emissions (kg/screening period)
i	=	component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open ended-line)
n	=	number of i components
σ_i	=	correlation equation coefficient for component type i from Table 200-5
SV_n	=	screening value for component n
βi	=	correlation equation exponent for component type i from Table 200-5
t	=	time (hours) component has been leaking – default value is time from last screening

(ii) For screening values greater than 9,999 ppmv, the operator shall calculate the VOC emissions using Equation 200-17.

$$E_{VOCP} = \sum_{i=1}^{6} CC_i \times PF_{iP} \times t \qquad \textbf{Equation 200-17}$$

Where:

E_{VOCP}	=	VOC emissions for components pegged over SV 9,999 ppmv (kg/screening period)
i	=	component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open-ended line)
CC_i	=	number of i components pegged over 9,999 ppmv
PF_{iP}	=	VOC emission factor (kg/hr) for component type i pegged over 9,999 ppmv from Table 200-5
t	=	time component has been leaking (hours) – default value is time since last screening

(C) The operator shall calculate CH_4 emissions using Equation 200-18. Operators shall use system specific determinations of gas composition and methane content (refinery fuel gas, natural gas, associated gas, flexigas, low Btu gas), where available, to determine a CF_{VOC} value. When representative data is not available, operators shall use the default value of 0.6 for CF_{VOC}.

$$CH_4 = \sum_{1}^{n} \left(E_{VOC-0} + E_{VOC-LC} + E_{VOCP} \right)_n \times CF_{VOC} \times 0.001 \qquad \textbf{Equation 200-18}$$

Where:

CH_4	=	methane emissions (metric tons/year)
n	=	number of screenings/year
E_{VOC-0}	=	zero component VOC emissions (kg/screening period)
E_{VOC-LC}	=	leaking component VOC emissions (kg/screening period)
E_{VOCP}	=	VOC emissions for components pegged over 9,999 ppmv (kg/screening period)
CF_{VOC}	=	VOC to CH_4 conversion factor (default CF_{VOC}=0.6)
0.001	=	conversion factor – kg to metric tons

WCI.204 Sampling, Analysis, and Measurement Requirements

(a) Catalyst Regeneration.

(1) For FCCUs and fluid coking units, the operators shall measure the following parameters using methods that comply with the measurement accuracy provisions in WCI.2(g).

(A) The daily oxygen concentration in the oxygen enriched air stream inlet to the regenerator.
(B) Continuous measurements of the volumetric flow rate of air and oxygen enriched air entering the regenerator.
(C) Continuous measurement of the volumetric flow rate of exhaust gas leaving the regenerator.
(D) Continuous measurements of the CO_2, CO and O_2 concentrations in the regenerator exhaust gas.
(E) Daily measurements of the carbon content of the coke burned.
(F) The number of days of operation.

(2) For periodic catalyst regeneration, the operators shall measure the following parameters using methods that comply with the measurement accuracy provisions in WCI.2(g).

(A) The mass of catalyst regenerated in each regeneration cycle.
(B) The weight fraction of carbon on the catalyst prior to and after catalyst regeneration.

(3) For continuous catalyst regeneration in operations other than FCCUs and fluid cokers, the operators shall measure the following parameters using methods that comply with the measurement accuracy provisions in WCI.2(g).

(A) The hourly catalyst regeneration rate.
(B) The weight fraction of carbon on the catalyst prior to and after catalyst regeneration.
(C) The number of hours of operation.

(b) Process vents. Operators shall measure the following parameters for each process vent using methods that comply with the measurement accuracy provisions in WCI.2(g).

(1) The vent flow rate for each venting event.
(2) The molar fraction of CO_2, N_2O, and CH_4 in the vent gas stream during each venting event.
(3) The duration of each venting event.

(c) Asphalt Production. Operators shall measure the mass of asphalt blown using methods that comply with the measurement accuracy provisions in WCI.2(g).

(d) Sulfur Recovery. The operator shall measure the volumetric flow rate of acid gas to the SRU using methods that comply with the measurement accuracy provisions in WCI.2(g). If using source specific molecular faction value instead of the default factor, the operator shall conduct an annual test of the CO_2 content using methods approved by [insert jurisdiction]. The operator shall submit a test plan to the [insert jurisdiction] for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [*insert jurisdiction*].

(e) Flares and Other Control Devices. The operator shall measure:

(1) The volume of gas destroyed annually determined to accuracy of ± 7.5%.
(2) The carbon content using methods that comply with the measurement accuracy provisions in WCI.2(g).

(f) Storage Tanks. The operator shall measure the annual throughput of crude oil, naphtha, distillate oil, asphalt, and gas oil for each storage tank using flow meters that comply with the measurement accuracy provisions in WCI.2(g).

(g) Wastewater Treatment. Operators shall measure the following parameters using methods that comply with the measurement accuracy provisions in WCI.2(g).

(1) The daily volume of waste water treated.
(2) The quarterly chemical oxygen demand of the wastewater.
(3) The amount of sludge removed and the organic content of the sludge.
(4) The quarterly nitrogen content of the wastewater.

(h) Oil-Water Separators. Operators shall measure the daily volume of waste water treated by the oil-water separators using methods that comply with the measurement accuracy provisions in WCI.2(g).

(i) Equipment Leaks. Operators shall measure screening values for each valve, pump seal, connector, flange, and open-ended line used in natural gas, refinery fuel gas, and PSA off-gas systems using the methods specified in CAPCOA (1999) Method 3: Correlation Equation Method and an instrument capable of detecting methane. Operators shall conduct screenings at the frequency interval required by [*insert jurisdiction*].

Note: Comparability of the Canadian regulations to the leak detection and repair r regulations under 40 CFR 63, Subpart CC and 40 CFR 60, Subpart VV is under determination. These U.S EPA regulations require initially monthly monitoring for valves and pumps, which may be reduced to quarterly, semi-annual, or annual based on the percentage of leaking components.

Table 200-1. Coke burn rate material balance and conversion factors

	(kg min)/(hr dscm %)	**(lb min)/(hr dscf %)**
K_1	0.2982	0.0186
K_2	2.0880	0.1303
K_3	0.0994	0.0062

Table 200-2. Default MCF Values for Industrial Wastewater			
Type of Treatment and Discharge Pathway or System	**Comments**	**MCF**	**Range**
Untreated			
Sea, river and lake discharge	Rivers with high organic loading may turn anaerobic, however this is not considered here	0.1	0 - 0.2
Treated			
Aerobic treatment plant	Well maintained, some CH_4 may be emitted from settling basins	0	0 – 0.1
Aerobic treatment plant	Not well maintained, overloaded	0.3	0.2 – 0.4
Anaerobic digester for sludge	CH_4 recovery not considered here	0.8	0.8 – 1.0
Anaerobic reactor	CH_4 recovery not considered here	0.8	0.8 – 1.0
Anaerobic shallow lagoon	Depth less than 2 meters	0.2	0 – 0.3
Anaerobic deep lagoon	Depth more than 2 meters	0.8	0.8 – 1.0

For CH_4 generation capacity (B) in kg CH_4/kg COD, use default factor of 0.25 kg CH_4/kg COD.

The emission factor for N_2O from discharged wastewater (EF_{N2O}) is 0.005 kg N_2O-N/kg-N.

MCF = methane correction factor – the fraction of waste treated anaerobically.
COD = chemical oxygen demand (kg COD/m^3).

ATTACHMENT 11: ALUMINUM PRODUCTION

Applicability

These methodologies apply to all facilities that convert raw alumina mineral (Al_2O_3) to raw aluminum metal by an electrolytic process. Emissions must be reported for the following processes:

- CO_2 from anode consumption,
- CO_2 from anode and cathode baking,
- PFC from anode effects,
- CO_2 from green coke calcination, and
- SF_6 from cover gas consumption,

Primary aluminum smelting facilities can emit GHG from other activities that are not directly part of the aluminum smelting process. GHG emissions from the following activities are covered under other sections of the reporting Essential Requirements:

- Stationary combustion emissions from boilers, heaters, furnaces (§ WCI.20),
- Nonroad equipment (§ WCI.XX),
- Lime calcination (§ WCI.170), and
- SF_6 use in electrical equipment (§WCI.XX).

HFC use for refrigeration and cooling and not associated with the aluminum processes is not included in this category, nor is bauxite calcination to alumina and raw coke production which are assumed to be performed at other locations.

Emission Calculations

The following emission calculation methods were taken from the *Aluminum Production-Guidance Manual for Estimating Greenhouse Gas Emissions, Environment Canada, March 2004*. Other organizations are recommending very similar methodologies, including the International Aluminum Institute, WRI, IPCC and The Climate Registry.

Emissions will be calculated monthly using the following methods:

Pre-baked Anode Consumption:

To calculate emissions from pre-baked anode consumption, use the following equation:

$$Emissions_{CO_2} = NCC \times MP \times \frac{(100 - \%S_a - \%Ash_a - \%Imp_a)}{100} \times 3.664$$

Where:

Emissions $_{CO2}$ = carbon dioxide emissions (metric tons per year)
NCC = net annode consumption per metric ton of aluminum;(metric ton/ metric ton Al)
MP = annual aluminum production (metric ton);
S_a = sulphur content in baked anodes (wt %);
Ash_a = ash content in baked anodes (wt %);
Imp_a = content of fluorine and other impurities in baked anodes (wt %);
3.664 = conversion factor from carbon to CO_2.

Søderberg Anode Consumption:

To calculate emissions from Søderberg anode consumption, use the following equation:

$$Emissions_{CO_2} = \left[\begin{array}{l} (PC \times MP) - \left(BSM \times \frac{MP}{1000} \right) - \left(\frac{\%BC}{100} \times PC \times MP \times \left(\frac{\%S_p + \%Ash_p + \%H_p}{100} \right) \right) \\ - \left(\frac{100 - \%BC}{100} \times PC \times MP \times \frac{\%S_c + \%Ash_c}{100} \right) \end{array} \right] \times 3.664$$

Where:

Emissions $_{CO2}$ = carbon dioxide emissions (metric tons per year)
PC = paste consumption (metric tons paste/metric ton aluminum);
MP = annual aluminum production (metric tons);
BSM = emissions of benzene-soluble matter (kilograms benzene-soluble matter/metric ton aluminum);
BC = average binder (pitch) content in paste (wt %);
S_p = sulphur content in pitch (wt %);
Ash_p = ash content in pitch (wt %);
H_p = hydrogen content in pitch (wt %);
S_c = sulphur content in calcinated coke (wt %);
Ash_c = ash content in calcinated coke (wt %);
3.664 = conversion factor from carbon to CO_2.

Anode/Cathode Baking:

CO_2 emissions result from the baking of (pre-bake) anodes and cathodes. In cases where baking of anodes and cathodes occurs on-site, emissions should be calculated for both packing coke and pitch coking. The calculations require information on the net rate of raw material used for baked anode/cathode production, plus material composition information. To calculate emissions from packing coke for anodes, use the following equation:

$$Emissions_{CO_2} = \left(PCC \times BAP \times \frac{100 - \%Ash_{pc} - \%S_{pc} - \%Imp}{100} \right) \times 3.664$$

Where:

Emissions $_{CO2}$	=	carbon dioxide emissions (metric tons per year)
PCC	=	packing coke consumption per metric ton of baked anode (metric tons coke/metric ton anodes);
BAP	=	annual baked anode production (metric tons);
Ash_{pc}	=	ash content in packing coke (wt %);
S_{pc}	=	sulphur content in packing coke (wt %);
Imp	=	content of other impurities (wt %);
3.664	=	conversion factor from carbon to CO_2.

To calculate emissions that occur from oxidation of pitch volatile matter in ***pitch coking***, use the following equation:

$$Emissions_{CO_2} = \left(GAW - BAP - \left(\frac{\%H_p}{100} \times \frac{\%PC}{100} \times GAW \right) - RT \right) \times 3.664$$

Where:

Emissions $_{CO2}$	=	carbon dioxide emissions (metric tons per year)
GAW	=	annual green anode tonnage (metric tons);
BAP	=	annual baked anode production (metric tons).
H_p	=	hydrogen content in pitch (wt %);
PC	=	average pitch content (wt %) in green anode;
RT	=	annual recovered tar (metric tons);
3.664	=	conversion factor from carbon to CO_2.

To calculate similar emissions from the baking of cathodes, the methodology follows the above methodology for anodes, where values for baked cathode production, green cathode tonnage and cathode composition data are substituted into the equations for packing coke and pitch coking.

<u>Emissions from Anode Effects:</u>

The two PFCs known to be emitted from the occurrence of anode effects (also termed anode events) during primary aluminum smelting are CF_4 and C_2F_6. The most accurate estimates of these PFC emissions from anode effects are based on either continuous monitoring of emissions or development of smelter-specific relationships for emissions based on measured values and operating conditions. This requires both a comprehensive measurement program to establish the smelter-specific relationship as well as on-going collection of operating parameter data (e.g. frequency and duration of anode effects, anode effect over-voltage) and production data.

If continuous monitoring of PFC emissions is not selected, there are two approaches that may be used to relate monitored emissions, typically obtained from field measurements, to process data in order to develop smelter-specific relationships that can be used to estimate emissions. The two approaches are the Slope method or the Pechiney method, which are described below.

Slope Method - The **Slope** method uses a linear least squares relationship between anode effect frequency and duration and emissions, such that emissions can be calculated using the following equation:

$$Emissions_{CF_4,C_2F_6} = slope_{CF_4,C_2F_6} \times AEF \times AED \times MP$$

Where:

$Emissions_{CF4,\ C2F6}$	=	Emissions of CF_4 or C_2F_6 (metric tons/yr)
$slope_{CF4,\ C2F6}$	=	slope of the emissions relationship- measured ([Metric tons of CF_4 or C_2F_6 /metric ton Al]/[anode effect minutes/pot-days]);
AEF	=	anode effect frequency (number of anode effects per pot per day);
AED	=	anode effect duration (minutes per anode effect);
MP	=	total aluminum production (metric tons).

Note that the product of the anode effect frequency and duration can be expressed as "anode effect minutes per pot-day."

Pechiney Method - The **Pechiney** method (or over-voltage method) uses the anode effect over-voltage as the process parameter in combination with the quantity of aluminum produced to calculate PFC emissions. The anode effect over-voltage (AEO) represents the sum of the differences between the total cell voltage and the equilibrium voltage for each second during an anode event divided by the total number of seconds in the chosen period (e.g. one day). This calculation is carried out once the cell voltage exceeds 8 volts and continues until the voltage returns to the equilibrium point. The over-voltage coefficient is determined from the measurement of PFC emissions. The full calculation is:

$$Emission_{CF_4,C_2F_6} = Over - voltage \quad coefficient_{CF_4,C_2F_6} \times \frac{AEO}{CE} \times MP$$

Where:

$Emissions_{CF4,\ C2F6}$	=	Emissions of CF_4 or C_2F_6 (metric tons/yr)
Over-voltage coefficient $_{CF4,\ C2F6}$	=	experimentally measured ([Metric tons of CF_4 or C_2F_6/metric ton Al]/ mV)
AEO	=	anode effect over-voltage (millivolts per pot per day);
CE	=	current efficiency of aluminum production process, expressed as a fraction;
MP	=	annual aluminum production (metric tons).

Under either approach, the calculation is to be completed for each of the PFC gases emitted (CF_4 and C_2F_6) and for each operating pot line at the facility.

Note: It has been recommended that facilities be allowed to use a technology based emission factor in place of measuring either the slope coefficient or the over-voltage coefficient required *by the above two methods. This approach is equivalent to the IPCC Tier 2 method which has a reported uncertainty of +/-6% to +/-44%, depending on the process. The IPCC Tier 3 method requires the use of site measured values for greater accuracy. The WCI seeks stakeholder comments regarding the practicalities of requiring the IPCC Tier 3 method as opposed to allowing a Tier 2 method as well.*

CO_2 Emissions from Green Coke Calcination

The process of coke calcination, where coke is heated to high temperatures in order to drive off volatile matter, results in emissions of CO_2. The facility may purchase coke materials in the calcined state, or it may operate a calcining furnace. If coke calcination is conducted on-site at the facility, the following equation can be used to calculate the CO_2 emissions from this process:

$$Emissions_{CO_2} = \left[\left[GC \times \frac{(100 - \%H_2O_{gc} - \%V_{gc} - \%S_{gc})}{100} - (CC + UCC + DE) \times \frac{(100 - \%S_{cc})}{100}\right] \times 3.664\right] + \left[GC \times 0.035 \times \frac{44}{16}\right]$$

Where:

$Emissions_{CO2}$	=	carbon dioxide emissions (metric tons prr year)
GC	=	annual green coke feed (metric tons);
H_2O_{gc}	=	humidity in green coke feed (wt %);
V_{gc}	=	volatiles in green coke feed (wt %);
S_{gc}	=	sulphur content in green coke feed (wt %);
S_{cc}	=	sulphur content in calcinated coke (wt %);
CC	=	annual calcinated coke produced (metric tons);
UCC	=	annual under-calcinated coke produced (metric tons);
DE	=	annual coke dust emissions (metric tons);
3.664	=	conversion factor from carbon to CO_2;
0.035	=	Assumed CH4 and tar content in coke volatiles, contributing to CO_2 emissions
44/16	=	conversion factor from methane to CO_2.

For the composition parameters in the above equation, facility-specific values should be used for the coke input and output streams of the calcining operation to ensure accuracy of the emission estimates.

SF_6 Emissions from Use as a Cover Gas

For some specialized applications, SF_6 may be used as a cover gas at aluminum facilities. SF_6 is essentially non-reactive during this process. If this SF_6 use occurs, emissions are calculated based on the quantity of SF_6 consumed:

$$Emissions_{SF_6} = Consumption_{SF_6}$$

The consumption of SF_6 may be determined by:

- measured weight difference of gas cylinders used at the facility for this purpose;
- accounting of delivered purchases and inventory changes of SF6 used for this purpose; and
- metering of flow rates at the point used.

The first two methods based on weight are generally more accurate. When using measured weights, it is important to account for any gas in the heels of the cylinders returned to the supplier. If accounting or delivery records are used over an annual time period, beginning and end of year inventories must be taken into account.

Reporting Requirements

Annual emissions will be reported by emission source (i.e. emissions from prebaked anode consumption or from anode effect) and by GHG.

Sampling, Analysis, and Measurement Methods

Issue: Sampling, analysis, and measurement methods have not been specified in the available methodologies for the aluminum industry.

Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the aluminum industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.

There are several possible approaches to specifying monitoring methods:

- Specify the accuracy required for each datum and allow the source to select their own methodologies that meet the accuracy requirements, and require the verifiers to certify the accuracy requirements were achieved, [*This approach is especially useful for monitoring that is currently being made with a wide variety of instruments and are likely being made with high accuracy, such as monitoring of raw material flows and product flows; however, much burden is placed on verifiers to ensure the accuracy of the methods used. This approach is used for monitoring fuel flow for combustion sources.*]
- Specify the accuracy required for each datum and require the source to submit a monitoring plan that meets the accuracy requirements, and require the verifiers to certify the source followed the approved plan. [*This approach places significant burden on WCI to approve individual monitoring plans.*]

- Specify the methodologies that should be followed, selecting them from available ASTM, ISO, U.S. EPA, and EC methodologies; however, there are not established methods for all parameters. Listed below are examples of the available methodologies for monitoring the aluminum industry.

ISO 9055:1988. Carbonaceous materials for the production of aluminum -- Pitch for electrodes -- Determination of sulfur content by the bomb method.

ISO 10238:1999. Carbonaceous materials used in the production of aluminum -- Pitch for electrodes -- Determination of sulfur content by an instrumental method.

ISO 8006:1985. Carbonaceous materials used in the production of aluminum -- Pitch for electrodes -- Determination of ash.

ISO 8005-2005. Carbonaceous materials used in the production of aluminum -- Green and calcined coke -- Determination of ash content

ISO 10237-1997. Carbonaceous materials for use in the production of aluminum -- Calcined coke -- Determination of residual-hydrogen content.

ISO 5931:2000. Carbonaceous materials used in the production of aluminum -- Calcined coke and calcined carbon products -- Determination of total sulfur by the Eschka method.

Slope and Over-voltage Coefficient: *Protocol for Measurement of Tetrafluoromethane and Hexafluoroethane Emissions from Primary Aluminum Production.* U.S. Environmental Protection Agency and International Aluminum Institute. April 2008.

ASTM D3173 Test Method for Moisture in the Analysis Sample of Coal and Coke

The following parameters are not covered by a specific ASTM or ISO methodology. They are candidates for being addressed using one of the first two approaches listed above:

- Mass flow rates or consumption of aluminum, paste, carbon, anodes, coke, recovered tar, and coke dust,
- Emissions of benzene soluble matter,
- Binder content in paste,
- Pitch content in anodes,
- Current efficiency,
- Anode effect frequency,
- Anode effect duration,
- Anode effect over-voltage,
- Current efficiency,
- Volatile content in coke

ATTACHMENT 12: LEAD PRODUCTION

Applicability

There are two primary production processes used to produce lead from lead concentrates: the sintering/smelting process and the direct smelting process. In the sintering/smelting process, the lead concentrates are initially combined with recycled sinter, lime rock and silica, oxygen, and high lead content sludge to produce a sinter roast. The sinter roast is then put into a blast furnace (i.e., traditional blast or Imperial Smelting) with other metal-containing ores, air, smelter by-products, and metallurgical coke. This reduction of lead oxide in the furnace results in the production of CO_2 emissions. In the direct smelting process, the sintering step is skipped and the lead concentrates are entered directly into the furnace (i.e., Isasmelt-Ausmelt, Queneau-Schumann-Lurgi, and Kaldo for bath smelting and Kivcet for flash smelting) with reducing agents.

In addition to the sintering/smelting and direct smelting primary production processes, secondary production or recycling of lead is also conducted. Most of the recycled lead comes from scrapped lead acid batteries. The lead acid batteries are either crushed with a hammer mill or smelted whole. All of the furnaces used for primary production, as well as electric arc and electric resistance furnaces, can be used to smelt recycled scrap lead.

Emission Calculations

The following emission calculation methods are from the 2006 IPCC Guidelines, Volume 3, Section 4.6.

The Tier 3 methodology recommends using actual directly measured CO_2 emissions data, if available. Alternatively, facility-specific data regarding reducing agents and carbon contents can be used to calculate emissions for the Tier 3 methodology. The Tier 2 methodology is similar to the Tier 3 method, except that default carbon contents for the reducing agents are used instead of facility-specific carbon contents. Default carbon contents are available for the following reducing agents: blast furnace gas, charcoal, coal, coal tar, coke, coke oven gas, coking coal, electric arc furnace (EAF) carbon electrodes, EAF charge carbon, fuel oil, gas coke, natural gas, and petroleum coke.

The emission calculation equation is:

$$E_{Pb} = \sum_{x} (RA_x \times C_x) \times 3.664$$

Where:

E_{Pb} = CO_2 emissions from lead production (metric tons);
RA_x = Quantity of reducing agent *x* used (metric tons);
C_x = Carbon content of reducing agent *x* (metric tons C/metric tons of *x*);
3.664 = Conversion factor from metric tons of C to metric tons of CO_2.

The Tier 3 method (using either actual directly measured CO_2 emissions data or facility-specific reducing agent quantities and carbon contents) is recommended to estimate emissions from lead production facilities.

The uncertainty for Tier 3 facility-specific measured CO_2 data has been estimated to be ±5 percent. The uncertainty associated with the Tier 3 facility-specific reducing agent quantities and carbon contents is also estimated to be ±5 percent. The uncertainty of the Tier 2 reducing agent carbon contents is estimated to be ±15 percent.

Reporting Requirements

Annual CO_2 emissions (measured or calculated) based on the IPCC Tier 3 method will be reported for each facility. Facility-specific quantities and carbon contents of each reducing agent used will also be reported.

Sampling, Analysis, and Measurement Methods

The Tier 3 method from the 2006 IPCC Guidelines specifies facility-specific emission measurements or facility-specific data regarding reducing agents and carbon contents. The following measurement methods should be used.

Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the lead industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.

(a) Facility CO_2 emissions. Determine facility CO_2 emissions using continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).

Wherever possible, measurements of carbon contents of the material balance input materials should be conducted as described below.

(b) Fuel Carbon Content Requirements. Fuel carbon contents should be measured in the following manner (from WCI.25):

(1) For coal and coke, solid biomass-derived fuels, and waste-derived fuels; use ASTM 5373-02 (Reapproved 2007).
(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) "Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2002).
(3) For gaseous fuels, use ASTM D1945-03 or ASTM D1946-90 (Reapproved 2006).

(c) By-Product Carbon Content Monitoring Requirements. Carbon contents of by-products (e.g., blast furnace gas, coke oven gas, coal tar, light oil, coke breeze, sinter off gas, etc.) used in lead production processes should be monitored in the following manner:
[Method to be determined.]

(d) Electrode Carbon Content Requirements. Carbon contents of carbon electrodes used in lead production processes should be monitored in the following manner:
[Method to be determined.]

(e) Quantity Measurement Requirements. The quantities of process inputs, outputs, and by-products must be determined using the following methods:

- For solid process inputs, outputs, and by-products, quantities must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.
- For liquid process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes, such as *[Method to be determined]*.
- For gaseous process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes, such as *[Method to be determined]*.

ATTACHMENT 13: ZINC PRODUCTION

Applicability

There are three primary production processes used to produce zinc: electro-thermic distillation, pyrometallurgical, and electrolytic. In electro-thermic distillation, roasted concentrate and secondary zinc products are combined into a sinter feed that is then burned resulting in a zinc oxide-rich sinter. This sinter is then fed into an electric retort furnace with metallurgical coke which reduces the zinc oxide; the resultant vaporized zinc is then captured in a vacuum condenser. The pyrometallurgical process utilizes an Imperial Smelting Furnace, which allows for the simultaneous treatment of both lead and zinc concentrates (estimated emissions must be allocated to both lead and zinc production to avoid double-counting). In the electrolytic process, zinc sulfide is calcined, which results in the production of zinc oxide. The zinc oxide is leached in sulfuric acid and then drawn out of solution using electrolysis. The electrolytic process does not result in non-energy CO_2 emissions.

In addition to primary production, zinc can be recovered from various materials using more than 40 hydrometallurgical and pyrometallurgical technologies. The preferred technologies are dependent upon the zinc source and the desired end use for the recovered zinc. In general, the processes consist of zinc concentration, sintering, smelting, and refining. Many of the sintering, smelting, and refining steps are identical to the primary production process steps. Two concentration processes are the Waelz Kiln and slag reduction or fuming processes.

Emission Calculations

The following emission calculation methods are taken from the 2006 IPCC Guidelines, Volume 3, Section 4.7.

The Tier 3 methodology recommends using actual directly measured CO_2 emissions data, if available. Alternatively, facility-specific emission factors and material quantities can be used to calculate emissions for the Tier 3 methodology. The Tier 2 methodology uses country-specific emission factors developed from facility statistics regarding reducing agent use, furnace types, and other process materials. Unlike lead, default carbon contents are not provided for reducing agents used in zinc production.

The Tier 1 methodology for zinc production uses default emission factors for different zinc product types. The emission calculation equation for Tier 1 is:

$$E_{Zn} = (Zn_{ET} \times EF_{ET}) + (Zn_{PM} \times EF_{PM}) + (Zn_{Sec} \times EF_{Sec})$$

Where:

E_{Zn} = CO_2 emissions from zinc production (metric tons);
Zn_{ET} = Quantity of zinc produced by electro-thermic distillation (metric tons);
EF_{ET} = Emission factor for electro-thermic distillation (metric tons CO_2/metric tons of zinc produced);
Zn_{PM} = Quantity of zinc produced by pyrometallurgical process (Imperial Smelting Furnace Process (metric tons);
EF_{PM} = Emission factor for pyrometallurgical process (metric tons CO_2/metric tons of zinc produced);
Zn_{Sec} = Quantity of zinc produced by secondary production process (e.g., Waelz Kiln, etc.) (metric tons);
EF_{Sec} = Emission factor for secondary production process (metric tons CO_2/metric tons of zinc produced).

A default emission factor is not available for the electro-thermic distillation process because of a lack of data; emissions will be underestimated if a facility-specific emission factor for the electro-thermic distillation process is not identified and used. The default emission factor for the pyrometallurgical process (i.e., Imperial Smelting Furnace) is 0.43 metric tons CO_2/metric tons of zinc produced. The default emission factor for the secondary production process (i.e., Waelz Kiln) is 3.66 metric tons CO_2/metric tons of zinc produced.

The uncertainty for Tier 3 facility-specific measured CO_2 data has been estimated to be ±5 percent. The uncertainty associated with the Tier 3 facility-specific reducing agent quantities and carbon contents is also estimated to be ±5 percent. The uncertainty of the Tier 2 country-specific emission factors is estimated to be ±15 percent. The uncertainty of the Tier 1 default emission factors is estimated to be ±50 percent.

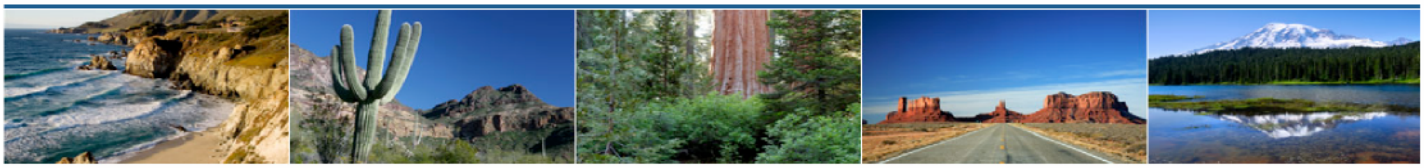
The Tier 3 method (using either actual directly measured CO_2 emissions data or facility-specific emission factors and material quantities) is recommended to estimate emissions from zinc production facilities.

Reporting Requirements

Annual CO_2 emissions (measured or calculated) based on the IPCC Tier 3 or Tier 2 method will be reported for each facility.

Sampling, Analysis, and Measurement Methods

(a) Facility CO_2 emissions. The Tier 3 method from the 2006 IPCC Guidelines specifies facility-specific emission measurements. Determine facility CO_2 emissions using continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).
(b) Quantity Measurement Requirements. Alternatively, Tier 3 facility-specific emission factors can be used if facility-specific emission measurements are not available. For solid process outputs, quantities must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.



ATTACHMENT 14: COAL MINE FUGITIVE EMISSIONS

Applicability

As part of the geological processes of coal formation, CO_2 and CH_4 may also be produced and trapped in the coal seam until the coal is exposed and broken during mining. In general, CH_4 is the predominant greenhouse gas emitted from coal mines. The following five processes are potential source categories for fugitive emissions associated with both underground and surface coal mines:

- Mining (emissions from the breakage of coal and associated strata, including ventilation air and degasification systems for underground mines);
- Post-mining operations (subsequent handling, processing, and transportation of coal);
- Low temperature oxidation (oxidation of coal when exposed to oxygen in air);
- Uncontrolled combustion (active fire caused by trapped heat and increased temperature from low temperature oxidation); and
- Abandoned mines.

The following methodology focuses solely on CH_4 mining emissions. Emissions from post-mining operations (including storage piles) are addressed in Section WCI.100. Coal oxidation occurs in both underground and surface mines; however, emissions are not expected to be significant. Uncontrolled combustion also occurs in underground and surface mines, but it is difficult to quantify and infeasible to include in the methodology. Estimation of emissions from abandoned underground mines requires the emission rate at closure/abandonment (i.e., when all active mine ventilation ceases) and "decline curves" (i.e., hyperbolic models of declining emissions as a function of time). At best, the uncertainty of estimated abandoned mine emissions is ±50 percent.

Emission Calculations

The following emission calculation methods were taken from the 2006 IPCC Guidelines, Volume 2, Section 4.1. The following methods can be used to calculate emissions:

Underground Mining

The Tier 3 method for underground mining is mine-specific measurement data based on ventilation air and degasification system measurements. The Tier 2 method relies on basin-specific emission factors that need to be obtained from sample ventilation air data or from a quantitative relationship that accounts for the gas content of the coal and the surrounding strata affected by the mining process. If Tier 3 or Tier 2 data are not available, then Tier 1 emission factors could be used. If Tier 1 or Tier 2 methods are utilized, then methane recovered and utilized for energy production or flaring should be subtracted from the emission estimates; this subtraction is not needed for the Tier 3 methodology, because the Tier 3 mine-specific measurements should take methane recovery and utilization into account.

The Tier 2 and Tier 1 equations are as follows:

$$E_{Underground-CH4} = E_{Mining-CH4} - R_{CH4}$$

Where:

$E_{Underground-CH4}$ = Total CH_4 emissions from underground coal mining (metric tons);
$E_{Mining-CH4}$ = CH_4 emissions from underground coal mining operations (metric tons);
R_{CH4} = CH_4 recovered and utilized for energy production or flared.

$$E_{Mining-CH4} = P_{Underground} \times EF_{Underground-CH4} \times 0.00067$$

Where:

$E_{Mining-CH4}$ = CH_4 emissions from underground coal mining operations (metric tons);
$P_{Underground}$ = Underground coal production (metric tons);
$EF_{Underground-CH4}$ = CH_4 emission factor (m^3 CH_4/metric ton coal);
0.00067 = Conversion factor from volume of CH_4 to mass of CH_4 (metric ton/m^3).

The Tier 1 emission factors for underground coal mining are identified as high, average, or low. The high emission factor is 25 m^3/metric ton (i.e., at depths greater than 400 meters). The average emission factor is 18 m^3/metric ton (i.e., at depths between 200 and 400 meters). The low emission factor is 10 m^3/metric ton (i.e., at depths less than 200 meters).

$$E_{Post-CH4} = P_{Underground} \times EF_{Post-CH4} \times 0.00067$$

Where:

$E_{Post-CH4}$ = CH_4 emissions from underground coal post-mining operations (metric tons);
$P_{Underground}$ = Underground coal production (metric tons);
$EF_{Post-CH4}$ = CH_4 emission factor (m^3 CH_4/metric ton coal);
0.00067 = Conversion factor from volume of CH_4 to mass of CH_4 (metric ton/m^3).

For underground mines, the uncertainty for the Tier 3 mining emission estimates ranges from ±5 percent for continuous monitoring up to ±30 percent for more infrequent monitoring. The uncertainty of the Tier 2 mining emission factors is ±50-75 percent, while the uncertainty of the Tier 1 mining emission factors is a factor of 2 greater/smaller.

Surface Mining

It is not feasible to collect mine-specific Tier 3 measurement data for mining operations at surface mines, so Tier 2 emission factors are an alternative approach for this category.

$$E_{Mining-CH4} = P_{Surface} \times EF_{Surface-CH4} \times 0.00067$$

Where:

$E_{Mining-CH4}$	=	CH_4 emissions from surface coal mining operations (metric tons);
$P_{Surface}$	=	Surface coal production (metric tons);
$EF_{Surface-CH4}$	=	CH_4 emission factor (m^3 CH_4/metric ton coal);
0.00067	=	Conversion factor from volume of CH_4 to mass of CH_4 (metric ton/m^3).

The Tier 2 emission factors for surface coal mining are identified as high, average, or low. The high emission factor is 2.0 m^3/metric ton (i.e., for overburden depths greater than 50 meters). The average emission factor is 1.2 m^3/metric ton (i.e., for overburden depths between 25 and 50 meters). The low emission factor is 0.3 m^3/metric ton (i.e., for overburden depths less than 25 meters). For surface mines, the uncertainty of the Tier 2 mining emission factors is a factor of 2 greater/smaller.

Because of the high uncertainty associated with estimating emissions from mining operations at surface coal mines, these emissions will not be included in the reporting requirements at this time.

Reporting Requirements

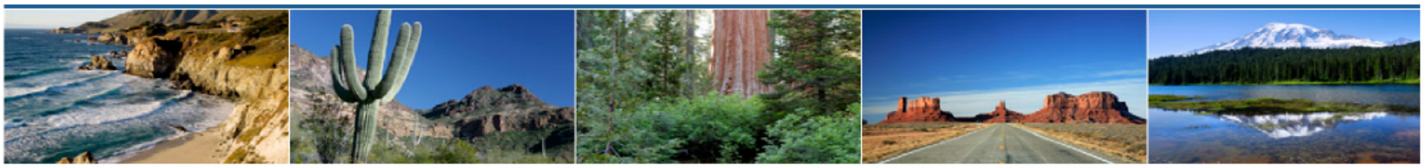
Annual CH_4 emissions will be reported for each specific underground mine using the Tier 3 methodology.

Sampling, Analysis, and Measurement Methods

Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the mining industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these mines for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a mine.

Ventilation air and/or degasification system measurements will need to be taken for development of underground Tier 3 mining emission estimates. More frequent sampling (preferably continuous) will reduce the amount of uncertainty. Appropriate measurement methods are likely specified by the U.S. Mine Safety and Health Administration, although none have been identified to date.

Ventilation measurements are typically conducted on a periodic basis with air flow measurements and handheld methanometers. Drainage gas utilized for energy production is usually continuously measured with a flow meter with gas composition samples taken at a periodic basis. Drainage gas vented to the atmosphere is periodically sampled, along with the associated gas composition.



ATTACHMENT 15: PULP AND PAPER MANUFACTURING

Several documents were identified as having the most comprehensive estimation methods for the pulp and paper industry. In these documents, the primary authority for estimating GHG emissions from pulp and paper manufacturing is: *Calculation Tools for Estimating Greenhouse Gas Emissions from Pulp and Paper Mills, Version 1.1, July 8, 2005, a project of The Climate Change Working Group of The International Council of Forest and Paper Associations (ICFPA).* This reference is the basis of the GHG estimation methodology used by WRI and by Climate Leaders.

Applicability

The ICFPA methodology lists the following sources of GHG at pulp and paper manufacturing facilities:

1. Stationary combustion units such as fossil and biomass fired boilers and dryers (§ WCI.20)
2. Lime kilns and calciners (§ WCI.170)
3. Electric generation units (§ WCI.40)
4. Nonroad equipment (§ WCI.XX)
5. Anaerobic waste and wastewater treatment
6. Black liquor boilers

Methods for estimating emissions from sources 1 through 4 in the above list are or will be addressed under other sections of the Essential Requirements for mandatory reporting, as noted. However, most of the process CO_2 emissions from the lime kilns at pulp and paper mills is derived from organic carbon, which must be tracked separately from the fossil CO_2.

Emission Calculations – Anaerobic Treatment and Black Liquor Boilers

For purposes of reporting, WCI will likely require a method similar to that required for reporting wastewater CH_4 and N_2O emissions from refineries in WCI.203(g). WCI will examine the uncertainty of the biogenic decay models, such as those used to estimate emissions for municipal landfills and municipal wastewater treatment plants, to determine their appropriateness for estimating anaerobic treatment processes for purposes of including these emissions in the cap-and-trade program.

Black liquor boilers are a source of CO_2, CH_4 and N_2O emissions. The ICFPA reports that all CO_2 emissions from black liquor boilers are of biogenic origin and not reportable. Thus, they do not present a methodology for determining CO_2 emissions from this source. The Climate Registry (TCR) and the IPCC offer only emission factors for determining CO_2 emissions from black liquor boilers. The IPCC reports that the 95% confidence interval for their CO_2 factor ranges from 80,700 to 110,000 (± 15%) kg/TJ. Similarly, the reported IPCC factors for CH_4 and N_2O emissions from black liquor boilers range by a factor of 10 at the 95% confidence level.

Recommended Reporting Requirements (Under Development)

Methods for estimating emissions from sources 1 through 4 in the above list are or will be covered under other sections of the Essential Requirements. In January 2009, special instructions will be developed for lime kilns (source 2) to instruct reporters on how to account for biogenic and fossil process CO_2 emissions, and a specific methodology based on the refinery method (WCI.203(g)) will be prescribed for estimating wastewater emissions (source 5).

Later in 2009, a new methodology will be developed for black liquor boilers (source 6) Note that both fossil and biogenic carbon leave the black liquor boiler as both a gas (CO_2) and a solid (Na_2CO_3), thus a unique material balance methodology will be needed. As with any new methodology, it should be peer reviewed before being finalized for use in the WCI program.

Sampling, Analysis, and Measurement Methods

All further methods development will stipulate that fossil and biogenic process emissions will be reported separately, and will contain requirements pertaining to sampling, analysis, and measurements, as applicable to the specific emission quantification method input(s).

§ WCI.40 ELECTRICITY GENERATION

WCI.41 Source Category Definition

An electricity generator is any combustion device that combusts solid, liquid, or gaseous fuel for the purpose of producing electricity either for sale or for use onsite. This source category excludes cogeneration units subject to WCI.50.

WCI.42 Greenhouse Gas Reporting Requirements

For each facility, the emissions data report shall include the following information:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil fuels, reported by fuel type.
(2) Total CO_2 emissions for all biomass fuels combined.
(3) Total CH_4 emissions for fuels combined.
(4) Total N_2O emissions for all fuels combined.

(b) Annual fuel consumption:

(1) For gases, report in units of million standard cubic feet or cubic meters.
(2) For liquids, report in units of gallons or liters.
(3) For non-biomass solids, report in units of short tons or metric tons.
(4) For biomass-derived solid fuels, report in units of bone dry short tons or bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions as specified in WCI.44.

(d) Average high heating value of each fuel, if used to compute CO_2 emissions as specified WCI.44.

(e) The nameplate generating capacity in megawatts and net power generated in the reporting year in megawatt hours.

(f) Process CO_2 emissions from acid gas scrubbers and acid gas reagent.

(g) Fugitive emissions of HFC from cooling units that support power generation.

(h) Fugitive CO_2 emissions from geothermal facilities.

(i) Fugitive CO_2 emissions from coal storage at coal-fired electricity generating facilities shall be reported as specified in section WCI.100.

WCI.43 Calculation of GHG Emissions

(a) **Calculation of CO_2 Emissions.** Operators shall use CEMS to measure CO_2 emissions if required to operate a CEMS by any other federal, state, provincial, or local regulation. Operators not required to operate a CEMS by another regulation may use either CEMS or the calculation methods specified in paragraphs (a)(1) through (a)(7). Operators using CEMS to determine CO_2 emissions shall comply with the provisions in section WCI.23(d).

(1) **Natural Gas.** For electric generating units combusting natural gas, use one of the following methods:

(A) If the high heat value is greater than or equal to 975 and less than or equal to 1,100 Btu/scf use either:

i. The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

ii. The measured heat content of the fuel and the calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(B) If the high heat value is less than 975 or greater than 1,100 Btu/scf, use the measured carbon content of the fuel and the calculation methodology 3 in section WCI.23(c).

(2) **Coal or Petroleum Coke.** For electric generating units combusting coal or petroleum coke, use the measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c).

(3) **Middle Distillates, Gasoline, Residual Oil, or Liquid Petroleum Gases.** For electric generating units combusting middle distillates (such as diesel, fuel oil, or kerosene), gasoline, residual oil, or LPG (such as ethane, propane, isobutene, n-butane, or unspecified LPG), use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(4) **Refinery Fuel Gas, Flexigas, or Associated Gas.** For electric generating units combusting refinery fuel gas, flexigas, or associated gas, use the methods specified in section WCI.30.

(5) **Landfill Gas, Biogas, or Biomass.** For electric generating units combusting landfill gas, biogas, or biomass, use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(6) **Municipal Solid Waste.** Electric generating units combusting municipal solid waste, may use the measured steam generated, the default carbon content emission factor in Table 20-1, and the calculation methodology in section WCI.23(b)(2) provided the facility is not subject to the verification requirements of WCI.8. If the facility is subject to the verification requirements of WCI.8, the operator shall use CEMS to measure CO_2 emissions in accordance with WCI.23(d).

(7) **Start-up Fuels.** The operators of generating facilities that primarily combust biomass-derived fuels but combust fossil fuels during start-up, shut-down, or malfunction operating periods only, shall calculate CO_2 emissions from fossil fuel combustion using one of the following methods:

(A) The default emission factors from Tables 20-1 and 20-2 and calculation methodology 1 provided in section WCI.23(a);
(B) The measured heat content of the fuel and calculation methodology 2 provided in section WCI.23(b);
(C) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or
(D) For combustion of refinery fuel gas, the measured heat content and carbon content of the fuel, and the calculation methodology provided in section WCI.30.

(8) **Co-fired Electricity Generating Units.** For electricity generating units that combust more than one type of fuel, the operator shall calculate CO_2 emissions as follows.

(A) For co-fired electricity generators that burn only fossil fuels, CO_2 emissions shall be determined using one of the following methods:

i. A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method need not report emissions separately for each fossil fuel.
ii. For units not equipped with a continuous emission system, calculate the CO2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(4) of this section.

(B) For co-fired electricity generators that burn biomass-derived fuel with a fossil fuel, CO_2 emissions shall be determined using one of the following methods:

i. A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method shall determine the portion of the total CO_2 emissions attributable to the biomass-derived fuel and portion of the total CO_2 emissions attributable to the fossil fuel using the methods specified in section WCI.23(d)(4).
ii. For units not equipped with a continuous emission system, calculate the CO_2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(7) of this section.

(b) **Calculation of CH_4 and N_2O Emissions.** Operators of electricity generating units shall use the methods specified in section WCI.24 to calculate the annual CH_4 and N_2O emissions. For coal combustion, use the default CH_4 emission factor of 1g of CH_4/mmBtu.

(c) **Calculation of CO_2 Emissions from Acid Gas Scrubbing.** Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall calculate the annual CO_2 emissions from these processes using Equation 40-1 if these emissions are not already captured in CO_2 emissions determined using a continuous emissions monitoring system.

$$CO_2 = S \times R \times \left(CO_{2\,MW} / Sorbent_{MW}\right)$$ **Equation 40-1**

Where:

CO_2	=	CO_2 emitted from sorbent for the report year, metric tons;
S	=	Limestone or other sorbent used in the report year, metric tons;
R	=	Ratio of moles of CO_2 released upon capture of one mole of acid gas;
$CO_{2\ MW}$	=	Molecular weight of carbon dioxide (44);
$Sorbent_{MW}$	=	Molecular weight of sorbent (if calcium carbonate, 100).

(d) Calculating Fugitive HFC Emissions from Cooling Units. Operators of electricity generating facilities shall calculate fugitive HFC emissions for each HFC compound used in cooling units that support power generation or are used in heat transfers to cool stack gases using either the methodology in paragraph (d)(1) or (d)(2). The Operator is not required to report GHG emissions from air or water cooling systems or condensers that do not contain HFCs.

(1) Use Equation 40-2 to calculate annual HFC emissions:

$$HFC = HFC_{inventory} + HFC_{purchases/acquisitions} - HFC_{sales/disbursements} + HFC_{\Delta capacity} \qquad \textbf{Equation 40-2}$$

Where:

HFC	=	Annual fugitive HFC emission, metric tons;
$HFC_{inventory}$	=	The difference between the quantity of HFC in storage at the beginning of the year and the quantity in storage at the end of the year. Stored HFC includes HFC contained in cylinders (such as 115-pound storage cylinders), gas carts, and other storage containers. It does not include HFC gas held in operating equipment. The change in inventory will be negative if the quantity of HFC in storage increases over the course of the year.
$HFC_{purchases/acquisitions}$	=	The sum of all HFC acquired from other entities during the year either in storage containers or in equipment.
$HFC_{sales/disbursements}$	=	The sum of all the HFC sold or otherwise transferred offsite to other entities during the year either in storage containers or in equipment.
$HFC_{\Delta capacity}$	=	The net change in the total nameplate capacity (i.e. the full and proper charge) of the cooling equipment). The net change in capacity will be negative if the total nameplate capacity at the end of the year is less than the total nameplate capacity at the beginning of the year.

(2) Use service logs to document HFC usage and emissions from each cooling unit. Service logs should document all maintenance and service performed on the unit during the report year, including the quantity of HFCs added to or removed from the unit, and include a record at the beginning and end of each report year. The operator may use service log information along with the following simplified material balance equations to quantify fugitive HFCs from unit installation, servicing, and retirement, as applicable. The operator shall include the sum of HFC emissions from the applicable equations in the greenhouse gas emissions data report.

$$HFC_{Install} = R_{new} - C_{new}$$

$$HFC_{Service} = R_{recharge} - R_{Recover}$$

$$HFC_{Retire} = C_{retire} - R_{retire}$$

Where:

$HFC_{Install}$	=	HFC emitted during initial charging/installation of the unit, kilograms;
$HFC_{Service}$	=	HFC emitted during use and servicing of the unit for the report year, kilograms;
HFC_{Retire}	=	HFC emitted during the removal from service/retirement of the unit, kilograms;
R_{new}	=	HFC used to fill new unit (omit if unit was pre-charged by the manufacturer), kilograms;
C_{new}	=	Nameplate capacity of new unit (omit if unit was pre-charged by the manufacturer), kilograms;
$R_{recharge}$	=	HFC used to recharge the unit during maintenance and service, kilograms;
$R_{recover}$	=	HFC recovered from the unit during maintenance and service, kilograms;
C_{retire}	=	Nameplate capacity of the retired unit, kilograms; and
R_{retire}	=	HFC recovered from the retired unit, kilograms.

(e) **Fugitive CO_2 Emissions from Geothermal Facilities.** Operators of geothermal electricity generating facilities shall calculate the fugitive CO_2 emissions using one of the following methods:

(1) Calculate the fugitive CO_2 emissions using Equation 40-3:

$$CO_2 = 7.53 \times Heat \times 0.001 \qquad \textbf{Equation 40-3}$$

Where:

CO_2	=	CO_2 emissions, metric tons per year;
7.53	=	Default fugitive CO_2 emission factor for geothermal facilities, kg per mmBtu; and
Heat	=	Heat taken from geothermal steam and/or fluid, mmBtu/yr.

(2) Calculate CO_2 emissions using [*insert jurisdiction*] approved source specific emission factor.

WCI.44 Monitoring Requirements

(a) **CO_2, CH_4 and N_2O Emissions from Fuel Combustion.** Operators using CEMS to estimate CO_2 emissions from fuel combustion shall comply with the requirements in section WCI.23(d). Operators using methods other than CEMS shall comply with the applicable fuel sampling, fuel consumption monitoring, heat content monitoring, and carbon content monitoring specified in section WCI.25.

(b) **CO_2 Emissions from Acid Gas Scrubbing.** Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall measure the

amount of limestone or other sorbent used during the reporting year using methods that comply with the measurement accuracy provisions in WCI.2(g).

(c) **CO_2 Emissions from Geothermal Facilities.** Operators of geothermal facilities shall measure the heat recovered from geothermal steam. If using source specific emission factor instead of the default factor, the operator shall conduct an annual test of the CO_2 emission rate using a method approved by [*insert jurisdiction*]. The operator shall submit a test plan to the [*insert jurisdiction*] for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [*insert jurisdiction*].-

§ WCI.20 GENERAL STATIONARY COMBUSTION

§ WCI.21 Source Category Definition

General stationary fuel combustion sources are devices that combust solid, liquid, or gaseous fuel for the purpose of generating steam (or providing useful heat or energy) for industrial, commercial, or institutional use; or reducing the volume of waste by removing combustible matter. General stationary combustion sources are boilers, combustion turbines, engines, incinerators, and process heaters, and any other stationary combustion device that is not specifically addressed under the provisions for another source category in this rule.

[The source category definition may need to be revised after the remaining ER sections are completed.]

§ WCI.22 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil fuels, reported by fuel type.
(2) Total CO_2 emissions for all biomass fuels combined.
(3) Total CH_4 emissions for all fuels combined.
(4) Total N_2O emissions for all fuels combined.

(b) Annual fuel consumption:

(1) For gases, report in units of million cubic meters.
(2) For liquids, report in units of liters.
(3) For non-biomass solids, report in units of metric tons.
(4) For biomass-derived solid fuels, report in units of bone dry short tons or bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average high heating value of each fuel, as used to compute CO_2 emissions.

(e) Annual steam generation in pounds or kilograms, for units that burn biomass or municipal solid waste.

[Please note that most of the calculation methodologies in this section currently accommodate inputs in English units, only, and not SI units. The section will be revised to allow inputs in SI units, as well as to provide applicable Canadian emission factors from "National Inventory Report 1990-2006: Greenhouse Gas Sources and Sinks in Canada – The Canadian Government's Submission to the UN Framework Convention on Climate Change, April 2008." (http://www.ec.gc.ca/pdb/ghg/inventory_e.cfm)]

§ WCI.23 Calculation of CO_2 Emissions

For each fuel, calculate CO_2 mass emissions using one of the four calculation methodologies specified in this section, subject to the restrictions in §WCI.23 (e).

(a) **Calculation Methodology 1**. Calculate the annual CO_2 mass emissions by substituting a fuel-specific default CO_2 emission factor, a default high heating value, and the annual fuel consumption into the Equation 20-1:

$$CO_2 = Fuel \times HHV \times EF \times 0.001$$ **Equation 20-1**

Where:

CO_2 = Annual CO_2 mass emissions for the specific fuel type (metric tons).
Fuel = Mass or volume of fuel combusted per year (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).
HHV = Default high heat value of the fuel, from column 3 of Table 20-1 (mmBtu per mass or mmBtu per volume, as applicable).
EF = Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 (kg CO_2/mmBtu).
0.001 = Conversion factor from kilograms to metric tons.

(b) **Calculation Methodology 2**. Calculate the annual CO_2 mass emissions using a default CO_2 emission factor, and either Equation 20-2 or 20-3, as appropriate:

(1) Equation 20-2 of this section can be used for any type of fuel for which an emission factor is provided in Tables 20-1 or 20-2:

Equation 20-2

$$CO_2 = \sum_{p=1}^{n} Fuel_P \times HHV_P \times EF \times 0.001$$

Where:

CO_2 = Annual CO_2 mass emissions for a specific fuel type (metric tons).
n = Number of required heat content measurements for the year as specified in WCI.25.
$Fuel_p$ = Mass or volume of the fuel combusted during the measurement period "p" (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).
HHV_p = High heat value of the fuel for the measurement period (mmBtu per mass or volume).
EF = Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 or from Table 20-2 (kg CO_2/mmBtu).
0.001 = Conversion factor from kilograms to metric tons.

(2) Equation 20-3 of this section can be used for biomass solid fuels and municipal solid waste only:

$$CO_2 = Steam \times B \times EF \times 0.001$$ **Equation 20-3**

Where:

CO_2 = Annual CO_2 mass emissions from MSW combustion (metric tons).
Steam = Total mass of steam generated by MSW combustion during the reporting year (lb steam).
B = Ratio of the boiler's maximum rated heat input capacity to its design rated steam output capacity (mmBtu/lb steam).
EF = Default carbon content for MSW, from column 5 of Table WCI.20-1 (kg CO_2/mmBtu).
0.001 = Conversion factor from kilograms to metric tons.

(c) **Calculation Methodology 3**. Calculate the annual CO_2 mass emissions by substituting measurements of fuel carbon content, molecular weight (gaseous fuels, only), and the quantity of fuel combusted into the following equations. For solid fuels, the amount of fuel combusted is obtained from company records kept as provided in this rule. For liquid and gaseous fuels, the volume of fuel combusted is measured directly, using fuel flow meters (including gas billing meters). For fuel oil, tank drop measurements may also be used.

(1) For a solid fuel, use Equation 20-4 of this section:

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times 3.664$$ **Equation 20-4**

Where:
CO_2 = Annual CO_2 mass emissions from the combustion of the specific solid fuel (metric tons).
n = Number of monthly carbon content determinations for the year.
$Fuel_i$ = Mass of the solid fuel combusted in month "n" (metric tons).
CC_i = Carbon content of the solid fuel, from the fuel analysis results for month "n"(percent by weight, expressed as a decimal fraction, e.g., 95% = 0.95).
3.664 = Ratio of molecular weights, CO_2 to carbon.

(2) For a liquid fuel, use Equation 20-5 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times 0.001$$ **Equation 20-5**

Where:
CO_2 = Annual CO_2 mass emissions from the combustion of the specific liquid fuel (metric tons).
n = Number of required carbon content determinations for the year, as specified in WCI.25.
$Fuel_i$ = Volume of the liquid fuel combusted in month "n" (gallons).
CC_i = Carbon content of the liquid fuel, from the fuel analysis results for month "n" (kg C per gallon of fuel).
3.664 = Ratio of molecular weights, CO_2 to carbon.
0.001 = Conversion factor from kg to metric tons.

(3) For a gaseous fuel, use Equation 20-6 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times \frac{MW}{MVC} \times 0.001 \qquad \textbf{Equation 20-6}$$

Where:

CO_2 = Annual CO_2 mass emissions from combustion of the specific gaseous fuel (metric tons).
n = Number of required carbon content and molecular weight determinations for the year, as specified in WCI.25.
$Fuel_i$ = Volume of the gaseous fuel combusted in a day or month, as applicable (scf).
CC_i = Average carbon content of the gaseous fuel, from the fuel analysis results for the day or month, as applicable (kg C per kg of fuel).
MW = Molecular weight of the gaseous fuel, from fuel analysis (kg/kg-mole).
MVC = Molar volume conversion factor (849.5 scf per kg-mole at standard conditions).
3.664 = Ratio of molecular weights, CO_2 to carbon.
0.001 = Conversion factor from kg to metric tons.

(d) **Calculation Methodology 4**. Calculate the annual CO_2 mass emissions from all fuels combusted in a unit, by using data from continuous emission monitoring systems (CEMS) as specified in (d)(1) through (d)(7).

(1) The operator of a facility that combusts fossil fuels or biomass and operates CEMS in response to federal, state, provincial, or local regulation, may use CO_2 or O_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F.

(A) The operator shall report CO_2 emissions for the report year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(B) If the operator of a facility that combusts biomass uses O_2 concentrations to calculate CO_2 concentrations, annual source testing must demonstrate that calculated CO_2 concentrations when compared to measured CO_2 concentrations meet the Relative Accuracy Test Audit (RATA) requirements in 40 CFR Part 60, Appendix B, Performance Specification 3.

(2) The operators of a facility that combusts municipal solid waste or other waste-derived fuels and operates a CEMS in response to federal, state, provincial, or local regulations must use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F.

(A) Annual CO_2 emissions shall be reported in metric tons based on the sum of hourly CO_2 mass emissions over the year.

(B) Emissions calculations shall not be based on O_2 concentrations.

(3) The operator of a facility that combusts MSW or other waste-derived fuels and calculates CO_2 emissions using the methodology provided in WCI.23(d)(2) shall determine the portion of emissions associated with the combustion of biomass-derived fuels using the method provided in WCI.23(f).

(4) An operator who uses CEMS data to report CO_2 emissions from a facility that co-fires fossil fuels with biomass or waste-derived fuels that are partly biomass shall determine the portion of total CO_2 emissions separately assigned to the fossil fuel and the biomass-derived fuel using the method provided in WCI.23(f), if applicable. The operator who co-fires pure biomass with fossil fuels may elect to calculate CO_2 emissions for the fossil fuels using methods designated in WCI.23(b)(3) by fuel type and then subtract the fossil fuel related emissions from the total CO_2 emissions determined using the CEMS based methodology.

(5) For any units for which CO_2 emissions are reported using CEMS data, the operator is relieved of the requirement to separately report process emissions from combustion emissions or to report emissions separately for different fossil fuels when only fossil fuels are co-fired. In this circumstance, operators shall still report fuel use by fuel type as otherwise required.

(6) If a facility is subject to requirements in 40 CFR Part 60 or 40 CFR Part 75 and the operator chooses to add devices to an existing continuous monitoring system for the purpose of measuring CO_2 concentrations or flue gas flow, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 60 or Part 75 that apply to the facility. If the facility is subject to both 40 CFR Part 60 and 40 CFR Part 75, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 75.

(7) If a facility does not have a continuous emissions monitoring system and the operator chooses to add one in order to measure CO_2 concentrations, the operator shall select and operate the CEMS pursuant to the requirements in 40 CFR Part 75.

(A) The operator shall use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F.

(B) The operator shall report CO_2 emissions for the report year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(C) Operators who add CEMS under this article are subject to specifications in WCI.23(d)(1)-(5), if applicable.

(e) **Use of the Four CO_2 Calculation Methodologies**. Use of the four CO_2 emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) Calculation Methodology 1 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high heating value between 975 and 1,150 Btu per cubic foot. Otherwise, Calculation Methodology 1 may be used for any type of fuel for which a default CO_2 emission factor and a default high heat value for the fuel is specified in Table 20-1.

(2) Calculation Methodology 2 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high heating value between 975 and 1,150 Btu per cubic foot. Otherwise, Calculation Methodology 2 may be used for any type of fuel combusted for which a default CO_2 emission factor for the fuel is specified in Table 20-1 or 20-2.

(3) Calculation Methodology 3 may be used for a unit of any size combusting any type of fuel, except when the use of Calculation Methodology 4 is required.

(4) Calculation Methodology 4 may be used for a unit of any size combusting any type of fuel, and must be used for either of the following conditions:

(i) A combustion unit with a CEMS that is required by any federal, state, provincial, or local regulation.

(ii) A municipal solid waste combustion unit that is subject to the verification requirements of WCI.8.

(f) **Biogenic CO_2 emissions**. The operator that combusts fuels or fuel mixtures that contain biomass shall determine the biomass-derived portion of CO_2 emissions using ASTM D6866-06a, as specified in this paragraph. This procedure is not required for fuels that contain less than 5 percent biomass by weight or for waste-derived fuels that are less than 30 percent biomass by weight on an annual basis.

(1) The operator shall conduct ASTM D6866-06a analysis at least every three months, and shall collect each gas sample for analysis during normal operating conditions over at least 24 consecutive hours.

(2) The operator shall divide total CO_2 emissions between biomass-derived emissions and non-biomass-derived emissions using the average proportionalities of the samples analyzed.

(3) If there is a common fuel source to multiple units at the facility, the operator may elect to conduct ASTM D6866-06a testing for one of the units.

§ WCI.24 Calculation of CH_4 and N_2O Emissions

Calculate the annual CH_4 and N_2O mass emissions from stationary fuel combustion sources using the procedures in paragraph (a), (b), or (c), as appropriate.

(a) If the heat content of the fuel is measured, calculate CH_4 and N_2O emissions the following Equation 20-7:

$$CH_4 \text{ or } N_2O = \sum_{1}^{n} Fuel_P \times HHV_P \times EF \times 0.001 \qquad \textbf{Equation 20-7}$$

Where:

CH_4 or N_2O	=	Combustion emissions from specific fuel type, metric tons CH_4 or N_2O per year.
n	=	Period/frequency of heat content measurements over the year (e.g. monthly n = 12).
$Fuel_P$	=	Mass or volume of fuel combusted for the measurement period specified by fuel type, units of mass or volume per unit time .
HHV_P	=	High heat value measured for the measurement period specified by fuel type, MMBtu per unit mass or volume.
EF	=	Default CH_4 or N_2O emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(b) If the heat content of the fuel is not measured, calculate CH_4 and N_2O emissions using the following equation:

$$CH_4 \ or \ N_2O = \sum_{1}^{n} Fuel \times HHV_D \times EF \times 0.001 \quad \textbf{Equation 20-8}$$

Where:

CH_4 or N_2O	=	CH_4 or N_2O emissions from a specific fuel type, metric tons CH_4 or N_2O per year.
Fuel	=	Mass or volume of fuel combusted specified by fuel type, unit of mass or volume per year.
HHV_D	=	Default high heat value specified by fuel type provided in Table 20-3, MMBtu per unit of mass or volume.
EF	=	Default emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(c) For municipal solid waste combustion, use Equation 20-9 of this section to estimate CH_4 and N_2O emissions:

$$CH_4 \ or \ N_2O = Steam \times B \times EF \times 0.001 \quad \textbf{Equation 20-9}$$

Where:

CH_4 or N_2O	=	Annual CH_4 or N_2O emissions from the combustion of a municipal solid waste (metric tons).
Steam	=	Total mass of steam generated by MSW combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's maximum rated heat input capacity to its design rated steam output (mmBtu/lb steam).
EF	=	Fuel-specific emission factor for CH_4 or N_2O, from Table WCI.20-3 of this subpart (kg CH_4 or N_2O per mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(d) The operator may elect to calculate CH_4 and N_2O emissions using source-specific emission factors derived from source tests conducted at least annually under the supervision of (*jurisdiction*). Upon approval of a source test plan, the source test procedures in that plan shall be repeated in each future year to update the source specific emission factors annually.

§ WCI.25 Monitoring and QA/QC Requirements

(a) **Fuel Sampling Requirements**. Fuel sampling must be conducted at the frequency specified in paragraph (a) (1) through (a)(4) of this section.

(1) At receipt of each new fuel shipment or delivery or on a monthly basis for middle distillates (diesel, gasoline, fuel oil, kerosene), residual oil, liquid waste-derived fuels, and LPG (ethane, propane, isobutene, n-Butane, unspecified LPG);

(2) Monthly for natural gas, associated gas, and mixtures of low Btu gas.

(3) Monthly for gases derived from biomass including landfill gas and biogas from wastewater treatment or agricultural processes.

(4) Monthly for solid fuels, as specified below:

(A) The monthly solid fuel sample shall be a composite sample of weekly samples.

(B) The solid fuel shall be sampled at a location after all fuel treatment operations and the samples shall be representative of the fuel chemical and physical characteristics immediately prior to combustion.

(C) Each weekly sub-sample shall be collected at a time (day and hour) of the week when the fuel consumption rate is representative and unbiased.

(D) Four weekly samples (or a sample collected during each week of operation during the month) of equal mass shall be combined to form the monthly composite sample.

(E) The monthly composite sample shall be homogenized and well mixed prior to withdrawal of a sample for analysis.

(F) One in twelve composite samples shall be randomly selected for additional analysis of its discreet constituent samples. This information will be used to monitor the homogeneity of the composite.

(b) Fuel Consumption Monitoring Requirements.

(1) Facilities that are subject to the verification requirements of WCI.8 must determine annual fuel consumption by direct measurement.

(2) Facilities that are not subject the verification requirements of WCI.8 may determine consumption on the basis of recorded fuel purchase or sales invoices measuring any stock change (measured in million Btu, gallons, million standard cubic feet, short tons or bone dry short, tons) using the following equation:

Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End

(3) Fuel consumption measured in Btu values shall be converted to the required metrics of mass or volume using heat content values that are either provided by the supplier, measured by the facility, or provided in Table 20-1.

(c) **Fuel Heat Content Monitoring Requirements.** High heat values shall be determined using one of the following methods:

(1) For gases, use ASTM D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), GPA Standard 2261-00 "Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography." The operator may alternatively elect to use on-line instrumentation that determines heating value accurate to within ± 5.0 percent. Where existing on-line instrumentation provides only low heating value, the operator shall convert the value to high heating value as specified in section 95125(c)(1)(C).

(2) For middle distillates and oil, or liquid waste-derived fuels, use ASTM D240-02 (Reapproved 2007), ASTM D240-87 (Reapproved 1991), ASTM D4809-00 (Reapproved 2005).

(3) For solid biomass-derived fuels use ASTM D5865-07a.

(4) For waste-derived fuels use ASTM D5865-07a or ASTM D5468-02 (Reapproved 2007). Operators who combust waste-derived fuels that are partly but not pure biomass shall determine the biomass-derived portion of CO_2 emissions using the method specified in section WCI.23(f), if applicable

(d) **Fuel Carbon Content Monitoring Requirements.** Fuel carbon contents should be monitored in the following manner.

(1) For coal and coke, solid biomass-derived fuels, and waste-derived fuels; use ASTM 5373-02 (Reapproved 2007).

(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) "Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2002).

(3) For gaseous fuels, use ASTM D1945-03 or ASTM D1946-90 (Reapproved 2006).

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type				
Fuel Type	**Carbon Content**	**High Heat Value**	**CO_2 Emission Factor**	**CO_2 Emission Factor**
Coal and Coke	**kg C / MMBtu**	**MMBtu / Short Ton**	**kg CO_2 / Short Ton**	**kg CO_2 / MMBtu**
Anthracite	28.26	25.09	2,597.94	103.54
Bituminous	25.49	24.93	2,328.35	93.40
Sub-bituminous	26.48	17.25	1,673.64	97.02
Lignite	26.30	14.21	1,369.32	96.36
Unspecified (Residential/Commercial)	26.00	22.24	2,118.67	95.26
Unspecified (Industrial Coking)	25.56	26.28	2,461.17	93.65
Unspecified (Other Industrial)	25.63	22.18	2,082.89	93.91
Unspecified (Electric Power)	25.76	19.97	1,884.86	94.38
Coke	27.85	24.80	2,530.65	102.04
Natural Gas (By Heat Content)	**kg C / MMBtu**	**Btu / Standard cubic foot**	**kg CO_2 / Standard cubic ft.**	**kg CO_2 / MMBtu**
975 to 1,000 Btu / Standard cubic foot	14.73	n/a	n/a	53.97
1000 to 1,025 Btu / Std cubic foot	14.43	n/a	n/a	52.87
1025 to 1,050 Btu / Std cubic foot	14.47	n/a	n/a	53.02
1050 to 1,075 Btu / Std cubic foot	14.58	n/a	n/a	53.42
1075 to 1,100 Btu / Std cubic foot	14.65	n/a	n/a	53.68
Greater than 1,100 Btu / Std cubic foot	14.92	n/a	n/a	54.67
Unspecified (Weighted U.S. Average)	14.47	1,027	0.0544	53.02

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type (continued)

Petroleum Products	kg C / MMBtu	MMBtu / Barrel	kg CO_2 / gallon	kg CO_2 / MMBtu
Asphalt & Road Oil	20.62	6.636	11.94	75.55
Aviation Gasoline	18.87	5.048	8.31	69.14
Distillate Fuel Oil (#1, 2 & 4)	19.95	5.825	10.14	73.10
Jet Fuel	19.33	5.670	9.56	70.83
Kerosene	19.72	5.670	9.75	72.25
LPG (energy use)	17.19	3.861	5.79	62.98
Propane	17.20	3.824	5.74	63.02
Ethane	16.25	2.916	4.13	59.54
Isobutane	17.75	4.162	6.44	65.04
n-Butane	17.72	4.328	6.69	64.93
Lubricants	20.24	6.065	10.71	74.16
Motor Gasoline	19.33	5.218	8.80	70.83
Residual Fuel Oil (#5 & 6)	21.49	6.287	11.79	78.74
Crude Oil	20.33	5.800	10.29	74.49
Naphtha (<401 deg. F)	18.14	5.248	8.30	66.46
Natural Gasoline	18.24	4.620	7.35	66.83
Other Oil (>401 deg. F)	19.95	5.825	10.14	73.10
Pentanes Plus	18.24	4.620	7.35	66.83
Petrochemical Feedstocks	19.37	5.428	9.17	70.97
Petroleum Coke	27.85	6.024	14.64	102.04
Still Gas	17.51	6.000	9.17	64.16
Special Naphtha	19.86	5.248	9.09	72.77
Unfinished Oils	20.33	5.825	10.33	74.49
Waxes	19.81	5.537	9.57	72.58
Other Solid Fuels	**kg C / MMBtu**	**MMBtu / Short Ton**	**kg CO_2 / Short Ton**	**kg CO_2 / MMBtu**
Biomass Derived Fuels (Solid). Wood and Wood Waste (12% moisture content) or other solid biomass-derived fuels	25.60	15.38	1,442.62	93.80
Municipal Solid Waste (MSW)	24.74	8.7	788.7	90.65
Biomass-derived Fuels (Gas)	**kg C / MMBtu**	**Btu / Standard cubic foot**	**kg CO_2 / Standard cubic ft.**	**kg CO_2 / MMBtu**
Biogas (includes landfill gas and manure biogas)*	28.4	Varies	Varies	104.06

Note: Heat content factors are based on higher heating values (HHV).
* The emission factors for biogas include both the CO_2 from combustion and the pass-through CO_2, which are assumed to be in equal proportions.

Table 20-2. Default Carbon Dioxide Emission Factors from Stationary Combustion for Waste Derived Fuels	
Fuel Type	**kg CO_2 / MMBtu**
Waste Oil	78
Tires	90
Plastics	79
Solvents	78
Impregnated Saw Dust	79
Other Fossil Based Wastes	84
Dried Sewage Sludge	116
Mixed Industrial Waste	88
Municipal Solid Waste	91
Note: Emission factors are based on higher heating values (HHV). Values were converted from LHV to HHV assuming that LHV are 5 percent lower than HHV for solid and liquid fuels.	

Table 20-3. Default CH_4 and N_2O Emission Factors from Stationary Combustion by Fuel Type		
Fuel Type	**CH_4 Emission Factor (kg CH_4/ MMBtu)**	**N_2O Emission Factor (kg N_2O / MMBtu)**

ESSENTIAL REQUIREMENTS OF MANDATORY REPORTING FOR THE WCI

DRAFT

GENERAL PROVISIONS

§ WCI.0 PURPOSE

§ WCI.1 APPLICABILITY

§ WCI.2 GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE

§ WCI.3 CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT

§ WCI.4 DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS

§ WCI.5 COMPLIANCE AND ENFORCEMENT

§ WCI.6 INCORPORATION BY REFERENCE

§ WCI.7 DESIGNATED REPRESENTATIVE

§ WCI.8 REQUIREMENTS FOR VERIFICATION OF EMISSIONS DATA REPORTS

§ WCI.9 DEFINITIONS

§ WCI.10 GLOBAL WARMING POTENTIALS

EMISSIONS QUANTIFICATION AND MONITORING

§ WCI.20 THROUGH § WCI.XX *[under development and/or to be provided in separate documents]*

§ WCI.0 PURPOSE

This rule requires mandatory reporting and verification of greenhouse gas (GHG) emissions data by certain facilities that directly emit GHG, by importers of electricity, and by suppliers of fossil fuels. The GHGs that must be reported under this rule are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), and sulfur hexafluoride (SF_6).

§ WCI.1 APPLICABILITY

(a) The GHG emissions reporting requirements, and related monitoring, recordkeeping, and verification requirements of this rule apply to the owners and operators *[Each jurisdiction will select the specific terminology for the regulated persons in accordance with their customary rule-writing practices]* of any facility that meets the requirements of paragraph (a)(1)of this section; and any fuel suppliers and electricity importers that meet the requirements of paragraph (a)(2), (a)(3), or (a)(4) of this section:

(1) Any facility that emits 10,000 metric tons CO_2e or more per year in combined emissions from one or more of the source categories listed in this paragraph in any calendar year starting in 2010.

[Please note that the quantification and monitoring methods for most of these source categories are currently being assessed. Only source categories for which adequate quantification methods exist will be included in the final WCI Essential Requirements for mandatory reporting.]

(A) Adipic acid manufacturing
(B) Aluminum production
(C) Ammonia manufacturing
(D) Cement production
(E) Coal mine fugitive emissions (active and abandoned)
(F) Cogeneration
(G) Electricity generation
(H) Electronics Manufacturing
(I) Ferroalloy production
(J) Glass Production and other uses of carbonates
(K) HCFC-22 production
(L) Hydrogen production
(M) Industrial wastewater
(N) Iron and steel production
(O) Lead production
(P) Lime manufacturing
(Q) Magnesium production
(R) Natural gas distribution systems
(S) Nitric acid manufacturing
(T) Nonroad equipment at facilities
(U) Oil and gas production & gas processing

(V) Petrochemical production
(W) Petroleum refineries
(X) Phosphoric acid production
(Y) Pulp and paper manufacturing
(Z) SF6 from electrical equipment
(AA) Soda ash manufacturing
(BB) Stationary fuel combustion
(CC) Zinc production

(2) All importers of electricity. Importers of electricity include both retail providers and marketers that import electricity into the WCI region.
(3) Any supplier that within the WCI region distributes gasoline and diesel transportation fuels in quantities that when combusted would emit 10,000 metric tons CO2e per year or more in any calendar year starting in 2010.
(4) Any supplier that distributes within the WCI region residential, commercial, and industrial fuels in quantities that when combusted would emit 10,000 metric tons CO_2e per year or more in any calendar year starting in 2010.

(b) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold in paragraph (a)(1) of this section, the owner or operator shall calculate annual CO_2e emissions, as described in paragraphs (b)(1) through (b)(4)of this section.

(1) Estimate the annual emissions of CO_2, CH_4, N_2O, HFC, PFC, and SF_6 in metric tons for each unit, process, activity, or operation for which emission calculation methodologies are provided in sections WCI.20 through WCI.XX. The GHG emissions shall be calculated using methodologies specified in each applicable section.
(2) For stationary combustion units, carbon dioxide emissions from the combustion of biomass fuels shall be included in the calculations.
(3) Sum the total facility emissions for each GHG and calculate the metric tons of CO_2e using equation 1-1 below.

$$CO_2e = \sum_{i=1}^{n} GHG_i \text{ x } GWP_i \qquad \textbf{Equation 1-1}$$

Where:

CO_2e = Carbon dioxide equivalent, metric tons/year.
GHG_i = Mass emissions of each greenhouse gas emitted, metric tons/year.
GWP_i = Global warming potential for each greenhouse gas from Table 10 of this regulation.
n = The number of greenhouse gases emitted.

(4) For purpose of determining if an emission threshold has been exceeded, any CO_2 that is captured for on-site use, on-site storage, or transfer off-site must be included in the emissions total.

(c) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of liquid transportation fuels in paragraphs (a)(3) of this section, the owner or operator shall follow the procedures of paragraphs (c)(1) through (c)(3) below:

(1) Calculate the total mass in metric tons per year of CO2, CH4, and N2O that would result from the complete combustion or oxidation of all gasoline and diesel transportation fuels that are distributed within the WCI region. The mass of each GHG shall be calculated using any of the applicable methodologies specified in section WCI.250 of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO2e using Equation 1-1 of this rule.

(d) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of residential, commercial, and industrial fuels in paragraph (a)(4) of this section, the owner or operator shall follow the procedures of paragraphs (d)(1) and (d)(2) below:

(1) Calculate the total mass in metric tons per year of CO_2, CH_4, and N_2O that would result from the complete combustion or oxidation of all residential, commercial, and industrial fuels that are distributed within the WCI region. The calculation shall exclude any fuels that are supplied to facilities that are required to report GHG emissions under section WCI.1(a)(1). *[These accounting issues will be dealt with in 2009.]* The mass of each GHG shall be calculated using any of the applicable methodologies specified in section WCI.260 of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO_2e using Equation 1-1 of this rule.

(e) If the operations of a facility or fuel supplier that is subject to this rule change such that emissions fall below 10,000 metric tons CO_2 per year, then the following reporting requirements shall apply:

[Please note that the requirements of this subsection do not currently address reporters who emit >25,000 metric tons during 1 or more years, and then drop below 25,000 metric tons and above 10,000 metric tons in subsequent years. A provision for these reporters to cease verification after some period of time is under consideration.]

(1) If, prior to such emission reduction, the emissions report was subject to the verification requirements of this rule; then the owner or operator shall continue to submit verified emission reports until reported emissions are below 10,000 metric tons CO_2e per year for a minimum of 3 consecutive years. If reported emission are less than 10,000 metric tons CO_2 per year during 3 consecutive years, then the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(2) If, prior to such emission reduction, the emissions report was not subject to the verification requirements of this rule; then the owner or operator shall submit to the *[jurisdiction]* a signed statement certifying that emissions are less than 10,000 metric tons CO_2e during the prior year. After certifying that emissions are below 10,000 metric tons CO_2e per year for 3 consecutive years, the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(3) Notwithstanding the requirements of paragraphs (e)(1) and (2) of this section, a facility or fuel supplier that is subject to an emissions limitation under the WCI cap and trade program must continue to submit verified annual reports.

(f) Upon request by the *jurisdiction*], owner or operator of any facility or fuel supply operation must submit a demonstration that emissions have not exceeded one or more of the applicability criteria specified in this section in any year since 2010. Such demonstration shall be provided to the [*jurisdiction*] within 20 working days of receipt of a written request.

§ WCI.2 GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE

[Please note that the specific requirements of this section may change based on the future final design of the marketing trading program.]

(a) **General**. Owners or operators that are subject to this rule must submit an annual GHG emissions report. Owners and operators must collect emissions data; calculate GHG emissions; and follow the procedures for quality assurance, missing data, recordkeeping, and reporting as specified in these General Provisions and in each relevant section WCI.20 through WCI.XX of this rule.

(1) A facility, fuel supplier, or electricity importer that commenced operation before January 1, 2010, must report emissions beginning in 2011 for GHGs emitted in calendar year 2010.

(2) A new facility, fuel supplier, or electricity importer that commences operation on or after January 1, 2010, must report emissions for the first calendar year in which the facility operates, beginning with the first operating month and ending on December 31 of that year. Each subsequent annual report must cover emissions for the calendar year, beginning on January 1 and ending on December.

(b) **Reporting and Verification Schedule**.

(1) Annual GHG emissions reports must be submitted to [*the jurisdiction*] by April 1 of each year for emissions in the previous calendar year.

(2) Reporters subject to the verification requirements of WCI.8, must complete their verification process, including submittal of a verification statement to [*the jurisdiction*], according to the following schedule:

(A) For reporting years 2010 through 2011, September 1 of the year following the reporting year.

(B) For reporting years 2012 and later, *[date to be determined]* .

(c) **Submission of GHG Emissions Report**. The annual GHG emissions report must be submitted to [*the jurisdiction*] in a format [*to be specified by each jurisdiction*].

(d) **Simplified Emission Calculation Methods for De Minimis Sources**. The owner or operator may elect to designate as de minimis one or more sources or pollutants that collectively emit no more than 3 percent of the facility's total CO2e emissions, but not to exceed 20,000 metric tons CO_2e. The owner or operator may estimate emissions for these de minimis sources using alternative methods to those required to be used by this rule. If verification of the emissions report is required by this rule, then the selection of any alternative GHG calculation method is subject to the concurrence of the verification team that the use of such methods provides reasonable assurance that the emissions so designated do not exceed the applicable de minimis limits. The operator shall separately identify and include in the emissions data report the emissions from designated de minimis sources.

(e) **GHG Inventory Management Plan**. The owner or operator shall prepare and follow a written GHG inventory management plan that ensures that the emissions calculations and other information that is required to be reported under this rule are transparent, accurate, and independently verifiable. The owner or operator shall establish, document, implement, and maintain data acquisition and handling activities for the calculation and reporting of GHG emissions. Such activities shall include measuring, monitoring, analyzing, recording, processing and calculating the parameters specified by this rule. The owner or operator shall implement systems of internal audit, quality assurance, and quality control for the reporting program and the data reported.

(f) **GHG Emissions Report Revisions**.

(1) The owner or operator shall maintain documentation to support any revisions made to a previously submitted annual GHG emissions report. Documentation for all revisions shall be retained by the operator for 7 years.

(2) If, after the verification deadline, a report subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report within 60 days of the finding. To the extent possible, the revised report must correct all identified errors. A revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*].

(3) If, after the report submittal deadline, a report not subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report within 30 days of the finding. To the extent possible, the revised report must correct all identified errors. A revised report will be accepted only if approved by [*the jurisdiction*].

(4) An owner or operator that voluntarily chooses to correct errors of 5 percent or less in total CO_2e emissions reported may do so according to the following requirements:

(A) For reports subject to verification, a revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*].

(B) For reports not subject to verification, a revised report will be accepted if approved by [*the jurisdiction*].

(g) **Fuel Use Measurement Accuracy.** The operator shall use procedures to quantify fuel use (mass or volume flow) that provide data with an accuracy within ±5 percent. All fuel use measurement devices shall be maintained and calibrated in a manner and at a frequency required to maintain this level of accuracy. The operator shall make available to the verification team documentation to support this level of accuracy. The operator who measures solid fuels shall validate fuel consumption estimates with belt or conveyor scale calibrations conducted at least quarterly, and retain record of such calibrations.

(h) Where this rule specifies a choice between use of a fuel-based calculation or use of a continuous emissions monitoring system (CEMS) to calculate CO2 emissions, the operator shall make this choice and continue to use the method chosen for all future emissions data reports, unless the use of the alternative calculation method is approved in advance by *[the jurisdiction]*.

§ WCI.3 CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT

Each annual GHG emissions report shall contain the following information:

(a) Facility name, identification number, physical address, mailing address, and NAICS code.

(b) Reporting year.

(c) Date of report submittal.

(d) Total facility emissions aggregated from all applicable source categories in subparts WCI.20 through WCI.XX expressed in metric tons of CO_2e calculated using Equation 1-1 of section WCI.1, excluding emissions from CO_2 that is captured and CO_2 emissions from the combustion of biomass and biomass-derived fuels, which are reported separately.

(e) Total facility emissions of CO_2 from the combustion of biomass and biomass-derived fuels.

(f) Total annual mass of CO_2 captured for on-site use, on-site storage, or transfer off site, in metric tons.

(g) For applicable fuel supplier categories in subparts WCI.250 and WCI.260, total CO_2e emissions aggregated from all specified fuels.

(h) Emissions from each applicable source category or fuel supplier category in subparts WCI.20 through WCI.XX, expressed in metric tons per year of CO_2, CH_4, N_2O, HFC, PFC, and SF_6. CO_2 emissions from the combustion of biomass and biomass-derived fuels shall be reported separately.

(i) For electricity importers, the information required by WCI.60.

(j) Emissions and other data for individual units, processes, activities, and operations as specified for each source category in sections WCI.20 through WCI.XX of this rule.

(k) Mass emissions from each designated de minimis source or pollutant, reported in metric tons per year of each GHG for which an alternative emission calculation method is used.

(l) Name and contact information including e-mail address and telephone number of the person primarily responsible for preparing and submitting the emissions report.

(m) A signed and dated statement provided by the owner or operator, or their designated representative, certifying that the report has been prepared in accordance with this rule and that, subject to verification, the statements and information contained in the emissions data report are true, accurate, and complete to the best of their knowledge.

§ WCI.4 DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS

(a) The operator shall establish and maintain procedures for document retention and record keeping. The operator shall retain all documents regarding the design, development and maintenance of the GHG inventory in paper, electronic or other usable format for a period of not less than 7 years following submission of each emissions data report. The retained documents, including GHG emissions data, shall be sufficient to allow for the verification of each emissions data report.

(b) Upon request by *[jurisdiction],* the operator shall provide within 10 working days all documents and data used to develop an emissions data report.

(c) In addition to information submitted as part of the emissions data report, each operator shall retain, at a minimum, the following information for at least 7 years after the submission of the report:

(1) A list of all GHG sources (i.e., units, operations, processes, and activities) included in the emission estimates.
(2) All data used to calculate emissions for each source, categorized by process and fuel or material type.
(3) Documentation of the process for collecting emissions data.
(4) Any GHG emissions calculations and methods used;
(5) All emission factors used for emission estimates, including documentation for any factors not provided in the rule.
(6) All input data used for emission estimates.
(7) Documentation of biomass fractions for specific fuels.
(8) All other data submitted to the [*jurisdiction*] under this rule, including the GHG emissions report.
(9) All computations made to gap-fill missing data.
(10) Names and documentation of key facility personnel involved in emissions calculating and reporting;
(11) Any other information that is required for the verification of the GHG emissions report.
(12) A log to be prepared for each reporting year, beginning January 1, documenting all procedural changes made in GHG accounting methods and changes to instrumentation for GHG emissions estimation.
(13) A copy of the GHG Inventory Management Plan.

(d) For measurement based methodologies, the following information also must be retained for at least 7 years after the submission of the emissions data report:

(1) List of all emission points monitored.
(2) Collected monitoring data.
(3) Quality assurance and quality control information collected under the GHG Inventory Management Plan required by section WCI.2 of this rule.
(4) A detailed technical description of the continuous measurement system, including documentation of any findings and approvals by federal, State or local agencies.
(5) Raw and aggregated data from the continuous measurement system.
(6) A log book of all system down-times, calibrations, servicing, and maintenance of the continuous measurement system.
(7) Documentation of any changes in the continuous measurement system over time.

§ WCI.5 COMPLIANCE AND ENFORCEMENT

(a) Knowing submission of false information to the *[jurisdiction*] or a verification body, shall constitute a single, separate violation of the requirements of this article for each day after the information has been received by the [*jurisdiction*].

(b) Each violation of this rule shall constitute a single, separate violation for each day beyond the specified reporting date. A violation includes failure to submit any report, failure to collect data needed to calculate GHG emissions, failure to monitor and test as required, failure to calculate GHG emissions following the methodologies specified in this rule, failure to retain required records, failure to provide all information required in the report, and failure to submit a report on time. For the purposes of this rule, "report" means any GHG emissions data report, verification opinion, or other document required to be submitted by this rule.

§ WCI.6 INCORPORATION BY REFERENCE

The following documents are incorporated by reference into this rule. These materials are incorporated as they exist on the date this article is adopted.

[This list will be revised as additional calculation methods are selected.]

(a) American Society for Testing and Materials (ASTM) D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), ASTM D240-02 (Reapproved 2007), ASTM D4809-00 (Reapproved 2005), ASTM 5373-02 (Reapproved 2007), ASTM D5291-02 (Reapproved 2007), ASTM D3238-95 (Reapproved 2005), ASTM D2502-04, ASTM D2503-92 (Reapproved 2002), ASTM D1945-03, ASTM D1946-90 (Reapproved 2006), ASTM D6866-06a, ASTM D388-05, ASTM D5468-02 (Reapproved 2007), ASTM D240-87 (Reapproved 1991), ASTM D5865-07a, ASTM Specification D396-07, ASTM Specification D975-07b.

(b) California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities, California Air Pollution Control Officers Association (CAPCOA) and California Air Resources Board (ARB), February 1999.

(c) Control of Emissions from Refinery Flares, Rule 118, South Coast Air Quality Management District, Amended November 4, 2005.

(d) U.S. EPA TANKS Version 4.09D, US Environmental Protection Agency, October 2005.

(e) Gas Processors Association (GPA) Standard 2261-00, Revised 2000.

§ WCI.7 DESIGNATED REPRESENTATIVE

(a) **General**. Each fuel supplier, electricity importer, and owner or operator of a facility that is subject to this rule, shall select a designated representative that is responsible for certifying and submitting GHG emissions reports under this reporting rule.

(b) **Authorization of a Designated Representative**. The designated representative of the facility shall be selected by a certificate of representation agreement that is signed by the designated representative and owners or operators of the facility. The designated representative must be an individual having responsibility for the overall operation of the facility or activity such as the position of the plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company.

(c) **Responsibility of the Designated Representative**.

(1) The designated representative of the facility shall represent and by any representations, actions, inactions, or submissions, legally bind each owner and operator in all matters pertaining to this rule.

(2) Each GHG emission report submitted under this rule must be signed by the designated representative and must contain the following certification statement: "I have been

authorized to make this submission on behalf of the owners and operators of the facility (or supply operation, as appropriate). I certify under penalty of law that I have personally examined the information submitted in this document. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

(d) **Changing a Designated Representative**. The designated representative may be changed at any time upon submission of a superseding certificate of representation. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous designated representative before time of the superseding certificate of representation shall be binding on the new designated representative and the owners and operators.

(e) **Changes in Owners and Operators**. In the event of any change in ownership of the facility, any new owner or operator shall be deemed to be bound by the representations, actions, inactions, and submissions of the designated representative of the facility until such time as the designated representative is changed.

(f) **Certificate of Representation**. A certificate of representation must be submitted to *[the jurisdiction]* and kept on location by the facility, fuel supplier, or electricity importer. The certificate shall include the following information:

(1) Identification of the facility, fuel supplier, or electricity importer for which the certificate of representation is submitted.
(2) The name, address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the designated representative.
(3) A list of the owners and operators.
(4) Certification statements that the actions of the designated representative with respect to this rule are binding on the owners and operators, and that the designated representative has the necessary authority to carry out duties and responsibilities on behalf of the owners and operators.
(5) The signature of the designated representative and owner(s) and operator(s), and the dates signed.

§ WCI.8 REQUIREMENTS FOR VERIFICATION OF EMISSIONS DATA REPORTS

[To be added later]

§ WCI.9 DEFINITIONS

[Partial list of definitions. Additional definitions are under development.]

"Adverse verification statement" means a verification statement rendered by a verification body stating that the verification body cannot say with reasonable assurance that the submitted emissions data report is free of material misstatement, or that it cannot provide a qualifying statement that the emissions data report conforms to the requirements of this article.

"Biomass fuels" or "biomass-derived fuels" means fuels derived entirely from biomass.

“Carbon dioxide equivalent" or “CO_2 equivalent” or "CO_2e" means a measure for comparing carbon dioxide with other GHGs, based on the quantity of those gases multiplied by the appropriate global warming potential (GWP) factor and commonly expressed as metric tons of carbon dioxide equivalent.

“Conflict of interest” means a situation in which, because of financial or other activities or relationships with other persons or organizations, a person or body is unable or potentially unable to render an impartial verification opinion of a potential client’s greenhouse gas emissions, or the person or body’s objectivity in performing verification services is or might be otherwise compromised.

“Continuous emissions monitoring system” or “CEMS” means the total equipment required to obtain a continuous measurement of a gas concentration or emission rate from combustion or industrial processes.

“Electricity generating unit” or “EGU” means any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce electric power.

“Exporter” means…*[To be defined later for liquid transportation and RCI fuels accounting]*

“Facility” means any property, plant, building, structure, stationary source, stationary equipment or grouping of stationary equipment or stationary sources located on one or more contiguous or adjacent properties, in actual physical contact or separated solely by a public roadway or other public right-of way, under common operational control, and having the same first two digits of the Standard Industrial Classification (SIC) or same first three digits of the North American

Industry Classification System (NAICS) code. *[Some special facilities, such as oil and gas production fields will have separate definitions.]*

“Global warming potential” or “GWP factor” means the radiative forcing impact of one mass-based unit of a given greenhouse gas relative to an equivalent unit of carbon dioxide over a given period of time.

“Greenhouse gas”, “greenhouse gases” or “GHG” means carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs).

“Hydrofluorocarbons” or “HFCs” means a class of GHGs primarily used as refrigerants, consisting of hydrogen, fluorine, and carbon.

“Importer” means…*[To be defined later with input from the Electricity Subcommittee.]*

“Lead verifier” means a person that has met all of the requirements in section WCI.9 [TBD], and who may act as the lead verifier of a verification team providing verification services or as a lead verifier providing an independent review of verification services rendered.

“Material misstatement” means one or more inaccuracies identified in the course of verification that result in the total reported emissions being outside the 95 percent accuracy required to receive a positive verification opinion.

“Owner or operator” means any person who owns, leases, operates, controls, or supervises a facility or fuel supply operation; or who imports electricity into the WCI region.

“Perfluorocarbons” or “PFCs” means a class of greenhouse gases consisting on the molecular level of carbon and fluorine.

“Positive verification opinion” means a verification opinion rendered by a verification body stating that the verification body can say with reasonable assurance that the submitted emissions data report is free of material misstatement and includes a qualifying statement that the emissions data report conforms to the requirements of this article.

“Reasonable assurance” means a high degree of confidence that submitted data and statements are valid.

“Stationary combustion unit” means any boiler, heater, furnace, kiln, turbine, internal combustion engine, incinerator or other non-mobile source device that combusts any solid, liquid, or gaseous fuel for purposes of producing useful heat or energy for industrial, commercial, or institutional use; or for purposes of reducing the volume of waste by removing combustible material.

“Supplier” means . . . [To *be defined later for liquid transportation and RCI fuels accounting.]*.

“Verification” means the process used to ensure that an operator’s emissions data report is free of material misstatement and complies with WCI’s reporting procedures and methods for calculating and reporting GHG emissions.

“Verification body” means a firm accredited by WCI or its agent, that is able to render a verification opinion and provide verification services for operators subject to reporting under this article.

“Verification cycle” means one year of full verification and the next consecutive two years of less intensive verification for operators subject to annual verification. For operators subject to triennial verification, a verification cycle means one year of full verification, and if elected, the next consecutive two years of less intensive verification. A verification cycle cannot exceed three calendar years.

“Verification statement” means the final opinion rendered by a verification body attesting whether an operator’s emissions data report is free of material misstatement and a qualifying statement whether the emissions data report conforms to the requirements of this article.

“Verification services” means services provided during verification as specified in section WCI.9, including but not limited to reviewing an owner’s or operator’s emissions data report, verifying its accuracy according to the standards specified in this section, assessing the owner’s or operator's compliance with this section, and submitting a verification opinion to the *[jurisdiction or its agent].*

"Verification team" means all of those working for a verification body, including all subcontractors, to provide verification services for an operator. The lead verifier for the verification team shall be a lead verifier in the verification body.

"Verifier" means an individual accredited by WCI or its agent to carry out verification services as specified in section WCI.9.

"Waste-derived fuel" means a fuel typically derived from waste and generally used as a substitute for conventional fossil fuels. Waste-derived fuels can include fossil fuels such as waste oil, plastics, or solvents; biomass such as dried sewage or impregnated saw dust; or fractions of both fossil fuels and biomass such as municipal solid waste or tires.

§ WCI.10 Global Warming Potentials

Owners and operators must use the global warming potential (GWP) values given in Table WCI.10-1 when converting emissions of greenhouse gases to metric tons of carbon dioxide equivalent (CO_2e).

Table WCI.10-1. Global Warming Potential Factors for Greenhouse Gases			
Common Name	**Formula**	**Chemical Name**	**GWP**
Carbon dioxide	CO_2		1
Methane	CH_4		21
Nitrous oxide	N_2O		310
Sulfur hexafluoride	SF_6		23,900
Hydrofluorocarbons (HFCs)			
HFC-23	CHF_3	trifluoromethane	11,700
HFC-32	CH_2F_2	difluoromethane	650
HFC-41	CH_3F	fluoromethane	150
HFC-43-10mee	$C_5H_2F_{10}$	1,1,1,2,3,4,4,5,5,5- decafluoropentane	1,300
HFC-125	C_2HF_5	pentafluoroethane	2,800

§ WCI.200 PETROLEUM REFINERIES

§ WCI.201 Source Category Definition

A petroleum refinery consists of all processes used to produce gasoline, aromatics, kerosene, distillate fuel oils, residual fuel oils, lubricants, asphalt, or other products through distillation of petroleum or through redistillation, cracking, rearrangement or reforming of unfinished petroleum derivatives.

WCI.202 Greenhouse Gas Reporting Requirements

The annual emissions report must contain the following information reported at the facility-level:

(a) Catalyst Regeneration. Report CO_2 emissions.

(b) Process Vents. Report CO_2, N_2O, and CH_4 emissions.

(c) Asphalt Production. Report CO_2 and CH_4 emissions.

(d) Sulfur Recovery. Report CO_2 emissions.

(e) Stationary Combustion Units Other than Flares and Control Devices. Report CO_2, N_2O, and CH_4 emissions as specified in WCI.23.

(f) Flares and Other Control Devices. Report CO_2, N_2O, and CH_4 emissions.

(g) Above-Ground Storage Tanks. Report CH_4 emissions.

(h) Wastewater Treatment. Report CH_4 and N_2O emissions.

(i) Oil-Water Separators. Report CH_4 emissions.

(j) Equipment Leaks. Report CH_4 emissions.

(k) Feedstock Consumption: Report feedstock consumption by type for all feedstocks which result in GHG emissions in the reporting year (including petroleum coke) in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

(l) Fuel Consumption: Report fuel consumption by fuel type consumed in the reporting year in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

WCI.203 Calculation of GHG Emissions

The operator shall calculate GHG emissions using the methods in paragraphs (a) through (i) of this section.

(a) ***Catalyst Regeneration.*** For units equipped with CEMS, operators shall calculate CO_2 process emissions resulting from catalyst regeneration using CEMS in accordance with WCI.20. In the absence of CEMS data, the operator shall use the methods in paragraphs (a)(1) through (a)(3).

(1) The operator shall calculate process CO_2 emissions from the continuous regeneration of catalyst material in fluid catalytic cracking units (FCCU) and fluid cokers using Equations 200-1, 200-2, and 200-3.

$$CO_2 = \sum_{d=1}^{n} CR_d \times CF \times 3.664 \times 0.001$$ **Equation 200-1**

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
n	=	number of days of operation in the report year
CR_d	=	daily average coke burn rate (kg/day)
CF	=	carbon fraction in coke burned
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

$$CR_d = \left[\sum_{i=1}^{n} [K_1 Q_r \times (\%CO_2 + \%CO) + K_2 Q_a - K_3 Q_r \times [\%CO/2 + \%CO_2 + \%O_2] + K_3 Q_{oxy} \times (\%O_{oxy})]_i \right] / n$$

Equation 200-2

Where:

CR_d	=	daily average coke burn rate (kg/day or lb/day)
K_1, K_2, K_3	=	material balance and conversion factors (K_1, K_2, and K_3 from Table 200-1
n	=	number of hours per day
Q_r	=	volumetric flow rate of exhaust gas before entering the emission control system (dscm/min or dscf/min)
Q_a	=	volumetric flow rate of air to regenerator as determined from control room instrumentation (dscm/min or dscf/min)
$\%CO_2$	=	CO_2 concentration in regenerator exhaust, percent by volume – dry basis
%CO	=	CO concentration in regenerator exhaust, percent by volume – dry basis
$\%O_2$	=	O_2 concentration in regenerator exhaust, percent by volume – dry basis
Q_{oxy}	=	volumetric flow rate of O_2 enriched air to regenerator as determined from control room instrumentation (dscm/min or dscf/min)
$\%O_{xy}$	=	O_2 concentration in O_2 enriched air stream inlet to regenerator, percent by volume – dry basis

$$Q_r = (79 \times Q_a + (100 - \%Q_{xy}) \times Q_{oxy}) / (100 - \%CO_2 - \%CO - \%O_2)$$ **Equation 200-3**

Where:

Q_r	=	volumetric flow rate of exhaust gas from regenerator before entering the emission control system (dscm/min or dscf/min)
Q_a	=	volumetric flow rate of air to regenerator, as determined from control room instrumentation (dscm/min or dscf/min)

$\%Q_{xy}$	=	oxygen concentration in oxygen enriched air stream, percent by volume – dry basis
Q_{oxy}	=	volumetric flow rate of O_2 enriched air to regenerator as determined from catalytic cracking unit control room instrumentation (dscm/min or dscf/min)
$\%CO_2$	=	carbon dioxide concentration in regenerator exhaust, percent by volume – dry basis
%CO	=	CO concentration in regenerator exhaust, percent by volume – dry basis. When no auxiliary fuel is burned and a continuous CO monitor is not required, assume %CO to be zero
$\%O_2$	=	O_2 concentration in regenerator exhaust, percent by volume – dry basis

(2) The operator shall calculate process CO_2 emissions resulting from periodic catalyst regeneration using Equation 200-4.

$$CO_2 = \sum_{i=1}^{n} CRR \times \left(CF_{spent} - CF_{regen}\right)_i \times 3.664 \times 0.001 \qquad \textbf{Equation 200-4}$$

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
CRR	=	mass of catalyst regenerated (mass/regeneration cycle)
CF_{spent}	=	weight fraction carbon on spent catalyst
CF_{regen}	=	weight fraction carbon on regenerated catalyst (default = 0)
n	=	number of regeneration cycles
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

(3) The operator shall calculate process CO_2 emissions resulting from continuous catalyst regeneration in operations other than FCCUs and fluid cokers (e.g. catalytic reforming) using Equation 200-5.

$$CO_2 = CC_{irc} \times (CF_{spent} - CF_{regen}) \times H \times 3.664 \qquad \textbf{Equation 200-5}$$

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
CC_{irc}	=	average catalyst regeneration rate (metric tons/hr)
CF_{spent}	=	weight carbon fraction on spent catalyst
CF_{regen}	=	weight carbon fraction on regenerated catalyst (default = 0)
H	=	hours regenerator was operational (hr/yr)
3.664	=	ratio of molecular weights, CO_2 to carbon

(b) ***Process Vents.*** Except for process emissions reported under other requirements of this regulation, the operator shall calculate process emissions of CO_2, CH_4, and N_2O from process vents using Equation 200-6.

$$E_x = \sum_{i=1}^{n} VR_i \times F_{xi} \times (MW_x / MVC) \times VT_i \times 0.001 \qquad \textbf{Equation 200-6}$$

Where:

E_x	=	emissions of x (metric tons/yr), where x = CO_2, N_2O, or CH_4
VR_i	=	vent rate for venting event i (scf/unit time)
F_{xi}	=	molar fraction of x in vent gas stream during event i
MW_x	=	molecular weight of x (kg/kg-mole)
MVC	=	molar volume conversion (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole for STP of 60°F, and 1 atmosphere)
VT_i	=	time duration of venting event i
n	=	number of venting events
0.001	=	conversion factor – kg to metric tons

(c) ***Asphalt Production:*** The operator shall calculate CO_2 and CH_4 process emissions from asphalt blowing activities using Equations 200-7 and 200-8.

$$CH_4 = (M_A \times EF \times MW_{CH4} / MVC) \times (1 - DE) \times 0.001$$ **Equation 200-7**

Where:

CH_4	=	CH_4 emissions (metric tons/yr)
M_A	=	mass of asphalt blown (10^3 bbl/yr)
EF	=	emission factor (EF = 2,555 scf $CH_4/10^3$ bbl)
MW_{CH4}	=	CH_4 molecular weight (16.04 kg/kg-mole)
MVC	=	molar volume conversion factor (849.5 scf/kg- mole, for STP of 20°C and 1 atmosphere)
DE	=	control measure destruction efficiency (DE = 98% expressed as 0.98)
0.001	=	conversion factor – kg to metric tons

$$CO_2 = (M_A \times EF \times MW_{CH4} / MVC) \times DE \times 2.743 \times 0.001$$ **Equation 200-8**

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
M_A	=	mass of asphalt blown (10^3 bbl/yr)
EF	=	emission factor (EF = 2,555 scf $CH_4/10^3$ bbl)
MW_{CH4}	=	CH_4 molecular weight (16.04 kg/kg-mole)
MVC	=	molar volume conversion factor (849.5 scf/kg mole, for STP of 20°C and 1 atmosphere)
DE	=	control measure destruction efficiency (DE = 98% expressed as 0.98)
2.743	=	CH_4 to CO_2 conversion factor
0.001	=	conversion factor – kg to metric tons

(d) ***Sulfur Recovery.*** The operator shall calculate CO_2 process emissions from sulfur recovery units (SRUs) using Equation 200-9. For the molecular fraction (MF) of CO_2 in the sour gas, use either a default factor of 0.20 or a source specific molecular fraction value approved by [*insert jurisdiction*] and derived from source tests conducted at least once per calendar year under the supervision of [*insert jurisdiction*].

$$CO_2 = FR \times MW_{CO2} / MVC \times MF \times 0.001 \qquad \textbf{Equation 200-9}$$

Where:

CO_2	=	emissions of CO_2 (metric tons/yr)
FR	=	volumetric flow rate of acid gas to SRU (scf/year)
MW_{CO2}	=	molecular weight of CO_2 (44 kg/kg-mole)
MVC	=	molar volume conversion (849.5 scf/ kg-mole, for STP of 20°C and 1 atmosphere or 836 scf/kg-mole, for STP of 60°F, and 1 atmosphere)
MF	=	molecular fraction (%) of CO_2 in sour gas (default MF = 20% expressed as 0.20)
0.001	=	conversion factor – kg to metric tons

(e) ***Flares and Other Control Devices.***

(1) The operator shall calculate and report CO_2, CH_4 and N_2O emissions resulting from the combustion of flare pilot and purge gas using the appropriate method(s) specified in sections WCI.20.

(2) The operator shall calculate and report CO_2 emissions resulting from the combustion of hydrocarbons routed to flares for destruction using Equation 200-10.

$$CO_2 = RFI \times EF_{NMHC} \times CF_{NMHC} \times 3.664 \times 0.001 \qquad \textbf{Equation 200-10}$$

Where:

CO_2	=	CO_2 emissions (metric tons/year)
RFT	=	refinery feed input (m^3/yr)
EF_{NMHC}	=	non-methane hydrocarbon emission factor (EF_{NMHC} = 0.002 kg/m^3 throughput)
CF_{NMHC}	=	conversion factor – NMHC to carbon (CF_{NMHC}= 0.6)
3.664	=	ratio of molecular weights, CO_2 to carbon0.001 = conversion factor – kg to metric tons

(3) The operator who uses methods other than flares (e.g. incineration, combustion as a supplemental fuel in heaters or boilers) to destroy low Btu gases (e.g. coker flue gas, gases from vapor recovery systems, casing vents and product storage tanks) shall calculate CO_2 emissions using Equation 200-11. The operator shall determine CC_A and MW_A quarterly using methods specified in section WCI.20 and use the annual average values of CC_A and MW_A to calculate CO_2 emissions.

$$CO_2 = GV_A \times CC_A \times MW_A / MVC \times 3.664 \times 0.001 \qquad \textbf{Equation 200-11}$$

Where:

CO_2	=	CO_2 emissions (metric tons/year)
GV_A	=	volume of gas A destroyed annually (scf/year)
CC_A	=	carbon content of gas A (kg C/kg fuel)
MW_A	=	molecular weight of gas A
MVC	=	molar volume conversion factor (849.5 scf/kg- mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole, for STP of 60°F, and 1 atmosphere)
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

(f) ***Storage Tanks.*** For above-ground storage tanks containing crude oil, asphalt, naphtha, and distillate oils that are not equipped with vapor recovery technology, the operator shall calculate CH_4 emissions using the U.S. EPA TANKS Model (Version 4.09D). For crude oil, naphtha, and distillate oils, use the default chemical databases for crude oil (RVP 5), distillate fuel oil No. 2, and jet naphtha (JP4), respectively. For asphalt, use the data in Table 200-4 to create an asphalt chemical database. The annual throughput for each storage tank must be distributed equally across the twelve months of the year and the single-component liquid option selected. The total VOC emission values generated by the model shall be converted to methane emissions using:

(1) A default conversion factor of 0.6 (CH_4 = 0.6 * VOC); or
(2) Species specific conversion factors determined by storage tank headspace vapor analysis using a sampling and analysis methodology approved by [*insert jurisdiction*].

(g) ***Wastewater Treatment****.*

(1) The operator shall calculate CH_4 emissions from wastewater treatment using Equation 200-12.

$$CH_4 = [(Q \times COD_{qave}) - S] \times B \times MCF \times 0.001 \qquad \textbf{Equation 200-12}$$

Where:

CH_4	=	emission of methane (tons/yr)
Q	=	volume of wastewater treated (m^3/yr)
COD_{qave}	=	average of quarterly determinations of chemical oxygen demand of the wastewater (kg/m^3)
S	=	organic component removed as sludge (kg COD/yr)
B	=	methane generation capacity (B = 0.25 kg CH_4/kg COD)
MCF	=	methane conversion factor for anaerobic decay (0-1.0) from Table 200-2
0.001	=	conversion factor – kg to metric tons

(2) The operator shall calculate N_2O emissions from wastewater treatment using Equation 200-13.

$$N_2O = Q \times N_{qave} \times EF_{N2O} \times 1.571 \times 0.001 \qquad \textbf{Equation 200-13}$$

Where:

N_2O	=	emissions of N_2O (metric tons/yr)
Q	=	volume of wastewater treated (m^3/yr)
N_{qave}	=	average of quarterly determinations of N in effluent (kg N/m^3)
EF_{N2O}	=	emission factor for N_2O from discharged wastewater (0.005 kg N_2O-N/kg N)
1.571	=	conversion factor – kg N_2O-N to kg N_2O
0.001	=	conversion factor – kg to metric tons

(h) ***Oil-Water Separators.*** The operator shall calculate CH_4 emissions from oil-water separators using Equation 200-14.

$$CH_4 = EF_{sep} \times V_{water} \times CF_{NMHC} \times 0.001 \qquad \textbf{Equation 200-14}$$

Where:

CH_4	=	emission of methane (tons/yr)
EF_{sep}	=	NMHC (non methane hydrocarbon) emission factor (kg/m^3) from Table 200-3.
V_{water}	=	volume of waste water treated by the separator (m^3/yr)
CF_{NMHC}	=	NMHC to CH_4 conversion factor (CF_{NMHC} = 0.6)
0.001	=	conversion factor – kg to metric tons

(i) ***Equipment leaks***. The operator shall calculate CH_4 emissions for all components in natural gas, refinery fuel gas, and PSA off-gas systems as follows:

(1) Components shall be identified as one of the following classification types: valve, pump seal, connector, flange, open-ended line. Operators shall use the Component Identification and Counting Methodology and screening methods found in Method 3 in CAPCOA (1999), which is incorporated by reference in WCI.6. Operators shall measure and record emissions using instrumentation capable of detecting methane.

(2) The VOC emissions shall be calculated using the following methods:

(A) For components where the measured screening value (SV) is indistinguishable from zero when corrected for background, operators shall calculate VOC emissions using Equation 200-15:

$$E_{VOC-0} = \sum_{i=1}^{6} CC_i \times ZF_{i0} \times t \qquad \textbf{Equation 200-15}$$

Where:

E_{VOC-0}	=	zero component VOC emission (kg/screening period)
i	=	component type (1 = valve, 2 = pump seal, 3 = other, 4 = connector, 5 = flange, 6 = open-ended line)
CC_i	=	number of i components where SV = 0
ZF_{i0}	=	zero VOC emission factor (kg/hr) for component i from Table 200-5

t = time (hours) since last screening

(B) For leaking components, operators shall calculate VOC emissions using the following methods:

(i) For screening values between background and 9,999 ppmv, the operator shall calculate the VOC emissions using Equation 200-16.

$$E_{VOCL-C} = \sum_{i=1}^{6} \sum_{n=1}^{n} \left(\sigma_i \times SV_n^{\beta i}\right) \times t$$ **Equation 200-16**

Where:

$E_{VOCL\text{-}C}$ = leaking components VOC emissions (kg/screening period)
i = component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open ended-line)
n = number of i components
σ_i = correlation equation coefficient for component type i from Table 200-5
SV_n = screening value for component n
βi = correlation equation exponent for component type i from Table 200-5
t = time (hours) component has been leaking – default value is time from last screening

(ii) For screening values greater than 9,999 ppmv, the operator shall calculate the VOC emissions using Equation 200-17.

$$E_{VOCP} = \sum_{i=1}^{6} CC_i \times PF_{iP} \times t$$ **Equation 200-17**

Where:

E_{VOCP} = VOC emissions for components pegged over SV 9,999 ppmv (kg/screening period)
i = component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open-ended line)
CC_i = number of i components pegged over 9,999 ppmv
PF_{iP} = VOC emission factor (kg/hr) for component type i pegged over 9,999 ppmv from Table 200-5
t = time component has been leaking (hours) – default value is time since last screening

(C) The operator shall calculate CH_4 emissions using Equation 200-18. Operators shall use system specific determinations of gas composition and methane content (refinery fuel gas, natural gas, associated gas, flexigas, low Btu gas), where available, to determine a

CF_{VOC} value. When representative data is not available, operators shall use the default value of 0.6 for CF_{VOC}.

$$CH_4 = \sum_{1}^{n} \left(E_{VOC-0} + E_{VOC-LC} + E_{VOCP}\right)_n \times CF_{VOC} \times 0.001 \qquad \textbf{Equation 200-18}$$

Where:

CH_4	=	methane emissions (metric tons/year)
n	=	mumber of screenings/year
E_{VOC-0}	=	zero component VOC emissions (kg/screening period)
E_{VOC-LC}	=	leaking component VOC emissions (kg/screening period)
E_{VOCP}	=	VOC emissions for components pegged over 9,999 ppmv (kg/screening period)
CF_{VOC}	=	VOC to CH_4 conversion factor (default CF_{VOC}=0.6)
0.001	=	conversion factor – kg to metric tons

WCI.204 Monitoring Requirements:

(a) ***Catalyst Regeneration***.

(1) For FCCUs and fluid coking units, the operators shall measure the following parameters using methods that comply with the measurement accuracy provisions in WCI.2(g).

(A) The daily oxygen concentration in the oxygen enriched air stream inlet to the regenerator.
(B) Continuous measurements of the volumetric flow rate of air and oxygen enriched air entering the regenerator.
(C) Continuous measurement of the volumetric flow rate of exhaust gas leaving the regenerator.
(D) Continuous measurements of the CO_2, CO and O_2 concentrations in the regenerator exhaust gas.
(E) Daily measurements of the carbon content of the coke burned.
(F) The number of days of operation.

(2) For periodic catalyst regeneration, the operators shall measure the following parameters using methods that comply with the measurement accuracy provisions in WCI.2(g).

(A) The mass of catalyst regenerated in each regeneration cycle.
(B) The weight fraction of carbon on the catalyst prior to and after catalyst regeneration.

(3) For continuous catalyst regeneration in operations other than FCCUs and fluid cokers, the operators shall measure the following parameters using methods that comply with the measurement accuracy provisions in WCI.2(g).

(A) The hourly catalyst regeneration rate.
(B) The weight fraction of carbon on the catalyst prior to and after catalyst regeneration.
(C) The number of hours of operation.

(b) ***Process vents.*** Operators shall measure the following parameters for each process vent using methods that comply with the measurement accuracy provisions in WCI.2(g).

(1) The vent flow rate for each venting event.
(2) The molar fraction of CO_2, N_2O, and CH_4 in the vent gas stream during each venting event.
(3) The duration of each venting event.

(c) ***Asphalt Production.*** Operators shall measure the mass of asphalt blown using methods that comply with the measurement accuracy provisions in WCI.2(g).

(d) ***Sulfur Recovery.*** The operator shall measure the volumetric flow rate of acid gas to the SRU using methods that comply with the measurement accuracy provisions in WCI.2(g). If using source specific molecular faction value instead of the default factor, the operator shall conduct an annual test of the CO_2 content using methods approved by [insert jurisdiction]. The operator shall submit a test plan to the [insert jurisdiction] for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [*insert jurisdiction*].

(e) ***Flares and Other Control Devices.*** The operator shall measure:

(1) The volume of gas destroyed annually determined to accuracy of ± 7.5%.
(2) The carbon content using methods that comply with the measurement accuracy provisions in WCI.2(g).

(f) ***Storage Tanks.*** The operator shall measure the annual throughput of crude oil, naphtha, distillate oil, asphalt, and gas oil for each storage tank using flow meters that comply with the measurement accuracy provisions in WCI.2(g).

(g) ***Wastewater Treatment.*** Operators shall measure the following parameters using methods that comply with the measurement accuracy provisions in WCI.2(g).

(1) The daily volume of waste water treated.
(2) The quarterly chemical oxygen demand of the wastewater.
(3) The amount of sludge removed and the organic content of the sludge.
(4) The quarterly nitrogen content of the wastewater.

(h) ***Oil-Water Separators.*** Operators shall measure the daily volume of waste water treated by the oil-water separators using methods that comply with the measurement accuracy provisions in WCI.2(g).

(i) ***Equipment Leaks.*** Operators shall measure screening values for each valve, pump seal, connector, flange, and open-ended line used in natural gas, refinery fuel gas, and PSA off-gas systems using the methods specified in CAPCOA (1999) Method 3: Correlation Equation Method and an instrument capable of detecting methane. Operators shall conduct screenings at the frequency interval required by [*insert jurisdiction*].

[Comparability of the Canadian regulations to the leak detection and repair r regulations under 40 CFR 63, Subpart CC and 40 CFR 60, Subpart VV is under determination. These U.S EPA regulations require initially monthly monitoring for valves and pumps, which may be reduced to quarterly, semi-annual, or annual based on the percentage of leaking components.]

Table 200-1. Coke burn rate material balance and conversion factors		
	(kg min)/(hr dscm %)	**(lb min)/(hr dscf %)**
K_1	0.2982	0.0186
K_2	2.0880	0.1303
K_3	0.0994	0.0062

Table 200-2. Default MCF Values for Industrial Wastewater			
Type of Treatment and Discharge Pathway or System	**Comments**	**MCF**	**Range**
Untreated			
Sea, river and lake discharge	Rivers with high organic loading may turn anaerobic, however this is not considered here	0.1	0 - 0.2
Treated			
Aerobic treatment plant	Well maintained, some CH_4 may be emitted from settling basins	0	0 – 0.1
Aerobic treatment plant	Not well maintained, overloaded	0.3	0.2 – 0.4
Anaerobic digester for sludge	CH_4 recovery not considered here	0.8	0.8 – 1.0
Anaerobic reactor	CH_4 recovery not considered here	0.8	0.8 – 1.0
Anaerobic shallow lagoon	Depth less than 2 meters	0.2	0 – 0.3
Anaerobic deep lagoon	Depth more than 2 meters	0.8	0.8 – 1.0

For CH_4 generation capacity (B) in kg CH_4/kg COD, use default factor of 0.25 kg CH_4/kg COD.

The emission factor for N_2O from discharged wastewater (EF_{N2O}) is 0.005 kg N_2O-N/kg-N.

MCF = methane correction factor – the fraction of waste treated anaerobically.
COD = chemical oxygen demand (kg COD/m^3).

Table 200-3. Emission Factors for Oil/Water Separators	
Separator Type	**Emission factor (EF_{sep})[a] kg NMHC/m^3 wastewater treated**
Gravity type - uncovered	1.11e-01
Gravity type - covered	3.30e-03
Gravity type – covered and connected to destruction device	0
DAF[b] of IAF[c] - uncovered	4.00e-03[d]
DAF or IAF - covered	1.20e-04[d]
DAF or Iaf – covered and connected to a destruction device	0

a. EFs do not include ethane
b. DAF = dissolved air flotation type
c. IAF = induced air flotation device
d. EFs for these types of separators apply where they are installed as secondary treatment systems

ATTACHMENT 5: CEMENT MANUFACTURING

§ WCI.90 CEMENT MANUFACTURING

§ WCI.91 Source Category Definition

Cement manufacturing is comprised of all processes that are used to manufacture Portland, natural, masonry, pozzolanic, or other hydraulic cements.

§ WCI.92 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2, CH_4, and N_2O in metric tons.

(b) CO_2 process emissions from calcination (metric tons) and the following information:

(1) Clinker emission factor (kg CO_2/metric ton clinker).
(A) Quantity of clinker produced (metric tons).
(B) Total lime (CaO) content of clinker (wt. fraction).
(C) Total magnesium Oxide (MgO) content of clinker (wt. fraction).
(D) Uncalcined CaO (wt. fraction).
(E) Uncalcined MgO (wt. fraction).

(2) Cement kiln dust (CKD) emission factor (kg CO_2/metric ton CKD discarded).
(A) Plant specific CKD calcination rate (unitless ratio).
(B) Quantity of CKD discarded (metric tons).

(c) CO_2 process emissions from organic carbon oxidation (metric tons) and the following information:

(A) Amount of raw material consumed in the report year (metric tons).
(B) Organic carbon content of raw material (wt. fraction).

(d) CO_2, CH_4, and N_2O emissions from fuel combustion in all kilns combined, following the calculation methods and reporting requirements specified in WCI.93(c) (metric tons).

(e) CO_2, CH_4, and N_2O emissions from all other fuel combustion units combined (kilns excluded), following the calculation methods and reporting requirements specified in WCI.20 (metric tons).

(f) If a continuous emissions monitor is used to measure CO_2 emissions from kilns, then the requirements of paragraphs (b), (c), and (d) of this section do not apply for CO_2. Cement plants that measure CO_2 emissions using CEMS shall report fuel usage by fuel type for kilns.

(g) Operators of cement plants shall also comply with the reporting requirements for any other applicable source category listed at WCI.1(a), including but not limited to the following:

(1) Coal fuel storage as specified in WCI.100.
(2) Electricity generating as specified in WCI.40.
(3) Cogeneration systems as specified in WCI.50.

§ WCI.93 Calculation of Greenhouse Gas Emissions From Kilns

(a) Determine CO_2 emissions as specified under either paragraph (a)(1) or (a)(2) of this section.

(1) Use a continuous emissions monitoring system (CEMS) as specified in WCI.23(d).
(2) Calculate the sum of CO_2 process emissions from kilns and CO_2 fuel combustion emissions from kilns using the calculation methodologies specified in paragraph (b) and (c) of this section**.**

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions as the sum of emissions from calcination, using the method specified in paragraph (b)(1) of this section; and from organic carbon oxidation, using the method specified in paragraph (b)(2) of this section (Equation 90-0).

$$CO_2\text{ process} = CO_2\text{ calcination} + CO_2\text{ raw material} \qquad \textbf{Equation 90-0}$$

(1) Calcination Emissions. Calculate CO_2 process emissions from calcination using Equation 90-1 and a plant-specific clinker emission factor and a plant-specific cement kiln dust (CKD) emission factor as specified in this section.

$$CO_{2-C} = \sum_{i=1}^{12} [(Cli)\times(EF_{Cli})]+[(Q_{CKD})\times(EF_{CKD})] \qquad \textbf{Equation 90-1}$$

Where:

$CO_{2\text{-}C}$	=	CO_2 emissions from calcination, metric tones.
Cli	=	Monthly quantity of clinker produced, metric tons.
EF_{Cli}	=	Monthly clinker emission factor, metric tons CO_2/metric ton clinker computed as specified in paragraph (b)(1)(A) of this section.
Q_{CKD}	=	Monthly quantity CKD discarded (i.e., not recycled to the kiln), metric tons.
EF_{CKD}	=	Monthly CKD emission factor, computed as specified in paragraph (b)(1)(B) of this section.

(A) Monthly Clinker Emission Factor. Calculate a monthly plant-specific clinker emission factor (EF_{Cli}) for each report year based on the percent of measured CaO and MgO content in the clinker and using Equation 90-2.

$$\begin{aligned} EF_{Cli} &= [(CaO\ content - uncalcined\ CaO)\times Molecular\ ratio\ of\ CO_2/CaO] \\ &+ [(MgO\ Content - uncalcined\ MgO)\times Molecular\ ratio\ of\ CO_2/MgO] \end{aligned} \qquad \textbf{Equation 90-2}$$

Where:

CaO Content (by weight)	=	Total CaO content of Clinker (including calcined and uncalcined) (wt. fraction).
Non-carbonate CaO (by weight)	=	Uncalcined CaO of Clinker (wt. fraction).
Molecular ratio of CO_2/CaO	=	0.785.
MgO Content (by weight)	=	Total MgO content of Clinker (including calcined and uncalcined) (wt. fraction).

Non-carbonate MgO = Uncalcined MgO of Clinker (wt. fraction).
Molecular ratio of CO_2/MgO = 1.092.

(B) Monthly CKD Emission Factor. If CKD is generated and not recycled back to the kiln, then calculate a monthly plant-specific CKD emission factor. The CKD emission factor shall be calculated using Equation 90-3 and a plant-specific CKD calcination rate as specified in Equation 90-4.

$$EF_{CKD} = \frac{\frac{EF_{Cli}}{1 + EF_{Cli}} \times d}{1 - \left(\frac{EF_{Cli}}{1 + EF_{Cli}} \times d\right)} \qquad \textbf{Equation 90-3}$$

Where:

EF_{CKD} = Monthly CKD emission factor, kg CO_2/metric ton CKD discarded.
EF_{Cli} = Clinker emission factor, determined according to Equation 90-2.
d = CKD calcination rate, determined according to Equation 90-4.

$$d = 1 - \frac{fCO_{2CKD} \times (1 - fCO_{2RM})}{(1 - fCO_{2CKD}) \times fCO_{2RM}} \qquad \textbf{Equation 90-4}$$

Where:

d = CKD calcination rate (unitless ratio).
fCO_{2CKD} = Weight fraction of carbonate CO_2 in the CKD.
fCO_{2RM} = Weight fraction of carbonate CO_2 in the raw material.

(2) Organic Carbon Oxidation Emissions. Calculate CO_2 process emissions from the total organic content in raw materials by using Equation 90-5.

$$CO_{2-RM} = TOC_{RM} \times RM \times 3.664 \qquad \textbf{Equation 90-5}$$

Where:

CO_{2-RM} = CO_2 emissions from raw material oxidation, metric tons.
TOC_{RM} = Total organic carbon content in raw material (wt. fraction), measured using the method in WCI.94(c) or using a default of 0.002 (0.2%).
RM = Amount of raw material consumed (metric tons/yr).
3.664 = The CO_2 to carbon molar ratio.

(c) Fuel Combustion Emissions in Kilns. Calculate CO_2, CH_4, and N_2O emissions from stationary fuel combustion following the calculation methods specified in WCI.20. Cement plants that combust pure biomass-derived fuels and combust fossil fuels only during periods of start-up, shut-down, or malfunction may report CO_2 emissions from fossil fuels using the emission factor methodology in WCI.23(a). "Pure" means that the biomass-derived fuels account for 97 percent of the total amount of carbon in the fuels burned.

§ WCI.94 Sampling, Analysis, and Measurement Requirements

Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the cement industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.

(a) Determine the plant-specific weight fractions of CaO, MgO, uncalcined CaO, and uncalcined MgO in clinker from each kiln using *(method to be determined).* Determine the weight fraction of carbonate CO_2 in the CKD and the weight fraction of carbonate CO_2 in the raw material. The monitoring must be conducted monthly for each kiln from a clinker sample drawn from bulk clinker storage.

(b) If not using the default value of 0.002 for TOC_{RM} in Equation 90-5, the total organic carbon contents of raw materials must be determined annually *[monthly?]* using ASTM Method C114-07. The analysis must be conducted on sample material drawn from bulk raw material storage for each category of raw material.

(c) The quantity of clinker produced must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(d) The quantity of CKD discarded must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(e) The quantity of raw materials consumed (i.e. limestone, sand, shale, iron oxide, and alumina) must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

Economic Modeling – Next Steps

Economic Modeling Team

January 13, 2009
Conference Call

Outline of Presentation

- Status of economic modeling
- Discussion of suggestions from stakeholders on revisions to model and assumptions
- Input on priorities for sensitivity analysis in next round of modeling
- Additional comments and questions

Status of Economic Modeling

- Plans call for:
  - Expanding the model to include Manitoba, Ontario, and Quebec.
  - Addressing issues identified with the previous analysis
  - Repeating and updating analyses released in September to include all partners
  - Conducting additional sensitivity analyses
- Aim to complete and release in March
- Outcome of 3-Dec. San Francisco workshop

Summary of Decisions To Date Regarding Stakeholder Suggestions

- Conform model to 2-stage scope, 2012-2014 and 2015-2020
- Extend the model to 2030
- Update macroeconomic and/or energy price forecast
- Examine interaction of the complementary policies and cap-and-trade system
- Revise offsets and banking provisions

Summary of Decisions To Date Regarding Stakeholder Suggestions (Cont.)

- Examine a variety of combinations of auctioned and free allocations of allowances
- Expand reporting of inputs and outputs from modeling to provide more detail on power sector, transportation sector, and effects of energy efficiency complementary policy

Input on Priorities for Sensitivity Analysis in Next Round of Modeling

- *Time did not allow this topic to be discussed at S.F. workshop*
- *Moderator will solicit participant input*

Comments and Questions

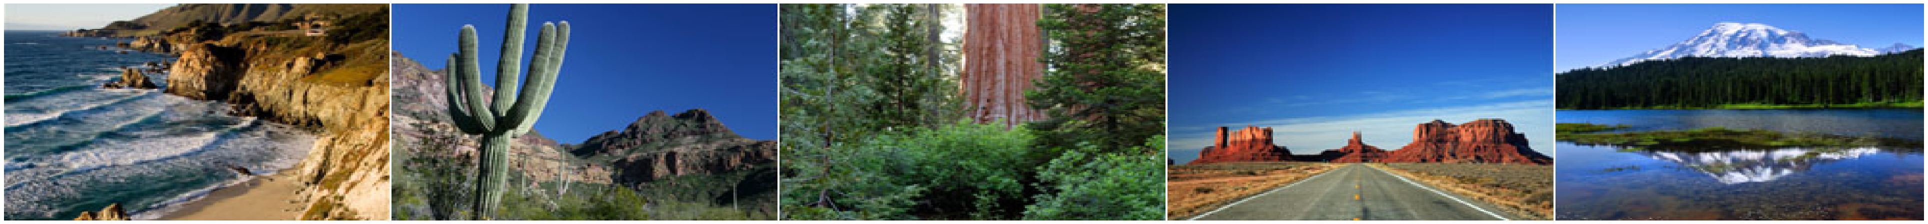
ELECTRICITY SUBCOMMITTEE
TECHNICAL WORKING SESSION

Phoenix, Arizona
January 15, 2009
9:00 a.m. to 5:00 p.m. Mountain

Location:
Sheraton Hotel Downtown
Phoenix, Arizona

AGENDA

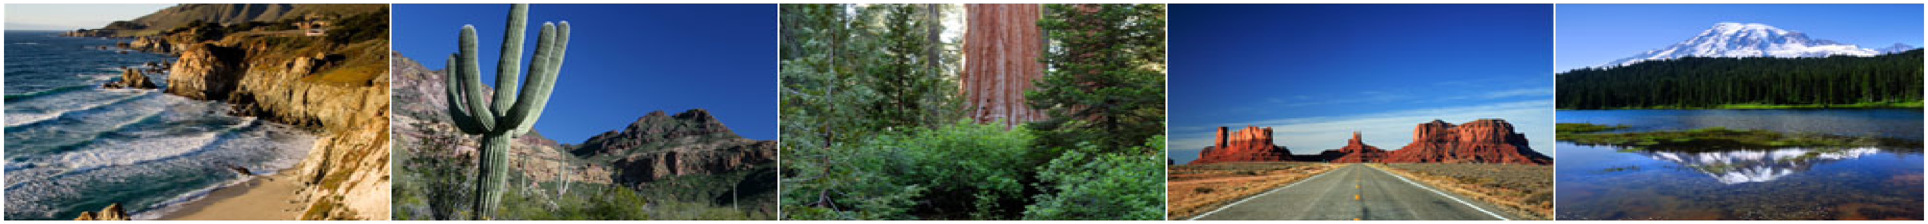
1.	**9:00 am**	**Welcome and Introductions** **David Van't Hof, Chair, WCI Electricity Subcommittee**
2.	**9:15**	**Review of the Process and Agenda**
3.	**9:30**	**Distributing Allowances and the Electricity Sector** **Scott Murtishaw, CA PUC** • **What are the distribution options?** • **What happens when states/provinces differ in their approaches to distributing allowances?**
4.	**10:00**	**Comments and Suggestions from TAG and Stakeholders**
7.	**12:00 pm**	**Lunch (On Your Own)**
8.	**1:00**	**Discussion on Allocations, continued.**
9.	**2:30 pm**	**Recap of Recent TAG Conference Calls** • **Renewable Energy Credits (RECs)** • **Common Boundary Approach** • **Default Rates**
10.	**4:15**	**Next Steps for the Electricity TAG Process**
11.	**4:45**	**Public Comment Session**
12.	**5:00**	**Adjourn**



GHG Allowance Allocation Options in the Electricity Sector

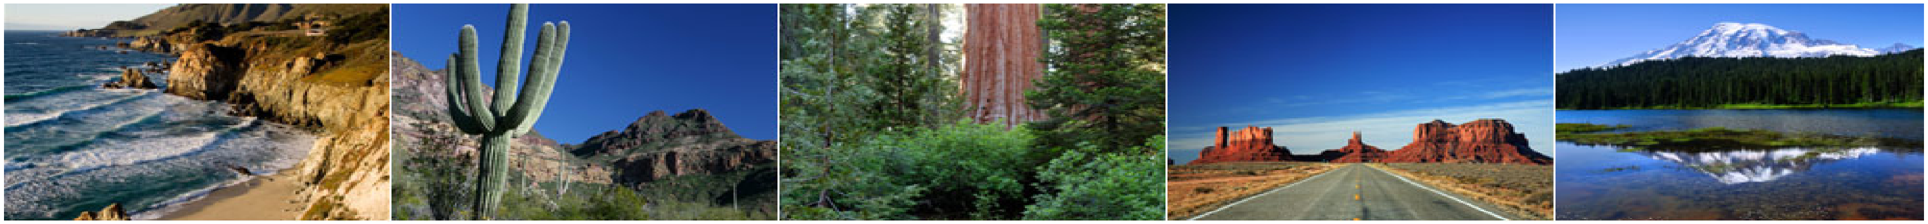
Scott Murtishaw
California Public Utilities Commission

WCI Technical Working Session
Phoenix, Arizona
January 15, 2009



Outline of Presentation

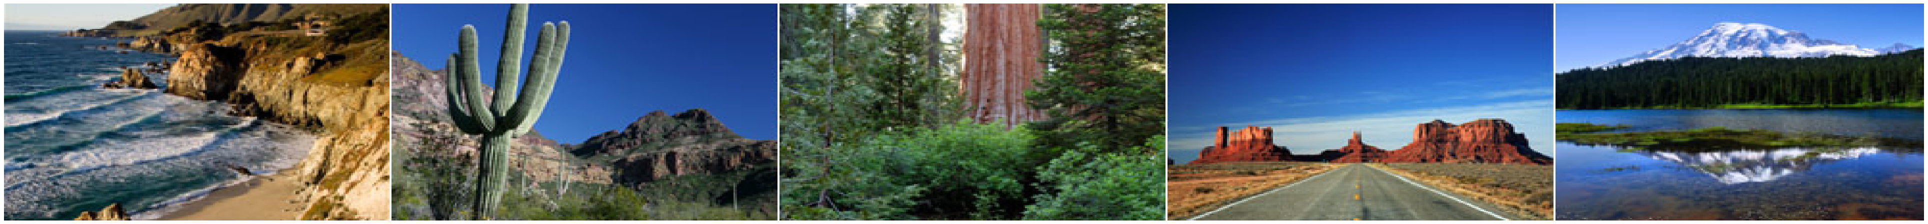
- Suggested Evaluation Criteria
- Overview of Basic Allocation Options
- Windfall Profits
  - Why and how they occur
  - Rough calculation of potential consumer losses for some WCI Partners
- Mechanics and Evaluation of Basic Allocation Options and Variants
- Possible Effects of Non-Harmonized Allocation Policies



Some WCI Allocation Purposes and Objectives

<u>From the WCI Design Recommendations:</u>

- Funding energy efficiency and renewable energy incentives
- Funding RDD&D of carbon capture, renewable and efficiency technologies
- Reducing consumer impacts, especially for low-income consumers;
- Providing for worker transition and green jobs;
- Achieving emission reductions in communities that experience disproportionate environmental impacts;
- Providing transition assistance to industries;
- Recognizing early actions to reduce emissions and/or;
- Promoting economic efficiency



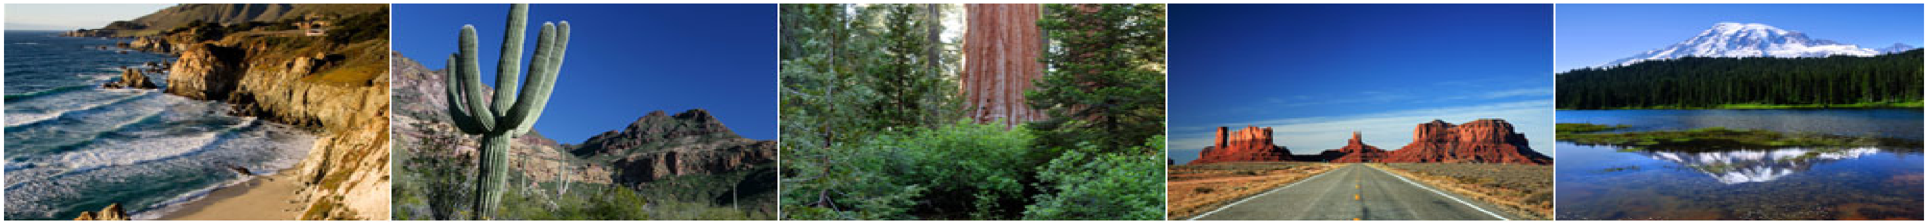
Suggested Evaluation Criteria

Principal Criteria

- Total consumer costs: Impacts on retail electricity customers
- Distribution of consumer costs: Equity among customers of retail providers

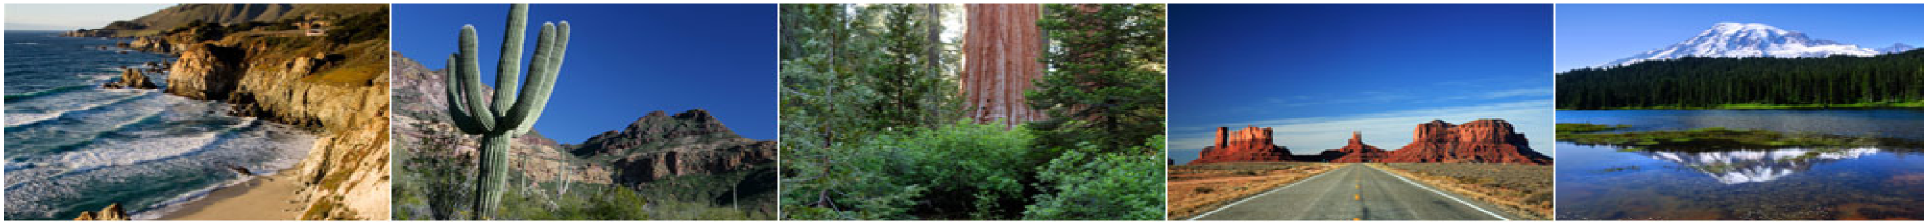
Additional Criteria

- Administrative simplicity/transparency
- Accommodation of new entrants



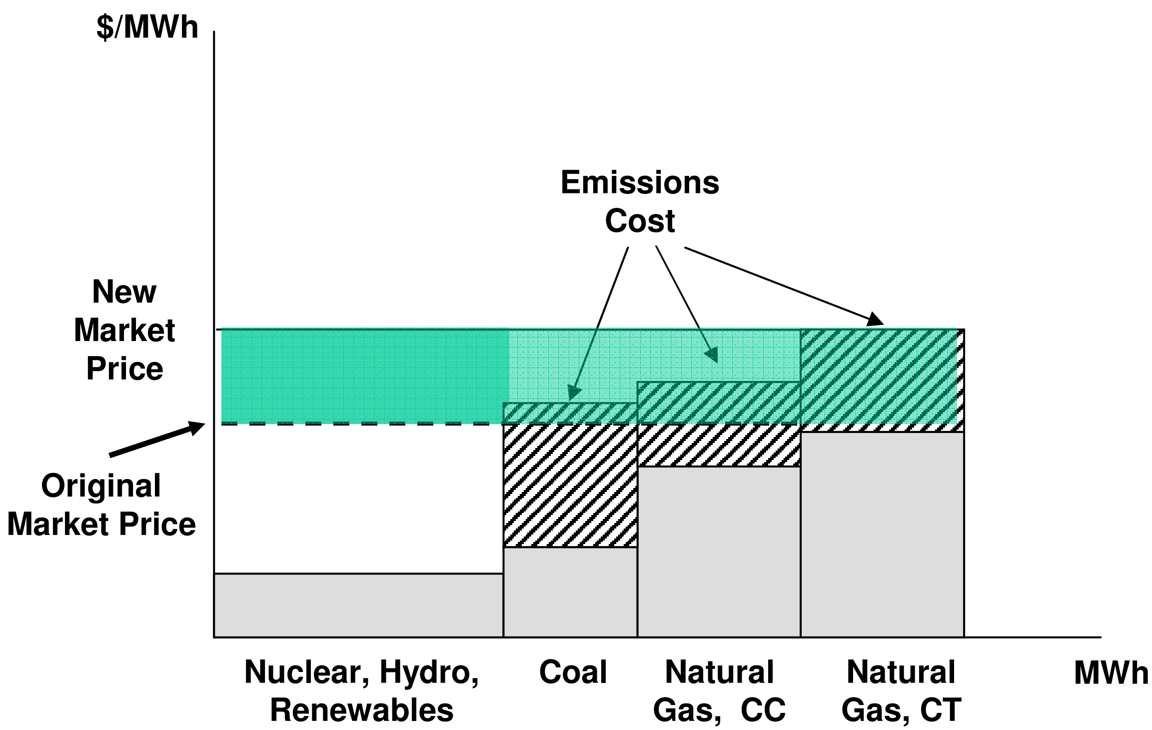
Basic Allocation Options

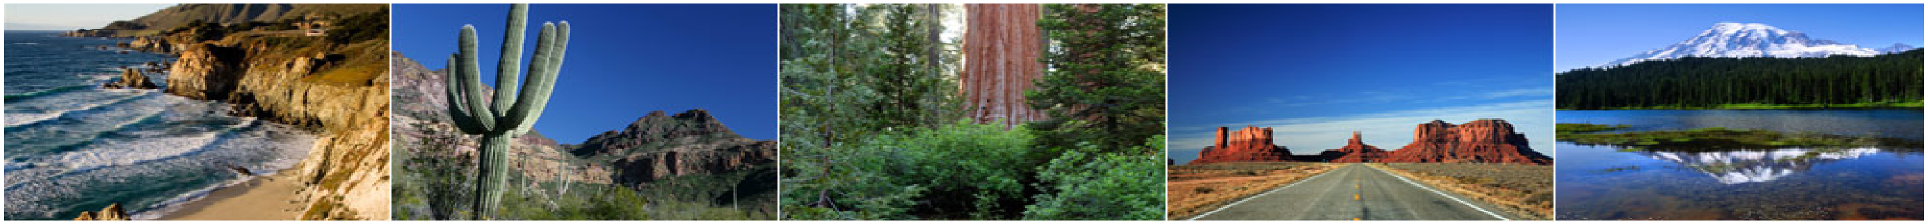
- Administrative (usually free) allocation
  - Emission-based, historic base year(s) ("grandfathering")
  - Output-based, usually with updating
  - Input-based, usually with updating
- Auctioning
- Hybrids that combine one or more options



Explanation of Windfall Profits

…in situations where retail providers make market purchases from independent generators or deliverers

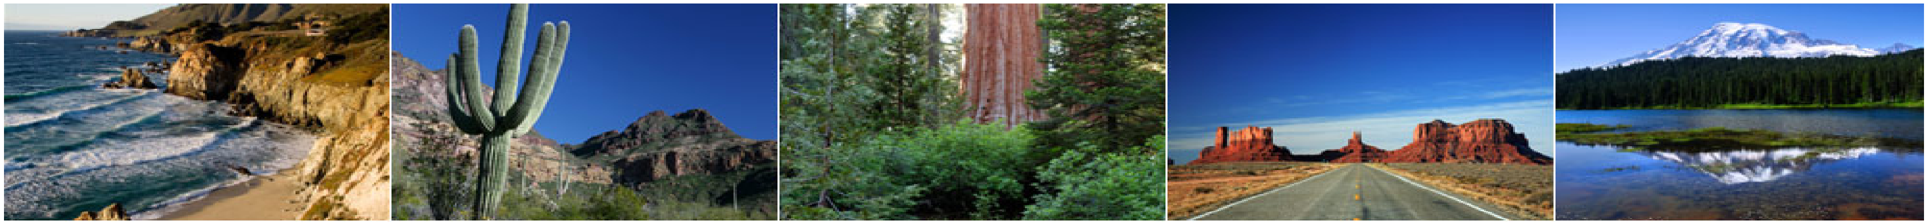




Rough Estimates of Potential Windfalls

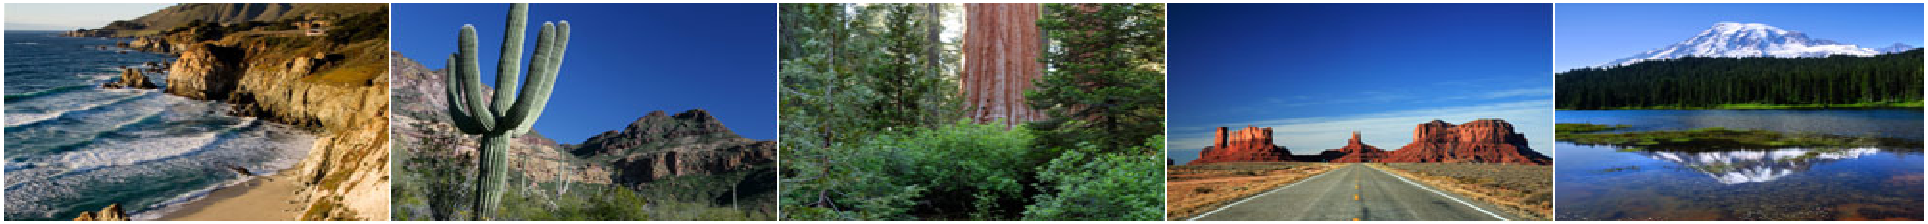
	Generation to Serve Load, TWh	Market Purchases, TWh	Market Purchase Share	Windfall Potential, Million US $
CA	295	170	58%	$1,700
WA	95	10	11%	$100
ON	165	60	36%	$600
BC	55	8	15%	$80
NM	23	2	9%	$20

Assumptions: \$20/tonne allowance price, gas on margin at 500 kg CO_2/MWh, and full pass-through of opportunity costs



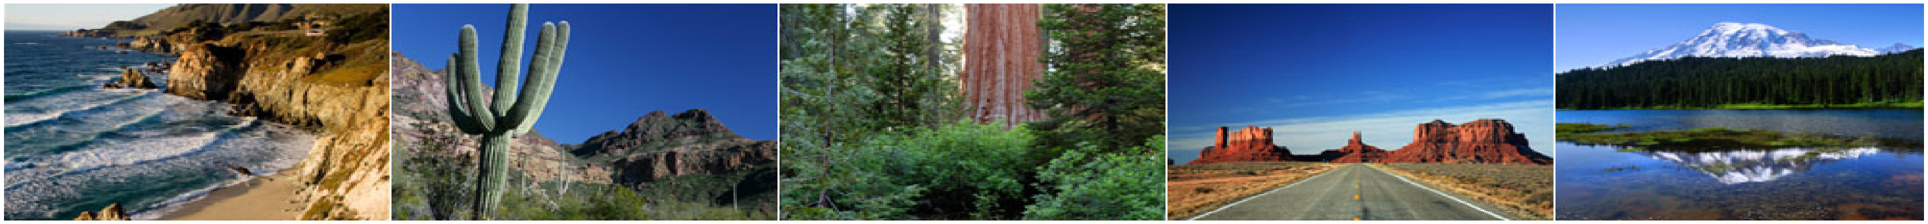
Allocation Options in this Analysis

- Administrative allocation to deliverers
  - Emission-Based Allocation (EBA)
  - Output-Based Allocation (OBA): delivered MWh
- Auctioning: Allocation of allowances or auction revenue rights to retail providers with subsequent auctioning
  - Emission-Based: emissions of sources used to serve load
  - Sales-Based



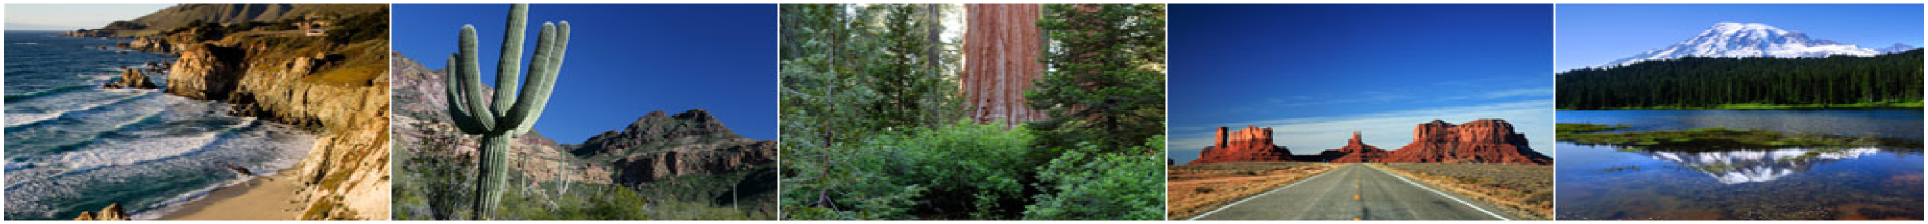
Emission-Based Allocation Mechanics

- Provide allowances to deliverers on an historic emissions basis
- Possible multi-year baseline to smooth variations due to hydro production and weather
- All deliverers receive proportional declining allowances
- Awarded in perpetuity based on historic period
- Administrative determination of baseline and historic emissions from unspecified purchases



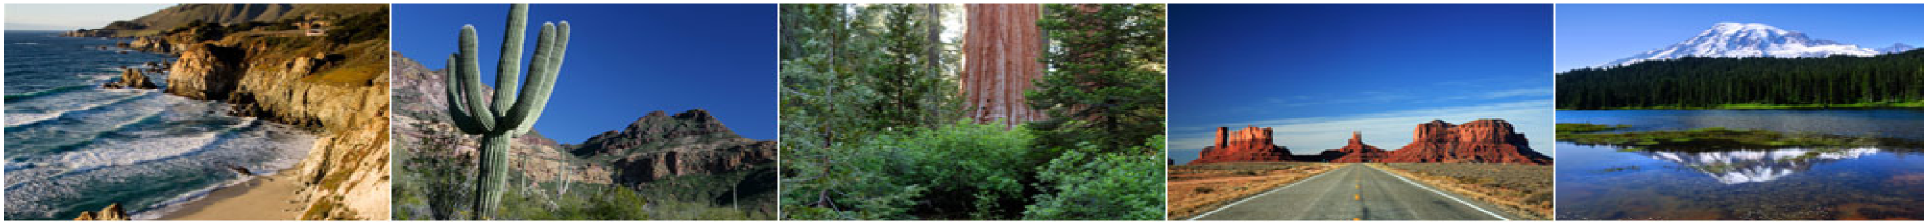
Evaluation of Emission-Based Allocation

- **Total Consumer Cost:** Higher costs for market-dependent customers; for fully-resourced, it depends on provider decision of how to use allowance value
- **Distribution of Costs**: Limited distributional impacts among customers
- **Administrative Simplicity:** Simple, except administrative decision on baseline
- **New Entrants**: Discriminates against them without set-aside provision



Output-Based Allocation Mechanics

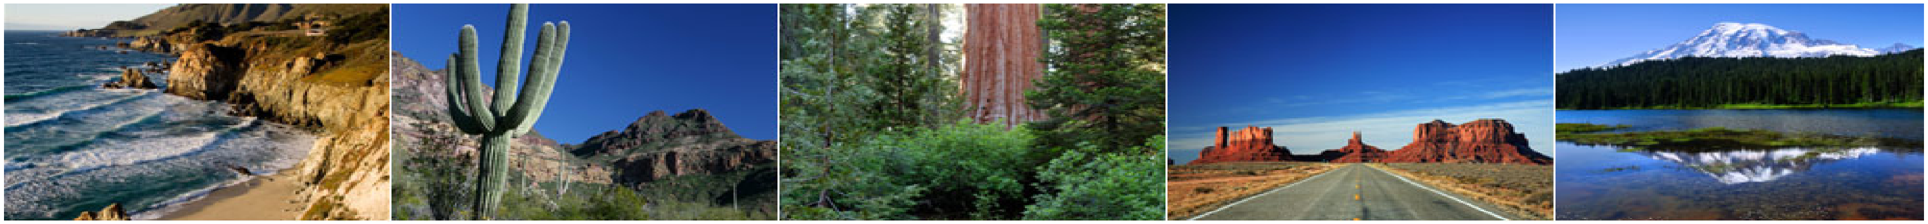
- Freely Allocate Allowances on a Per MWh Basis
- Measurement of Output Updated Regularly
- Benchmarking vs. Fixed-Cap
  - Benchmarking is allocating at a fixed rate per unit of output
  - Total number of allowances allocated cannot be known in advance
  - Fixed-cap output-based allocation distributes a fixed number of allowances based on shares of a prior year’s output



Hypothetical Fixed-Cap OBA

Assumes 100 Million Ton Cap in 2012

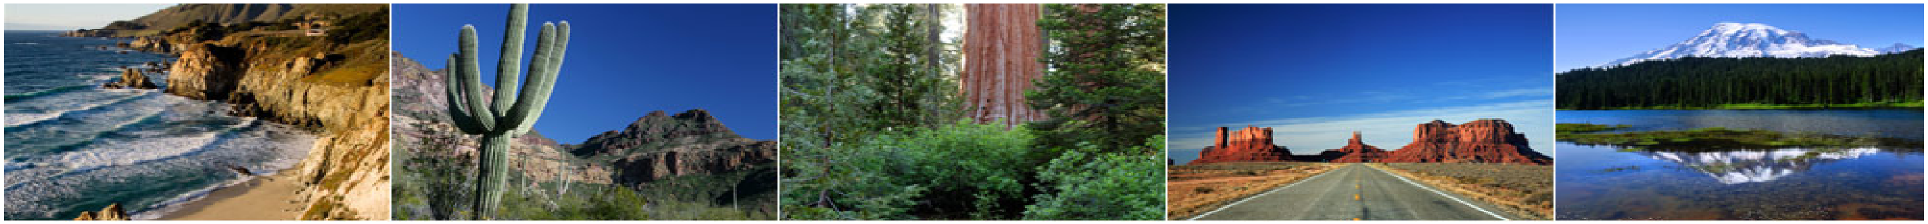
	Deliveries in 2011, Million MWh	Share of 2011 Deliveries, Million MWh	2012 Allowances Received, Millions
Deliverer A	100	50%	50
Deliverer B	75	37.5%	37.5
Deliverer C	25	12.5%	12.5
Total	**200**	**100%**	**100**



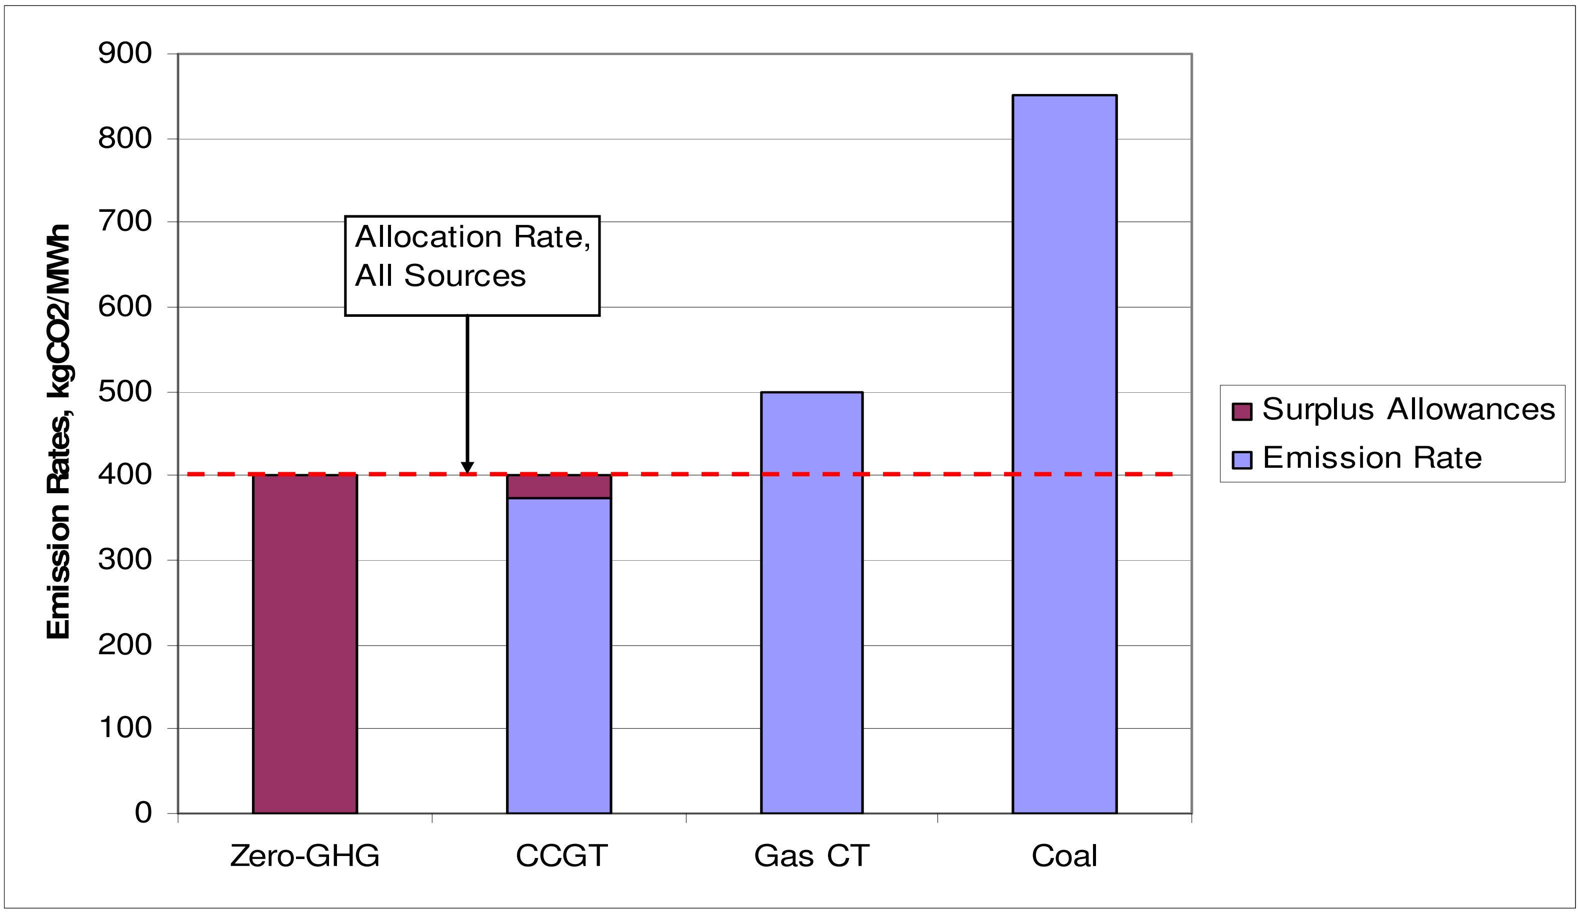
Pure Output-Based Allocation

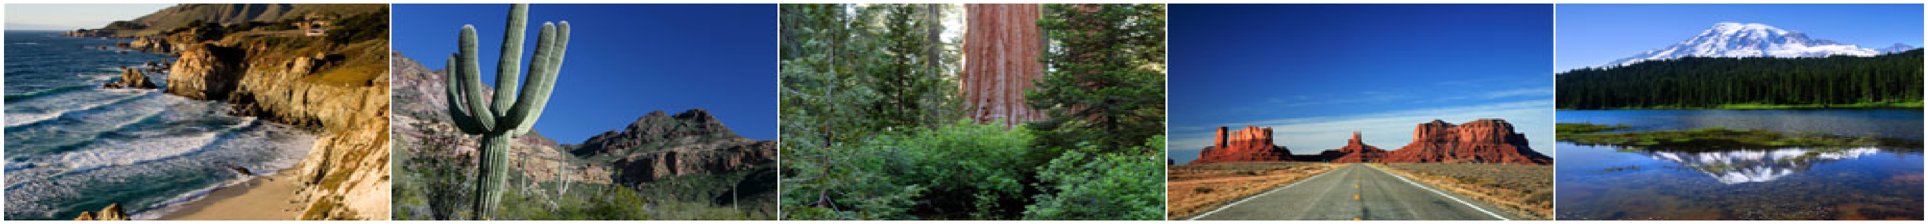
- Allocation to all generation
- Uniform level of allowances provided to deliverers for each unit of generation

$$\frac{\text{(Total Capped Emission Level in 2012, tons CO2e)}}{\text{(Total Generation in 2011, MWh)}} = \text{Allowances per MWh}$$



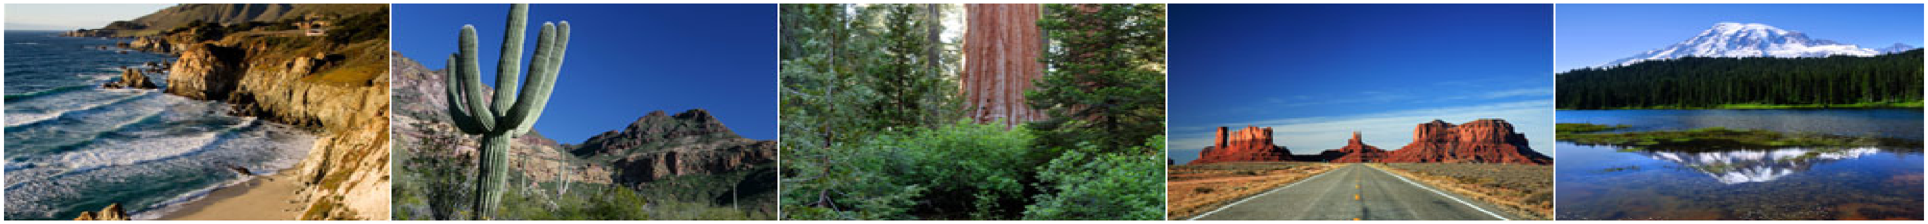
Pure OBA, Impact by Resource Type





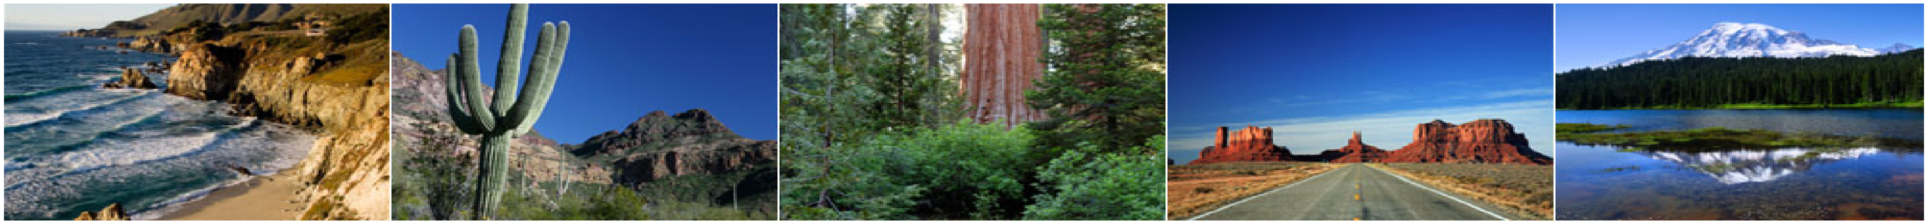
Evaluation of Pure OBA

- **Total Consumer Cost:** Dampens energy price increases, but economic efficiency losses and higher allowance prices
- **Distribution of Costs**: Disadvantages customers of retail providers with high GHG portfolios
- **Administrative Simplicity:** Transparent, simple formula for allocating allowances
- **New Entrants**: With frequent updating, easily accommodates new entrants



Variations of OBA

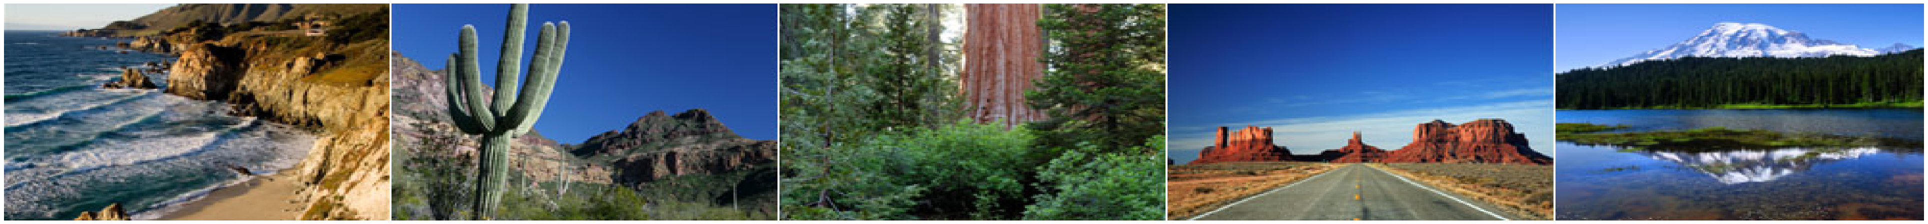
- Restricting Generator Eligibility
  - Exclude all, or a subset of, zero-GHG deliverers
- Fuel Differentiated Output Weighting
  - Higher per MWh allocation rate to high emitters



Hypothetical Fuel-Differentiated OBA

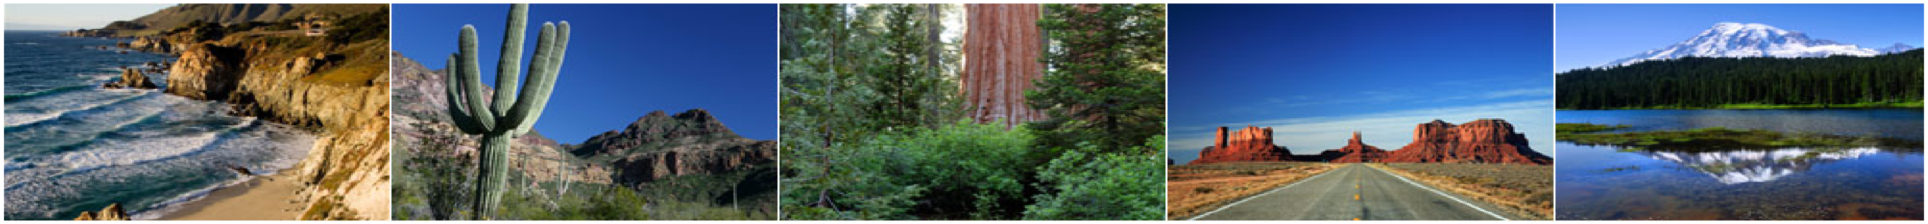
Weighting Factor: Gas-Fired = 1, Coal-Fired = 2

	Unweighted Generation			Weighted Generation		
Generation Fuel Type	**Deliveries in 2011, (million MWh)**	**Share of 2011 Deliveries**	**2012 Allowances Received, (In million tons)**	**Weighted Deliveries in 2011, (million MWh)**	**Share of 2011 Weighted Deliveries**	**2012 Allowance Received, (in million tons)**
Gas-Fired	**100**	**66.7%**	**66.7**	**100**	**50%**	**50**
Coal-Fired	**50**	**33.3%**	**33.3**	**100**	**50%**	**50**



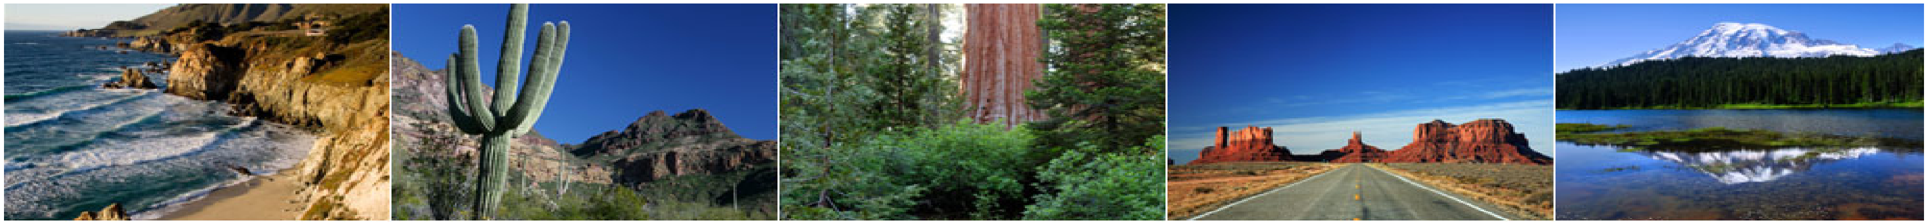
Evaluation of Fuel-Differentiated OBA

- **Total Consumer Cost:** Dampens energy price increases, but economic efficiency losses and higher allowance prices
- **Distribution of Costs**: Minimizes distributive effects
- **Administrative Simplicity:** Relatively simple, but necessitates determination of weighting factors
- **New Entrants**: With frequent updating, easily accommodates new entrants



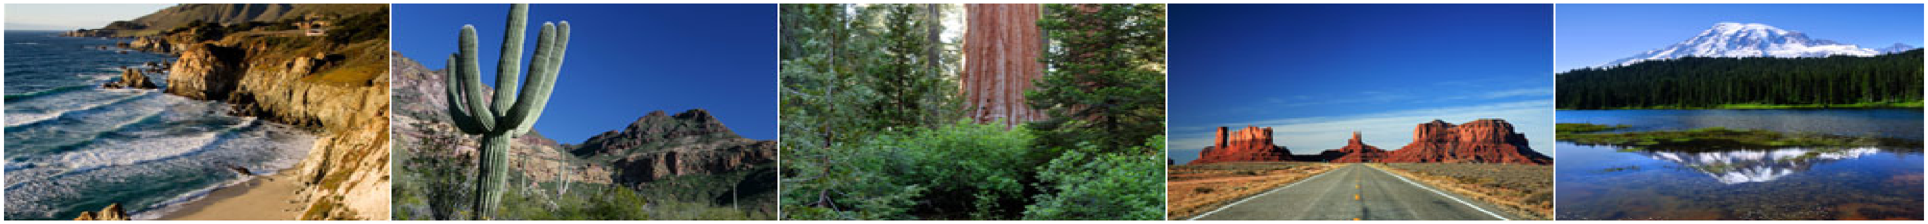
Auctioning Mechanics

- Auctions of GHG allowances conducted by state/provincial agencies or their agents
- Entities with a compliance obligation buy allowances according to anticipated need from the auction and/or the secondary market



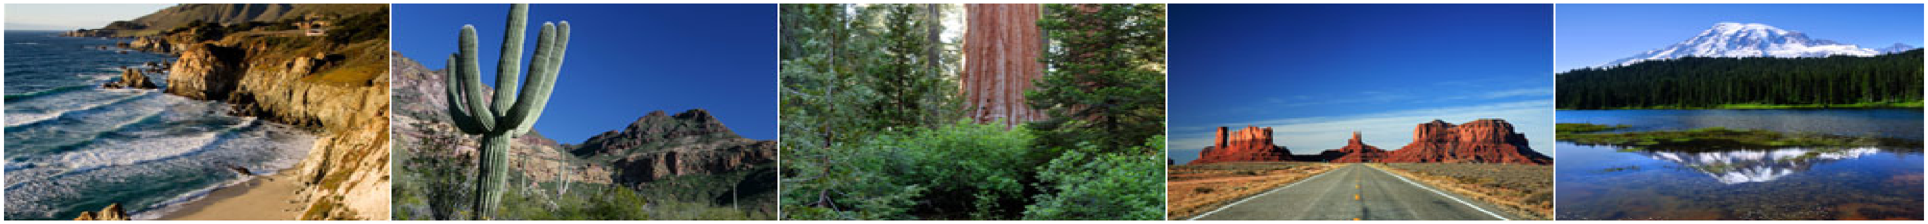
Description of a Pure Auction Allocation

- All allowances are distributed by auction
- Assumes no direct refund of auction revenues for electricity customer benefit
- Assumes auctions revenues provide benefits relatively evenly across jurisdiction



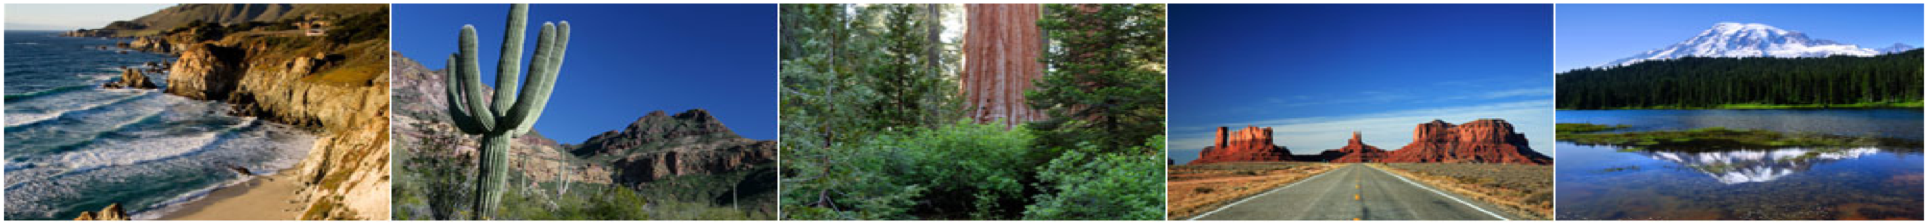
Evaluation of Pure Auction

- **Total Consumer Cost**: The need for deliverers to recover allowance costs raises the cost of electricity to consumers
- **Distribution of Costs**: Customers of high-GHG retail providers experience larger cost increases than customers of low-GHG retail providers
- **Administrative Simplicity**: Requires no baselines for deliverers or retail providers
- **New Entrants**: No barrier to market entry for new deliverers



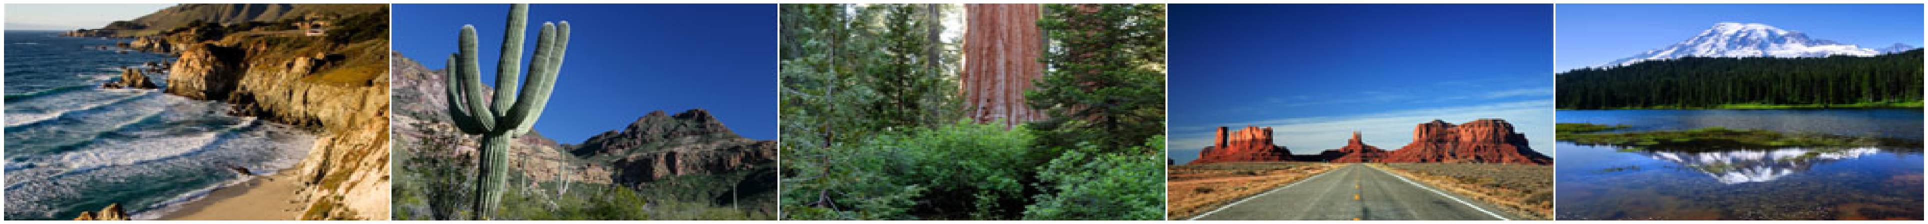
Mechanics for Recycling Auction Revenue to Retail Providers

- A certain number of allowances per vintage are reserved for the electricity sector
- Either allowances or auction revenue rights are allocated to retail providers
- Retail providers must auction allowances received through this mechanism in the centralized auction



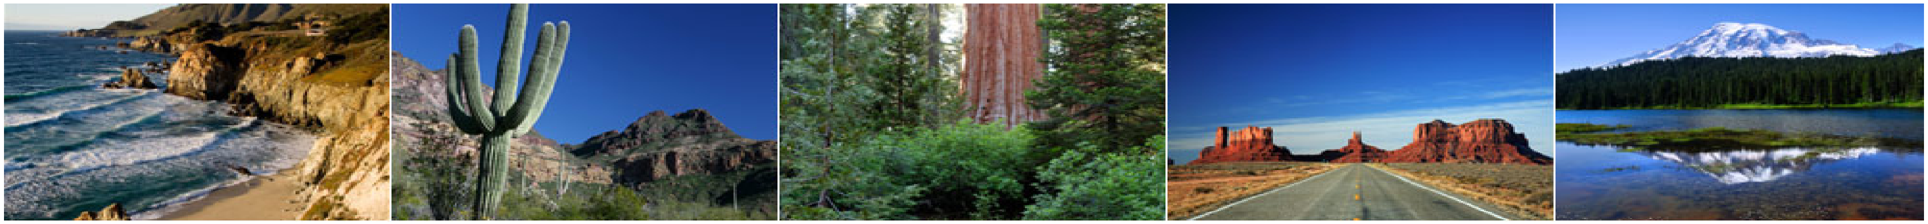
Variations on Auctioning with Revenue Recycling

- **Emission-Based**: Auction revenue given to retail providers on the basis of emissions associated with serving load in a fixed, historical base period
- **Sales-Based**: Auction revenue given to retail providers on the basis of retail sales
  - Verified energy savings could also qualify for auction revenues



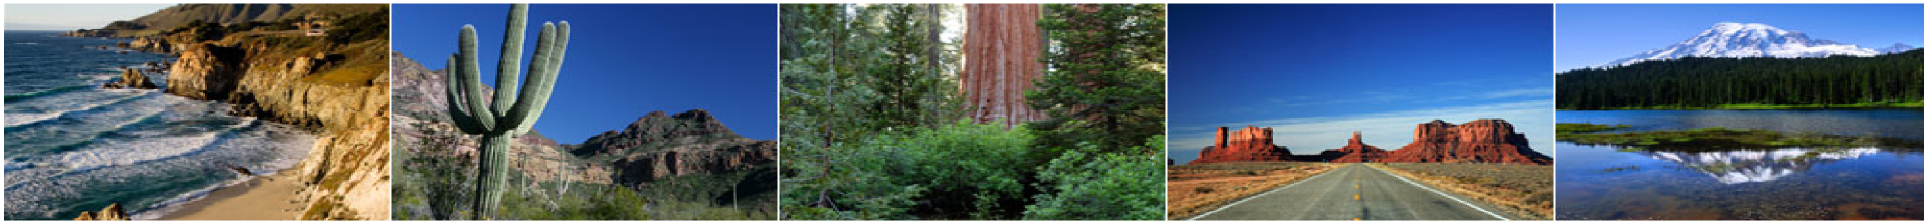
Evaluation of Emission-Based Revenue Recycling

- **Total Consumer Cost**: Relatively low cost to consumers
- **Distribution of Costs**: Minimizes distributive effects
  - In the long-run, retail providers with fast-growing loads would be disadvantaged
- **Administrative Simplicity**: Need to calculate base period emissions for all retail providers adds some additional complexity
- **New Entrants**: Disadvantages new retail providers (ESPs or new utilities carved from existing territories) without reallocation of allowance revenues



Evaluation of Sales-Based Revenue Recycling

- **Total Consumer Cost**: Relatively low cost to consumers
- **Distribution of Costs**: High-GHG retail providers spend much more on allowances (whether directly or embedded in market prices) than they receive in auction revenue
  - Distribution of revenue on “net” load (subtraction of load served by utility-owned nuclear and hydro resources) is one method to consider
- **Administrative Simplicity**: Allocating on a sales basis is administratively simple
- **New Entrants**: Without a set-aside mechanism, dis-advantages new retail providers until allocation update

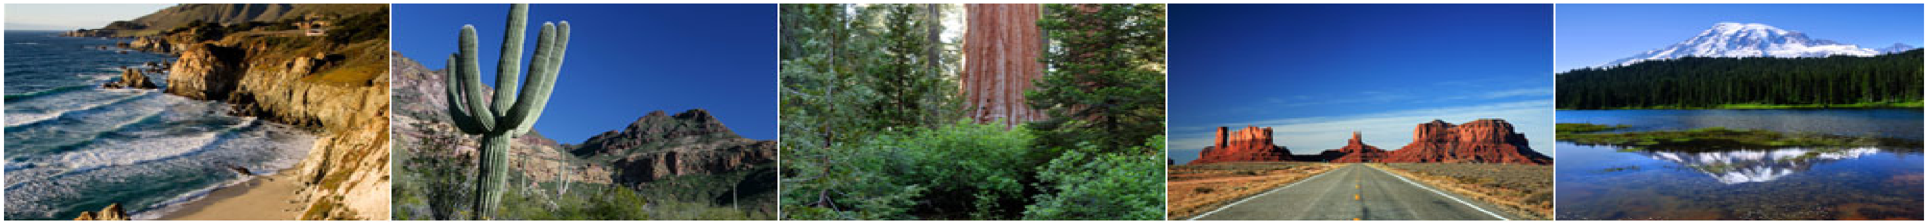


Summary of Options

✓ = performs well, ✗ = performs poorly

Allocation Method	Total Consumer Cost	Distribution of Costs	Admin Simplicity	New Entrants
Pure Emission-Based	✗/✓[1]	✓	✓	✗
Pure Output-Based	✓	✗	✓	✓
Fuel-Diff'd Output-Based	✓	✓	✗	✓
Pure Auction	✗[2]	✗[2]	✓	✓
Emission-Based Recycling	✓	✓	✗	✗/✓[3]
Sales-Based Recycling	✓	✗	✓	✓

1 Depends on whether retail provider is market-dependent or vertically integrated
2 Depends on how the issuing jurisdiction uses the revenues
3 Performs well for new generators but not new retail providers



Consequences of Non-Harmonization

- Auctioning and EBA send the same marginal price signal to generators
- Under either auctioning or EBA, new entrants face full marginal cost
- OBA reduces the marginal price signal for both existing and new deliverers
- Generation will tend to gravitate to jurisdictions using OBA

ELECTRICITY COMMITTEE DISCUSSION PAPER ON FJD BOUNDARY OPTIONS FOR REGULATING ELECTRICITY IMPORTS

January 12, 2009

Scott Murtishaw, California PUC[1]

1 Introduction

This discussion paper reviews various boundary, monitoring, and enforcement options for regulating electricity imported from non-WCI locations. The WCI Design Recommendations released on September 23 define the point of regulation for imported power imported as:

> For power that is generated outside the WCI jurisdictions (or generated by a federal entity or on tribal lands) for consumption within a WCI Partner jurisdiction, the FJD [first jurisdictional deliverer] is the first entity that delivers that electricity over which the consuming WCI partner jurisdiction has regulatory authority.[2]

The Electricity Committee and stakeholders in the electricity sector have determined that this approach to implementing the FJD point of regulation could negatively affect liquidity in the wholesale power market. Other approaches to implementing the FJD point of regulation may maintain a high degree of liquidity

---

[1] The author wishes to acknowledge the extensive comments received on a previous draft from Clare Breidenich, WPTF; Rob Campbell, Powerex; Mark Meldgin, PG&E; and Kevin Nordt, Grant County PUD.

[2] Western Climate Initiative, 2008. Design Recommendations for the WCI Regional Cap-and-Trade Program. http://www.westernclimateinitiative.org/ewebeditpro/items/O104F20432.PDF

in the power market and simplify the reporting and tracking procedures for electricity market participants.

The Electricity Committee has identified four basic options to regulating the emissions associated with imports from non-WCI locations.[3] The first option is an individual boundary approach as envisioned in the WCI Design Recommendations. The rest are variants of a common boundary approach that eliminates regulation of transmission paths crossing intra-WCI borders. These options are described below.

1. Option 1 is an individual boundary approach whereby the purchasing/selling entity (PSE) holding title to non-WCI generated power when it is imported into the consuming jurisdiction (state or province) is financially liable for GHG allowances regardless of who first imported the non-WCI power into the WCI.[4] The party that imports the non-WCI generated power into the consuming jurisdiction must surrender the appropriate quantity of GHG allowances to that jurisdiction. Each jurisdiction is responsible for monitoring transmission paths crossing its own borders and is responsible for collecting GHG allowances from liable entities.

2. Option 2 is a common boundary approach whereby the entity holding title to non-WCI generated power when it is initially imported into any WCI jurisdiction is financially liable for GHG allowances regardless of where within the WCI the power is ultimately consumed. The entity holding title to the non-WCI generated power when it is imported into the WCI must surrender the appropriate quantity of GHG allowances to the WCI jurisdiction where the power is consumed. The jurisdiction where the power is consumed is responsible for monitoring power delivered to its jurisdiction and is responsible for collecting GHG allowances from liable entities.

3. Option 3 is a common boundary approach whereby the entity holding title to non-WCI generated power when it is initially imported into any WCI jurisdiction is financially liable for GHG allowances regardless of where within the WCI the power is ultimately consumed. The entity holding title to the non-WCI generated power when it is imported into the WCI must surrender the appropriate quantity of GHG allowances to the WCI jurisdiction where the power is consumed. Unlike Option 2, the jurisdiction into which the power is initially imported into the WCI is responsible for

[3] Power that originates outside the WCI, is wheeled through the WCI, and then exported from the WCI is exempt under all scenarios.
[4] Power shall be deemed to have been consumed in a jurisdiction when an e-tag (or other transmission record) lists a final point of delivery in that jurisdiction.

monitoring whether non-WCI power has been delivered to a WCI jurisdiction, while the jurisdiction where the power is ultimately consumed is responsible for enforcing the collection of allowances associated with that power delivery.

4. Option 4 is a common boundary approach whereby the entity holding title to non-WCI generated power when it is initially imported into any WCI jurisdiction is financially liable for GHG allowances regardless of where within the WCI the power is ultimately consumed. The entity holding title to the non-WCI generated power when it is imported into the WCI must surrender the appropriate quantity of GHG allowances to the WCI jurisdiction into which the power is initially imported. The state/province where the power is initially imported is responsible for monitoring whether non-WCI power has been delivered to a WCI jurisdiction and is responsible for collecting GHG allowances from liable entities.

These four options are explored more fully below. Section 2 provides background information on certain aspects of wholesale power markets that are relevant to the boundary option decision. Section 3 gives a hypothetical wholesale power transaction that is used as a concrete example to ground the subsequent description of how the options could work in practice. Section 4 describes the four options in more detail using the hypothetical scenario as a common example. In addition, this section explains how the choice between an individual boundary approach and a common boundary approach could potentially impact wholesale power market liquidity. Finally, Section 5 offers some concluding thoughts on the interaction between the boundary approach and allowance apportionment as well as initial ideas on existing tools that could facilitate monitoring of non-WCI imports.

2 Power Market Attributes that Impact the Policy Discussion

Before analyzing the four approaches, it is useful to describe a few attributes of power markets that are particularly important when evaluating the options. These include the following:

1. A large share of power, at least in the Western Electricity Coordinating Council (WECC) area, is bought and sold in the forward markets. A forward market transaction can occur anywhere from one month ahead of delivery up to many years before delivery. For some entities, more than 80 percent of their power purchases and sales are done in the forward markets.

2. The power markets cannot be represented by a simplified model of a generator selling to a consumer. Typically, there are many intermediaries taking title to power between the point of generation and the point of consumption. Some of these entities may be wheeling power while others

may simply be buying and selling at one location. It is common to have five or more entities in the delivery chain.

3. The vast majority of forward power market transactions are executed through brokers or electronic exchanges. When executing trades through brokers or electronic exchanges, the buyer and seller are anonymous until the transaction is executed.

4. Power scheduling is the process by which energy trades that are completed in the forward and spot markets are converted into physical flows of electricity. The scheduling process identifies where the power is being generated, which transmission lines the power is moving on, and where the power is being consumed. The scheduling process also identifies which entity holds title to the power on every transmission link.

5. The scheduling process results in the creation of an e-tag that is submitted to each entity in the transaction chain and the balancing authorities that are involved in the physical path. All e-tags in the WECC area are also submitted to WECC. An example of an e-tag is contained in Appendix 1.

6. Since trading always precedes scheduling, it is impossible for an entity to know the generator, transmitter, or consumer of the electricity it is buying/selling at the time the trade is executed. That information can only be obtained through the scheduling process, which may be months or years after the energy trade was executed.

3 Hypothetical Example of a Wholesale Power Transaction

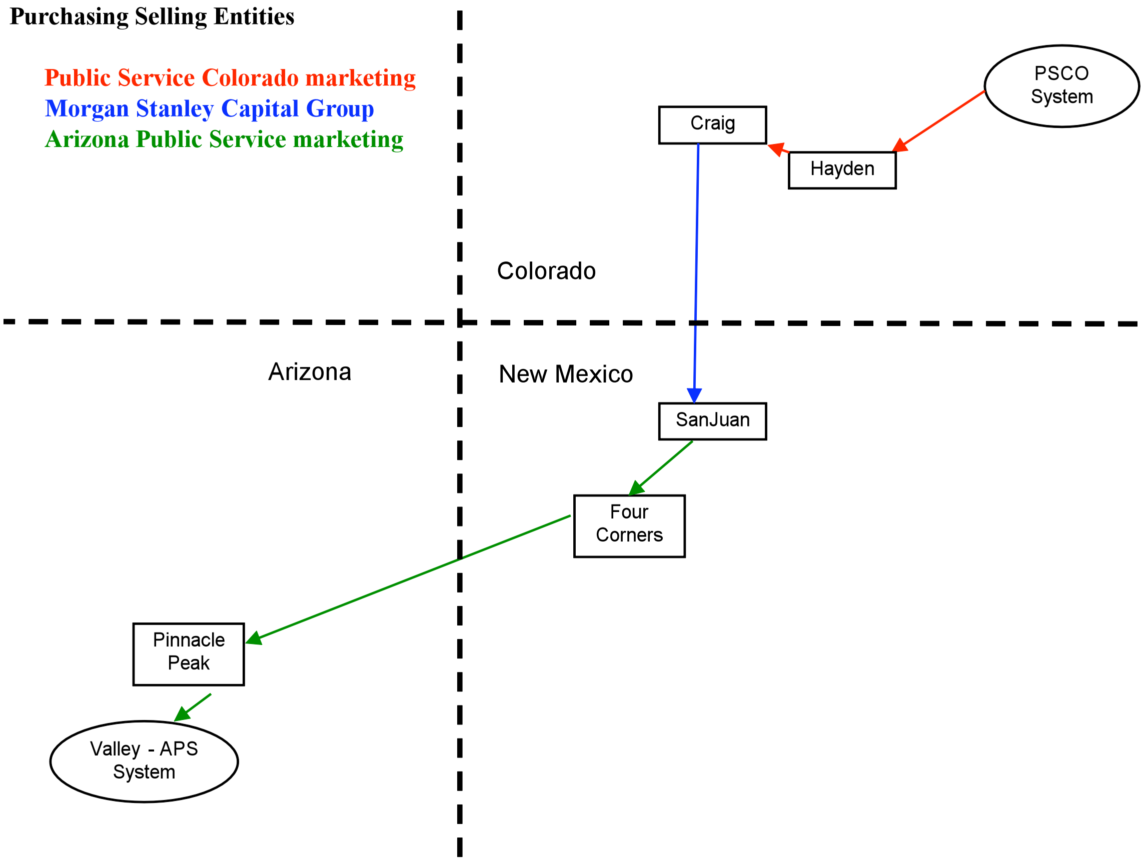
In order to help ground discussion of the four boundary options, the following scenario will be used to provide an illustrative example of how each option could work in practice. This discussion assumes that the entire physical chain is captured and reported on a single e-tag. Splitting the chain into separate e-tags could result in a different outcome. In this example, Morgan Stanley Capital Group (MSCG) purchases power from Public Service Company of Colorado (PSC). PSC generates and delivers the power to MSCG at the Craig substation located in Colorado where MSCG takes title. MSCG arranges for transmission from Craig to the San Juan substation located in New Mexico. Since MSCG held title to the power and arranged for the transmission from Craig to San Juan, MSCG is the PSE of record when the power entered the WCI jurisdiction in New Mexico. MSCG sells the power to Public Service of New Mexico (PNM) at the San Juan substation. PNM resells the power to Arizona Public Service (APS) at San Juan. APS schedules transmission from the San Juan substation to the Pinnacle Peak substation in Arizona. APS is the PSE of record when the power is transmitted from New Mexico to Arizona since APS held title of the power when it was transmitted from San Juan to Pinnacle Peak. APS is the sink for the power at the Valley substation.

Table 1. Summary of Hypothetical Wholesale Power Transaction

Action	Location
PSC generates	PSC System (CO)
PSC transmits	PSC System (CO) to Craig (CO)
PSC sells to MSCG	Craig (CO)
MSCG transmits	Craig (CO) to San Juan (NM)
MSCG sells to PNM	San Juan (NM)
PNM sells to APS	San Juan (NM)
APS transmits	San Juan (NM) to Pinnacle Peak (AZ)
APS sinks	Valley (AZ)

Note: PSC = Public Service of Colorado, MSCG = Morgan Stanley Capital Group, PNM = Public Service of New Mexico, APS = Arizona Public Service.

Figure 1. Illustration of Hypothetical Wholesale Power Transaction



Note: A detailed view of this path is included in Appendix 2.

Table 1 summarizes this transaction, and Figure 1 provides a graphical representation. Note that PNM does not appear in Figure 1 because PNM participates only as a financial participant. In other words, PNM is not a PSE on any physical portion of the transmission path. The following section describes how each FJD boundary option applies to the transaction example.

4 Application of the Four Boundary Options to the Hypothetical Power Transaction

4.1 Option 1: Individual State and Provincial Boundaries

Under this option, the consuming jurisdiction monitors each transmission path that crosses its border with any other jurisdiction, including tribal lands. Any power consumed in that jurisdiction and generated in a non-WCI location triggers a compliance obligation. The entity that assumes the compliance obligation is the PSE holding title to the power as it crosses the consuming jurisdiction's border.

Using Arizona as an example, Arizona would monitor the transmission paths connecting it to California, Nevada, Utah, Navajo Nation, and New Mexico. E-tags showing a final point of delivery in Arizona and a first point of receipt in a non-WCI location trigger a compliance obligation. The entity with the compliance obligation is the entity holding title to the power on the path that crosses the Arizona border. Referring to the illustrative example, APS would be the entity with the compliance obligation since APS held title to the power when it was transmitted into Arizona along the San Juan/Pinnacle Peak path. The state of Arizona would be responsible for monitoring APS' obligation and collecting the appropriate GHG allowances.

This approach is problematic for a number of reasons described below.

1. The central problem associated with Option 1 is that it is impossible for an entity to know its GHG allowance liability at the time of the transaction. For example, when APS purchased power from PNM at San Juan, there was no way of knowing that the power at San Juan would be sourced from a non-WCI generator in Colorado. This stems from the fact that many power trades occur in the forward markets while scheduling isn't done until a day before delivery. This will result in an unknown potential future allowance liability for any entity intending to wheel power across any intra-WCI state line. Price certainty and transaction-finality are key attributes of a liquid and efficient power market.

2. This could result in a game of allowance liability "pass the buck." As soon as the transaction is scheduled, APS will realize that it has an allowance liability associated with its purchase from PNM and will try to mitigate that liability. APS did nothing to incur this liability and has no way to reduce this liability except to try to pass it along to someone else downstream. There are numerous ways for APS to accomplish this. For example, a

scheduler at APS could try to switch the non-WCI upstream generator path with an intra-WCI upstream generator path.

Table 2. APS Transmission Schedules before Passing Allowance Liability

APS Schedule 1 - Before

Action	Location
PSC Generates	PSC System (CO)
PSC Sells To MSCG	Craig (CO)
MSCG Transmits	Craig (CO) to San Juan (NM)
MSCG Sells to PNM	San Juan (NM)
PNM Sells to APS	San Juan (NM)
APS Transmits	San Juan (NM) to PP (AZ)
APS Transmits	PP (AZ) to Valley (AZ)
APS Sinks	Valley (AZ)

APS Schedule 2 – Before

Action	Location
PNM Generates	PNM System (NM)
PNM Sells to APS	San Juan (NM)
APS Sells to SRP	San Juan (NM)
SRP Transmits	San Juan (NM) to PV (AZ)
SRP Sells to Barclays	Palo Verde (AZ)
Barclays Transmits	PV (AZ) to SP15 (CA)
Barclays Sells to SCE	SP15 (CA)
SCE / CAISO Sinks	SP15 (CA)

Shading indicates entity liable for GHG allowances.
PP = Pinnacle Peak, PV = Palo Verde, SP15 = South of Path 15

Table 3. APS Transmission Schedules after Passing Allowance Liability

APS Schedule 1 – After

Action	Location
PNM Generates	PNM System (NM)
PNM Sells to APS	San Juan (NM)
APS Transmits	San Juan (NM) to PP (AZ)
APS Transmits	PP (AZ) to Valley (AZ)
APS Sinks	Valley (AZ)

APS Schedule 2 – After

Action	Location
PSC Generates	PSC System (CO)
PSC Sells To MSCG	Craig (CO)
MSCG Transmits	Craig (CO) to San Juan (NM)
MSCG Sells to PNM	San Juan (NM)
PNM Sells to APS	San Juan (NM)
APS Sells to SRP	San Juan (NM)
SRP Transmits	San Juan (NM) to PV (AZ)
SRP Sells to Barclays	PV (AZ)
Barclays Transmits	PV (AZ) to SP15 (CA)
Barclays Sells to SCE	SP15 (CA)
SCE / CAISO Sinks	SP15 (CA)

Shading indicates entity liable for GHG allowances.
PP = Pinnacle Peak, PV = Palo Verde, SP15 = South of Path 15

The entity with the allowance liability is highlighted in yellow in the above example. In Table 2 APS is saddled with the allowance liability in Schedule 1. No entity downstream from the generator faces any potential allowance liability in Schedule 2 since the generator within WCI faces the allowance liability. In Table 3, the "After" case, APS is able to shift the allowance liability from itself in Schedule 1 to Barclays in Schedule 2.

This is accomplished by adjusting the transmission schedules. An APS scheduler notices that it has two purchases at San Juan – one from MSCG which came with an allowance liability and one from PNM without an allowance liability (since the generator within WCI faces the allowance liability). The APS scheduler simply chooses the other upstream path, directing the PNM-generated power to its own load ("After" Schedule 1) and directing the non-WCI generated power to APS' sale to Salt River Project (SRP) at San Juan. The non-WCI power ultimately ends up with Barclays who imports it into California where Southern California Edison (SCE) is the sink. Barclays now has the allowance liability since it imports the power into California and the power is consumed in California. Just as APS had done nothing to bring this allowance liability on itself in the "Before" case, Barclays has done nothing to bring this allowance liability upon itself in the "After" case.

Although the allowance liability has been shifted from one unwitting market participant to another, it's important to note that nothing has changed in the physical system. The same generators are running and the same amount of power is being transmitted across the same lines. The only difference is that the allowance liability has been passed from APS to Barclays. Barclays will in turn attempt to pass the allowance liability the next day (easily accomplished by choosing not to move the power across state lines and simply selling at Palo Verde). Through this game of pass the carbon buck, the non-WCI allowance liability will shift from one entity to the next based on scheduling acumen.

3. At the time MSCG decides to purchase power at a non-WCI location (Craig) it doesn't know whether it will ultimately have a GHG allowance liability or not. If MSCG doesn't price the potential GHG allowance liability into the price at which it sells to PNM, it can easily lose money if it ends up importing the power into New Mexico and the power is ultimately consumed in New Mexico. As a result, most prudent traders would price the potential liability into the transaction, leaving open the possibility that it will earn extra profit should the GHG allowance liability end up with another party. In this example MSCG was lucky and earned extra profit equal to the amount of GHG allowance liability it had originally priced into the transaction with PNM just as APS ("Before" case) and then Barclays ("After" case) suffered unanticipated GHG allowance liability losses.

4. In addition to market liquidity and efficiency concerns, Option 1 will likely result in higher administrative costs. Option 3 and Option 4 require market participants and regulators to monitor a relatively small number of transmission paths linking non-WCI jurisdictions with WCI jurisdictions. Option 1 creates the added burden for market participants and regulators to monitor all internal WCI paths that connect two WCI jurisdictions.

5. Due to the nature of the scheduling process, the allowance liability buck will typically be passed further downstream, just as APS did in the example. As a result, much of the non-WCI generated power will be scheduled into California as the furthest downstream geographic point and the region with the highest prices. Traders who schedule power into California may be particularly wary of accepting any power generated outside WCI.

6. The likely result of this will be a bifurcated market within WCI with two products types – "WCI generated power" and "non-WCI generated power."

Markets for the two separate products will have less liquidity than a market that can encompass both products. Very few entities will be willing to purchase non-WCI generated power from brokers or pooled markets because of the uncertain liability and the inability to manage this uncertainty in a systematic way. Only those entities who are buying non-WCI power to transmit all the way to their service territory to serve load will have certainty about who has allowance liability (since they would have it and could price it at the time of the transaction). This outcome could make non-WCI power extremely illiquid and difficult to trade. Transfers between regions will be reduced and more efficient plants in non-WCI regions may not run when they should due to the lack of a market for their product. This runs counter to the longstanding benefits that have been gained through inter-regional trade.

4.2 Option 2: Common Boundary with Monitoring and Enforcement by Consuming Jurisdiction

Under this option the entity holding title to non-WCI generated power when it is initially imported into any WCI jurisdiction is financially liable for GHG allowances. The jurisdiction where the power is ultimately consumed is responsible for monitoring whether non-WCI power has been consumed in its jurisdiction and for collecting GHG allowances from liable entities. As with all options, wheel through transactions are exempt since the power is not generated or consumed within the WCI.

Let's examine how the sample transaction plays out under Option 2. Table 4 depicts two schedules used in the discussion of Option 1: "APS Schedule 1 – Before" with the initial schedule and "APS Schedule 2 – After" the result of APS passing the allowance liability downstream.

Table 4. APS Schedules with Common Boundary

APS Schedule 1 - Before

Action	Location
PSC Generates	PSC System (CO)
PSC Sells To MSCG	Craig (CO)
MSCG Transmits	Craig (CO) to San Juan (NM)
MSCG Sells to PNM	San Juan (NM)
PNM Sells to APS	San Juan (NM)
APS Transmits	San Juan (NM) to PP (AZ)
APS Transmits	PP (AZ) to Valley (AZ)
APS Sinks	Valley (AZ)

Yellow shading indicates entity liable for GHG allowances.
Blue shading indicates reporting and enforcement jurisdiction.
PP = Pinnacle Peak, PV = Palo Verde, SP15 = South of Path 15

APS Schedule 2 – After

Action	Location
PSC Generates	PSC System (CO)
PSC Sells To MSCG	Craig (CO)
MSCG Transmits	Craig (CO) to San Juan (NM)
MSCG Sells to PNM	San Juan (NM)
PNM Sells to APS	San Juan (NM)
APS Sells to SRP	San Juan (NM)
SRP Transmits	San Juan (NM) to PV (AZ)
SRP Sells to Barclays	PV (AZ)
Barclays Transmits	PV (AZ) to SP15 (CA)
Barclays Sells to SCE	SP15 (CA)
SCE / CAISO Sink	SP15 (CA)

The entity with the GHG allowance liability is highlighted in yellow and the portion of the schedule that dictates which jurisdiction is responsible for monitoring and collecting GHG allowances is highlighted in blue. In both schedules MSCG has the allowance liability since MSCG made the decision to import non-WCI power into the WCI. Option 2 (and the other common boundary approaches) does not create an opportunity to pass the allowance liability buck – the buck starts and stops with the entity that chose to import the non-WCI power into the WCI. The state of Arizona will be responsible for monitoring the schedules in "APS Schedule 1 – Before" and collecting the GHG allowances from MSCG since the power was consumed by APS in Arizona. The state of California will be responsible for monitoring the schedules in "APS Schedule 2 – After" and collecting the GHG allowances from MSCG since the power was consumed by SCE in California.

This system has the following advantages:

1. The entity that decides to import the power does so knowing exactly the number of GHG allowances that it will be liable for. Because the compliance obligation does not change, MSCG can incorporate the compliance cost into its sales prices.

2. The entity that creates the GHG allowance liability is responsible for procuring the allowances to meet the liability. In this example, MSCG made the decision to import the non-WCI power into the WCI and is responsible for procuring GHG allowances under all scenarios. The allowance liability cannot be passed and is not assigned through the scheduling process to unwitting downstream entities. Downstream participants (e.g., APS and Barclays in Option 1) do not have to worry about having the compliance obligation shift to them based on the final point of delivery.

3. Once non-WCI power is imported into WCI, it can be traded interchangeably with WCI-generated power. Liquidity and efficiency are maximized as a result.

4.3 Option 3: Common Boundary with Monitoring by Boundary Jurisdiction and Enforcement by Consuming Jurisdiction

Option 3 will create the same outcome as Option 2 with respect to GHG allowance liability. That is, MSCG as the importer of non-WCI power into the WCI would always be liable for the GHG allowances. The difference between Option 2 and Option 3 pertains to the reporting function. Under Option 2, both monitoring and enforcement are performed by the WCI jurisdiction where the power sinks. In Option 3, the monitoring is performed by the jurisdiction where the power is initially imported (in this example, New Mexico) while the enforcement is performed by the jurisdiction where the power is consumed (Arizona). Under this option, each WCI jurisdiction would monitor only those transmission paths that connect it to non-WCI jurisdictions.

4.4 Option 4: Common Boundary with Monitoring and Enforcement by Boundary Jurisdiction

Under this option the allowance liability is the same as in Option 2 or Option 3. The only difference is the determination of which jurisdiction is responsible for monitoring the transactions and collecting the GHG allowances. The jurisdiction where the non-WCI power is initially imported bears the monitoring and GHG allowance collection responsibilities under Option 4.

MSCG has the allowance liability since it is the initial importer of non-WCI power into the WCI. MSCG reports the transaction to New Mexico and is obligated to surrender allowances to New Mexico since the non-WCI power was first imported into the WCI at the San Juan substation. As in Option 3, each WCI jurisdiction would monitor only those transmission paths that connect it to non-WCI jurisdictions.

4.5 Summary of Boundary Options

Table 5 summarizes the four boundary options and shows how they apply to the hypothetical example. Note that while Option 1 is the option envisioned in the Design Recommendations, Option 2 preserves the same assignment of monitoring and enforcement responsibilities while offering the potential benefits of a common boundary approach. Options 3 and 4 may potentially reduce administrative costs by narrowing the set of transmission paths that must be monitored.

Table 5. Summary of Four Boundary Options

Boundary Option	Regulated Entity (First Jurisdictional Deliverer)	State/Province		
		Consuming	Monitoring	Enforcing
Option 1	Consuming State Importer – APS	AZ	AZ	AZ
Option 2	First WCI Importer – MSCG	AZ	AZ	AZ
Option 3	First WCI Importer – MSCG	AZ	NM	AZ
Option 4	First WCI Importer – MSCG	AZ	NM	NM

5 Discussion

5.1 Interaction among Boundary Options, GHG Inventories and Apportionment

One question that has arisen regarding Options 3 and 4 concerns the effect it would have on each Partner jurisdiction's inventory. For example, would the emissions associated with Arizona's imports count against New Mexico's inventory or Arizona's? Because the emissions fall under WCI jurisdiction as a result of Arizona's consumption, it seems reasonable that the emissions would continue to count as part of Arizona's inventory. The boundary states and provinces that monitor, or monitor and enforce, on behalf of other Partner jurisdictions would simply provide the information on emissions associated with imports to the consuming jurisdictions for inclusion in their inventories.

A related concern is that Options 3 and 4 could be interpreted as being inconsistent with the WCI Design Recommendations regarding apportionment of the regional target among participating jurisdictions. The WCI regional goal includes emissions from non-WCI electricity imports. The Design Recommendations state that apportionment of allowances is to be based on the individual goals set by each jurisdiction. Together, these WCI decisions imply that the allowances associated with imports from non-WCI sources will be apportioned to the states or provinces on the basis of the historical pattern of consumption since the emissions associated with imports comprise a part of the consuming jurisdiction's GHG inventory. In other words, each jurisdiction's apportionment would be set relative to its in-jurisdiction emissions (with possible adjustments due to intra-WCI power flows and other factors) plus emissions associated with non-WCI power imports in the base year. Each jurisdiction would then be responsible for distributing (via direct allocation or auction) allowances to capped entities up to the level of its apportionment. In the scenario above, the emissions associated with the power imported from Colorado count against the regional goal by dint of Arizona's consumption (and assuming that there has been an historical pattern of Arizona importing power from Colorado), Arizona would issue the allowances covering these emissions.

Moving the point of regulation upstream to the common boundary point need not affect the apportionment of allowances related to non-WCI imports. The compliance obligation is still triggered by the fact that the power transaction terminates in the consuming state. Moreover, Arizona's consumers of imported power will bear the brunt of the embedded GHG compliance cost because the GHG cost will be included in the price of the power imported from Colorado, regardless of whether compliance is enforced by Arizona or by New Mexico on Arizona's behalf.

5.2 Use of a Centralized Tool for Monitoring

Another question is how monitoring and enforcement will work under each of the boundary options. Under the proposed WCI reporting rules, each non-WCI FJD would report power imports to individual WCI jurisdictions (either the common boundary or consuming jurisdiction). While this self-reported information will be important for transparency, it will not be sufficient for identifying all FJDs and enforcing compliance due to the opportunities and incentives to under- or misreport imports. For this reason, an additional source of information will be required.

Fortunately, most of the data that is required to enforce any of these options is contained in e-tags. One option is to collect e-tag data from balancing authorities. However, this approach may be administratively burdensome since it would require each WCI jurisdiction to collect data from the numerous balancing authorities in that jurisdiction and to compare the data to that collected by other jurisdictions. A preferable approach for WECC transactions is to access the data already collected by WECC's Western Interchange Tool (WIT).

If WIT schedule data is available to the WCI regulators, then either the WIT administrators or another organization could develop queries for the e-tag data to identify entities with GHG liabilities for each individual WCI jurisdiction. This would simplify monitoring and enforcement of imports because there is no need for each jurisdiction to build its own computer system to track e-tags. It is possible that using WIT could effectively equalize the boundary options' administrative costs. While WIT does not capture all of the information needed for monitoring and verification of intra-balancing authority imports (e.g., within the PacifiCorp East balancing authority), it can identify the FJD for the majority of non-WCI imports.

Appendix 1: Sample E-Tag

Sample Transaction Tag Example

	Market Path			
Line	PSE	Product	Contract	Misc(Token/Value)
1	PSCMPS	G-FS

ECONOMIC MODELING TEAM 42

STAKEHOLDER ENGAGEMENT 45

Introduction

This *2009-10 Work Plan* describes the approach to operating the Western Climate Initiative (WCI) over the next 12 to 18 months. The WCI is a cooperative effort of U.S. states and Canadian provinces that are collaborating to identify policies to reduce greenhouse gas (GHG) emissions, including the design and implementation of a regional cap-and-trade program. The WCI began in February 2007 with the governors of Arizona, California, New Mexico, Oregon, and Washington, who have since been joined by the premiers of British Columbia, Manitoba, Ontario, and Quebec, and the governors of Montana and Utah. Participation in the WCI reflects the strong commitment of each Partner jurisdiction to take cooperative actions to reduce GHG emissions.

After 18 months of extensive analysis, stakeholder consultation, and deliberation, the WCI released its *Design Recommendations for the WCI Regional Cap-and-Trade Program* on September 23, 2008.[1] The design for the WCI cap-and-trade program is comprehensive. When it is fully implemented in 2015, the WCI program will cover up to 90 percent of the GHG emissions in WCI Partner states and provinces. Through its broad scope, the WCI program will reduce compliance costs while reducing emissions across the economy. It will also help spur growth in new green technologies, help build a strong clean-energy economy, and enhance North American energy security.

Over the past few months as we have seen the world economy falter, questions have been raised as to whether this is the right time to be moving forward with a cap-and-trade program. We believe that it is important to move forward with the cap-and-trade program, while acknowledging the need for flexibility in the short term due to the current economic situation. This will provide policy certainty over the longer term to guide investments in lower emitting technologies during the economic recovery period. We cannot ignore the far greater costs associated with failing to achieve the carbon reductions science says must be made. The longer we wait, the more we delay, the higher those costs and the steeper the reductions we and our children will have to make. If delayed, those reductions will be costlier to make with less flexibility than we have today as they will need to be made over a much shorter time line. Now is the time to plan and prepare; the WCI program does not begin until January of 2012, by which time the North American and world economies will have certainly turned around. Our goal is not to further burden an already struggling economy, but to help pave the way to build the new economy on a clean energy platform.

Stakeholder Engagement

The WCI Partner jurisdictions want to ensure that the WCI process continues to promote an effective dialogue between the WCI Partner jurisdictions and all stakeholders. Through this dialogue the WCI Partner jurisdictions receive the benefit of stakeholder perspectives and expertise, while stakeholders have access to the information they need to understand the

[1] For more information on WCI and to access the design recommendations, visit www.westernclimateinitiative.org.

work of the WCI and provide timely and meaningful input into the deliberations of the WCI Partner jurisdictions. Stakeholder engagement consists of: 1) stakeholder processes conducted by individual WCI Partners within their jurisdiction; 2) stakeholder engagement opportunities with all WCI Partner jurisdictions (similar to the workshops held in 2008); and 3) stakeholder engagement activities conducted by WCI Committees. The final section in this *2009-10 Work Plan* provides a brief description of the major deliverables and milestones for each WCI Committee. In the near future, a more detailed timeline of WCI stakeholder activities will be available. The purpose of these activities is to ensure that stakeholders have the opportunity to review and provide comments on draft documents and recommendations, and to provide feedback at working sessions. Stakeholders are also involved within WCI jurisdictions as the Legislative branches hold hearings and otherwise consider proposals from these efforts.

2009 WCI Committees

The WCI is led by designated representatives from each member state and province. The WCI Partners lead and direct the overall effort by recommending policy for the implementation of the WCI program; developing and approving work plans, budgets and work products; and providing direction to advisors and support staff to achieve the objectives of the WCI. As necessary to accomplish the purposes of the WCI, the WCI Partners will form working Committees. Each Committee is or will be chaired or co-chaired by a WCI Partner or Partners. Each WCI Partner jurisdiction may designate representatives to serve as members on each Committee. Governors or premiers who have formally requested official observer status in the WCI, and whose request has been approved by consensus of the WCI Partners, may designate representatives to participate as observers to the WCI. Observers are also invited to participate on the Committees. Advisors and contractors may be enlisted to provide Committee members with policy and technical guidance and assistance. Committees may form task groups as needed to accomplish specific work of the Committee, and will be responsible for determining the members, scope, and outcomes of these task groups.

This *2009-10 Work Plan* contains a description of the anticipated activities, tasks and deliverables that will be accomplished by the six working Committees of the WCI to further develop the WCI cap-and-trade program and should be considered a work in progress:

- **Reporting Committee:** The Reporting Committee will develop a GHG-emissions reporting system that will support the WCI cap-and-trade program by ensuring that WCI jurisdictions receive necessary and accurate emissions data in a timely manner. A reporting system will be designed to coordinate the use of a common set of functionally-equivalent jurisdictional reporting rules, standardized reporting tools, and a regional GHG emissions database.
- **Cap Setting and Allowance Distribution Committee (CSAD):** The CSAD Committee will recommend methodologies for establishing each WCI Partner jurisdiction's allowance budgets, including the one-time budget adjustment in 2012. Additionally, the Committee will examine harmonization of allowance distribution, offsets compliance limits, and will develop the approach for issuing Early Reduction Allowances.

- **Markets Committee:** The Markets Committee will develop recommendations on common elements needed to guide the proper development and operation of a robust and transparent allowance and offset credit trading market. The Markets Committee will coordinate with other Committees to develop elements for implementing a WCI cap-and-trade program that is effectively similar and that provides a uniform measure of environmental integrity across jurisdictions. The Committee will examine compliance verification and enforcement; oversight of the primary, secondary and derivatives markets; auction design, and tracking systems and related infrastructure. It will also assess the design and operation of a regional administrative body to support the implementation of the cap-and-trade program.
- **Electricity Committee:** The WCI Electricity Committee addresses issues specific to the electric sector related to the design and implementation of the WCI cap-and-trade program. Over the past year, the Electricity Committee has assessed policy mechanisms for addressing electricity sector emissions, consulting with stakeholders on conference calls, in public meetings, and through the release of written documents for review and comment. In 2009, the Electricity Committee will continue to examine technical issues related to the First Jurisdictional Deliverer (FJD) approach and issues concerning reliability and electricity market efficiency.
- **Offset Committee:** The Offset Committee will make recommendations on the design and operation of the offset system, including the process for issuing offset credits and the criteria necessary for offset projects to be used to meet compliance obligations within the WCI cap-and-trade program.
- **Complementary Policies Committee:** The WCI Partner jurisdictions recognize that it will take other policies working in concert with cap-and-trade to achieve the regional reduction goal. The purpose of the Complementary Policies Committee is to recommend other policies that will aid in achieving individual and regional emissions reductions goals, for both capped and uncapped sectors.
- **Economic Modeling Team:** The Economic Modeling Team will provide economic analysis to inform the development of the WCI cap-and-trade program policy and design options. The Team serves as a resource for WCI Partners and other Committees.

Collaboration

The WCI Partner jurisdictions recognize the importance of collaborating with the other regional initiatives currently underway (i.e., the Regional Greenhouse Gas Initiative in the Northeast U.S. and the Midwest Greenhouse Gas Accord in Midwest North America) and with the U.S. and Canadian federal governments. To facilitate collaboration and communication, the WCI Partner jurisdictions have designated one U.S. and one Canadian representative to serve in the position of WCI Liaison. The WCI Liaisons are the primary but not sole WCI contacts for interaction with federal governments and other state, provincial, and regional efforts.

Reporting Committee

The purpose of the Reporting Committee is to develop a GHG-emissions reporting system that will support the WCI cap-and-trade program by ensuring that WCI Partner jurisdictions receive necessary and accurate emissions data in a timely manner. Elements of the reporting system will need to include jurisdictional reporting rules, reporting tools, and a regional emissions database. Jurisdictional reporting rules will need to include, at a minimum, a common set of functionally equivalent requirements sufficient to ensure that "a metric ton is a metric ton" across the WCI Partner jurisdictions.

Completion of the initial version of the essential requirements for reporting, which will serve as the basis for jurisdictional rules, is scheduled for the end of February 2009. The Reporting Committee will divide its work into five tasks in 2009:

Task 1: Provide ongoing guidance to WCI Partner jurisdictions as they undertake stakeholder processes in the course of adopting reporting rules in conformance with the essential requirements for reporting.

Task 2: Work with The Climate Registry (TCR) to develop the regional emissions reporting database.

Tasks 3–4: Augment the essential requirements for reporting by developing reporting requirements (i.e., applicability, quantification and monitoring methods, and report content requirements) for additional source categories that, due to the need to conduct detail analyses of points of regulation (PORs), a lack of adequate quantification or monitoring methods, and other factors, were not included in the initial essential requirements for reporting. Determine criteria for verifier accreditation and conflict of interest determination.

Task 5: Provide WCI comments on the proposed U.S. EPA GHG reporting rule and possibly the anticipated Environment Canada GHG reporting rule.

Description of Tasks and Deliverables

TASK 1: ONGOING TECHNICAL SUPPORT AND GUIDANCE IN SUPPORT OF JURISDICTIONAL RULEMAKING

As jurisdictions undertake their rulemaking processes in 2009, stakeholder comments and involvement will likely increase, and new or unforeseen issues will be discovered. Jurisdictions may also need WCI assistance in interpreting or communicating reporting requirements internally within their agencies. The Reporting Committee will respond to comments and conduct research on which to base changes to methods, reporting requirements, etc. The Committee will also provide jurisdiction support, as necessary.

Task	Deliverables	Dates
1	Response to stakeholder comments received in 2009	Throughout 2009
	Technical support to jurisdictions	Throughout 2009
	Status report on types of technical support provided to each jurisdiction and WCI	Quarterly in 2009

TASK 2: DEVELOP WCI REPORTING DATABASE WITH THE CLIMATE REGISTRY (TCR)

WCI Partner jurisdictions have agreed that the emissions reporting component of the cap-and-trade program should rely as heavily as possible on the infrastructure developed by TCR. Emissions data will be reported to jurisdictions. Some states and provinces will collect data through their independent reporting systems and databases and then transfer the data to WCI's regional database; other jurisdictions will use a customized segment of TCR's "Common Framework" data platform. WCI will need to move forward with development of the reporting mechanism in 2009 in order to be ready for the first year of reporting, when 2010 emissions are reported in 2011. The WCI will develop a regional emissions data repository to store and manage GHG data across the region. The database will use a modified version of TCR's Climate Registry Information System (CRIS) to serve as the technical back end of this regional repository. The Reporting Committee will work with TCR to develop the requirements for the regional emissions data repository; the requirements for data transfer into and out of the regional emissions database; the report needs; and the design of the user interface of the regional emissions repository. In addition, the Reporting Committee will participate in beta-testing the application, and will provide feedback and direction throughout the development process.

The scope of work for developing the emissions reporting and database infrastructure will include development of:

- WCI Program Module, incorporating the WCI's essential requirements for reporting, which will be used as the basis for collection and management of reported emissions data by WCI jurisdictions that adopt the Common Framework.
- WCI Regional Emissions Database, which will consolidate WCI emissions data and support data analysis for the cap-and-trade program and emissions inventory.
- Data Collection from WCI Partner jurisdictions, which is the transfer of emissions reporting data from jurisdictions to the regional emissions database, either via the Common Framework or through the transfer of data from independent jurisdictional databases.
- Analysis, report presentation, and user interface tools, which will provide access to specified emissions data by WCI Staff and Partners, regulated parties, and the public.

Development of the Regional Emissions Database will be in two phases. Phase 1, to be completed June 1, 2009, will include the preparation of a scope of work, the development of a white paper to outline different options for how WCI structures its emissions reporting process, a detailed requirements analysis document, and an executive summary of the proposed requirements for the WCI Partner jurisdictions.

Phase 2, to be completed by December 31, 2009, will include design and development of the application, systems testing, and application deployment with beta testing and education. At the end of Phase 1, TCR will develop a detailed timeline for each component of Phase 2, as well as a Phase 2 budget.

Development of the emissions reporting system and emissions database is closely related to the Markets Committee's task 4 (development of tracking systems and related infrastructure). The Reporting and Markets Committees will work closely together to ensure a smooth flow of emissions data from the emissions database to the allowance tracking system.

Additional effort may be needed by those jurisdictions that choose to work with TCR to modify the CRIS application to meet their individual jurisdictional reporting and database needs.

Task	Deliverables	Dates
2	Reporting Options White Paper	mid-March 2009
	Database Requirements Analysis	June 1, 2009
	Database Design	Oct. 1, 2009
	System Testing Complete	Nov. 15, 2009
	Beta Testing and Education Complete	Dec. 31, 2009

TASK 3: SOURCE CATEGORY-SPECIFIC EMISSIONS QUANTIFICATION REQUIREMENTS

3.1. Source Category-Specific Support

Some work will need to be conducted during 2009 to address outstanding issues related to source category specific methods that could not be completely resolved during 2008. These outstanding issues fall into three areas:

- Finalizing quantification and/or sampling, analysis, and measurement methods for certain source categories, such as those listed in Table 4 of the January 9, 2009 Reporting Committee background document (cement, lime, iron and steel, electronics, etc.), including development of all equations, emission factors, etc., in metric units.
- Addressing stakeholder comments on the essential requirements for reporting after they are finalized in January 2009.
- Developing rule-format language for the source category methods that were previously developed in "narrative" format.

Most of this work will be completed by the end of March 2009, and all work can be completed by the end of June 2009.

3.2. Oil and Gas Exploration and Production, and Gas Processing

Write emissions quantification and monitoring and related essential requirements sections (definitions, report requirements, etc.) based on the TCR/Western Regional Air Partnership (WRAP) Oil and Gas Protocol Project's Task 2 output (technical review of high-tier emissions quantification methods).[2] The TCR/WRAP Technical Review, which will likely build on existing methodologies, such as the American Petroleum Institute's "Compendium of Greenhouse Gas Emissions Methodologies for the Oil and Gas Industry" (2004) and those developed for use by industry in Canada, will be available in March 2009.

3.3. Natural Gas Transmission and Distribution (methane and other non-combustion GHGs directly emitted by these facilities)

Address non-combustion direct emissions from facilities in the source category sectors. The work will consist of writing emissions quantification and monitoring and related essential requirement sections (definitions, report requirements, etc.) based on 1) CCAR protocol (for eventual adoption by TCR) for this source category (scheduled for completion sometime in 2009), and on 2) any Environment Canada protocol available during 2009.

3.4. Transportation and RCI Fuels GHG Methods, POR, and Accounting

Develop the essential requirements for reporting liquid transportation fuels. Work will include writing draft requirements for emissions quantification methodologies, engaging with industry representatives, and subsequent modification of the draft requirements. The appropriate point of regulation (POR) is an issue that differs across jurisdictions and will need to be addressed; however, the Committee will not identify the jurisdiction-specific PORs, recognizing that the POR may vary across jurisdictions. Appropriate quantification methodologies are likely to depend on the POR, so it will likely be necessary to identify a variety of POR-specific methodologies. The Committee will need to update the portions of the essential requirements pertaining to reporting transportation and RCI fuels to incorporate decisions made by WCI with regard to transaction "accounting," to avoid double-counting of emissions and/or gaps in reported emissions by fuel suppliers, industrial sources, and jurisdictions. This work would occur after the WCI has made decisions within the Markets Committee, or other Committees—which could be in either calendar year 2009 or beyond.

3.5. Development of New Emissions Factors and Quantification Methods

Develop an RFP and pursue research to develop accurate emissions factors and/or quantification methods for source categories where adequate GHG emissions factors and/or quantification/monitoring methods are not currently available. This analysis would include establishing priorities, and would likely involve source testing and measurements. Some source data may be relatively inexpensive to obtain, while others will be more extensive and expensive to develop. Based on methods developed, the essential requirements for reporting would be updated.

[2] Information on this project is available at http://www.wrapair.org/ClimateChange/GHGProtocol/.

3.6. Evaluation of Monitoring Protocols for Cap-and-Trade Compliance

The WCI Partner jurisdictions recommended the inclusion of certain emission categories in the essential requirements for reporting, for which either quantification method uncertainties may be high or quantification methods are being developed. The Reporting Committee will evaluate the acceptable level of accuracy of quantification methods for inclusion in compliance reporting. Various forms of accuracy such as the level of uncertainty, bias, measurement error, sampling error, and other pertinent factors (possibly including factors other than methodological uncertainty) will be reviewed for the source categories under consideration. This work will be done in close cooperation with TCR's protocol development processes. This will help the WCI Partner jurisdictions to consistently and transparently determine which emissions sources should be included and which emissions sources have justification for delayed inclusion or exclusion.

Task	Deliverables	Dates
3.1	Changes in reporting essential requirements, based on comments received from stakeholders in the first quarter of 2009.	June 2009
3.2	Documentation of reporting essential requirements pertaining to oil and gas exploration and gas processing POR, and GHG emissions quantification and monitoring method	July 2009
3.3	Documentation of reporting essential requirements pertaining to natural gas transmission and distribution	December 2009
3.4	Documentation of reporting essential requirements pertaining to transportation and RCI fuels	June 2010
3.5	Development of GHG emission factors and quantification methods	December 2009
3.6	Defining acceptable level of accuracy of quantification and monitoring methods	June 2010

TASK 4: DETERMINE CRITERIA FOR VERIFIER ACCREDITATION AND CONFLICT OF INTEREST DETERMINATION

The Reporting Committee will develop criteria for verifier accreditation. Accreditation will be consistent with international standards (ISO 14065) through an accreditation program to be developed under ISO 17011, and will include a requirement to demonstrate knowledge of the WCI reporting requirements. Other aspects of the verifier accreditation that will be specified include the accreditation cycle, the criteria and process for revoking accreditation, insurance requirements, required technical competencies, and subcontracting issues. Requirements will also be developed for determining conflict of interest (COI) between verifiers and reporters.

This work will build upon recognized international standards and the verifier standards developed by the California Air Resources Board (CARB) and TCR. WCI will work closely with CARB and TCR in developing these criteria.

The completion date for this Task will allow for implementation/accreditation to occur in 2010, to ensure that a pool of verifiers is ready for 2011, the first year that reports will be submitted and verified.

Task	Deliverables	Dates
4	Documented verifier accreditation and COI requirements as a revision to the reporting essential requirements	September 2009 (to complete essential requirements)

TASK 5: RECOMMEND WCI COMMENTS ON PROPOSED U.S. EPA GHG REPORTING RULE AND ENVIRONMENT CANADA GHG REPORTING RULE

The Reporting Committee will review the proposed U.S. EPA GHG reporting rule, which is anticipated to be published in the first quarter of 2009. The Committee will prepare a summary of the proposed rule, compare it to the WCI essential requirements for reporting, and make recommendations on formal comments that WCI may submit to U.S. EPA. In addition, Environment Canada is expected to promulgate a mandatory GHG reporting rule. The Committee will seek opportunities to provide input into this federal reporting rule as well.

Task	Deliverables	Dates
5	Documented WCI comments on proposed U.S. EPA GHG mandatory reporting rule	Exact date TBD, but prior to closure of the 60 day public comment deadline to allow for Partner review
	Comparison of Environment Canada GHG reporting rule and WCI essential requirements	Exact date TBD, within 2 months after the first notice of the proposed federal regulations being published in the *Canada Gazette*

Cap Setting and Allowance Distribution Committee

The Cap Setting and Allowance Distribution Committee (CSAD) has been formed to recommend methodologies for establishing the regional WCI GHG emissions cap, each WCI Partner jurisdiction's allowance budgets, and allowance distribution guidelines. The work of CSAD will help to ensure that the data being used to inform these decisions are as accurate as possible, that the approach taken addresses competitiveness issues, and that methodologies are applied consistently to achieve each WCI Partner jurisdiction's specific goal as well as the WCI regional goal.

As described below, CSAD has divided its work into the following six tasks:

Task 1: Data Review and Collection
Task 2: Cap and Budget Setting
Task 3: Competitiveness Analysis
Task 4: 2012 One-Time Budget Adjustments
Task 5: Offsets Compliance Limit
Task 6: Early Reduction Allowances (ERA)

Description of Tasks and Deliverables

TASK 1: DATA REVIEW AND COLLECTION

CSAD, with the collaboration of each WCI Partner jurisdiction, will:

- Perform data review and recommend to the WCI Partner jurisdictions how to improve and harmonize historical data used to inform cap and budget[3] setting.
- Collect and review economic and demographic data, and develop and recommend a common, consistent emission projection methodology and assumptions to enable 2012 and 2015 best estimates of actual emissions that will be used in setting caps and budgets.
- Assess the implications of differences between the inventory methodologies used to collect historical data and reporting methodologies that will be used for compliance, and recommend any adjustments that may be needed to account for reasonably anticipated differences.

[3] The term "budget" refers to the total number of allowances to be issued by a WCI Partner jurisdiction in a given year or compliance period. The term "cap" refers to the sum of all WCI Partner jurisdictions' budgets in a given year or compliance period.

1.1. Prepare CSAD's Preliminary Information

- Organize the historical jurisdictional emissions data to distinguish emissions categories that are currently expected to be covered and not covered by the cap-and-trade system.
- Update the historical jurisdictional emissions data with any inventories updated since January 2008, as identified by the WCI Partner jurisdictions.
- Identify emissions data and appropriate information that will be coming from other Committees, such as the Electricity and Reporting Committees.

1.2. Perform Historical Data and Projected Emissions Review and Analysis

Each WCI Partner jurisdiction will work with CSAD to review and analyze data and projected emissions of:

- WCI Partner jurisdictions' historical data for both covered and non-covered source categories.
- WCI Partner jurisdictions' 2012 and 2015 projected emissions for covered source categories.
- WCI Partner jurisdictions' 2020 projected emissions for non-covered source categories.

1.3. Compare and Assess Differences Between Inventory Methodologies and Reporting Methodologies

- Analyze the differences between the inventory methodologies used to collect historical emissions data and reporting methodologies that will be used for compliance.
- Identify covered source categories where significant differences may be reasonably anticipated, and any adjustments that may be needed to account for them.

1.4. Develop and Present a Work Plan for Harmonizing WCI Partner Jurisdictions' Data and Projected 2012 and 2015 Emissions

Each WCI Partner jurisdiction will work with CSAD to:

- Recommend adjustments that may be needed to improve historical data, as well as procedures to fill any data gaps.
- Develop a consistent methodology for projecting 2012 and 2015 emissions for capped source categories.
- Develop an approach for estimating emissions from sources in source categories covered under the cap, but below 25,000 $MMTCO_2e$, in order to inform the setting of caps to meet the 2020 goals.
- Develop a consistent methodology for projecting 2020 emissions for uncapped source categories, in order to inform the setting of caps to meet the 2020 goals.

1.5. Provide an Emissions Data Set, Including Projections, for WCI Partner Jurisdiction Use in Cap Setting and Other Tasks Noted Below, and Establish Procedures for any Future Adjustments

- Implement a work plan for harmonizing data and projections.
- Produce, in collaboration with every WCI Partner jurisdiction, a report containing tables with each WCI Partner jurisdiction's emissions data and projections by covered source category for the 1990–2012 and 2015 period, and non-covered source categories for the 1990–2020 period, along with supporting documentation.
- Produce, in collaboration with every WCI Partner jurisdiction, an Annex to the report assessing the level of uncertainty/quality associated with the data.
- Establish a procedure for updating the data set and correcting it for errors over time;
- Post the data set on the WCI website for stakeholder review.
- Obtain WCI Partner jurisdiction approval for use of the data set as the basis for cap setting and other analysis.

Task	Deliverables	Dates
1.1	Assemble and update existing data and data needs	2009 Q1
1.2	Historical data and project emissions methodology review and analysis	2009 Q2
1.3	Compare reporting and inventory methods and assess implications	2009 Q2
1.4	Work plan for harmonizing WCI Partner jurisdiction's data	2009 Q3
1.5	Provide an emissions data set and data report[4]	2009 Q4

TASK 2: CAP AND BUDGET SETTING

CSAD, in collaboration with each WCI Partner jurisdiction, will:

- Recommend a methodology for establishing the aggregate regional cap for 2012 and then yearly to 2020.
- Recommend a methodology for establishing each WCI Partner jurisdiction's emissions allowance budget for 2012 and then yearly to 2020.
- Recommend a process and a methodology to review each WCI Partner jurisdiction's upcoming overall and yearly emissions allowance budget, and aggregate regional cap to 2020, prior to the beginning of each new compliance period. This will provide flexibility to make adjustments to the program at the end of each compliance period particularly in response to the current economic situation.

[4] To complete this task, CSAD will need the information from the Electricity Committee on the emissions from the FJDs.

2.1. Prepare CSAD's Preliminary Information Needs

- Identify specific source categories to be included in 2012 and 2015 (Reporting Committee).
- Identify other factors that may affect cap and budget setting, such as early reduction allowances.

2.2. Propose a Methodology and/or Guidelines for Establishing WCI Partner Jurisdiction Caps and Yearly Allowance Budgets

- Develop a proposal on the methodology or guidelines for each WCI Partner jurisdiction to follow in creating their respective allowance budgets.
- Develop a white paper on options to deal with new entrants and plant shut-downs.

2.3. Review WCI Partner Jurisdiction Budgets, the Regional Cap, and the 2020 Regional Goal

- Each WCI Partner jurisdiction will work in collaboration with CSAD to calculate the WCI Partner jurisdictions' preliminary 2012–2020 yearly allowance budgets based on the methodology and/or guidelines developed as part of subtask 2.2. The preliminary WCI Partner jurisdiction budgets will then be reviewed by all WCI Partner jurisdictions prior to being finalized by each WCI Partner jurisdiction.
- Calculate the preliminary regional cap as the sum of each WCI Partner jurisdiction's preliminary budget.

2.4. Develop a Process and Methodology to Review WCI Partner Jurisdiction Budgets and Performance of the Cap-and-Trade Program

Develop a process and methodology to:

- Review each WCI Partner jurisdiction's emission allowance budget prior to the beginning of each new compliance period, taking into account the latest reported emissions for covered sources as well as new sources, including new entrants.
- Review and report past compliance period data, cap, budget, and allowances relative to the stated WCI regional goals to assess overall performance of the cap-and-trade program, and to also provide possible cap and allowance adjustment options for consideration for future compliance periods.

Task	Deliverables	Dates
2.1	Assessment of information needed and factors that may affect budget-setting	2009 Q2
2.2	Methodology for budget calculations	2009 Q2
2.3	Preliminary budgets and cap	2010 Q1
2.4	Cap/budget review process	2010 Q1

TASK 3: COMPETITIVENESS ANALYSIS

The purpose of this task is for CSAD to:

- Seek, receive, review and perform analyses on competitiveness issues, from sectors or sources that have been identified and/or that self-identify as having competitiveness issues related to cap-and-trade.
- Assess how WCI Partner jurisdictions should address competitiveness issues 1) among the identified industries, and 2) within each identified industry. If a common allowance distribution method is recommended, CSAD will recommend a distribution method or methods for consideration by the WCI Partner jurisdictions.

3.1. Develop a Statement of Principle on the Evaluation of Competitiveness Issues
CSAD will develop a statement of principle that describes how competitiveness issues will be evaluated. This statement will include an evaluation grid under which competitiveness issues will be evaluated, as well as the specific circumstances under which CSAD will undertake its own analysis. It will also include policy options for WCI Partner jurisdictions to address competitiveness issues. The statement of principle will be posted on the WCI website for stakeholder review.

3.2. Solicit Information to Elucidate Competitiveness Issues
The purpose for this subtask is to:

- Ask emitters/sectors with potential compliance obligations to provide information about their competitiveness issues.
- Initiate, conduct and/or review independent analysis to assess competitiveness issues in specific sector as per the principles defined in subtask 3.1.

The Committee will initiate this process with a stakeholder consultation where the statement of principle will be presented.

3.3. Create Workgroups
CSAD will create workgroups that will review the information provided by each sector and other relevant data and analyses. The workgroups will assess the need for an ongoing dialog with stakeholders that submitted competitiveness information.

3.4. Competitiveness Analysis
The workgroups will review the information provided, assess competitiveness issues, and perform or oversee any additional required analysis. It is expected that stakeholder consultation will be required to discuss the information provided.

3.5. Options to Address Competitiveness
For each sector identified as having competitiveness issues, the workgroups will provide recommendations for addressing those issues. The recommendations will contain:

- A review of the submitted information based on the published parameters (see subtask 3.1).

- A literature review.
- Any necessary additional analysis.
- Options for the treatment of the sector/sources to address the competitiveness issues raised based on the options (tools) identified in subtask 3.1.

Task	Deliverables	Dates
3.1	Competitiveness evaluation and statement of principle	2009 Q2
3.2	Solicit proposals	2009 Q2
3.3	Create a workgroups	2009 Q2
3.4	Competitiveness analysis	2010 Q1
3.5	Options to address competitiveness	2010 Q2

TASK 4: 2012 ONE-TIME BUDGET ADJUSTMENTS

The purpose of this task is to develop and recommend a methodology for the distribution of the one-time, one percent contribution by WCI Partner jurisdictions' of their 2012 budgets. This one-time one percent contribution will account for:

- Production and consumption of electricity in megawatt hours.
- Population growth.
- Share of total WCI Partner jurisdictions' emissions in 2001 through 2005.

4.1. Data Collection

To calculate the distribution of the one-time one percent WCI Partner jurisdictions' budget contribution, CSAD will use the data set put together by CSAD task 1, Data Review. Preliminary adjustments (subtask 4.3) will be based on the existing data compiled by CSAD subtask 1.1 and the Final Adjustment (subtask 4.4) will be based on the Final Data Set provided by CSAD subtask 1.5.

4.2. Adjustment Proposal

The Committee will produce a methodology for the distribution of the one-time one percent contribution by WCI Partner jurisdictions' of their 2012 budget. Each of the three distribution criteria (population, electricity production/consumption, and emission share) will be treated separately. More than one methodology might be proposed for each criterion. The weight to attribute to each criterion will also be addressed separately. As part of this subtask, the Committee will recommend a common definition for each criterion. Also, it is presumed that where possible, common data sources (assembled in CSAD task 1) and/or methodologies will be used for all jurisdictions for each criterion.

4.3. Preliminary Adjustments to WCI Partner Jurisdictions' 2012 Budgets

Each WCI Partner jurisdiction will work in collaboration with the Committee to calculate the preliminary adjustments to their 2012 budgets based on the preliminary data received from subtask 4.1 and the distribution method chosen by WCI Partner jurisdictions.

4.4. Final Adjustments to WCI Partner Jurisdictions' 2012 Budgets

Each WCI Partner jurisdiction will work in collaboration with the Committee to calculate and present the final adjustments to their 2012 budgets. This adjustment will be calculated based on the final emission and socio-economic data.

Task	Deliverables	Dates
4.1	Data collection (performed as part of task 1)	2009 Q2
4.2	Adjustment proposal	2009 Q3
4.3	Preliminary adjustments to WCI Partner jurisdictions' 2012 budgets	2009 Q4
4.4	Final adjustments to WCI Partner jurisdictions' 2012 budgets	2010 Q1

TASK 5: OFFSETS COMPLIANCE LIMIT

The purpose of this task is to develop and recommend a methodology for implementing the offset limit of no more than 49 percent of the total emission reductions from 2012–2020 in order to ensure that a majority of emission reductions occur at WCI covered entities and facilities.

5.1. Background Paper

CSAD, in collaboration with the Markets and Offsets Committees, will identify and evaluate options for implementing the offset limit. As part of assembling background information and developing a background paper, CSAD will review offset limiting processes from other trading schemes. The background paper will be posted on the WCI website for stakeholder review and comments.

5.2. Draft Recommendation

Based on the comments received in subtask 5.1, CSAD will recommend options on implementing the offset limit. This recommendation will be posted on the WCI website for stakeholder review and comments.

5.3. Final Recommendation

Based on comments received in subtask 5.2, CSAD will review the recommended options on implementing the offset limit and present a final set of options.

5.4. Calculate the Offset Limit

CSAD will calculate the offset limit based on the option chosen by WCI Partner jurisdictions and the allowance budgets (CSAD task 2).

Task	Deliverables	Dates
5.1	Background paper	2009 Q2
5.3	Draft recommendations for stakeholder comments	2009 Q2
5.4	Final recommendations	2009 Q3
5.5	Calculate offset limit	2009 Q4

TASK 6: EARLY REDUCTION ALLOWANCES (ERA)

The purpose of this task is to develop the Early Reduction Allowances (ERA) element of the program, including the process and criteria for awarding ERAs.[5]

CSAD will:

- Review existing approaches for ERA in other jurisdictions and/or existing trading systems.
- Develop the criteria for determining eligibility for ERAs including voluntary, additional, verifiable, permanent, and enforceable.
- Develop recommendations for the entities that are eligible for ERAs.
- Develop recommendations on a process for issuing ERAs and administration of ERAs.

ERAs must be developed and adopted within a timeframe that allows the WCI Partner jurisdictions to establish the number of allowances that will be issued in 2012, and be adopted as provisions in the essential elements. The proposed deadline for the completion of the task is October 2009.

An administrative process is needed to enable the implementation of ERAs, along with supporting capacity.

The ERAs should be designed to be: 1) simple to implement, 2) transparent to all parties, 3) fair for all covered sources, and should 4) provide consistency in the approach for all sectors.

<u>6.1. Background Paper on Approaches to Recognizing Early Reductions</u>
Review, assess and consider approaches taken by other jurisdictions to recognize early reductions (RGGI, EU-ETS, etc.), including criteria for determining eligibility for ERAs.

<u>6.2. Develop the Criteria for Determining Eligibility for ERAs</u>
Evaluate the range of possible criteria for determining eligibility for ERAs, and define the meaning for each criterion. Consider possible criteria such as voluntary, additional, verifiable, permanent, and enforceable, and provide guidance on how these criteria could be implemented in ERAs. Develop options and recommendations on the criteria, taking into consideration factors such as simplicity in implementation, fairness, verifiability, transparency and consistency, and others as needed.

<u>6.3. Develop Recommendations for Entity Eligibility for ERAs</u>
ERAs could be issued to a range of entities including the facility, a corporation or company, a municipal government, a government agency, and even perhaps the government of a WCI Partner jurisdiction. While many ERA projects may take place at a single facility or process, in other instances, industries or utilities may replace older facilities with a new facility at the

[5] ERAs are described in Section 8.11 of the *Design Recommendations for the WCI Regional Cap-and-Trade Program*.

same or different sites. CSAD will review possible type of projects that could qualify for ERAs and will evaluate which entities could be eligible to receive the ERAs. In addition, CSAD will consider how ERAs could be distributed by the WCI Partner jurisdictions.

6.4. Develop Recommendations on a Process for Issuing ERAs

Identify major steps needed to administer ERAs, including application for ERAs, evaluation of applications, determination of ERAs to be issued, notification of entities and WCI of eligible ERAs for each WCI Partner jurisdiction, and coordinating issuance of ERAs with issuance of allowances under the cap. Evaluate and recommend an administrative structure to implement ERAs, and linkage to other programs such as offsets.

Task	Deliverables	Dates
6.1	Background paper on approaches to ERAs	2009 Q1
6.2	Develop the criteria for determining eligibility for ERAs	2009 Q2
6.3	Develop recommendations for entity eligibility for ERAs	2009 Q2
6.4	Develop recommendations on a process for issuing ERAs and administration ERAs	2009 Q3

Markets Committee

The WCI has formed the Markets Committee to coordinate the development of recommendations on issues and elements needed to guide the proper development and operation of a robust allowance and offset credit trading market.

As described in this work plan, the Markets Committee has divided its work into the following six tasks:

Task 1: Cap-and-Trade Essential Elements
Task 2: Compliance Verification and Enforcement
Task 3: Market Oversight
Task 4: Tracking Systems and Related Infrastructure
Task 5: Regional Administrative Body
Task 6: Auction Design

As described below, each task proposes a plan to incorporate stakeholder input, including white papers, workshops, conference calls, and written comments. In addition, the Committee proposes that the Co-Chairs hold regular stakeholder conference calls to provide updates on the status of the Committee activities. Through these regular updates, stakeholders will be able to track the overall progress of the Committee's activities.

Description of Tasks and Deliverables

TASK 1: CAP-AND-TRADE ESSENTIAL ELEMENTS

The purpose of this task is to coordinate the writing of essential elements for the WCI regional cap-and-trade program. The essential elements will be available to WCI Partners for review and adoption in the development of each jurisdiction's cap–and-trade rules.

The functions performed under this task are:

- Create the framework for the essential provisions that each Partner is expected to adopt, to ensure effectively consistent implementation of the cap-and-trade program among the WCI Partner jurisdictions.
- Integrate the products from the other task groups within this Committee and from the other Committees into a coherent suite of essential elements. As part of this integration, identify inconsistencies or conflicts among products or recommendations from other task groups and Committees that need to be resolved.
- Identify any gaps in the inputs to the essential elements, and recommend an approach for filling the gaps.

The cap-and-trade essential element must be developed and approved by the WCI Partners jurisdictions within a timeframe that allows the WCI Partners to adopt regulations consistent with jurisdictional statutory and regulatory requirements before the 2012 program start date.

The following are the proposed subtasks for task 1:

<u>1.1. Determine appropriate level of detail for final work product</u>

<u>1.2. Develop time line for completing task work product so that program can begin on January 1, 2012</u>

The task group will:

- Identify the time frame needed by each jurisdiction to adopt rules given each jurisdiction's administrative procedure requirements.
- Identify the elements that will come from other task groups and Committees and their time frame for delivery. Based on work plan design, identify gaps in essential elements being developed by task groups and Committees.
- Identify and develop a coordination process with other task groups and Committees as needed.
- Based on WCI design and needs of individual Partner jurisdictions, determine if any elements need to be completed on an expedited timeline.
- Develop a stakeholder process that at a minimum includes the stakeholder processes included in this work plan. The WCI's stakeholder process will supplement each jurisdiction's informal and formal rulemaking processes, and take into account the minimum time frame jurisdictions may require for public review and comment.

<u>1.3. After completion of subtasks 1.1 and 1.2, prepare an outline of the cap-and-trade essential elements</u>
The outline shall identify or explain in brief the issues that will be covered in each section or subsection. Provide this draft for stakeholder review and comment no later than the beginning of the third quarter of 2009.

<u>1.4. Continue to draft and refine language for final work product</u>
Provide a draft for stakeholder review in the fourth quarter of 2009.

<u>1.5. Provide the final draft for stakeholder review by the end of the second quarter of 2010</u>

Task	Deliverables	Dates
1.1-1.2	Determine appropriate level of detail. Develop time line for completing task work product.	Jan–May 2009
1.3	Prepare outline of the final work product for stakeholder comment.	May–July 2009
1.4	Develop and release draft of work product for stakeholder comment	August–December 2009

Task	Deliverables	Dates
1.5	Develop and release final draft of model work product for stakeholder comment.	January–June 2010

TASK 2: COMPLIANCE VERIFICATION AND ENFORCEMENT

The purpose of this task is to develop recommendations related to compliance verification and enforcement requirements to ensure compliance by the regulated community and define linkages across WCI Partner jurisdictions. The task will address the consistency/uniformity needed across jurisdictions and the degree of flexibility warranted. This task will also address what elements would be needed to ensure equivalent treatment and stringency among WCI Partner jurisdictions as well as issues related to inter-state, inter-provincial, and international linkages.

The recommendations will focus on:

- Creating a consistent and coordinated framework for compliance verification and enforcement that can be used within the individual WCI Partner jurisdictions, including recommendations for harmonizing elements of enforcement to ensure credibility and similar stringency across Partner jurisdictions.
- Identifying, evaluating, and recommending any agreements, instruments, or other mechanisms needed to support cooperative enforcement across WCI Partner jurisdictions.
- Developing and recommending options for reporting on the consistency of compliance verification and enforcement.

The proposed timeline for preparing recommendations for WCI Partner consideration is March 2010 to enable inclusion in the cap-and-trade program regulations.

The following steps will be performed:

- Establish Goals: Determine the criteria for recommendations and definition of successful completion of the task.
- Identify Issues: Clearly identify the issues for which the Committee recommendations will be needed as part of the essential elements.
- Produce a white paper to provide background information. The white paper will describe compliance verification and enforcement issues and propose a framework for subsequent assessment and recommendations.
- Options: Identify and evaluate the options for compliance verification and enforcement provisions and establishing linkages.
- Recommendations: Recommend the options for consideration and approval.

Task	Deliverables	Dates
2	Establish goals	2009 Q1
	Identify issues	2009 Q2
	White paper and stakeholder comment	2009 Q3
	Draft recommendations released, stakeholder comment	2010 Q1
	Final recommendations released	2010 Q1

TASK 3: MARKET OVERSIGHT

The purpose of this task is to provide recommendations that are designed to ensure that the allowance and offset credit trading market is organized properly to operate reliably and prevent or minimize manipulation. The recommendations will cover four main areas:

- Market architecture, including the relationship between the program and external organizations that comprise the market (such as exchanges).
- Program design elements (such as transaction tracking and disclosure) to prevent improper market activity.
- Market surveillance activities (such as jurisdictional and market roles in data collection and analysis) to detect improper market activity, considering primary, secondary and derivatives markets.
- Enforcement responsibilities and authorities for each jurisdiction to investigate and enforce against suspected improper market activity.

To enable the appropriate pieces of the recommendations to be included in cap-and-trade program regulations, the proposed deadline for preparing recommendations for WCI Partner consideration is March 2010.

The Committee anticipates that there are important differences between U.S. and Canadian requirements, particularly for enforcement responsibilities. Consequently, this task must carefully examine requirements in both countries (and Mexico in the event that Mexican States implement the program), and assess any cross-border issues that may arise.

- Stakeholder Involvement: Stakeholders have expressed interest that the allowance and offset trading markets have appropriate safeguards and oversight and function efficiently. This task should be completed in as open and transparent manner as possible to ensure stakeholder confidence in the market oversight function. A stakeholder workshop will be held early in the execution of this task, and subsequent stakeholder events will be used to create dialogue and participation among stakeholders. In particular, the initial stakeholder workshop will be used to help identify issues to be examined in the task, and help frame the process for developing recommendations.

The following steps will be performed as part of this task:

- Define Objectives: Define the objectives of the market architecture and the market oversight function, including prevention, surveillance, and enforcement.

- White paper: Identify and evaluate options for market oversight, including program rules, market data collection and analysis, and involvement of appropriate enforcement agencies and institutions. Assemble background information on the market oversight function, identifying previous examples and expertise required. As part of assembling background information, review trading provisions, rules, and oversight processes from other environmental programs (such as acid rain, EU ETS, and RGGI) and financial markets. Review characteristics of financial instruments and literature on environmental markets and trading. Identify if any proposed essential elements may have the potential to create barriers to future trading across systems. Produce a draft white paper that describes market oversight and proposes a framework for subsequent assessment and recommendations. Distribute to stakeholders for comments.
- Recommendations: Recommend the options for consideration and adoption by the WCI Partner jurisdictions.

This task requires specialized expertise in existing and potential market architecture and how to prevent, detect, and enforce against improper market activity.

Task	Deliverables	Dates
3	Stakeholder workshop	2009 Q2
	White paper and stakeholder comment	2009 Q2
	Draft recommendations released, stakeholder comment	2010 Q1
	Final recommendations released	2010 Q1

TASK 4: TRACKING SYSTEMS AND RELATED INFRASTRUCTURE

The purpose of this task is to provide recommendations adoption regarding specification for a tracking system(s) and for how the tracking system will be created and maintained. Work on this task will identify issues that will need to be addressed in developing a tracking system, which include defining its functional requirements and business rules. The recommendations will cover the following areas:

- How the tracking system could be created/adapted from another system, structured, and administered.
- How the tracking system could record and track emissions, allowances, and offsets. (Note: The Reporting Committee has identified TCR as a repository of GHG emissions data.)
- How the tracking system could manage the import and export of allowances and offsets credits with other compliance systems.
- How the tracking system could demonstrate compliance, or the amount of non-compliance, at the end of compliance periods, including what information should be made public through the system.

The timelines for this task assume that a tracking system needs to be in place in by mid-2011 at the latest to support tracking of allowances and offset credits in the cap-and-trade programs.

This task will integrate with other tasks that may rely on the capabilities of the tracking system, including compliance verification and enforcement across jurisdictions, market oversight mechanisms, and regional administrative activities. The task will also require input and communication with the Reporting and Offsets Committees.

The following steps will be performed as part of this task:

- Objectives: Lay out a set of objectives—what a tracking system would be expected to accomplish and the standards it would be expected to meet.
- Definitions: Create working definitions of what a tracking system is, and what the main components of it could be, in order to start working from a set of common terminology.
- Consolidation of Current Knowledge: Examine what types of tracking systems are currently operational, and identify components that they have in common as well as their differences.
- Stakeholder Engagement: Input is needed both from stakeholders who will be using the tracking system and with those who have experience and can communicate lessons learned with existing tracking systems.
- White paper: Produce a white paper to provide information on what a tracking system is, and what capabilities it could have, in order to develop a basis for the development of options and recommendations for the task group, and to give the broader working group an understanding of the issues. Bring together an analysis of existing emissions, allowance and offset credit tracking systems, stakeholder input and feedback from within the task group into a working document that will serve as a basis for development of recommendations.
- Recommendations: Prepare recommendations on a WCI tracking system.

Task	Deliverables	Dates
4	White paper and stakeholder comment	2009 Q2
	Draft recommendations released, stakeholder comment	2009 Q4
	Final recommendations released	2010 Q1

TASK 5: REGIONAL ADMINISTRATIVE BODY

The purpose of this task is to provide recommendations regarding the design and operation of a regional administrative body to support the implementation of the WCI cap-and-trade program. The recommendations will cover three main areas:

- Functions to be performed by the regional administrative body.
- Organization of the regional administrative body.

- Governance, funding, and oversight of the regional administrative body, and planning for bringing it into existence.

The recommendations must be developed and adopted within a timeframe that allows the WCI Partner jurisdictions to adopt the recommendations and bring the body into existence in time to use it to initiate the program. At the latest, the WCI Partner recommendations may be required by September 2010, so that the body can be brought into existence by April 2011. This timing would enable the regional body to support the start of the cap-and-trade program with allowance tracking and auction execution.

The following may be potential roles for a regional administrative organization:

- Coordinate the regional auction of allowances.
- Track emissions and provide public information on progress towards the WCI regional goal.
- Monitor and report on market activity, including any potential market manipulation.
- Serve as a forum for WCI Partner jurisdictions to update one another on program progress.
- Coordinate review and adoption of protocols for offsets.
- Coordinate review and adoption of updated reporting protocols.
- Coordinate review and issuing of offset credits.
- Suggest criteria and means to accredit service providers to deliver validation and verification services.
- Disclose allowance and offset prices.

Also of note is that this task requires as input the results of other tasks, including recommendations on tracking systems and related infrastructure that could potentially be operated and maintained by the regional administrative body; recommendations on market oversight functions that could potentially be undertaken by the regional administrative body; and understanding of potential roles of other entities, such as TCR.

Successfully completing this task first requires defining the function of the regional administrative body:

- <u>Functions</u>: Identify options for the scope of the functions that a regional administrative body could perform to support the regionally coordinated program. Consider length of time and quantity of staff time required by each function. Review examples.

- <u>Criteria</u>: Adopt and apply criteria to identify the functions and appropriate scope of functions to be considered for the regional administrative body.

Based on these steps, a fully defined scope of responsibility for regional administrative body can be recommended to the WCI Partner jurisdictions for consideration. Once the WCI Partner jurisdictions have approved the organizational scope, the design of the organization itself can be initiated, along with the plan for governance, funding, and oversight.

The following subtasks are proposed:

5.1. Recommended Functions
Identify, evaluate, and recommend functions to be performed by the regional administrative body. As part of this subtask: review examples, confer with the Legal Team, and assess the relevance and importance of organizational functions being considered.

5.2. Organizational Design
Design an organization to carry out the functions selected and defined in subtask 5.1, and describe the WCI Partner jurisdictions' goals for successful execution of those tasks. The Organizational Design will include an organization chart; proposed staffing levels with draft position descriptions, task statements, and funding requirements; and a detailed timeline outlining the necessary legal and logistical steps required to bring the organization into existence.

5.3. Governance, Funding, Oversight
Recommend approaches for governance, funding, and oversight. Additionally, this subtask will include identifying steps required by the WCI Partner jurisdictions to engage the body to provide services.

Task	Deliverables	Dates
5.1	White paper and stakeholder comment	2009 Q3
	Draft recommendations released, stakeholder comment	2009 Q4
	Final recommendations released	2010 Q1
5.2	White paper and stakeholder comment	2010 Q2
	Final recommendations released	2010 Q3
5.3	White paper and stakeholder comment	2010 Q1
	Draft recommendations released, stakeholder comment	2010 Q2
	Final recommendations released	2010 Q3

TASK 6: AUCTION DESIGN

The purpose of this task is to provide recommendations to the WCI Partner jurisdictions on the design of the auction that will be used to auction emission allowances in a regionally coordinated manner consistent with applicable state and provincial law. To enable the recommendations to be included in WCI Partner jurisdictions' cap-and-trade program rules, the proposed deadline for preparing recommendations is May 2010.

In approaching this task, the task group recognizes that auction design requires specialized expertise. Additionally, the WCI Partners and stakeholders insist that the auction include appropriate safeguards and oversight. This task should be completed in as open and transparent manner as possible to ensure stakeholder confidence in the market function.

The following steps will be performed:

- Goals of auction design: Define success and performance metrics for the cap-and-trade program auctions.
- White paper: Considerable work has been done to design government auctions for environmental products (RGGI, EU ETS, Acid Rain) and other assets (financial and commodity). The auction design process should start by considering previous examples; expertise required; and experts who the WCI Partner jurisdictions may consider for providing advice and assistance. Review of the RGGI auction design is recommended as an important element. The white paper will create a framework for informing decisions on auction design, including a catalog of the decisions to be made and assessment of their inherent tradeoffs.
- Technical Analysis: Technical analysis of auction design options may inform and support design recommendations. The scope of the analysis depends on what the WCI Partner jurisdictions find is needed to make a decision regarding the auction design. If the WCI Partner jurisdictions find that the existing literature addresses the critical design questions to their satisfaction, then limited additional analyses may be required. Alternatively, if fundamental questions remain to be addressed, or in the least applied to WCI Partner jurisdiction conditions, then more in-depth analyses may be needed. The extent of the analyses required will be determined following the preparation of the white paper and the response of stakeholders to it.

Task	Deliverables	Dates
6	White paper and stakeholder comment	2009 Q3
	Technical analysis	TBD
	Draft recommendations released, stakeholder comment	2010 Q1
	Final recommendations released	2010 Q1

Electricity Committee

The purpose of the WCI Electricity Committee is to address issues specific to the electric sector related to the design and implementation of the WCI Partner jurisdictions' cap-and-trade program. The WCI Electricity Committee has assessed policy mechanisms for addressing electricity sector emissions, consulting with stakeholders on conference calls, in public meetings and through the release of written documents for review and comment. Among the issues examined have been technical issues regarding the First Jurisdictional Deliverer (FJD) approach and issues concerning reliability and electricity market efficiency. The Electricity Committee is continuing its examination of issues, and will provide input to other WCI committees on electricity sector issues.

The Electricity Committee proposes to divide its work into the following five tasks:

Task 1: Provide Essential Elements for Reporting for the Electric Sector
Task 2: Assess FJD Boundary Options for WCI Partner jurisdictions
Task 3: Attributing Emissions to Imported Electricity
Task 4: Allowance Set-Asides for Voluntary Renewable Energy Products
Task 5: Competitiveness and Reliability Issues Related to Distribution of Allowance and Allowance Value

Description of Tasks and Deliverables

TASK 1: PROVIDE ESSENTIAL ELEMENTS FOR REPORTING FOR THE ELECTRIC SECTOR

The purpose of this task is to provide input to the Reporting Committee on the essential elements of mandatory reporting requirements for the electric sector, including reporting requirements for electricity imports. A draft version will be issued for stakeholder comment in February, and the Electricity Committee will prepare a final version for the Reporting Committee in March.

Task	Deliverables	Dates
1	Draft essential elements	2009 Q1
	Final essential elements	2009 Q1

TASK 2: ASSESS FJD BOUNDARY OPTIONS FOR WCI PARTNER JURISDICTIONS

The Electricity Committee and its Technical Advisory Group examined issues associated with the implementation of First Jurisdictional Deliverer (FJD) as the point of regulation, including potential impacts on the efficiency of wholesale power markets. The Committee has produced a discussion paper and held a conference call with stakeholders to consider other alternatives. The findings of the FJD options assessment will be released for stakeholder review and comment in Q2 2009. The recommendations from the Committee will also be provided to the Markets Committee.

Task	Deliverable	Date
2	FJD Assessment for Stakeholders	2009 Q2
	Recommendation to Market Committee	2009 Q4

TASK 3: ATTRIBUTING EMISSIONS TO IMPORTED ELECTRICITY

The purpose of this task is to prepare a report that addresses several issues related to emissions associated with imported electricity, focusing particularly on default emission rates for unspecified power imports. The assessment will examine options for defining default emission rates, and the implications for contract shuffling and leakage. The potential role of Renewable Energy Certificates (RECs) used for Renewable Portfolio Standards will also be examined. The report will discuss options and methodologies for setting default rates with a recommendation planned by Q4 2009. The Committee will also work with the CSAD Committee to develop base year estimates of emissions associated with power imported from non-WCI locations to assist in the cap setting process.

Task	Deliverables	Dates
3	Draft Report on Emission Attribution	2009 Q2
	Stakeholder Workshop	2009 Q2
	Final Report on Emission Attribution	2009 Q2
	Recommended Data Set and Methodology for Base Year Estimates to CSAD Committee	2009 Q4
	Draft Default Rates for Stakeholders	2009 Q4
	Final Default Rates	2009 Q4

TASK 4: ALLOWANCE SET-ASIDE FOR VOLUNTARY RENEWABLE ENERGY PRODUCTS

The purpose of this task is to examine issues regarding the role of a set-aside of allowances in some states or provinces that could be retired when consumers purchase renewable energy certificates (or RECs) in the voluntary market. Without a set-aside or alternative mechanism for retiring allowances, renewable energy marketers and developers are concerned that under cap-and-trade, demand for voluntary renewable energy (VRE) will fall significantly as consumers realize that their purchases no longer contribute to GHG emission reductions. A set-aside would allow the VRE market to continue to make GHG emission reduction claims. Recognizing that the use of set asides is left to the discretion of each Partner jurisdiction, the Committee will identify the issues associated with creating a set aside for this purpose for Partners' information.

Task	Deliverables	Dates
4	Issue Discussion Paper on VRE Set-Asides	2009 Q3

	Convene Stakeholder Call	2009 Q3
	Draft Report on VRE Set-Asides	2009 Q3
	Final Report on VRE Set-Asides	2009 Q4

TASK 5: COMPETITIVENESS AND RELIABILITY ISSUES RELATED TO DISTRIBUTION OF ALLOWANCE AND ALLOWANCE VALUE

The purpose of this task is to examine allowance distribution issues that are specific to the electric sector, with particular emphasis on competitiveness and reliability impacts. The electricity sector in WCI jurisdictions includes a mix of competitive wholesale markets and many vertically integrated, rate regulated utilities as well as large regional differences in GHG intensity. The implications of allowance distribution policies may differ markedly compared to other sectors. Additionally, stakeholders have expressed concerns that certain aspects of cap-and-trade design could undermine grid reliability. The Electricity Committee will provide an assessment of these issues in a report to the CSAD Committee and the WCI Partners.

Task	Deliverables	Dates
5	Draft Report on Allowance Distribution in Electric Sector	2009 Q3
	Convene Stakeholder Call	2009 Q3
	Final Report/Proposal on Allowance and Allowance Value Distribution in Electric Sector	2009 Q4

Offset Committee

The purpose of the Offset Committee is to make recommendations to the WCI Partner jurisdictions on the design and operation of the offset system as part of the WCI cap-and-trade program, including the criteria necessary for offset projects to be used to meet compliance obligations within the regional program.

The Committee will:

- Recommend and define the essential elements for the offsets system, including the necessary rules and infrastructure, to create and operate the offset system as part of the cap-and-trade program.
- Recommend standards and a process for accepting offset credits from other GHG trading programs and recognizing emission allowances from other GHG trading systems.
- Coordinate the joint review, development, and approval of offset protocols and initiate the establishment of a process to coordinate the review and recommendation of protocols proposed by project developers.
- In conjunction with any further economic modeling, provide input to the Economic Modeling Team on projected offset supply (tonnes CO_2e/year) and costs.

The Offsets Committee will collaborate with the CSAD Committee on accounting methods for ERAs.

The Offsets Committee proposes to divide its work into the following four tasks:

Task 1: Offset System Essential Elements
Task 2: Offsets and Allowances from Systems Other than the WCI
Task 3: Offset Protocols
Task 4: Offset Supply Analysis

Description of Tasks and Deliverables

TASK 1: OFFSET SYSTEM ESSENTIAL ELEMENTS

The Offsets Committee will recommend essential elements and infrastructure to create and operate the offset system as part of the cap-and-trade program.

The deliverables are a suite of recommendations that will enable the efficient and effective creation and operation of the offset system. The recommendations will be developed in conjunction with the Markets, CSAD, and Reporting Committees and will accompany the recommended cap-and-trade essential elements being developed as part of Task 1 in the Markets Committee.

The deliverables include:

- The definition of a WCI GHG offset
- Detailed eligibility criteria for GHG offset projects for compliance purposes under the cap-and-trade system.
- Detailed requirements for the registration, validation, monitoring, quantification, reporting, verification, certification, and issuance of offsets.
- Recommended aspects of the regulation and enforcement of offset project activities that should be included in the cap-and-trade essential elements.
- Recommended functions of the regional administrative body and tracking system related to the offset system.

Task	Deliverables	Dates
1	Define a WCI GHG offset	2009 Q1
	Develop detailed eligibility criteria for GHG offset projects for compliance purposes under the cap-and-trade system	2009 Q3
	Develop detailed requirements for the registration, validation, monitoring, quantification, reporting, verification, certification, and issuance of offsets	2009 Q3
	Recommend aspects of regulation and enforcement related to offsets that should be included in the cap-and-trade essential elements	2009 Q3
	Recommend functions of the regional administrative body and tracking system related to the offset system	2009 Q3
	Final recommendation of essential elements for the offsets system	2009 Q4

TASK 2: OFFSETS AND ALLOWANCES FROM SYSTEMS OTHER THAN THE WCI

The Offsets Committee will recommend standards for evaluating and, if appropriate, accepting tradable units (offset credits and allowances) from programs other than the WCI cap-and-trade program. The Committee may recommend added criteria to ensure similar rigor to WCI approved/certified offset projects or other requirements appropriate to enable use of these offset credits in the cap-and-trade program.

The Committee will monitor the ongoing development of the United Nations Framework Convention on Climate Change (UNFCCC) negotiations as they pertain to the future design of the Clean Development Mechanism (CDM) and any new carbon finance mechanisms. The Committee will also follow International Carbon Action Partnership deliberations with respect to the use of international offsets and the linking of emission trading systems. The Committee will prepare comments for the WCI on these processes.

Task	Deliverables	Dates
2	Perform an analysis on the standards which could be used to evaluate and, if appropriate, accept tradable units from programs other than the WCI	2009 Q3
	Recommend standards for evaluating and, if appropriate, accepting tradable units from programs other than WCI	2009 Q4
	Monitor ongoing development of international offset mechanisms and the linking of emission trading systems, and prepare comments for the WCI, as needed	Ongoing

TASK 3: OFFSET PROTOCOLS

WCI protocols will be detailed, project-type specific instructions for project developers that describe standard approaches, equipment, procedures, and requirements for project development, operation, monitoring, calculation, reporting and verification. Protocols must meet the criteria and requirements that are identified in task 1.

The Offsets Committee will review existing organizations and institutions which may have the capacity or structures to perform the protocol review and recommendation process. An analysis of these bodies' strengths and weaknesses will be conducted and compared to the internal capabilities of the WCI.

Upon completion of eligibility criteria under task 1, evaluation and review of existing offset protocols, and, if and as needed, the development of new offset protocols will begin. The Committee will also initiate the establishment of a process to coordinate the review and recommendation of project types and protocols proposed by project developers.

Evaluation and adaptation of existing protocols will be the focus of Committee work for during 2009, and will begin with the following project types:

- Agriculture
  - Soil sequestration
  - Manure management
  - Anaerobic digestion
  - Rangeland management
- Forestry
  - Afforestation
  - Reforestation
  - Forest management
  - Forest preservation/conservation
  - Forest products
  - Urban forestry
- Waste management
  - Landfill gas
  - Waste and wastewater treatment

The WCI Partner jurisdictions have chosen to begin evaluating the project types on the previous list because they are interested in understanding if they are suitable for the offset system, if they will meet the criteria for environmental integrity, and if adequate protocols/methodologies for their quantification and monitoring exist or can be adapted or developed. Project types that appear on the previous list are not guaranteed to be in an offset system. Similarly, omission of project types from this list does not preclude additional project types from being evaluated by the Committee. The Committee will recommend additional opportunities to the WCI Partner jurisdictions for protocols that are not identified in the previous list of project types.

Offset protocols benefit greatly from collaborative review and development by experts, academics, project developers, government agencies, and the public with reasonable oversight from the regulator or program authority to guide the process and ensure the protocol meets all of the criteria of the offset system. Interest in protocol review, development, and adaption exists across the continent and it is expected that large numbers of stakeholders will want to be involved in the WCI protocol review and development process. The Committee will aim to identify those stakeholders with knowledge, experience and resources to be directly involved in the appropriate protocol task teams.

Additional project types for which substantial high quality protocol development work has been conducted may also be considered during 2009.

The Committee will ensure protocol task groups are formed as appropriate in order to:

- Identify existing offset protocols applicable to the project type.
- Evaluate each applicable protocol against the eligibility criteria identified in task 1, including monitoring, quantification, and verification components.
- Recommend candidate protocols for adaptation to the WCI offset system.
- Adapt project-specific components of each candidate protocol, such as site-specific or regional quantification factors and project specific verification requirements, to the WCI offset system.
- Recommend adapted protocols for approval.

These steps may be taken in conjunction with other organizations or jurisdictions engaged in protocol development or the use of offset protocols.

Where no suitable protocol exists, the Committee may examine the feasibility of developing a new protocol and if approved, will recommend a course of review for that protocol.

Task	Deliverables	Dates
3	Review existing organizations and institutions which may have capacity/structure to perform protocol review and recommendation, and identify options for selecting/developing offset protocols from other programs	2009 Q1
	Form protocol task groups	As needed

Task	Deliverables	Dates
	Evaluate and adapt existing protocols	2009
	Issue draft and final WCI protocol language	2009
	Where no suitable protocol exists, recommend a course of development for that protocol	As needed

TASK 4: OFFSET SUPPLY ANALYSIS

In conjunction with any further economic modeling, provide input to the Economic Modeling Team on projected offset supply (tonnes CO_2e/year) and costs.

The estimates will:

- Cover the period 2010 through 2020.
- Be derived from offset supply scenarios developed by the Committee, incorporating the conditions of the reference case and policy case of the existing economic modeling and potential state, regional, national, continental and international regulatory outcomes.
- Be delivered to the Economic Modeling Team in a form suitable for incorporation in the existing economic modeling being undertaken.

The Committee will review and assess existing scenario analyses and offset cost and supply information for the three regions. If suitable information is not available, the Committee will recommend internal and/or contract resources to develop or deliver the information.

Task	Deliverables	Dates
4	Develop offset supply estimates	To be scheduled per economic modeling timing requirements

Complementary Policies Committee

(Included June 23, 2009)

The WCI Partners recognize that it will take numerous policies working in concert with cap-and-trade to achieve the regional GHG reduction goals in a cost-effective manner. These "complementary" policies achieve a variety of additional common goals and objectives:

- Remove market barriers to lower emissions (e.g., competing incentives, regulatory disincentives and financial barriers)
- Reach beyond actions that respond to a direct carbon price
- Achieve reductions outside (or below) the cap
- Encourage investments in low-carbon technologies
- Lower the cost per metric ton of reductions in GHG emissions in the cap-and-trade program
- Lower the cost of transitioning to a low-carbon economy
- Prevent emissions and economic leakage
- Create and retain green jobs

As used within the WCI, "complementary policies" includes policies that will reduce GHG emissions outside the cap and will assist with the transition to a low-carbon economy. The Complementary Policies Committee will focus on and recommend to the WCI Partners policies where harmonization would be useful to both achieve the regional emission reduction goal and assist with the transition to a low-carbon economy. This process will examine policies to reduce emissions from capped and uncapped sectors. The Committee will:

- Examine GHG reduction policies implemented in Partner jurisdictions and other GHG reduction policies that could be more effective and achieve additional benefits if harmonized across WCI jurisdictions
- Engage with states and provinces outside of WCI to harmonize the design or implementation of certain complementary policies
- Examine the most effective manner for interaction between state/provincial and federal complementary policies
- Develop a list of policies to consider for harmonization across the WCI Partner jurisdictions, also noting any barriers to those policies
- Work with agencies that have an authority in the area of labor and/or training to identify potential issues where other types of policies may be needed to transition to a low-carbon economy, including worker training and other workforce transition needs
- Recommend, in conjunction with the appropriate agencies, the principles or outcomes for programs that may assist with workforce transition, job creation or retention or the revitalization of local communities that depend on energy-intensive industries

Where appropriate, the Committee will work with WCI Partners and other Committees to incorporate the impacts of the selected complementary policies in other WCI analytical work such as economic modeling.

To the extent non-WCI states and provinces begin to participate with the WCI on one or more complementary policies, that state or province is included in the work indicated below as a "WCI Partner jurisdiction."

The Complementary Policies Committee proposes to divide its work into the following five tasks:

Task 1: Evaluation of Greenhouse Gas Reduction Policies
Task 2: Alternative Ways to Obtain Stakeholder Views and Involvement and Engaging Non-WCI States and Provinces
Task 3: Other Policies to Assist In the Transition to a Low-Carbon Economy
Task 4: Evaluation and Recommendations for Harmonized Policies
Task 5: Inventory of Inter-Jurisdictional Adaptation Work Groups, Committees and Other Collaborations

Description of Tasks and Deliverables

TASK 1: EVALUATION OF GREENHOUSE GAS REDUCTION POLICIES

Deliverable: A white paper that describes the complementary policies the Committee believes could be more effective and achieve additional benefits if harmonized across WCI jurisdictions and the criteria to be used for further evaluations.

Each of the WCI Partner jurisdictions has a climate change plan that, in addition to cap-and-trade, includes other policy instruments needed to achieve the jurisdiction's own emissions reduction goals or targets and to achieve emission reductions outside the cap. The first step in evaluating and recommending policies is to identify policies already underway or recommended for adoption in each Partner jurisdiction for further analysis. The Complementary Policies Committee also may identify other complementary policies implemented outside the WCI jurisdictions.

<u>1.1. Compile a list of WCI complementary policies</u>
Using a matrix format, each Partner will identify complementary policies already underway or recommended for adoption within their jurisdictions.

<u>1.2. Select policies for further evaluation</u>
Develop a subset of complementary policies from an assessment of the policies identified under Task 1.1 and policies from existing regional and national databases with the potential for substantial benefits if implementation is harmonized.

1.3. Develop criteria for further evaluation of these policies, such as:

- Effectiveness at mitigating greenhouse gas emissions (e.g., cost per metric ton)
- Ease and cost effectiveness for both implementation (government) and compliance (regulated entity)
- Effects on low-income communities or small businesses
- Barriers to harmonizing implementation
- Collateral benefits and costs (e.g., conserving water, increase use of electricity) or collateral detriments (e.g. increased fine particulate or air toxics pollution)
- Prevention of leakage outside the cap
- The potential to create or retain green jobs or otherwise transition to a low-carbon economy

1.4. Prepare white paper that describes:

- Why and when policies complementary to a cap-and-trade program are useful
- How complementary policies help achieve the WCI greenhouse gas reduction goal
- Each of the policies the Committee recommends for further evaluation under Task 4 and the benefits the Committee believes would accrue to the Partner jurisdictions if implementation was harmonized
- Which policies affect emissions under the cap and which do not
- The criteria the Committee will use for further evaluation

1.5. Submit white paper to stakeholders for review and comment
Seek stakeholder comment specifically on benefits that would result from harmonized implementation, the criteria to use to for further evaluation, issues the Committee should consider, and the types of policies that are needed to accompany the transition to a low-carbon economy, such as economic leakage, workforce development and community revitalization. Amend the white paper as necessary; finalize and prepare responses to comments received from stakeholders.

Task	Deliverables	Dates
1.1	Compile a list of WCI complementary policies	2009 Q2
1.2	Select policies for further evaluation	2009 Q3
1.3	Develop criteria for further evaluation of these policies	2009 Q3
1.4	Prepare white paper	First draft of white paper 2009 Q3
1.5	Submit white paper to stakeholders for review and comment	Paper available to stakeholders: 2009 Q4; Final Paper and response to comments 2010 Q1

TASK 2: ALTERNATIVE WAYS TO OBTAIN STAKEHOLDER VIEWS AND INVOLVEMENT AND ENGAGING NON-WCI STATES AND PROVINCES

Deliverables: Possible outreach plan; recommendations using other mediums for stakeholder comments

2.1. Possible Outreach Plan

To the extent the Committee identifies successful complementary policies being implemented in non-WCI jurisdictions or has identified benefits that could increase if a given policy was harmonized across more states and provinces, the Committee will develop an outreach plan for those states and provinces to join in this aspect of the WCI work.

2.2. Stakeholder Engagement Analysis

The Committee will evaluate methods for how the Committee and possibly the WCI Partners could engage stakeholders in a more open dialogue.

Task	Deliverables	Dates
2.1	Possible Outreach Plan	2010 Q1
2.2	Stakeholder Engagement Analysis	2009 Q2 and ongoing

TASK 3: OTHER POLICIES TO ASSIST IN THE TRANSITION TO A LOW-CARBON ECONOMY

Deliverable: Report on the principles that should guide workforce transition and community revitalization programs.

As a carbon price is built into the global economy, low-carbon opportunities will gain a competitive advantage. Transitioning to a low-carbon economy will change the workforce and training needs within the WCI jurisdictions and may impact communities that are dependent on energy-intensive industries. It is important that as the Committee identifies the programs and policies that will be necessary to achieve the emission reduction goals. The Committee will also consider the possible workforce and communities programs and policies so that the transition to a low-carbon economy will happen in a smooth and supportive manner.

3.1. Issues identification and communication

Assist in identifying and communicating workforce issues such as the type of trained workforce that will be needed to implement the complementary policies.

3.2. Create inventory

Working with appropriate agencies in the Partner jurisdictions, inventory the types of programs that could be used to assist with transitioning the workforce or communities to a low carbon economy.

3.3. Develop recommendations

Develop recommendations on the outcomes of these types of programs and policies in order to successfully position the WCI in a low carbon economy, providing green opportunities for our workers and communities.

3.4. Submit recommendations

Submit recommendations to stakeholder for review and comment; amend recommendations as necessary; finalize recommendation and prepare response to comments received from stakeholders

3.5. Make recommendations for additional analyses

Based on a review of available studies and in consultation with subject matter expert agencies, recommend where additional analyses may be necessary to evaluate the resources likely to be required for effective workforce transition and community revitalization programs associated with climate protection programs and policies.

Task	Deliverables	Dates
3.1	Issues identification and communication	2009 Q3 and Q4
3.2	Create inventory	2010 Q1 and Q2
3.3	Develop recommendations	2010 Q2
3.4	Submit recommendations	To stakeholders 2010 Q2; final recommendations and response to comments 2010 Q3
3.5	Make recommendations for additional analyses	2010 Q3 and Q4

TASK 4. EVALUATION AND RECOMMENDATIONS FOR HARMONIZED POLICIES

The Committee will recommend specific policies for regional harmonization.
Deliverable: White paper on the evaluation of and recommended policies for regional harmonization.

4.1. Evaluation and selection of policies for harmonization; design recommendations for selected policies

Evaluate the subset of policies from Task 1 against the adopted criteria from Task 1. Based on this evaluation, recommend which policies are most appropriate for regional harmonization. Identify any barriers to harmonizing these policies across the region. Include any needs related to job creation or retention or community needs associated with the specific policies. Develop design recommendations to facilitate regional harmonization of the selected policies.

4.2. Prepare white paper

Prepare white paper of the results of the analysis for inter-jurisdictional work on the selected policies.

4.3. Stakeholder review and comment

Request stakeholder review and comment; amend paper as needed, and prepare response to comments received

Task	Deliverables	Dates
4.1	Evaluation and selection of policies for harmonization; design recommendations for	2010 Q1

	selected policies	
4.2	Prepare white paper	First draft 2010 Q2 Final draft 2010 Q2
4.3	Stakeholder review and comment	Final draft to stakeholder 2010 Q3; Final recommendations with response to comments 2010 Q3

TASK 5: INVENTORY OF INTER-JURISDICTIONAL ADAPTATION WORK GROUPS, COMMITTEES AND OTHER COLLABORATIONS

The Committee will inventory the work that is currently taking place on adaptation issues. The WCI Partners may at that time make any further recommendations to the Committee for continued work in this area.

Task	Deliverables	Dates
5	Report on where WCI jurisdictions are working together on adaptation issues	2009 Q4

Economic Modeling Team

The Economic Modeling Team was formed in 2008 to provide WCI Partner jurisdictions with economic analysis to inform the development of the regional, multi-sector cap-and-trade program. In 2009, the Team will continue to serve as a resource to the WCI Partners and other Committees, and inform the development of cap-and-trade policy and design options.

The work of the Economic Modeling Team, continuing from 2008, is divided into the following tasks:

Task 8: Expand the WCI Version of ENERGY 2020
Task 9: Phase 3 Policy and Sensitivity Cases

Description of Tasks and Deliverables

TASK 8: EXPAND THE WCI VERSION OF ENERGY 2020

The purpose of this task is to expand the WCI version of ENERGY 2020 to include all the WCI Partner jurisdictions (including the three Canadian provinces omitted from the Phase 2 analyses) in a manner that enables subsequent expansion to additional states and provinces.

8.1. Expanded Model
The Economic Modeling Team will work with the contractor to expand the Phase 2 model to incorporate the three Canadian province partners: Manitoba, Quebec, and Ontario. The expanded model will be capable of being expanded to additional WCI partners in the U.S. and Canada.

8.2. Model Outputs
Prepare standard model output spreadsheets that incorporate the necessary model results for each of the WCI Partner jurisdictions and geographic regions. Model output will be provided to WCI Partner jurisdictions requesting it to conduct macroeconomic analyses.

8.3. Reference Case
Develop and provide the Reference Case for the expanded model. The Team will run the Reference Case, provide the Reference Case outputs, and address any questions or anomalies in the outputs. The Assumptions Book will be updated to reflect the expanded model and its inputs.

Task	Deliverables	Dates
8.1	Expanded model	2009 Q1
8.2	Updated output spreadsheets	2009 Q1
8.3	Reference Case outputs	2009 Q1

Task	Deliverables	Dates
	Update the Assumptions Book for Phase 3	2009 Q1

TASK 9: PHASE 3 POLICY AND SENSITIVITY CASES

The purpose of this task is to analyze policy and sensitivity cases using the expanded WCI version of ENERGY 2020, and includes the following.

9.1. Complementary Policies
The Economic Modeling Team will work to define how the complementary policies will be represented for the three newly included provinces; update the Phase 2 complementary policy specifications; and create sensitivity cases of the complementary policies for use in the sensitivity analysis.

9.2. Policy Cases
Specify the policy cases that will be used in the policy analyses. The policy cases will be based on the Phase 2 policy cases, and may include refinements in the specification of the program scope to reflect the phase in of coverage, the limit on offsets to reflect the limit on offset usage, banking parameters, and other policy inputs.

9.3. Sensitivity Cases
Specify the sensitivity cases that will be used in the sensitivity analyses. The sensitivity cases will be based on the Phase 2 sensitivity cases, but will include additional sensitivities as defined by the Economic Modeling Team, including complementary policy sensitivity, offset price sensitivity (including incorporating an offset supply curve), impacts of key assumptions such as no new coal plant construction (with and without FJD), and other factors.

9.4. Other Updates
Complete any other model updates necessary to perform the policy and sensitivity cases. These updates may include specification of additional technologies (e.g., plug-in hybrid vehicles) or other factors required to conduct the analyses.

9.5. Model Runs and Results
Conduct the policy and sensitivity analyses using the expanded model, and to provide the model results.

9.6. Assumptions Book
Update the Assumptions Book to reflect any model updates that were conducted to support the policy and sensitivity cases.

9.7. Analysis Follow Up
Address stakeholder questions that may arise from the analysis. Written explanations of the reasons for the observed results will be provided to questions regarding the analysis.

Task	Deliverables	Dates
9.1–9.4	Specification of the complementary policies, policy cases, and suggested sensitivity cases for Phase 3	2009 Q1
9.5	Model results publicly available	2009 Q2
9.6	Updated Assumptions Book for Phase 3	2009 Q2
9.7	Analysis follow-up	As requested

Stakeholder Engagement

The process that led to the *Design Recommendations for the WCI Regional Cap-and-Trade Program* released September 23, 2008 was careful and deliberate. At each step of design development, there were many opportunities and methods for stakeholder input on a regional level. These opportunities supplemented and did not replace extensive stakeholder consultations at the state and provincial levels. In addition, states and provinces have continued to conduct extensive stakeholder consultations directly in their jurisdictions. The decisions reached throughout the design process benefited greatly from stakeholder input.

The regional stakeholder process for the Design Recommendations included a number of important avenues for the sharing of information and input. Among them:

- Stakeholder Workshops
- Stakeholder Conference Calls
- Written Review and Comment
- The WCI Website (www.westernclimateinitiative.org)

The WCI Partner jurisdictions will continue to engage in regular consultation with stakeholders throughout the next phase of cap-and-trade program design through face-to-face meetings, webinars, video conferences, webcasts, teleconferences, and by releasing documents for stakeholder review and comment. A complete calendar of stakeholder engagement activities is being developed for the WCI website, and will be available in March 2009. The WCI Partner jurisdictions will be working to further improve the stakeholder process by coordinating the release of documents to stakeholders (e.g., a once-a-month release), coordinating stakeholder events such as calls/webinars (e.g., once a month, following the release of documents), and coordinating face to face events to reduce incremental travel (face to face events will also continue to have a call-in option).

Each WCI Committee anticipates soliciting public input on specific topics and work products, as described briefly below. Feedback will inform the development of Committee recommendations. For the most current information, stakeholders are encouraged to check the WCI website and/or join the WCI list serve to receive regular announcements about stakeholder activities.

Cap Setting and Allowances Committee

The CSAD Committee will engage stakeholders in reviewing the historical and projected emission data set that will be used to define Partner budgets. Through concept papers and release of draft material, stakeholders will be involved in the definition and criteria for Early Reduction Program and Offset Limit as well as in the criteria and policy options for Competitiveness Analysis. Once the criteria and policy options for Competitiveness Analysis are determined, the committee will seek the participation of stakeholders in providing information about their competitiveness issues. Workgroups will be created to review the information provided. It is expected that stakeholder consultation will be required to discuss the information provided.

Markets Committee

The Markets Committee will provide opportunity for written stakeholder feedback on the draft cap-and-trade essential elements. It will develop a stakeholder process that will supplement (not replace) each jurisdiction's administrative procedure requirements. For the remaining tasks under the Markets Committee, including Compliance Verification and Enforcement, Market Oversight, Tracking Systems and Related Infrastructure, Regional Administrative Body, and Auction Design, overview papers will be circulated for review and comment to help frame the issues. Stakeholder meetings will be held via teleconference early in the development of draft recommendations papers and face-to-face or teleconference meetings will be held with stakeholders to solicit input for final recommendations. For Market Oversight, a stakeholder workshop will be held early in the execution of this task to help identify issues to be examined in the task, and help frame the process for developing recommendations

Reporting Committee

The Reporting Committee will seek stakeholder review and comment on the additional sector-specific essential requirements for emissions reporting as proposals are developed throughout 2009. Proposed reporting requirements will be developed for oil and gas production, gas processing, and methane emissions from natural gas transmission and distribution. In addition, the point of regulation and definition of the reporting entity will be addressed for oil and gas production and for distribution of transportation fuels and residential, commercial and industrial fuels. Stakeholder feedback will be solicited via written comments and sector-specific conference calls. In addition, stakeholders will have the opportunity to review and comment on the design of the user interface for electronic submission of emissions reports, and a web demonstration of the system will be provided.

Electricity Committee

The Electricity Committee will continue to solicit stakeholder feedback on issues specific to the electric sector. Stakeholders will be asked to review written documents and provide comments on the essential elements of mandatory reporting requirements for the electric sector, options for the implementation of FJD, issues related to emissions associated with imported electricity, the role of set-aside allowances for renewable energy products, and allowance distribution issues specific to the electricity sector. Stakeholders will also be able to provide feedback at technical working sessions and through conference calls.

Economic Modeling

The Economic Modeling Team will provide opportunity for stakeholder input on the next phase of economic analysis being conducted to inform the development of cap-and-trade policy and design options. The Team plans to hold calls and meetings to preview results of the policy cases and sensitivity runs using the expanded WCI version of the ENERGY 2020 model. Written explanations for the observed results will be provided to stakeholder questions regarding the analysis. Comments provided by stakeholders will also be reflected in the updated Assumptions Book.

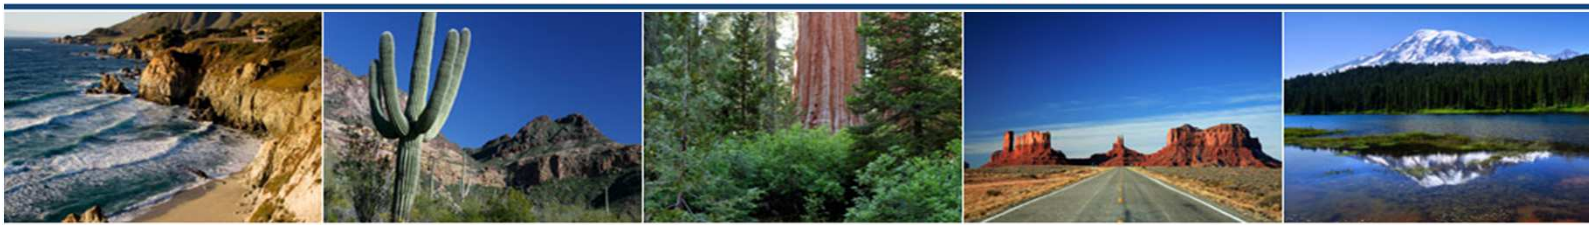
Complementary Policies

The Complementary Policies Committee will solicit input from stakeholders to inform its analysis of complementary policy options, including the selection of an initial set of policies to be examined. Stakeholders will have opportunities to review written drafts of the Committee's work and to participate in discussions with the Committee.

Offset Committee

The Offset Committee will engage stakeholders in the definition and criteria for offsets through concept papers and release of draft material related to recommendations on the essential elements of the offset system. The Committee plans to engage regional, national and international stakeholders in the analysis of options for integrating tradable units and linking with other GHG trading programs by releasing concept papers and engagement in conferences related to these topics. As the essential elements of the offset system become clear, the Offset Committee will seek the participation of stakeholders in the identification of standard protocols suitable for use in the WCI and will ensure expert advice and regional characteristics are incorporated into protocols where appropriate.

Western Climate Initiative



2009-10 Work Plan
Presentation to Stakeholders

Thursday, February 26
12:30 – 2:00 pm PST

Toll Free: 1-800-868-1837
Direct/International: 1-404-920-6440
Participant Code: 659537#

Reporting Committee

- "Background Document and Progress Report for Essential Requirements of Mandatory Reporting, Third Draft" released January 6, 2009 for stakeholder comment
  - Over 50 stakeholders provided comments
- Fourth Draft of Essential Requirements expected to be released late March-early April
  - Additional source category methods and reporting requirements
  - Revisions to previous draft
  - Responses to stakeholder comments
  - Stakeholder conference call to be scheduled

Reporting Committee

- Develop emissions reporting & database infrastructure
  - The Climate Registry will build repository for regional emissions database
  - Options for WCI jurisdictions:
    - Stand-alone reporting tool - data transfer to regional database
    - Customized reporting tool hosted by TCR - internal transfer to regional database
  - Mar.-Jun. 2009: System requirements analysis
  - Jun.-Nov. 2009: Design development
  - Nov.-Dec. 2009: Beta testing and training

- Spring 2009 (anticipated): Develop WCI comments on U.S. EPA proposed GHG reporting rule

Cap Setting and Allowance Distribution

- Develop and recommend methodologies for establishing the regional WCI GHG emission cap, each WCI Partner jurisdiction's allowance budget, and allowance distribution guidelines.

- Work divided into six tasks:
  – Task 1: Data Review and Collection
  – Task 2: Cap and Budget Setting
  – Task 3: Competitiveness Analysis
  – Task 4: 2012 One-time Budget Adjustment
  – Task 5: Offset Compliance Limit
  – Task 6: Early Reduction Allowances (ERA)

Cap Setting and Allowance Distribution

- Task 1 – Improve and harmonize historical data used to inform cap and budget setting
- Task 2 – Develop and recommend a methodology for establishing aggregate regional cap and Partner emission allowance budgets
- Task 3 – Evaluate competitiveness issues that may arise from implementation of the cap and trade program and develop options to address them
- Task 4 – Develop and recommend a methodology for the distribution of the one-time, one percent contribution by WCI Partner jurisdictions of their 2012 budget
- Task 5 – Develop and recommend a methodology for implementing the offset limit
- Task 6 – Develop the process and criteria for awarding Early Reduction Allowances

Markets Committee - Organization

- Support development and operation of robust and transparent allowance and offset credit trading market
- Work divided into six tasks:
  - Task 1: Cap-and-Trade Essential Elements
  - Task 2: Compliance Verification and Enforcement
  - Task 3: Market Oversight
  - Task 4: Tracking Systems and Related Infrastructure
  - Task 5: Regional Administrative Body
  - Task 6: Auction Design

Markets Committee - Outputs

- Task 1 – coordinate with other committees on essential elements for the cap-and-trade program
- Task 2 – compliance verification and enforcement requirements to ensure compliance by regulated community and define linkages across WCI Partner jurisdictions.
- Task 3 – oversight to ensure allowance and offset credit trading market operates reliably and prevent or minimize manipulation.
- Task 4 – specification for tracking system(s) including how created and maintained
- Task 5 – design and operation of regional administrative body to support implementation of WCI cap-and-trade program.
- Task 6 – design of auction of emission allowances in regionally coordinated manner consistent with applicable state and provincial law

Electricity Committee

- Stakeholder Technical Advisory Group process has examined a number of issues related to implementation of the First Jurisdictional Deliverer approach

- The Electricity Committee work plan for 2009 builds on and incorporates the learning from the TAG process

Electricity Committee

- The committee will focus on the following tasks in 2009:
  - Essential elements for reporting electricity emissions (Q1)
  - Written assessment of the FJD boundary issues to stakeholders (Q2); Final recommendation to Markets Committee (Q4)
  - Examine emission attribution for imported electricity, including the role of RECs in GHG accounting - draft report (Q2); then convene a workshop (Q2) and issue a final report on options and methodologies (Q2)
  - Continue work on default rates and recommend default emission rates applicable to imported power (Q4)
  - Examine with stakeholders the appropriate treatment of voluntary renewable energy in the cap-and-trade, including possible set-aside (Q3)
  - Issue report on treatment of voluntary renewable energy (Q4)
  - Examine with stakeholders allowance allocation issues in the electricity sector as they relate to competitiveness (Q3)
  - Issue draft allowance allocation report (Q3) and final report (Q4)

Offset Committee

Make recommendations to the WCI Partners on the design and operation of the offset system as part of the regional cap and trade program.

- Work divided into four tasks:
  - Task 1: Offset System Essential Elements
  - Task 2: Offsets & Allowances from other Systems
  - Task 3: Offset Protocols
  - Task 4: Offset Supply Analysis

Offset Committee

- Task 1 – develop a suite of recommendations for Partner consideration that will enable the efficient and effective creation and operation of the offset system
- Task 2 – recommend standards for evaluating and, if appropriate, accepting tradable units (offset credits and allowances) from programs other than the WCI cap and trade program
- Task 3 – recommend process to coordinate the review and recommendation of protocols
- Task 4 – in conjunction with any further economic modeling, provide input to the Economic Modeling Team, on projected offset supply (tonnes CO_2e/year) and costs

Complementary Policies

- Purpose: To recommend other policies for capped and uncapped sectors that will aid in achieving individual and regional emissions reductions goals, as well as policies related to the transition to a low-carbon economy

Tasks:

- Compile an inventory of complementary policies
- Select a subset of policies for further evaluation
- Evaluate the benefits of and barriers to harmonizing selected policies
- Final product –Policies that will work in concert with cap-and-trade to achieve regional reduction goals.

Economic Modeling

- Expanded Energy 2020 Model
  - Adding Manitoba, Ontario, and Quebec
  - Revising Reference Case: economic growth; fuel prices
  - Updating model output tables based on stakeholder feedback
    - Adding electric sector detail

- Updating Assumptions Book

Economic Modeling

- Policy Cases
  - Improving complementary policy modeling based on stakeholder input and further review by WCI team
    - Revising energy efficiency program assumptions: device vs. process improvements; economies of scale
  - Improving banking/offsets modeling based on stakeholder input and efforts of the Economic Modeling Team

- Sensitivity Cases
  - Defining cases to address stakeholder requests and program needs given limited resources
    - Examples include: energy efficiency effectiveness; auction vs. free allocation, price/availability of offsets

Stakeholder Engagement

- Ongoing stakeholder engagement is critical to the success of WCI
  - Stakeholder engagement activities will be coordinated across WCI committees
  - Opportunities to provide written comment and to participate in calls and workshops
  - Partner jurisdictions will continue their individual stakeholder processes

Stakeholder Engagement

- Monthly Status Report
  - Last Friday of each month beginning in March
  - Will highlight key activities of WCI and provide a calendar of upcoming stakeholder engagement opportunities

- Conference Calls / Webinars
  - First Thursday of every other month beginning in April (12:30 – 2:00 p.m. Pacific Time)

- Workshops
  - At least one major workshop in Fall 2009
  - Committees may hold additional workshops

Western Climate Initiative News

March 27, 2009

Upcoming Events

April 9: Markets Committee Workshop
The Markets Committee will host a stakeholder workshop on April 9 from 9:30 a.m. - 3:30 p.m. (Pacific) in Seattle, WA. The workshop is free, but registration is required. Teleconferencing/ webinar access is provided for those who cannot attend in person; registration is also required to participate in the webinar. Click here for further details and to register.

April 20: 4th Draft of Essential Requirements of Mandatory Reporting Release for Comment
The release of this document will be followed by a stakeholder conference call. Details on the call will be provided with the release via the WCI listserv and website.

April 30: Stakeholder Update Call
The next call to provide stakeholders with a status update of WCI activities will be Thursday, April 30, from 12:30 - 2:00 p.m. (Pacific). Details will be provided via the WCI listserv and website.

In This Issue

This is the first in a series of status reports that the WCI Partner jurisdictions intend to provide to all interested stakeholders. This and future reports are being issued on the last Friday of each month via the WCI listserv and website.

2009-2010 WCI Work Plan Available

On February 19, the WCI Partner jurisdictions released a detailed plan describing the work that they anticipate will move forward in 2009 and 2010. A call was hosted by the WCI Partners on February 26 to summarize the plan and address any questions.

3rd Draft of Essential Requirements of Mandatory GHG Reporting Issued

On January 6 the Reporting Committee released its third draft of the "Background Document and Progress Report for Essential Requirements of Mandatory Reporting for the WCI." At the request of stakeholders, the comment period was extended to February 3. Fifty-four commenters provided over 1,000 individual comments. The Committee is currently reviewing comments and revising the draft where appropriate. The final draft, including sections for additional source categories, is scheduled to be released for final stakeholder review and comment on April 20, and a final version will be available in late June.

Evaluating U.S. EPA Mandatory Draft GHG Reporting Rule

The Reporting Committee is evaluating the U.S. EPA's proposed rule for mandatory GHG reporting, and analyzing it for similarities and differences with the WCI draft requirements. The WCI Partner jurisdictions expect to submit public comments to EPA by the end of the public comment period based on this evaluation.

Committee Updates

- The **Economic Modeling Team** is working on a new round of analyses to incorporate the latest Partners to WCI (Ontario, Quebec and Manitoba) and to build in stakeholder recommendations received at the December 2, 2008 workshop. The updated analysis will be released for stakeholder review and comment later this spring.
- The new **Cap Setting & Allowance Distribution Committee** is working on each of its six tasks as described in the WCI

2009-2010 WCI Work Plan

3rd Draft of Essential Reporting Requirements

Evaluating U.S. EPA Proposed GHG Rule

Committee Updates

Corrections to the Design Recommendations Issued

New Website Coming

To subscribe or unsubscribe from the WCI listserv, click here.

Work Plan. As part of this work, the Committee plans to release a white paper addressing limits on the supply or use of offsets, and a white paper addressing early reduction allowances. Both papers are expected to be released by late May, and will be the subject of a webinar or meeting, followed by a period for submitting written public comments.

- In April, the **Offsets Committee** will invite stakeholders to participate in informational presentations from organizations and institutions with experience reviewing offset protocols. A listserv and website announcement will provide call in details.

Corrections to the WCI Cap-and-Trade Program Design Recommendations

Three corrections were made to the Design Recommendations to clarify the scope and point of regulation of transportation fuels, and the amount of auctioned allowances subject to a reserve price. These corrections to the Design Recommendations were posted to the WCI website on March 13.

New WCI Website Coming this Spring

The WCI website is currently being updated to improve the stakeholder comment process, access to documents, and awareness of upcoming products and events.

Agenda for April 9, 2009 Markets Committee Stakeholder Workshop
Seattle, Washington

9:30 – 10:30 a.m. (all times Pacific)	WCI Overview Markets Committee Overview Introduction to Market Concepts
10:30 – 11:00 a.m.	Task 6 Principles and Discussion
11:00 – 11:30 a.m.	Task 3 Principles and Discussion
11:30 – Noon	Task 2 Principles and Discussion
Noon – 1:30 p.m.	Lunch
1:30 – 3:30 p.m.	Task 3 Principles and Questions and Discussion

Markets Committee Draft Principles

The WCI Partner jurisdictions have formed the Markets Committee to coordinate the development of recommendations on issues and elements needed to guide the proper development and operation of a robust allowance and offset credit trading market. The WCI Partner jurisdictions and stakeholders want appropriate safeguards and oversight of the allowance and offset credit trading markets and want them to function efficiently. The Markets Committee is seeking stakeholder involvement to help achieve these goals.

To help guide the research, analysis, and deliberations of the Committee, the Committee is developing a set of principles that define the desired outcomes for three tasks described in the Committee work plan:

- Task 2: Compliance verification and enforcement;
- Task 3: Market oversight; and
- Task 6: Auction design.

Compliance verification and enforcement is part of the relationship between the Partner jurisdictions and the emitters and others who are required to surrender allowances or offset credits to satisfy a compliance obligation ("covered entities"). Market oversight is part of the Partner jurisdictions' relationship with all market participants, which may include covered entities and others who choose to buy and sell allowances and offset credits or their derivatives.

As guidelines, the principles will help inform how to weigh the multiple objectives inherent in providing effective oversight while also enabling the market to function efficiently and effectively. The principles also acknowledge differences in the legal and regulatory environment in WCI Partner jurisdictions.

The following draft principles will be discussed at a workshop on April 9, 2009 in Seattle, Washington. You may register to participate in the workshop in person or via teleconference (http://www.regonline.com/Checkin.asp?EventId=715231). The Committee will also invite written comments on these draft principles through the WCI website between April 20 – May 1, 2009 (www.westernclimateinitiative.org). The Committee may revise the principles based on the workshop discussion and comments received, as well as other information and suggestions received throughout the process.

Thank you in advance for your comments on these materials and your participation in the April 9, 2009 workshop.

Auction Design Draft Principles
(March 31, 2009 Draft)

These draft principles are proposed as guidelines for developing the auction design.

- **Fairness:** All market participants, especially covered entities, have fair and equal access to markets.

- **Efficiency:** The market is designed to operate efficiently so that greenhouse gas emission reductions can be achieved at the least cost. An efficient market means that allowance and offset credit prices reflect supply and demand, and accurately reveal the value of allowances and offset credits.

- **Effective Oversight:** The design and oversight of the allowance auction are effective in preventing or minimizing fraud, manipulation, and speculative excess. Auction participants have the capacity to execute the transactions when their bids win.

- **Transparency and the Reporting and Disclosure of Relevant Information:** Transparency in the design and the operation of the allowance auction builds and retains public confidence.

    - Reporting of relevant information to regulatory authorities and public disclosure of information has important benefits. It enables regulatory authorities to conduct effective oversight and ensure compliance. It also helps to ensure market efficiency, effective oversight, and compliance and enforcement. Coordinated and consistent release of market-relevant information allows all market participants have equal access to public information.
    - The reporting and disclosure requirements for compliance verification and enforcement balance these benefits against the need for entities to protect certain sensitive information. The potential to disclose certain information that could be used to manipulate the market is also considered. This balancing is consistent with applicable law relating to the disclosure of information.

- **Administrative Simplicity and Cost:** The auction is designed to be as simple as possible for participants and administrators. Administrative costs and transaction costs are minimized for all parties, consistent with the need to provide effective oversight.

- **Accountability:** All entities involved in the allowance and offset credit market, as regulators of the market or as participants in it, are accountable for their actions. The responsibility, authority, and capacity to conduct the necessary oversight and take appropriate action are fully defined for all agencies charged with compliance verification and enforcement.

- **Conflicts of Interest:** Conflicts of interest between market participants, monitors, and regulators are prevented.

- **Compatibility with Other Markets:** Entities that participate in allowance auctions may also be participants in other markets, such as the secondary market where allowances are traded or electricity wholesale markets. The auction design considers potential consequences of interactions between the operation of the auction and the operation of other markets and mitigates potential impacts.

Market Oversight Draft Principles
(March 31, 2009 Draft):

These draft principles are proposed as guidelines for developing oversight of the allowance and offset credit and associated derivatives trading market.

- **Fairness:** All market participants, especially covered entities, have fair and equal access to the market.

- **Efficiency:** The market is designed to operate efficiently so that greenhouse gas emission reductions can be achieved at the least cost. An efficient market means that allowance and offset credit prices reflect supply and demand, and accurately reveal the value of allowances and offset credits.

- **Effective Oversight:** The design and oversight of the market is effective in preventing or minimizing fraud, manipulation, and speculative excess.

- **Transparency and the Reporting and Disclosure of Relevant Information:** Transparency in the design and the operation of the allowance and offset credit market builds and retains public confidence.

    - Reporting of relevant information to regulatory authorities and public disclosure of information has important benefits. It enables regulatory authorities to conduct effective oversight and ensure compliance. It also helps to ensure market efficiency, effective oversight, and compliance and enforcement. Coordinated and consistent release of market-relevant information allows all market participants have equal access to public information.
    - The reporting and disclosure requirements for compliance verification and enforcement balance these benefits against the need for entities to protect certain sensitive information. The potential to disclose certain information that could be used to manipulate the market is also considered. This balancing is consistent with applicable law relating to the disclosure of information.

- **Administrative Simplicity and Cost:** Proposed rules are designed to be understood and enable entities to have a clear compliance path. Administrative costs and transaction costs are minimized for all parties, consistent with the need to provide effective oversight.

- **Accountability:** All entities involved in the allowance and offset credit market, as regulators of the market or as participants in it, are accountable for their actions. The responsibility, authority, and capacity to conduct the necessary oversight and take appropriate action are fully defined for all agencies charged with compliance verification and enforcement.

- **Conflicts of Interest:** Conflicts of interest between market participants, monitors, and regulators are prevented.

Compliance Verification and Enforcement Draft Principles
(March 31, 2009 Draft)

These draft principles are proposed as guidelines for developing compliance verification and enforcement requirements.

- **Harmonization Among Partner Jurisdictions:** To the extent permissible by law and in order to maintain the integrity of the program, compliance verification and enforcement are implemented by the Partner jurisdictions to achieve consistent regulation across jurisdictions. Enforcement and consistent regulation help to maintain a level playing field for entities. Harmonization includes:
    - Consequences for noncompliance: The consequences for non-compliance in one Partner jurisdiction are substantially the same as they would be if the non-compliance occurred in any other Partner jurisdiction.
    - Data submission by covered parties: Requirements for data submissions are consistent and timing is coordinated across Partner jurisdictions.
    - Compliance Verification: Compliance verification is consistent and timely across Partner jurisdictions.

- **Compliance:** Partner jurisdictions' policies lead to maximum compliance with regulatory requirements.

- **Transparency and the Reporting and Disclosure of Relevant Information:** Transparency in compliance verification and enforcement builds and retains public confidence.

    - Reporting of relevant information to regulatory authorities and public disclosure of information has important benefits. It enables regulatory authorities to conduct effective oversight and ensure compliance. It also helps to ensure market efficiency, effective oversight, and compliance and enforcement. Coordinated and consistent release of market-relevant information allows all market participants have equal access to public information.
    - The reporting and disclosure requirements for compliance verification and enforcement balance these benefits against the need for entities to protect certain sensitive information. The potential to disclose certain information that could be used to manipulate the market is also considered. This balancing is consistent with applicable law relating to the disclosure of information.

- **Administrative Simplicity and Cost:** Proposed rules are designed to be understood and enable entities to have a clear compliance path. Administrative costs and transaction costs are minimized for all parties, consistent with the need to provide effective compliance verification and enforcement.

- **Accountability:** All entities involved in the allowance and offset credit market, as regulators of the market or as participants in it, are accountable for their actions. The responsibility, authority, and capacity to conduct the necessary oversight and take appropriate action are fully defined for all agencies charged with compliance verification and enforcement.

Markets Committee Questions for Stakeholder Input

The WCI has formed the Markets Committee to coordinate the development of recommendations on issues and elements needed to guide the proper development and operation of a robust allowance and offset credit trading market. The WCI Partner jurisdictions and stakeholders want an allowance and offset trading market that has appropriate safeguards and oversight and that will function efficiently. The Markets Committee is seeking stakeholder involvement to help achieve these goals.

To help guide the research, analysis, and deliberations of the Market Oversight task of the Committee, the Committee is soliciting input on the attached questions. The Committee will be using these questions to motivate a discussion of market oversight issues at a workshop on April 9, 2009 in Seattle, Washington, and solicits input from stakeholders in response to them. The Committee will also be inviting written comments through the WCI website at www.westernclimateinitiative.org between April 20 – May 1, 2009.

Thank you in advance for your comments on these materials and your participation in the April 9, 2009 workshop.

<u>Market Oversight Questions for the April 9, 2009 Workshop</u>

1) Who should have the opportunity to purchase, own, and sell WCI Partner jurisdiction allowances and offset credits and under what conditions, if any, in the
   a) primary market?
   b) secondary markets?
2) What is your primary concern about how this market can be manipulated and by whom? Is there something peculiar to a market for greenhouse gases that could lead to excessive speculation?
3) What is the role you see for speculators in this market? Is it different than the role played in other markets?
4) How should WCI Partner jurisdictions monitor the WCI cap-and-trade markets? What tools and capacity should the WCI Partner jurisdictions develop?
5) What information should be collected by regulatory authorities for use in the oversight of WCI cap-and-trade primary, secondary, and derivatives markets? Of the information collected by regulatory authorities on the WCI cap-and-trade market, what information should be made public, in what form (e.g., aggregate form only), and at what frequency (e.g., daily, weekly)?
6) What financial instruments (e.g., derivative products) would you find important to manage risk and why?
7) What form should WCI Partner jurisdictions' interaction take with each other, with a WCI regional administrative organization, US and Canadian government institutions, and other external bodies (such as exchanges) to provide oversight of the primary, secondary, and derivatives markets, such as Memoranda of Agreement? What information should they exchange with these institutions?
8) What specific potential do you see for interaction between the markets for WCI Partner jurisdiction allowances and offset credits, markets for their derivatives, and other markets, e.g., renewable energy credits, that might create opportunities for, or exacerbate the effects of, fraud, manipulation, or speculative excess?
9) What trading rules would you like to see for WCI cap-and-trade market participants to ensure accountability, transparency, prevention of fraud, manipulation and excessive speculation?
10) What other market oversight issues, not covered in these questions, should the WCI Partner jurisdictions be looking at?

April 9, 2009 Stakeholder Meeting, Markets Committee Stakeholder Workshop, Seattle, Washington

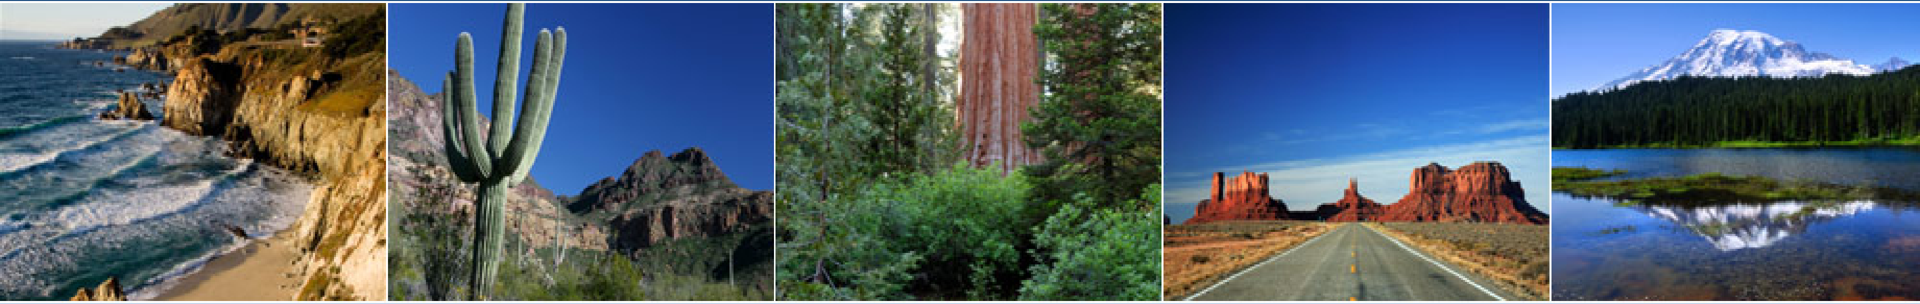
Western Climate Initiative



Markets Committee Stakeholder Workshop

Markets Committee Overview

April 9, 2009
Seattle, Washington

Markets Committee Mission

- Coordinate the development of recommendations on issues and elements needed to guide the proper development and operation of a robust allowance and offset credit trading market.

Markets Committee Tasks

- Task 1: Cap-and-Trade Essential Elements
- Task 2: Compliance Verification and Enforcement (CV&E)
- Task 3: Market Oversight
- Task 4: Tracking Systems and Related Infrastructure
- Task 5: Regional Administrative Organization
- Task 6: Auction Design

Markets Committee Output

- Essential elements of cap-and-trade program rule, including CV&E and Auction Design recommendations.
- Recommendations for market oversight.
- Design of necessary infrastructure.
  - Tracking systems.
  - Regional Administrative Organization.

Stakeholder Interaction

- Workshops:
  - Draft Principles
- Conference calls and webinars
- Joint educational opportunities
- Written comment:
  - White papers
  - Draft recommendations
- Individual jurisdictions' stakeholder processes

Remainder of Today’s Workshop

- Markets Committee Terms
- Role of Principles
- Draft Principles and Discussion
  - Auction Design
  - Market Oversight
  - Compliance Verification and Enforcement
- Market Oversight Discussion

Cap and Trade Terms (1)

Covered Facilities and Entities

Emission Allowances:

- WCI Partner jurisdictions issue emission allowances, or tradable permits.
- Declining number of allowances issued over time ensuring emission reductions.
- Allowances can be bought and sold (traded).

Cap and Trade Terms (2)

Offset Credits:

- WCI Partner jurisdictions issue or recognize offset credits for emissions reductions/removals that satisfy specific criteria.
- Offset credits can be bought and sold (traded).

Compliance Period:

- Three-year period during which facilities and entities have a compliance obligation.

Cap and Trade Terms (3)

Compliance Obligation:

- Covered facilities and entities must report their emissions annually.
- Covered facilities and entities must surrender a combination of emission allowances and offset credits equal to their emissions during the compliance period.
- Limits on the use of offset credits.

CV&E Terms

Compliance Verification:

- The process by which a WCI Partner jurisdiction determines whether a covered facility or entity has met its compliance obligation.

Enforcement:

- The steps taken by a WCI Partner jurisdiction when it believes a covered facility or entity has failed to meet its compliance obligation.

Market Terms (1)

Market Design:

- Market architecture
- Market rules
- Market oversight

Market Terms (2)

Market Architecture:

- Market participants and institutions that make up a market.
  - Covered facilities and entities
  - Regulatory authorities
  - Exchanges, brokers
  - Registry
  - Others
- Processes and tools used by the participants and institutions.

Market Terms (3)

Market Rules:

- Requirements of the market participants.
  - Reporting
  - Disclosure
  - Demonstrations of capability
  - Free of conflict of interest
  - Other
- Required processes and tools used by the participants and institutions.

Market Terms (4)

Market Oversight:

- Activities performed to ensure the proper operation of the markets.
  - Collection and release of market-relevant information.
  - Verification of compliance with market rules.
  - Data collection and analysis to detect violations of rules or laws.
  - Enforcement actions in response to suspected violations of rules or laws.

Market Terms (5)

Market Oversight (continued):

- Examples of potential violations:
  - Failure to Disclose: Failure to comply with mandatory disclosure requirements.
  - Fraud: Such as selling “allowances” that do not exist.
  - Manipulation: Attempt to interfere with the operation of a market.
  - Excessive Speculation: Commodity Exchange Act prohibits excessive speculation to prevent “sudden or unreasonable fluctuations or unwarranted changes in the price of commodities traded on an exchange.” [Reference :“Excessive Speculation in the Natural Gas Market,” U.S. Senate, 2007.]
  - Various trading violations, such as insider trading.

Market Terms (6)

Markets:

- **Primary:** Sale of allowances by issuing Partner jurisdictions, or offset credits by developers, through auctions, direct sales or other means.
- **Secondary:** Trading of allowances or offset credits between market participants.
- **Derivatives:** Instruments for which the value is "derived" from an underlying value for allowances or offset credits. Examples: forward, future, option, and swap contracts. Often used to manage risk.

Auction Context (1)

Auction is one means of distributing allowances

- Part of the primary market.
- May provide price discovery (especially early in the program).

WCI design goals

- 2012: auction at least 10% of allowances.
- 2020: increase proportion sold to 25%.
- Long-term goal: Aspire to a higher auction percentage over time, possibly to 100%.

Auction Context (2)

Auction design parameters:

- Auction type
- Frequency
- Participation
- Financial capability
- Lot Size
- Maximum purchase
- Reserve price (floor price)
- Others

Questions Regarding Markets Committee Terms?

Role of Principles

- Define desired outcomes.
- Guide data collection, analyses, and deliberations toward how to achieve the desired outcomes.
- Help identify tradeoffs required among desired outcomes.
- Acknowledge differences in the legal and regulatory environments in WCI Partner jurisdictions.

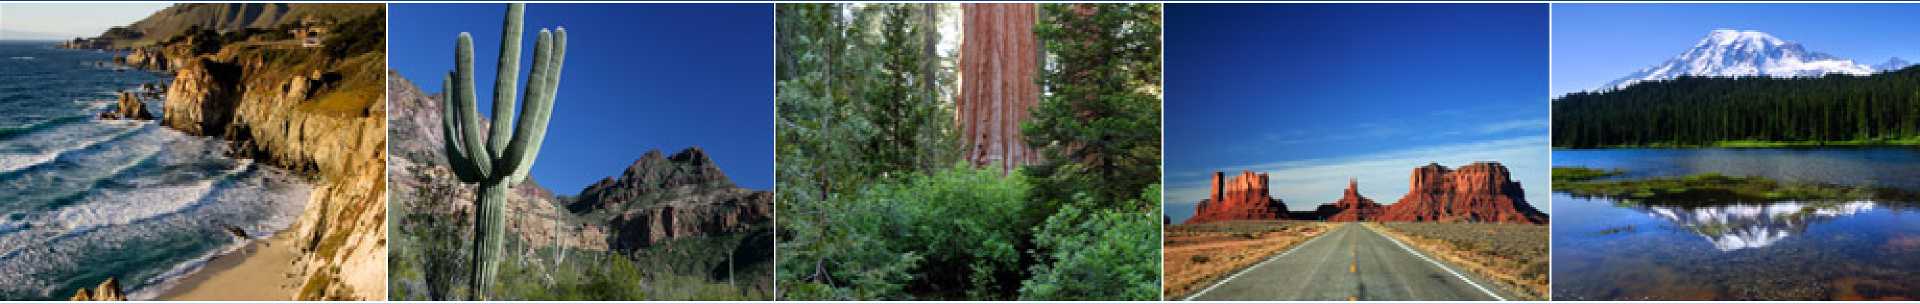
Status of Draft Principles

Principles	CV&E	Market Oversight	Auction Design
Fairness		✓	✓
Efficiency		✓	✓
Effective Oversight		✓	✓
Transparency	✓	✓	✓
Administrative Simplicity and Cost	✓	✓	✓
Accountability	✓	✓	✓
Conflicts of Interest		✓	✓
Compatibility with Other Markets			✓
Harmonization	✓		
Compliance	✓		

Principle Questions

- Anything unclear?
- Anything missing?
- Anything that does not belong?
- Comments on relative importance?

Western Climate Initiative



Markets Committee Stakeholder Workshop

Auction Design

April 9, 2009
Seattle, Washington

Task 6: Auction Design

- Mission: Provide recommendations on the design of the auction that will be used to auction emission allowances in a regionally coordinated manner consistent with applicable state and provincial law.

Draft Auction Design Principles:
Fairness

- All market participants, especially covered entities, have fair and equal access to markets.

Draft Auction Design Principles:
Efficiency

- The market is designed to operate efficiently so that greenhouse gas emission reductions can be achieved at the least cost. An efficient market means that allowance and offset credit prices reflect supply and demand, and accurately reveal the value of allowances and offset credits.

Draft Auction Design Principles:

Effective Oversight

- The design and oversight of the allowance auction are effective in preventing or minimizing fraud, manipulation, and speculative excess. Auction participants have the capacity to execute the transactions when their bids win.

Draft Auction Design Principles:

Transparency and the Reporting and Disclosure of Relevant Information

- Transparency in the design and the operation of the allowance auction builds and retains public confidence.
  - Reporting of relevant information to regulatory authorities and public disclosure of information has important benefits. It enables regulatory authorities to conduct effective oversight and ensure compliance. It also helps to ensure market efficiency, effective oversight, and compliance and enforcement. Coordinated and consistent release of market-relevant information allows all market participants have equal access to public information.
  - The reporting and disclosure requirements for auction design balance these benefits against the need for entities to protect certain sensitive information. The potential to disclose certain information that could be used to manipulate the market is also considered. This balancing is consistent with applicable law relating to the disclosure of information.

Draft Auction Design Principles:

Administrative Simplicity and Cost

- The auction is designed to be as simple as possible for participants and administrators. Administrative costs and transaction costs are minimized for all parties, consistent with the need to provide effective oversight.

Draft Auction Design Principles:

Accountability

- All entities involved in the allowance and offset credit market, as regulators of the market or as participants in it, are accountable for their actions. The responsibility, authority, and capacity to conduct the necessary oversight and take appropriate action are fully defined for all agencies charged with compliance verification and enforcement.

Draft Auction Design Principles:

Conflicts of Interest

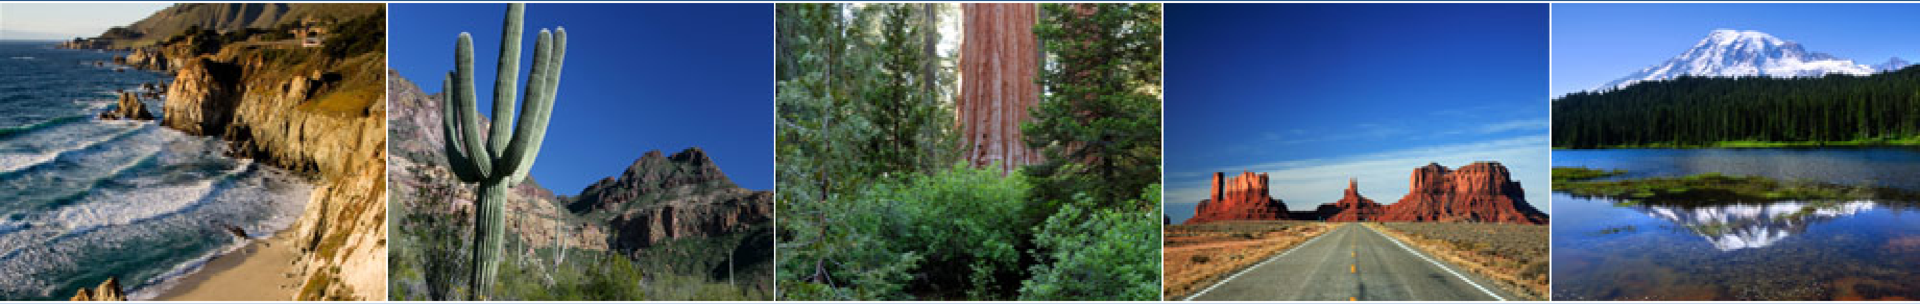
- Conflicts of interest between market participants, monitors, and regulators are prevented.

Draft Auction Design Principles:

Compatibility with Other Markets

- Entities that participate in allowance auctions may also be participants in other markets, such as the secondary market where allowances are traded or electricity wholesale markets. The auction design considers potential consequences of interactions between the operation of the auction and the operation of other markets and mitigates potential impacts.

Western Climate Initiative



Markets Committee Stakeholder Workshop

Market Oversight

April 9, 2009
Seattle, Washington

Task 3: Market Oversight

- Mission: Provide recommendations that are designed to ensure that the allowance and offset credit trading markets are organized properly to operate reliably and prevent or minimize manipulation.

Draft Market Oversight Principles:
Fairness

- All market participants, especially covered entities, have fair and equal access to markets.

Draft Market Oversight Principles:

Efficiency

- The market is designed to operate efficiently so that greenhouse gas emission reductions can be achieved at the least cost. An efficient market means that allowance and offset credit prices reflect supply and demand, and accurately reveal the value of allowances and offset credits.

Draft Market Oversight Principles:

Effective Oversight

- The design and oversight of the market is effective in preventing or minimizing fraud, manipulation, and speculative excess

Draft Market Oversight Principles:

Transparency and the Reporting and Disclosure of Relevant Information

- Transparency in the design and the operation of the allowance and offset credit market builds and retains public confidence.
  - Reporting of relevant information to regulatory authorities and public disclosure of information has important benefits. It enables regulatory authorities to conduct effective oversight and ensure compliance. It also helps to ensure market efficiency, effective oversight, and compliance and enforcement. Coordinated and consistent release of market-relevant information allows all market participants have equal access to public information.
  - The reporting and disclosure requirements for market oversight balance these benefits against the need for entities to protect certain sensitive information. The potential to disclose certain information that could be used to manipulate the market is also considered. This balancing is consistent with applicable law relating to the disclosure of information.

Draft Auction Design Principles:

Administrative Simplicity and Cost

- The auction is designed to be as simple as possible for participants and administrators. Administrative costs and transaction costs are minimized for all parties, consistent with the need to provide effective oversight.

Draft Market Oversight Principles:

Accountability

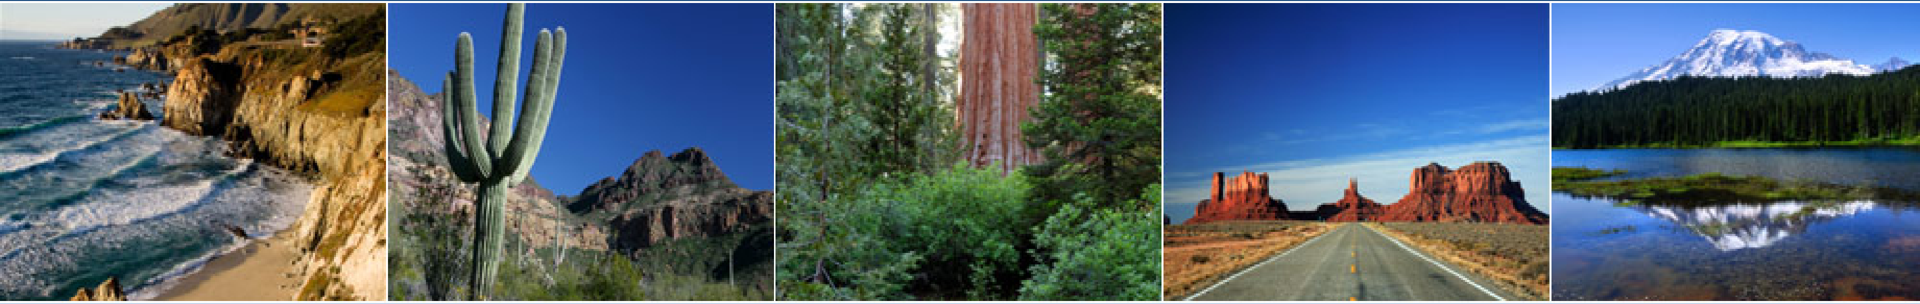
- All entities involved in the allowance and offset credit market, as regulators of the market or as participants in it, are accountable for their actions. The responsibility, authority, and capacity to conduct the necessary oversight and take appropriate action are fully defined for all agencies charged with compliance verification and enforcement.

Draft Market Oversight Principles:

Conflicts of Interest

- Conflicts of interest between market participants, monitors, and regulators are prevented.

Western Climate Initiative



Markets Committee Stakeholder Workshop

Compliance Verification and Enforcement

April 9, 2009
Seattle, Washington

Task 2: CV&E

- Mission: Develop recommendations related to compliance verification and enforcement requirements to ensure compliance by the regulated community and define linkages across WCI Partner jurisdictions.
  - Consistency/uniformity needed across jurisdictions and the degree of flexibility warranted.
  - Ensure equivalent treatment and stringency among WCI Partner jurisdictions.

Draft Compliance Verification and Enforcement Principles:

Harmonization Among Partner Jurisdictions

- To the extent permissible by law and in order to maintain the integrity of the program, compliance verification and enforcement are implemented by the Partner jurisdictions to achieve consistent regulation across jurisdictions. Enforcement and consistent regulation help to maintain a level playing field for entities.

Draft Compliance Verification and Enforcement Principles:

Harmonization Among Partner Jurisdictions

- Harmonization includes:
  - Consequences for noncompliance: The consequences for non-compliance in one Partner jurisdiction are substantially the same as they would be if the non-compliance occurred in any other Partner jurisdiction.
  - Data submission by covered parties: Requirements for data submissions are consistent and timing is coordinated across Partner jurisdictions.
  - Compliance Verification: Compliance verification is consistent and timely across Partner jurisdictions.

Draft Compliance Verification and Enforcement Principles:

Compliance

- Partner jurisdictions' policies lead to maximum compliance with regulatory requirements.

Draft Compliance Verification and Enforcement Principles:

Transparency and the Reporting and Disclosure of Relevant Information

- Transparency in compliance verification and enforcement builds and retains public confidence.
  - Reporting of relevant information to regulatory authorities and public disclosure of information has important benefits. It enables regulatory authorities to conduct effective oversight and ensure compliance. It also helps to ensure market efficiency, effective oversight, and compliance and enforcement. Coordinated and consistent release of market-relevant information allows all market participants have equal access to public information.
  - The reporting and disclosure requirements for compliance verification and enforcement balance these benefits against the need for entities to protect certain sensitive information. The potential to disclose certain information that could be used to manipulate the market is also considered. This balancing is consistent with applicable law relating to the disclosure of information.

Draft Compliance Verification and Enforcement Principles:

Administrative Simplicity and Cost

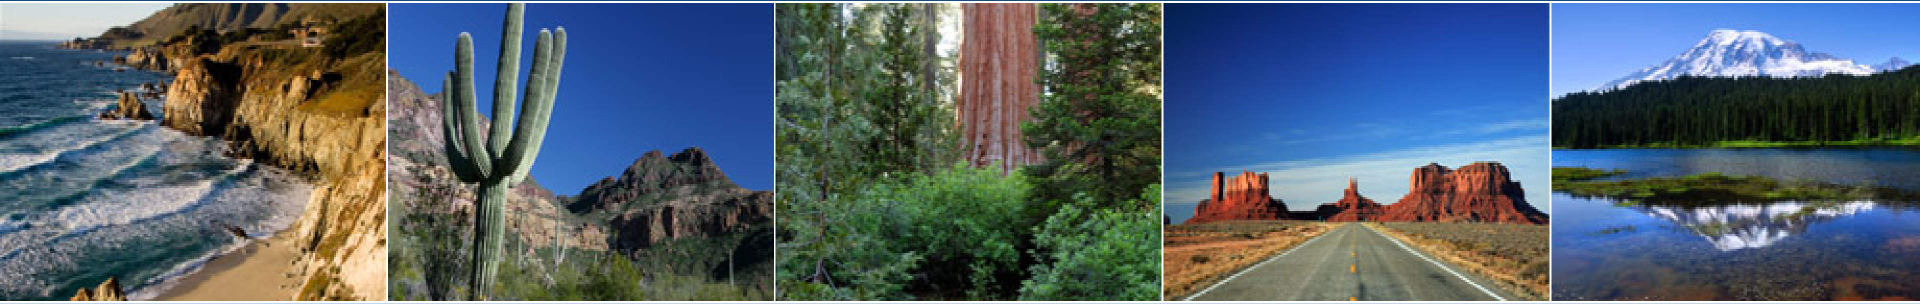
- Proposed rules are designed to be understood and enable entities to have a clear compliance path. Administrative costs and transaction costs are minimized for all parties, consistent with the need to provide effective compliance verification and enforcement.

Draft Compliance Verification and Enforcement Principles:

Accountability

- All entities involved in the allowance and offset credit market, as regulators of the market or as participants in it, are accountable for their actions. The responsibility, authority, and capacity to conduct the necessary oversight and take appropriate action are fully defined for all agencies charged with compliance verification and enforcement.

Western Climate Initiative



Markets Committee Stakeholder Workshop

Market Oversight Questions for Discussion

April 9, 2009
Seattle, Washington

Oversight of Allowance and Offset Credit Markets

- Market Architecture, Rules and Oversight
- Guided by principles

- Seek recommendations of “best practices”
- Review existing structures and practices
- Consider legal and regulatory frameworks in Partner jurisdictions

Oversight of Existing Markets for Financial Instruments (1)

Existing oversight might:

1. Provide models for WCI Partner jurisdictions to consider
2. Allow Partner jurisdictions to consider definitions of allowances and offset credits that place them into existing regulatory structures

Oversight of Existing Markets for Financial Instruments (2)

Canada

- Securities, commodities futures, and derivatives regulated by provincial securities commissions (AMF, MSC, BCSC, OSC, etc.)

U.S.

- Securities regulation shared by Securities Exchange Commission and state agencies
- Commodities regulation primarily under Commodity Futures Trading Commission (CFTC); oversight of energy commodities shared with the Federal Energy Regulatory Commission (FERC)

Oversight of Existing Markets for Financial Instruments (3)

Type of oversight depends on type of trade

- e.g., "Over-the-counter," or OTC, customized bilateral trades, are regulated differently from exchange-traded contracts, standardized contracts with anonymous counterparties;
- Primary, secondary, derivatives markets are treated differently

Oversight of Existing Markets for Financial Instruments (4)

Regional Greenhouse Gas Initiative

- Contracts with outside firm to provide market oversight services
- Requires reporting of prices with transfers

US EPA Acid Rain Program

- All allowance transfers and compliance accounts visible in online database
- Price data not collected

Market Oversight Questions for Discussion

1. Who should have the opportunity to purchase, own, and sell WCI Partner jurisdiction allowances and offset credits and under what conditions, if any, in the
   a) primary market?
   b) secondary markets?
2. What is your primary concern about how this market can be manipulated and by whom? Is there something peculiar to a market for greenhouse gases that could lead to excessive speculation?
3. What is the role you see for speculators in this market? Is it different than the role played in other markets?
4. How should WCI Partner jurisdictions monitor the WCI cap-and-trade markets? What tools and capacity should the WCI Partner jurisdictions develop?

Market Oversight Questions for Discussion

5. What information should be collected by regulatory authorities for use in the oversight of WCI cap-and-trade primary, secondary, and derivatives markets? Of the information collected by regulatory authorities on the WCI cap-and-trade market, what information should be made public, in what form (e.g., aggregate form only), and at what frequency (e.g., daily, weekly)?
6. What financial instruments (e.g., derivative products) would you find important to manage risk and why?
7. What form should WCI Partner jurisdictions' interaction take with each other, with a WCI regional administrative organization, US and Canadian government institutions, and other external bodies (such as exchanges) to provide oversight of the primary, secondary, and derivatives markets, such as Memoranda of Agreement? What information should they exchange with these institutions?

Market Oversight Questions for Discussion

8. What specific potential do you see for interaction between the markets for WCI Partner jurisdiction allowances and offset credits, markets for their derivatives, and other markets, e.g., renewable energy credits, that might create opportunities for, or exacerbate the effects of, fraud, manipulation, or speculative excess?
9. What trading rules would you like to see for WCI cap-and-trade market participants to ensure accountability, transparency, prevention of fraud, manipulation and excessive speculation?
10. What other market oversight issues, not covered in these questions, should the WCI Partner jurisdictions be looking at?

Western Climate Initiative

Overview: Western Climate Initiative

Markets Committee Meeting
Seattle, WA
April 9, 2009

www.westernclimateinitiative.org

WCI History

- Logical extension of West Coast and Southwest Governor's climate initiatives
- February 2007 – MOU signed by Governors of Arizona, California, New Mexico, Oregon and Washington
- British Columbia, Manitoba, Montana, Ontario, Quebec and Utah have since signed the Initiative
- Observers
  - U.S. states: AK, ID, CO, KS, NV, WY
  - Canadian provinces: Saskatchewan
  - Mexican states: Baja California, Chihuahua, Coahuila, Nuevo Leon, Sonora, Tamaulipas

Western Climate Initiative

Manitoba
GDP .... 48,586 Million C$
Population 1,186,700
Largest City.............. Winnipeg

British Columbia
GDP .... 190,214 Million C$
Population 4,380,300
Largest City .... Vancouver

Washington

Source for Canadian data: Statistics Canada

Initiative Collaboration Includes

Three specific directives:

- Set a regional emissions reduction goal
- Join a multi-state registry to track, manage and credit reductions
- *Design a regional multi-sector market-based mechanism*

Joint work to:

- *Promote clean and renewable energy in the region*
- *Increase energy efficiency*
- *Advocate for regional and national climate policies that are in the interest of western states*
- Identify measures to adapt to climate change impact

Cap-and-Trade Design Starting Point

- Firm 2020 emissions limit
  - Based on individual state and provincial emissions goals
- Common approach to quantifying emissions
- Individual state/provincial programs
  - Each state/province adopts own rules
  - Harmonized around essential elements
  - Linked to create a regional trading market
  - All allowances and offset credits have same value

Most Expansive Program Designed To-Date

- All 6 primary GHGs from all major sources, including transportation and other fuels
  - RGGI = CO_2 from electricity only
  - EU ETS = CO_2 from electricity, industrial combustion, and process emissions
- Will cover nearly 90% of the region's emissions by 2015
  - RGGI = ~28% of emissions
  - EU ETS = ~40% of emissions

WCI DESIGN

AND

2009 – 10 WORK PLAN

Cap-and-Trade
What Can Be Different

- State and provincial decisions:
  - Allocation of allowances within states and provinces
    - May standardize between sectors/jurisdictions
  - *Greater* percent of allowances auctioned than minimum
  - Use of most of the value of the allowances
  - *Fewer* offset credits than maximum allowed
  - Allowance set-asides
  - Recognition of early reductions (other than ERA)

Cap-and-Trade
What Has To Be the Same

- Basic reporting requirements
- Sectors, gases and thresholds (generally)
- Points of regulation
- Quantification methods
- Setting regional caps
- Establishing partner budgets
- Compliance periods; banking; borrowing

What Has To Be the Same, *cont.*

- Early reductions allowance (ERA) criteria
- Maximum offset credits allowed
- Offset criteria and protocols
- Auction design and implementation
- Linkage with other systems
- Participation in regional administrative organization

2009 – 10 WCI Organization

- US and Canadian Co-Chairs
  - One year staggered terms; rotates between jurisdictions
- Committee of the Whole
- Federal Liaisons
- Legal Team
- Continuing and New Committees and Task Groups:
  - Reporting Committee
  - Electricity Committee
  - Offset Committee
  - Cap Setting and Allowance Distribution Committee:
  - Markets Committee
  - Complementary Policies Committee
  - Economic Modeling Team

Stakeholder Input

- Ongoing stakeholder engagement is critical to the success of WCI
  - Stakeholder engagement activities are coordinated across WCI committees
  - Individual Partner jurisdictions will continue their own stakeholder work
- Materials posted on website for written comment
- Regular calls, workshops and list serv announcements
- Monthly newsletter

Reporting Committee

- "Background Document and Progress Report for Essential Requirements of Mandatory Reporting"
  - Third draft released January 6, 2009 for stakeholder comment
- Final draft currently under development
  - Revisions to previous draft in response to stakeholder comments
  - Sections for additional source category methods and reporting requirements
  - Scheduled to be released for stakeholder review and comment on April 20
  - Final version available in late June
- Develop emissions reporting & database infrastructure

Electricity Committee

- Stakeholder Technical Advisory Group process
  - Examined a number of issues related to implementation of the First Jurisdictional Deliverer approach
- Will now build on and incorporate the learning from the TAG process
- Work includes:
  - Essential elements for reporting electricity emissions
  - Assessment of the FJD boundary issues
  - Examine emission attribution for imported electricity, including the role of RECs in GHG accounting, treatment of voluntary renewable energy, and continued work on default rates
  - Examination of allowance allocation issues in the electricity sector, and their relation to competitiveness

Offset Committee

- Make recommendations on the design and operation of the offset system
- Work divided into four tasks:
  - Task 1: Offset System Essential Elements
  - Task 2: Offsets & Allowances from other Systems
  - Task 3: Offset Protocols
  - Task 4: Offset Supply Analysis

Cap Setting and Allowance Distribution

- Develop and recommend methodologies for establishing the regional emission cap, each Partner’s allowance budget
- Work divided into six tasks:
  - Task 1: Data Review and Collection
  - Task 2: Cap and Budget Setting
  - Task 3: Competitiveness Analysis
  - Task 4: 2012 One-time Budget Adjustment
  - Task 5: Offset Compliance Limit
  - Task 6: Early Reduction Allowances (ERA)

Markets Committee

- Support development and operation of robust and transparent allowance and offset credit trading market
- Work divided into six tasks:
  - Task 1: Cap-and-Trade Essential Elements
  - Task 2: Compliance Verification and Enforcement
  - Task 3: Market Oversight
  - Task 4: Tracking Systems and Related Infrastructure
  - Task 5: Regional Administrative Body
  - Task 6: Auction Design

Complementary Policies

- Response to directive in Initiative on clean energy and energy efficiency
- All WCI Partner jurisdictions have complementary policies in their climate action plans
- Economic analysis suggests complementary policies reduce the cost of cap-and-trade
  - Remove market barriers (such as split incentives)
  - Help with actions that do not fully respond to price
  - Ensures that all sectors are engaged in achieving reductions

Economic Modeling

- Expanded Energy 2020 Model
  - Adding Manitoba, Ontario, and Quebec
  - Revising Reference Case: economic growth; fuel prices
  - Updating model output tables based on stakeholder feedback (adding electric sector detail)
- Updating Assumptions Book
- Improving Policy Cases, banking/offsets analysis
- Adding Sensitivity Cases

National Context

- WCI Partner jurisdictions support a national approach for cap-and-trade
- WCI Partner jurisdictions are continuing to work on the details of its cap-and-trade design
- The Partners have and will continue to share what we've learned with Congressional staff and EPA
- The Partners are also working on identifying where national and regional complementary policies may be needed
- WCI program – cap-and-trade working together with other policies – serves as national model

Federal Proposals: Waxman-Markey Discussion Draft

- Title One: Clean Energy
  - Renewable Electricity (Portfolio) Standard
  - Carbon Capture and Storage
  - Low Carbon Fuel Standard
- Title Two: Energy Efficiency
  - Buildings, Lighting and Appliance, Utilities, Industrial Plants, Public Facilities, Mobile Sources
  - Transportation Planning
- Title Three: Reducing Global Warming Pollution
  - Federal cap-and-trade program
- Title Four: Transitioning to a Clean Energy Economy
  - Preserving domestic competitiveness
  - Green jobs
  - Adaptation

Climate Action Reserve Overview

Presentation to the Western Climate Initiative
Offsets Subcommittee Meeting
April 21, 2009

CLIMATE
ACTION
RESERVE

What is the Climate Action Reserve?

- National not-for-profit environmental organization headquartered in California, operating a registry for carbon offset projects throughout the U.S.

- Open and transparent:
  - protocol development
  - verification oversight
  - project registration & tracking

Standardized Protocols

- Reserve protocols assess industry practice as a whole, rather than individual project activities
  - Industry studies are conducted upfront
  - Additionality determined through standard and objective eligibility criteria
  - Baselines estimated using standard parameters and default factors to the extent practical and appropriate

Standardized Protocols

- Advantages
  - Less subjective determinations of eligibility
  - More certainty, less risk for developers and investors
  - Faster project processing
  - Greater transparency

Protocol Development Process

- Developed with broad public input
- Goal is to create a uniform standard that is widely recognized and builds on best practice
  - We incorporate the best elements of other protocols
  - We do not accept projects developed under other protocols (i.e. CDM, Gold Standard, VCS)
- Step-by-step quantification and verification instructions
- Conformant with ISO 14064 and GHG Protocol

Protocol Development Process

1. Literature review
2. Scoping/kick-off meeting
3. Multi-stakeholder workgroup formation
4. Draft protocol to workgroup
5. Revised draft released for public comment
6. Public workshop
7. Solicit public comments and respond
8. Adoption by Climate Action Reserve Board in public session

Project Types

- **Current**
  - – Forestry (improved forest management, avoided conversion, reforestation)
  - – Landfill gas capture
  - – Livestock (agricultural methane capture)
  - – Urban forestry
- **Under Development**
  - – Co-digestion, coalmine methane, industrial gases, and others forthcoming.

Project Eligibility Rules

- Additionality
  - Regulatory screen – not legally required
  - Project started operation after 1/1/2001
    - This will be changing with new protocols
  - Performance standards or other standard criteria for additionality
- Location – must be in the United States
  - Mexico and Canada coming soon
- Material compliance – must meet all applicable environmental regulations

Protocol Revision Process

- Protocols are updated to reflect public comments, practical experience, and new technical or regulatory developments
  - *Policy Revisions* involve changes to eligibility definitions or significant changes in baseline estimation methods
  - *Technical Revisions* involve editorial changes or technical changes to quantification & monitoring methods

Verification System

- The Reserve trains, accredits and oversees verifiers
  - Working with ANSI to ensure compliance with ISO
- Developer selects an accredited verifier
- The Reserve reviews conflict of interest (COI)
- Developer hires verifier
  - Verifier makes determination of eligibility (1st visit) and how many tonnes of reduction have taken place
  - Project documents, verification report and verification opinion submitted to and approved by the Reserve

Registry System

- Project developers have individual accounts
  – Reserve software is operated by APX
- The Reserve issues credits (“CRTs”) into accounts based on approved verification reports
  – Project documents are visible to the public
- Each CRT has a unique serial number for tracking
  – Includes embedded information about the project, project type, vintage and location
- CRTs can be transferred or retired

Focused and Limited Mission

- The Reserve focuses only on protocol development, verification, and registration
  - Does not fund or develop projects or solicit project proposals
  - Does not take ownership of offsets or retire them on behalf of others
  - Is not an exchange

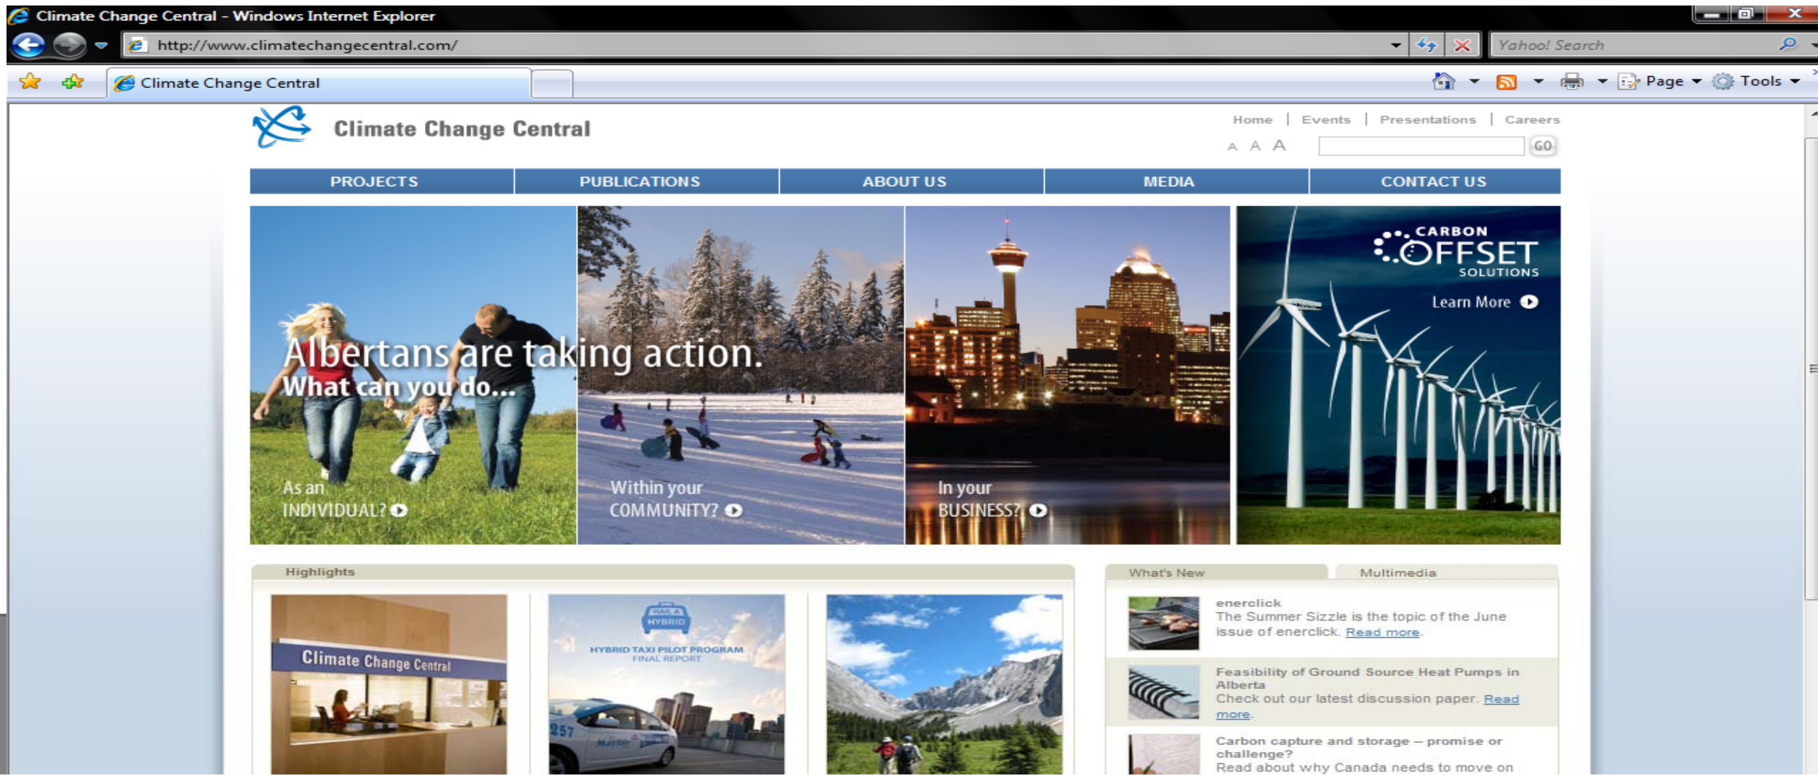
PROTOCOL REVIEW AND RECOMMENDATION PROCESS

WCI Offsets Committee Presentation
April 21, 2009

Climate Change Central

Who is Climate Change Central?

- Formed in 2000,Triple P Partnership – Not for Profit
- Goal - Advance Action that Accelerates Mitigation and Adaptation to Climate Change
  - Policy Analysis, Energy Efficiency, Clean tech deployment, environmental communications
- Facilitated development of the Carbon Offset Market in Alberta
- Active in several Provincial and National Fora in Canada



C3 Offset Program Function

- Advice and Input on a Well-Designed Offset System
  - On the ground experience in a Compliance-Based System; analysis of interactions/coherence between offsets and other policy measures
- Guidance Document Development – Project, Verification, Validation, Protocols
- Coordinating Transparent, Well-documented Evaluation, Review and Recommendation Process for Protocols, with Government Oversight
  - Based on ISO14064-2 principles and framework
- Science and Stakeholder Coordination for New Protocol Development
  - Tried and true method of standards development; ISO 14064-2 based;
  - Offset Registry Services
  - Audited system – Alberta Auditor General
- Subject Matter Experts in Agriculture and Forestry quantification
- Education and Awareness to Support the Market
- Evaluation Frameworks – feeds into Gov't Adaptive Management Process

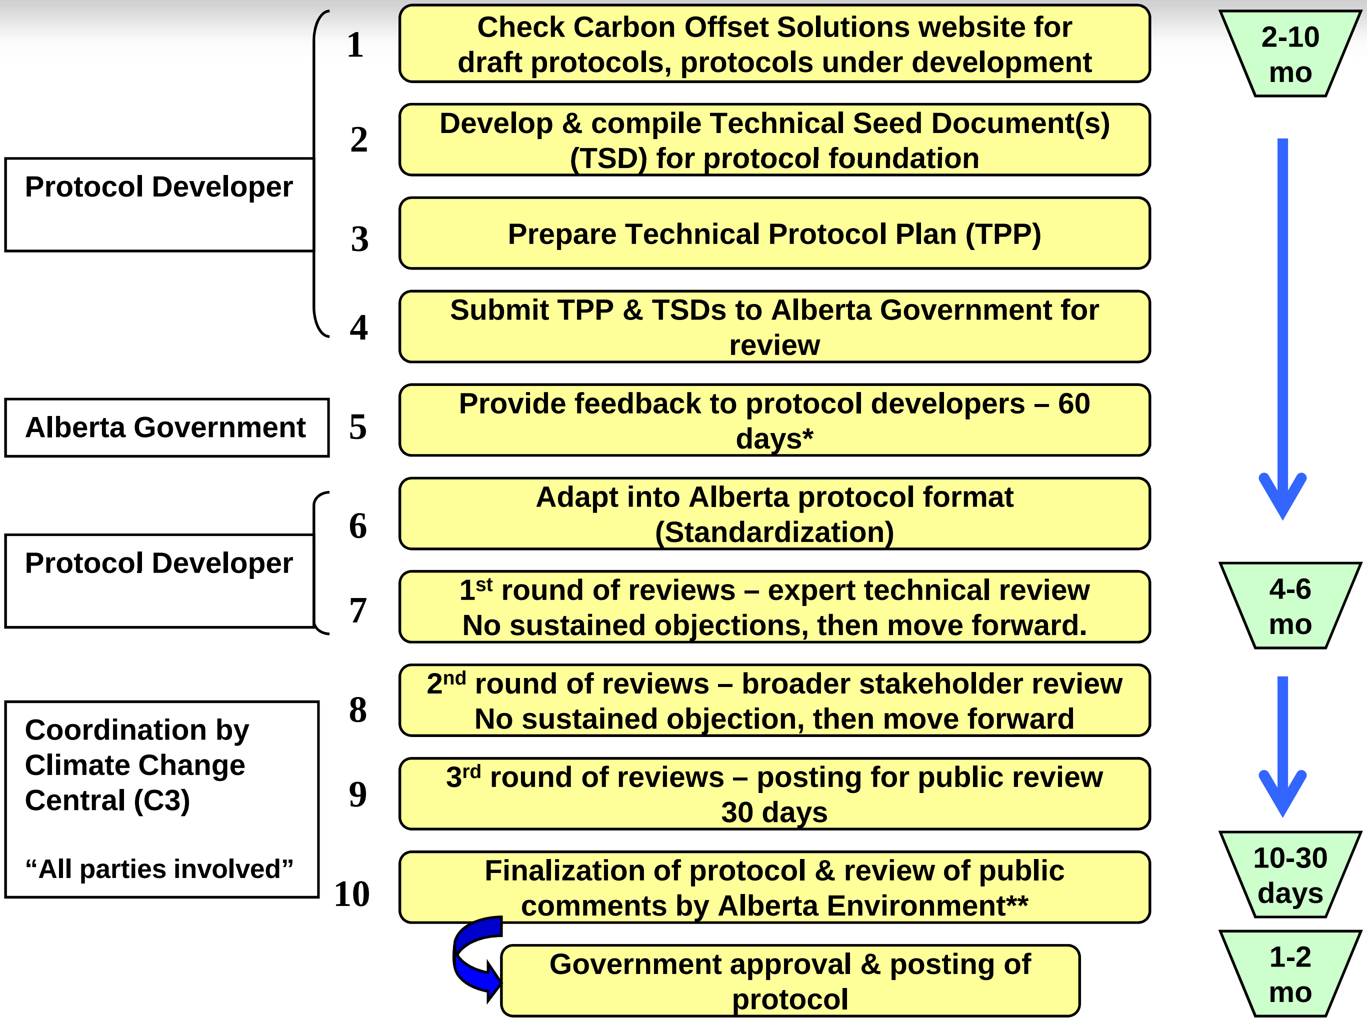
C3 Offset Experience

- Active at both the Federal and Provincial levels
- National/Federal Context
  - Secretariat to Canadian Federal-Provincial-Territorial Quantification Protocol Working Group (NOQT; 2003-'06)
  - Coordinated review of 200+ protocols/standards/methodologies ('07-'08)
    - Based on 1st and 2nd order screening criteria – adaptability of protocols
    - Environment Canada's Fast Track List of 46 eligible protocols
  - Coordinating protocol development for Ducks Unlimited and Canadian/American Fertiliser Institutes
    - Wetlands and Agricultural N_20 reduction protocols
- Industry-Provincial Offsets Group (IPOG) – input to Federal Government
  - Coordinating 10+ working groups; web-based collaboration tools
  - Coordinating Additionality, Permanence, Ownership/Eligibility Policy Papers

C3's Offset Experience

- Provincial Context – SK, AB and some ON input
  - Alberta's Government (Offset System)
    - Guidance Documents (Project, Verification, Protocols, Validation)
    - Protocol Review and Recommendation Process
      - Evaluation and adaptation process for pre-existing
      - Coordination of review for new protocols by project developers
    - Offset Registry
      - House and operate the Alberta Emission Offset Registry on www.carbonoffsetsolutions.ca
    - Education and Information
- Saskatchewan Government – Design, Advice and Technical Support
- Ontario – Preliminary technical and design advice on Offset System

Alberta Protocol Development and Review Process



Protocols – Types Identified/Approved for Development

- Guide to Protocol Developers (draft)/COS Website – initial scoping
  - Contact email, phone conversations, web displayed intentions
  - Coordination of interested parties – reduces duplication of effort
- Submission of Technical Seed Documents/Technical Protocol Plan
  - Escalating commitment/ internal review by Government
  - Manages resource risk for protocol developers/government
  - Coordinate the internal review – 60 day turnaround
- Submission deadlines to manage Protocol Review Process
- TPPs displayed on www.carbonoffsetsolutions.ca

Private Sector shares in development costs; innovation driven

APPROVED

- Afforestation
- Beef (3)
- Biofuels
- Biogas
- Biomass
- Energy Efficiency
- Pork
- Tillage Systems
- Waste Heat
- Landfill Gas/Landfill Bioreactor
- Renewables (3)
- Enhanced Oil Recovery
- Acid Gas Injection
- Intermodal Switching
- Road Rehabilitation
- Compost
- Energy Efficiency
- Wastewater Treatment

IN REVIEW/DEVELOPMENT

- FlyAsh Blending
- Engine Fuel Mgmt/Vent Gas Capture
- Pulp Sludge Application (forestry/agriculture
- Fugitive CH4 Emissions
- Energy Efficiency – Commercial/Insitutional
- Compressor Sation Retrofits
- Buildings (3)
- N20 Abatement - agriculture and industry
- Wetlands Management
- Reduced Summerfallow
- Residual Feed Intake in Beef
- Conversion to Perennial Forages
- Native Rangelands
- Pasture Management
- Soil Amendment

Protocol Review and Milestones

Protocol Developer

1 Check Carbon Offset Solutions website for draft protocols, protocols under development

2 Develop & compile Technical Seed Document(s) (TSD) for protocol foundation

3 Prepare Technical Protocol Plan (TPP)

4 Submit TPP & TSDs to Alberta Government for review

Alberta Government

5 Provide feedback to protocol developers – 60 days*

Protocol Developer

6 Adapt into Alberta protocol format (Standardization)

7 1st round of reviews – expert technical review No sustained objections, then move forward.

Coordination by Climate Change Central (C3)

“All parties involved”

8 2nd round of reviews – broader stakeholder review No sustained objection, then move forward

9 3rd round of reviews – posting for public review 30 days

10 Finalization of protocol & review of public comments by Alberta Environment

Government approval & posting of protocol

2-10 mo

4-6 mo

10-30 days

1-2 mo

C3 New Protocol Development Process

Science Coordination/Dvpmt of the Technical Seed Document

- Phase 1 – Planning and Compilation Science Discussion Document
  - Based on transparent, science-based standards and definitions, best practice guidance, with extensive literature reviews, scientific input/review from leading researchers and technical experts globally
  - ISO 14064-2 Framework
- Phase 2 – Science Coordination / Consultation
  - Discussion paper - primary vehicle for coordinating science, fostering discussion, suggesting options and building consensus on key protocol factors
  - Consensus Building Workshop / Science Coordination Workshop
  - 80% Consensus to advance options
- *Phase 3 – Development of a Technical Seed Document*
- *Phase 4 – Standardize into Alberta Protocol Template*

May take up to 12 - 18 mos. –enters Alberta Protocol Review Process

(http://www.carbonoffsetsolutions.ca/offsetprotocols/workshops.html

Recommendation/Approval Process

- Protocol Developers submit TSDs and TPPs – internal review
- 1st Round of Technical Review – C3/Government on 1st Round
- (http://www.carbonoffsetsolutions.ca/offsetprotocols/abprotocolReviewProcess.html
- C3 manages 2nd Round of 'Market Review'
  - Government attends; all issues posted; no sustained objection*
- 3rd Round – Public Posting
  - All submissions summarised and posted; post-process review with C3 and Government – recommendations reviewed
- Facilitate follow-up with Protocol Sponsors and Government, if needed
- Government makes ultimate decision
- Decisions Posted for maximum transparency

Ongoing Amendments

- Government gives credit duration period of 8 years (maybe 5+)
  - ‘Sink’ Protocols longer
- Protocols reviewed every 5 years – based on Best Available Science of the Day
- Grandfathering of Projects with “Protocol of the Day”
- But – if a direct problem in quantification – amendments immediate
  - If impacts existing projects – stakeholder consultation
- Anticipate protocol reviews will be a collaborative, transparent process

Design Criteria -Stage 1

- Eligibility – laid out in Regulation
- Design Criteria – First Cut – Technical Protocol Plan
  - *Description of the Project Type and How Reductions will be Achieved*
  - *Description of Background Information/Best Practice Guidance*
  - *Regulatory, Legal Requirements and/or Incentive/Grant Programs*
  - *Barriers to Implementation (risks)*
  - *Review of Technology – penetration levels*
  - *Review of Existing Projects -activity levels*
  - *Summary of Quantification Approaches used in the Proposed Protocol*
  - *Other Impacts (assuring permanence methods)*
  - *Assessment of Baseline Scenarios*
  - *Selection of Baseline Scenario*
  - *Definition of the Project Condition*
  - *Functional Equivalence*
  - *Flexibility Mechanisms*

Policy Criteria – Stage 2

- ISO 14064-2 Standard
  - Real, Measurable, Quantifiable, Verifiable
  - Promotes consistency and transparency in GHG quantification, monitoring, reporting and verification
  - Streamlined LCA assessment and on-site, upstream and downstream allows for scalability, stackability and ultimately fungibility
  - Functional Equivalence requirements (carbon intensity)
- Clear Guidance on Ownership

Policy Criteria – Stage 2

- Additionality
  - Designated by the Regulatory Authority (date, beyond BAU, regulations/other measures)
  - Process (ISO; transparency; technical review) – scalable to any measure of additionality (Ontario adaptation initiative)
- Permanence
  - Government policy enabled buffer reserve
  - Market-based approaches are evolving
- Registry Requirement
  - Mandatory – serialization and retirement for compliance

Subject Matter Experts

- Engaged Agriculture and Forestry Inventory Scientists
- Academia, industry technical experts, research institute scientists, provincial/federal scientists
- Developed tried and true science coordination process
  - Provide a ‘peer review’ IPCC style format
  - First Day – common understanding of Design Criteria
  - Remote/Anonymous voting by Technical Experts – comfort
  - Used successfully by Alberta Government, Ontario Government, Research Community in standards setting exercise and science consensus forming processes

Stakeholder/Market Review

- 600+ Email Group of Offset Stakeholders
- Face to Face Workshops – held 4 to date
  - Post 1st round results
  - Send out invites; draft protocols few weeks in advance
  - All 1st round technical providers; broader representation
  - Participants in Carbon Value Chain
  - Protocol Developers present approach
  - Facilitated Discussion by C3
  - No sustained objection to move a protocol forward to next stage

Public Round

- 600+ Email Group of Offset Stakeholders - notification
- Numbered Draft Protocol – submission email
- 30 Day public posting
- Comments compiled and displayed
- Two email notifications

Other Programs

- Coordinating IPOG Protocol Working Groups
  - Adaptation of 20 Alberta protocols – deviations
  - Provide solid analysis of the pros and cons of the various approaches, unique to the jurisdiction at hand
- Good policy decisions need robust technical analyses of the options…
- Ontario – adapted 16 protocols in
  - Process and format makes them scalable; adaptable with the documented, transparent history
- Saskatchewan – will likely do the same
- USDA-USEPA interested in understanding the process

Thoughts…

- Decide whether industry can bring forward new protocols – and at what stage
  - More opportunity than existing Ag, Forestry and Waste Protocols
  - Qualitative Limits?
- Systematic, Robust, Transparent Review Process – Scalable, Stackable and Fungible
  - Predefine the extent of the scope of review – the farther upstream and downstream the quantification goes - increased difficulty/uncertainty in identifying and quantifying primary and secondary effects
  - Consider adjusted baselines to accommodate differing regulatory scopes in jurisdictions –after analysis of coherence/interactions with other policy measures
- Agree on Coverage of Key Policy/Technical Issues
  - Design and Policy Criteria to assist protocol review and recommendation process

Daniele Violetti

Manager, CDM Process Management

James Grabert

Manager, Joint Implementation

Moderator:
David Abbass

CDM Public Information Officer

UNFCCC secretariat

CDM & JI

How they work, why they work

Presentation to

WCI Offsets Committee

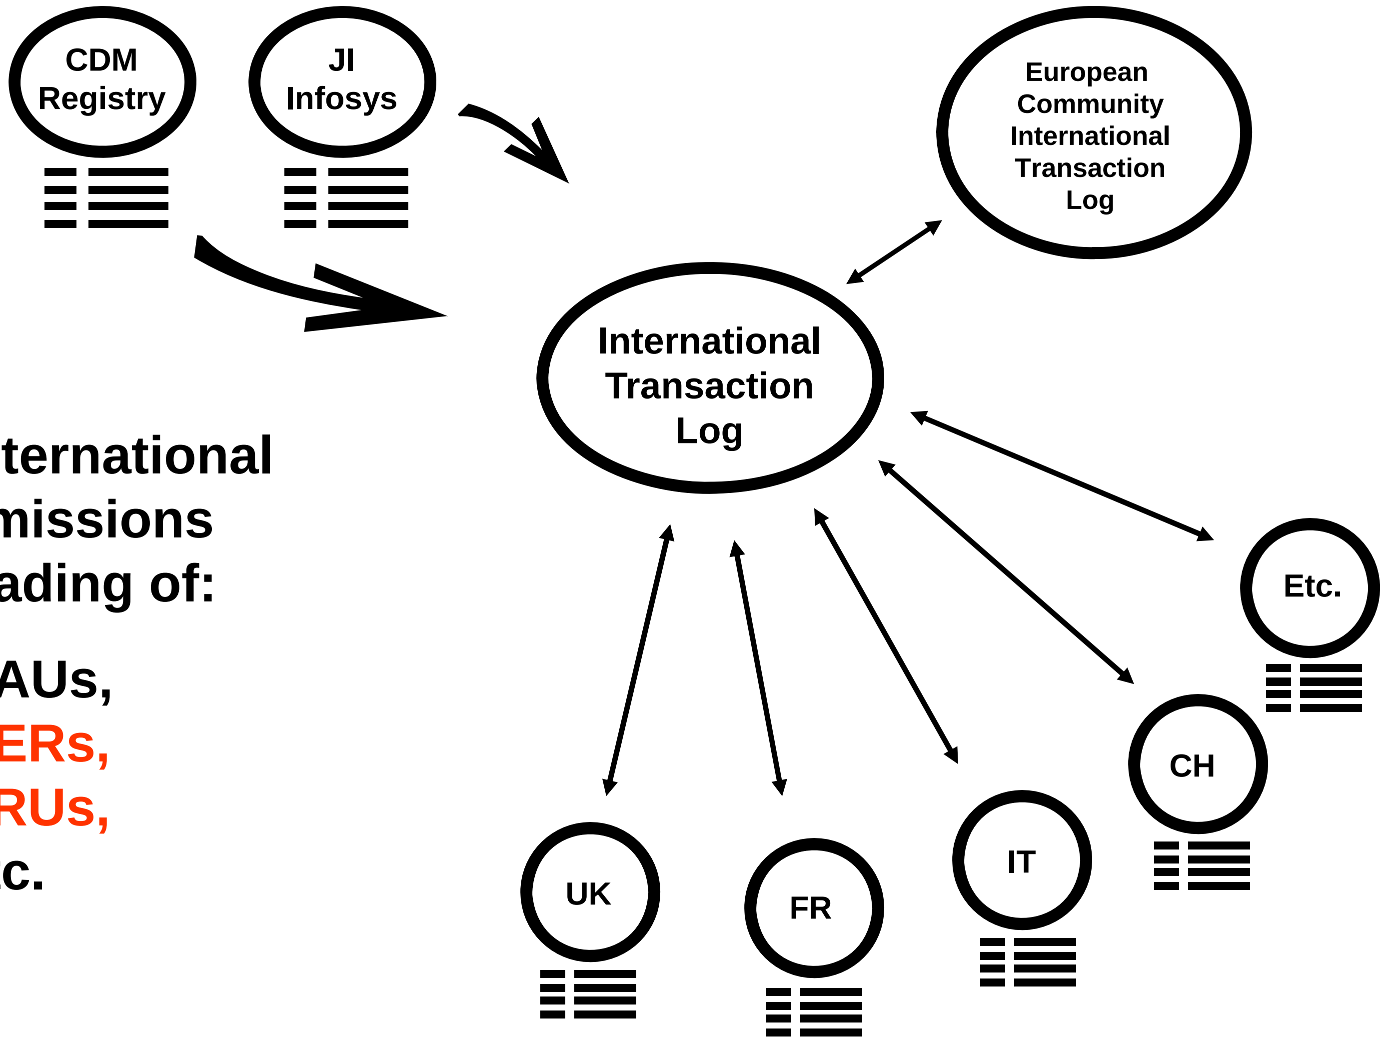
22 April 2009

Three market-based mechanisms

- International emissions trading (Article 17)
- Clean Development Mechanism (Article 12)
  - Emission reduction projects in developing countries
- Joint Implementation (Article 6)
  - Emission reduction projects in any country with a commitment under the Kyoto Protocol

Emissions trading | Essential market architecture in place

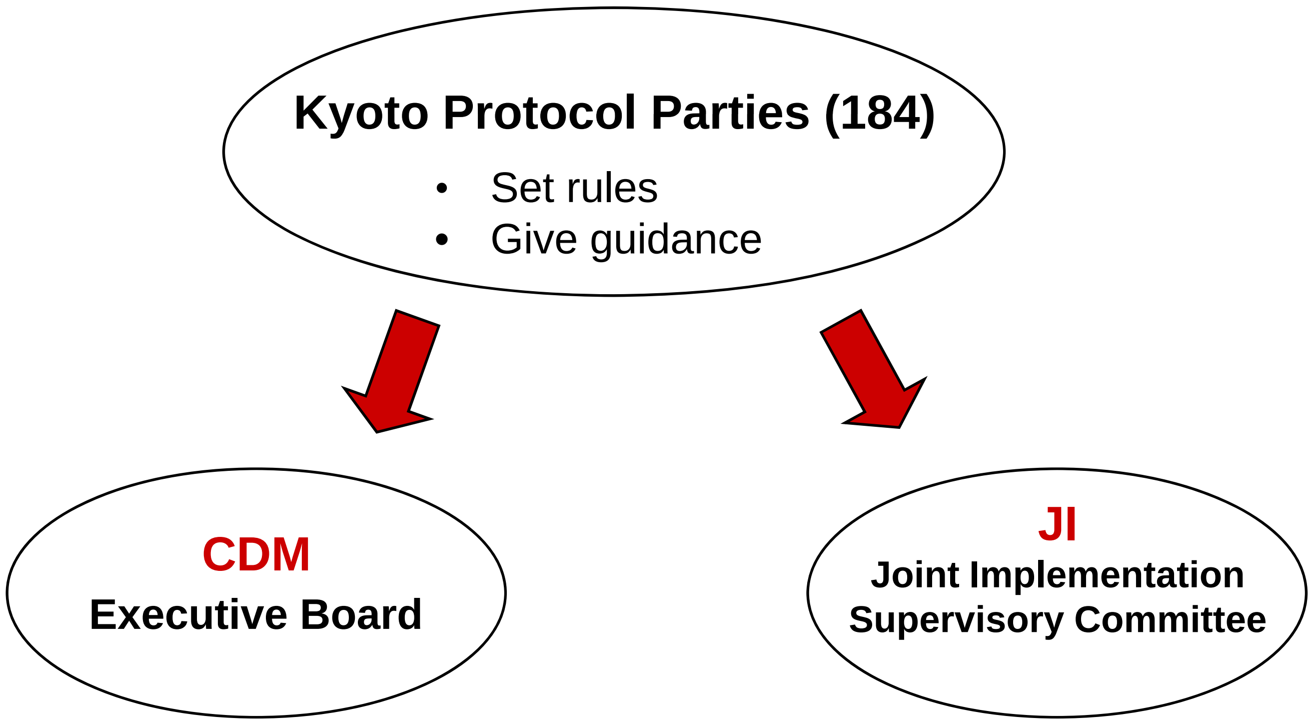
- International emissions trading (Article 17)



International emissions trading of:

AAUs,
CERs,
ERUs,
etc.

Project-based mechanisms | Background



Project-based mechanisms | Background

CDM and JI

- **Mechanisms implemented according to modalities, procedures, guidelines set by KP**

- **Continually improving, evolving based on "further guidance" by KP Parties**

- **Projects vetted by accredited, third-party certifiers – the extended arm of the regulators**

- **Regulators supported by panels, working groups, experts, secretariat**

Quality

- Real, measurable, verifiable, additional (units = 1 tonne CO_2)
- Continual improvement

Transparency

- Every document about every project available

Public input

- Regular calls for public input
- Periods for public review built in to registration, issuance processes
- Public input sought, e.g. in methodology development

CDM | Background

- Clean Development Mechanism (CDM) (Article 12)

  Emission reduction projects in developing countries

  - CDM assists countries to achieve sustainable development goals, creates incentive for investment, provides additional support for adaptation
  - CDM projects produce certified emission reductions (CERs)
  - CERs are saleable/tradable units that can be used for compliance with KP targets

Regulated mechanism overseen by

Executive Board

10 members, 10 alternate members who serve in their private and personal capacity

assisted by:

Methodology Panel

Accreditation Panel

Working groups (a/reforestation, small scale)

Registration and issuance team (roster of experts)

UNFCCC secretariat

CDM | A mechanism with global reach

1588 registered projects in

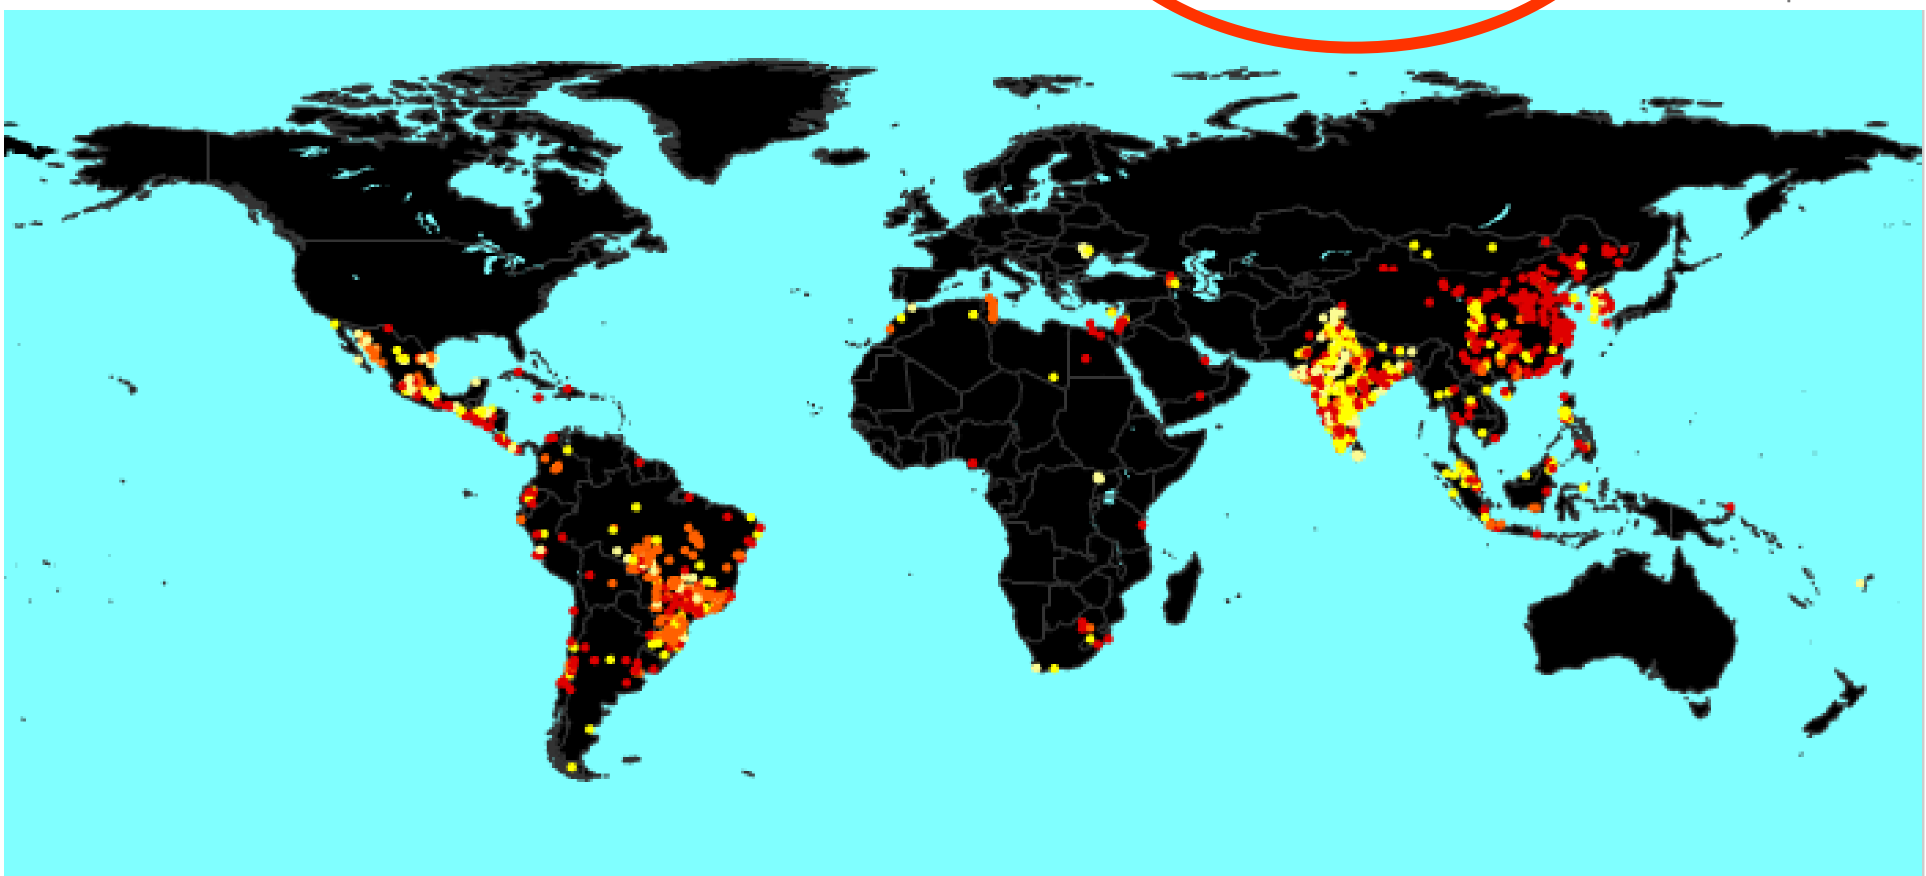
55 countries

Plus > 2600 more projects in pipeline

277 million CERs issued to date

>2.9 billion certified emission reductions expected to the end of 2012

Status: 22 April 2009



CDM | **Project cycle**

1. Project design: PP

Project participant prepares project design document, making use of approved emissions baseline and monitoring methodology. Secures letter of approval from host Party

6. CER issuance

5. Verification: DOE

4. Monitoring: PP

3. Registration: EB

2. Validation: DOE

1. Project design: PP

CDM | Project cycle

2. Validation: DOE

Project design document validated by accredited designated operational entity, private third-party certifier

6. CER issuance

5. Verification: DOE

4. Monitoring: PP

3. Registration: EB

2. Validation: DOE

1. Project design: PP

CDM | **Project cycle**

3. Registration: EB

Valid project submitted by DOE
to the Executive Board
with request for registration

6. CER issuance

5. Verification: DOE

4. Monitoring: PP

3. Registration: EB

2. Validation: DOE

1. Project design: PP

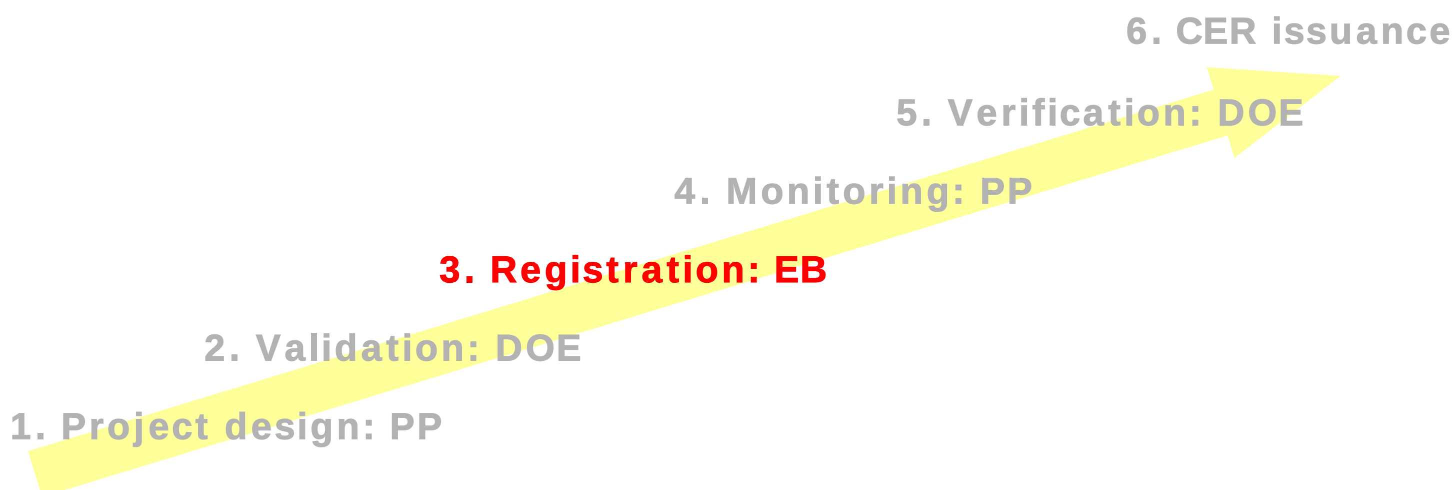
Registration step in detail

First: Completeness check by secretariat

Second: Work of certifier checked by expert from registration and issuance team (RIT)

Third: Work of RIT checked by secretariat

Fourth: If a Party or three members of Executive Board request review, project undergoes review, otherwise proceeds to registration



CDM | Project cycle

4. Monitoring: PP

Project participant responsible for monitoring actual emissions according to approved methodology

6. CER issuance

5. Verification: DOE

4. Monitoring: PP

3. Registration: EB

2. Validation: DOE

1. Project design: PP

5. Verification: DOE

Designated operational entity verifies that emission reductions took place, in the amount claimed, according to approved monitoring plan

6. CER issuance

5. Verification: DOE

4. Monitoring: PP

3. Registration: EB

2. Validation: DOE

1. Project design: PP

CDM | Project cycle

6. CER issuance: EB

Designated operational entity submits verification report with request for issuance to Executive Board

6. CER issuance

5. Verification: DOE

4. Monitoring: PP

3. Registration: EB

2. Validation: DOE

1. Project design: PP

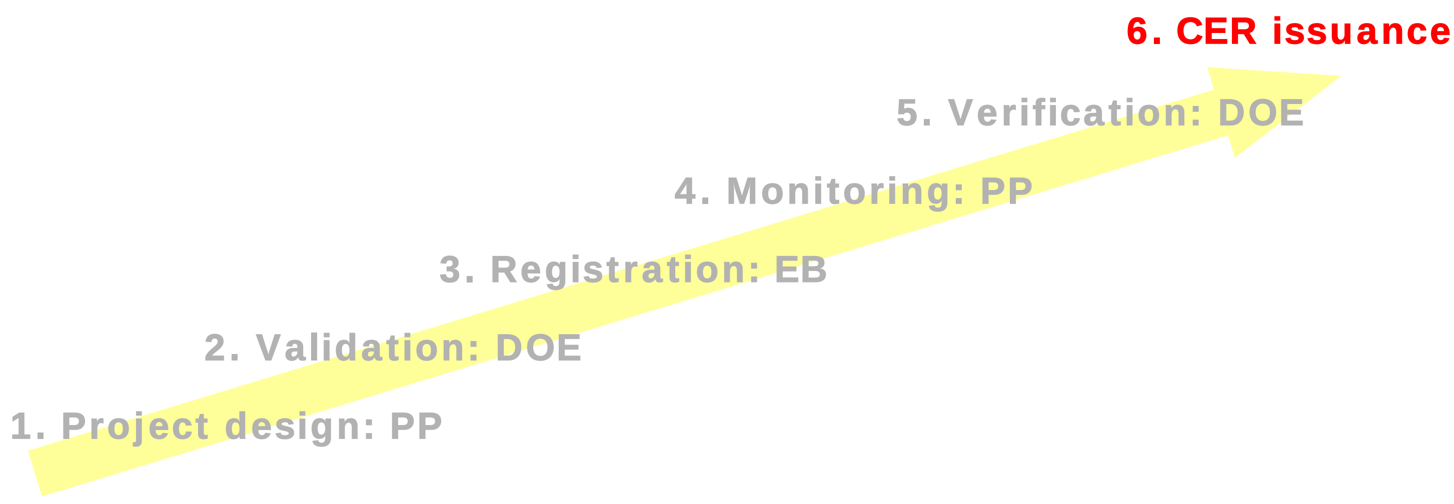
CER issuance step in detail

First: Completeness check by secretariat

Second: Work of certifier checked by expert from registration and issuance team (RIT)

Third: Work of RIT checked by secretariat

Fourth: If a Party or three members of Executive Board request review, issuance request undergoes review, otherwise proceeds to issuance



JI Track 2 | On the cusp?

- Joint Implementation (Article 6)

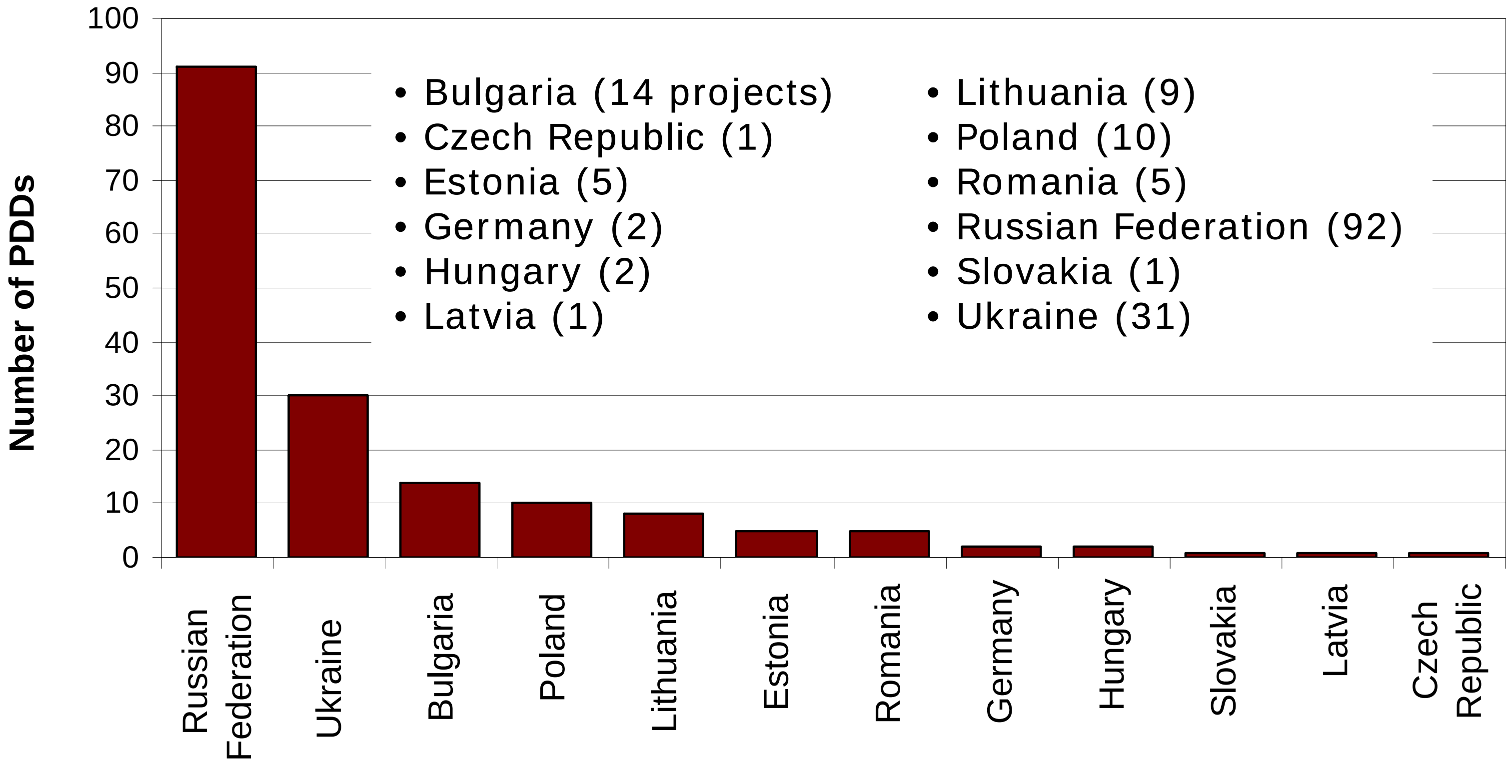
Emission reduction projects in <u>any country with a commitment under the Kyoto Protocol</u>

- Projects in capped environment
- Projects earn emission reduction units (ERUs)
- ERUs are created by conversion of existing assigned amount units (AAUs) held by the country
- ERUs are saleable/tradable units that can be used for compliance with KP targets

JI Track 2 | Project design documents

- **33 Parties have named designated focal points**
- **26 Parties have submitted procedures**
- **12 Parties hosting projects**

- **177 PDDs published for comment**



All published PDDs available on **UNFCCC JI website**: http://ji.unfccc.int

The 177 Project design documents represent

- **Emission reductions ~300 million t CO_2 eq. (2008-2012)**
  - Renewable energy (biomass, wind, hydro)
  - Methane avoidance (gas distribution, landfills, coal mine)
  - Destruction of nitrous oxide from chemical processes (nitric acid production)
  - Energy efficiency (manufacturing industries, district heating)
  - Fuel switch (manufacturing industries, transportation, power generation)
  - Power generation (modernization of power plants)

JI | **Project cycle**

1. Project design: PP

Project participant prepares PDD, making use of approved emissions baseline and monitoring methodology

6. ERU issuance

5. Verification: AIE

4. Monitoring: PP

3. Acceptance: JISC

2. Determination: AIE

1. Project design: PP

JI | Project cycle

2. Determination: AIE

Accredited independent entity (AIE), private third-party certifier, prepares and publishes PDD for public comment, and subsequently submits determination report to JISC

6. ERU issuance

5. Verification: AIE

4. Monitoring: PP

3. Acceptance: JISC

2. Determination: AIE

1. Project design: PP

JI | **Project cycle**

3. Acceptance: JISC

Project submitted by AIE to the Joint Implementation Supervisory Committee with request for determination. If letter of approval received, determination accepted (deemed final).

6. ERU issuance

5. Verification: AIE

4. Monitoring: PP

3. Acceptance: JISC

2. Determination: AIE

1. Project design: PP

Determination publication step in detail

First: Completeness check by secretariat

Second: Independent expert assigned to check determination report, two JISC members named to take lead in checking the determination

Third: Work of expert checked by secretariat

Fourth: If three members of JISC request review, or one Party, project undergoes review, otherwise project accepted

JI | **Project cycle**

4. Monitoring: PP

Project participant responsible for monitoring actual emissions according to approved methodology

6. ERU issuance

5. Verification: AIE

4. Monitoring: PP

3. Acceptance: JISC

2. Determination: AIE

1. Project design: PP

JI | Project cycle

5. Verification: AIE

Accredited independent entity verifies that emission reductions took place, in the amount claimed, according to approved monitoring plan

6. ERU issuance

5. Verification: AIE

4. Monitoring: PP

3. Acceptance: JISC

2. Determination: AIE

1. Project design: PP

JI | Project cycle

6. ERU issuance: Host Country

AIE submits verification report to JISC. If it is deemed to be in order, JISC approves emission reductions and host country is requested to proceed with issuance (i.e. convert equivalent number of AAUs into ERUs)

6. ERU issuance

5. Verification: AIE

4. Monitoring: PP

3. Acceptance: JISC

2. Determination: AIE

1. Project design: PP

ERU issuance step in detail

__First__: **Completeness check** by secretariat

__Second__: **Two JISC members** named to take lead in checking the verification

__Third__: If three members of JISC request review, or one Party, project undergoes **review**, otherwise **emission reductions approved**

Monitoring Emissions Allowance Markets

Pallas LeeVanSchaick, Ph.D.
Potomac Economics

Western Climate Initiative
Markets Committee Meeting
April 22, 2009

Introduction

- As the market monitor for the RGGI allowance market, Potomac Economics assists the RGGI States with market oversight. Potomac Economics also serves as the market monitor for several wholesale electricity markets in the U.S.
- This presentation provides an overview of market monitoring and how it contributes to market oversight:
  - ✓ Goal of market oversight
  - ✓ Primary objectives of market monitoring
  - ✓ Responsibilities of market monitors
  - ✓ Overview of the market monitoring process
  - ✓ Other market oversight issues
- Most aspects of market oversight are applicable to both emission allowance markets and electricity markets.

Goal of Market Oversight

- Cap-and-trade is an efficient mechanism for limiting CO2 emissions because it minimizes the cost impacts of emissions reductions.
  - ✓ CO2 allowance prices provide end-users and emitters with incentives to reduce emissions by adopting new technologies, improving energy efficiency, etc.
  - ✓ Such investment decisions are driven by price signals in the CO2 allowance market, making it important for the market to function efficiently.
- The goal of market oversight is to promote competition by:
  - ✓ Providing disincentives for anticompetitive conduct,
  - ✓ Reducing inefficient barriers to participation. Robust competition makes the market resistant to manipulation.
  - ✓ Identifying market rules or design issues that reduce the efficiency of the market.
- When there is uncertainty about whether a new market will be competitive, a well-designed market monitoring program helps ensure the market will be efficient.

Objectives of Market Monitoring

- Market monitors regularly analyze market outcomes in order to:
  - ✓ Identify and address anticompetitive behavior, which would distort the market outcomes and undermine confidence in the market.
  - ✓ Deter anticompetitive behavior by reducing the likelihood that such behavior will be profitable.
  - ✓ Identify inefficient market rules and recommend market design improvements.
    - – The market monitor is well positioned to identify factors that create barriers to entry, raise the cost of participation, or provide inefficient incentives.
    - – The best protection from anticompetitive conduct is robust competition.
  - ✓ Provide information about the market to policy makers, regulators, market participants, and the public. Such information is helpful in evaluating whether the market is functioning as intended.

Responsibilities of Market Monitors

- Market monitors have no regulatory authority.
  - ✓ Market monitors generally cannot impose remedies such as financial penalties.
  - ✓ Market monitors may request information from market participants, although such requests are only as compulsory as the participation agreements specify.
  - ✓ Market monitors investigate suspicious behavior and, if warranted, report findings to the appropriate entities, including state and federal regulators.
    - – The CFTC has jurisdiction over public commodities exchanges, and various agencies enforce state and federal antitrust laws.
- Market monitors should not be limited to addressing illegal conduct, but rather any issue that undermines market efficiency. When such conduct is identified, it can typically be addressed by:
  - ✓ Modifying the market rules.
  - ✓ Publishing information that makes the market more resistant to certain anticompetitive conduct.
  - ✓ Advising against the publication of information that could facilitate anticompetitive conduct.

Responsibilities of Market Monitor (cont.)

- Market monitors should collect information from the following sources:
  - ✓ Confidential information from the bidder qualification process, the auctions, and the allowance registry.
  - ✓ Public sources provide information that can be used to model the incentives of firms participating in the allowance market. (Some sources require a subscription.)
  - ✓ Confidential information from public exchanges and OTC transactions may not be available to the monitor (except what is obtained in an investigation).
- The market monitor should provide useful information to the public, regulators, and policy makers.
  - ✓ Information release should always balance concerns about transparency and other benefits of publication against concerns about confidentiality and facilitating anticompetitive conduct and confidentiality.
- Market monitors must avoid all potential conflicts of interest.
  - ✓ The market monitor's credibility requires it to be independent of any market participant, contractor, or other interested party.
  - ✓ Strict policies are needed to avoid financial or functional dependence on monitored entities.

Overview of the Market Monitoring Process

- We monitor the auction and the secondary market, screening the conduct of participants using competitive benchmarks. The competitive benchmarks are based on models of conduct that would be expected in a competitive and efficient market.
  - ✓ These expectations are based on the estimated value of allowances to each participant for compliance purposes or other business purposes. This requires classifying each participant as a compliance entity, a non-compliance entity, or a hybrid.
- To the extent that a market participant's conduct departs substantially from competitive expectations, we assess whether the conduct is likely:
  - ✓ A response to an inefficient market rule, or
  - ✓ An attempt to exercise market power or otherwise manipulate prices.
- If the conduct is potentially an exercise of market power or manipulation, we:
  - ✓ Use models to determine whether the conduct could have substantially affected the market.
  - ✓ Contact the market participant and request an explanation for the conduct.
- If warranted, we conduct a more detailed investigation and report findings to the appropriate entities.

Other Market Oversight Issues

- Participation in the market by non-compliance entities is beneficial for many reasons, including the following:
  - ✓ Non-compliance entities increase competition, reducing the potential exercise of market power by large compliance entities.
  - ✓ Brokers can assist smaller compliance entities in procuring allowances by providing advice and flexibility.
  - ✓ Non-compliance entities can help compliance entities hedge future compliance costs.
  - ✓ Not allowing their participation may discourage investment in offset projects and other efforts to reduce emissions.

Other Market Oversight Issues (cont.)

- Policies on information disclosure should balance the benefits of public disclosure against the likely costs.
  - ✓ The potential benefits of disclosure include:
    - – Transparency – information can help the public evaluate whether the market is working as intended.
    - – Information can reduce the cost of participation, increase certainty about expected future prices, or increase competition.
  - ✓ The potential harm from disclosure includes:
    - – Certain information that may facilitate collusion in the auction or unilateral market power.
    - – To avoid disclosure of confidential information, some firms may conceal their activity in the market. This would have the unintended effect of reducing the information available to the market monitor.
  - ✓ Hence, it is important to be selective about the information that is disclosed.

Other Market Oversight Issues (cont.)

- Policies on information collection:
  - ✓ Information could be collected from the auction process, the allowance registry, and/or the derivative market.
  - ✓ The collection of information should not impose undue cost on firms that participate in the auction or that hold allowances in the registry.
    - – Onerous reporting requirements can be circumvented, ultimately reducing the information available and increasing the difficulty of monitoring.
  - ✓ It would be difficult to collect information on derivatives (particularly OTC), since these would not be administered by WCI.
    - – It may be possible to obtain information on transactions in public exchanges. In this regard, there may be potential to develop a way to share information with the CFTC.
    - – Collecting information on OTC derivative transactions would likely be costly for market participants and the market monitor. Furthermore, such requirements could be difficult to enforce.

Western Climate Initiative News

April 24, 2009

This status report is issued on the last Friday of each month from WCI Partner jurisdictions to all interested stakeholders via the WCI listserv and website.

In This Issue

Upcoming Events

WCI Educational Opportunities Open to Stakeholders

WCI Comments on the American Clean Energy and Security Act

WCI Testifies on EPA's Proposed Mandatory GHG Reporting Rule

Markets Committee Taking Comments on Draft Principles

Offsets Committee Teleconferences on Protocol Review

Nova Scotia Joins the WCI

Upcoming Events

April 30: Stakeholder Update Call

The WCI's next bimonthly teleconference to update and hear from stakeholders will be on Thursday, April 30, from 12:30 to 2:00 pm (Pacific Time). To join the call, dial 1.800.868.1837 (toll free) or 1.404.920.6440 (direct dial), and enter participant code 659537#. A reminder and agenda for the call will be posted to the WCI website and sent to the listserv next week. (If you received this newsletter directly from the WCI, then you are on the listserv. If not, please go to the WCI website and join our listserv.)

Week of May 4: Release of Final Draft Essential Requirements of Mandatory Reporting for the WCI

Originally scheduled for release on April 20, the WCI will release its final draft of the essential requirements for mandatory reporting the week of May 4. A stakeholder conference call will be held on May 19 (see below) and a one-month period for written comment will be provided.

WCI Educational Opportunities Open to Stakeholders

The WCI is further extending its stakeholder engagement process to include opportunities for stakeholders to attend some of the teleconferences and webinars routinely conducted by WCI committees and task groups. Specifically, stakeholders will be invited to attend events in which experts share knowledge pertaining to various elements of the WCI cap-and-trade program design. Five such events, with stakeholder attendance, occurred the week of April 20 (see below). Future events will be posted on the WCI website and announced through the WCI listserv. Typically, there will be no opportunity on these teleconferences and webinars for stakeholders to make comments or ask questions, but stakeholder feedback can be provided at any time on the submit comments page of the WCI website, or during the bi-monthly stakeholder update calls. (See "Upcoming Events" to the left for information on the next stakeholder update call.)

In addition, a portion of each in-person meeting of the WCI Partners will be open to the public. These meetings generally occur every other month. The next WCI meeting which will be open to the public will occur on the afternoon of May 27 followed by a workshop on offset limits, early reduction allowances, and competitiveness issues on the morning of May 28 (see "Upcoming Events" to the left for additional information).

WCI Comments on the American Clean Energy

May 19: Stakeholder Call on Final Draft Essential Requirements

The Reporting Committee will host a teleconference to update and hear from stakeholders regarding the final draft essential requirements. The call will be held on Tuesday, May 19 from 12:00 pm to 2:00 pm (Pacific Time). Details for the call will be sent to the listserv and posted to the WCI website.

May 27: Partners Meeting, Seattle, WA

The WCI Partners will be meeting at the Grand Hyatt Hotel in Seattle, WA on May 27. Stakeholders and members of the public are invited to attend from 1:00 pm - 5:00 pm. There will be some time at the end of the day dedicated to public comments and questions. An informal reception will be hosted by the WCI Partners upon adjournment. The agenda and other meeting details will be posted to the WCI website and issued to the WCI listserv when available.

May 28: Cap Setting and Allowance Distribution (CSAD) Committee Workshop, Seattle, WA

Following on the WCI

and Security Act of 2009

On April 17, the WCI provided comments to the U.S. House of Representatives Energy and Commerce Committee regarding the Waxman-Markey discussion draft of The American Clean Energy and Security Act of 2009. A copy of these comments is available on the WCI website.

WCI Testifies on EPA's Proposed Mandatory GHG Reporting Rule

The WCI provided oral testimony to the US EPA at its April 16 public hearing in Sacramento on its proposed mandatory GHG reporting rule. A copy of the testimony is available on the WCI website. WCI expects to provide a complete set of written comments to US EPA prior to the close of the 60-day public comment period on June 9.

Markets Committee Taking Comments on Draft Principles and Market Oversight Questions

To help guide its research, analysis, and deliberations, the WCI Markets Committee is developing a set of principles that define the desired outcomes for three tasks described in the Committee work plan (Task 2: Compliance Verification and Enforcement; Task 3: Market Oversight; and Task 6: Auction Design). The draft principles, as well as market oversight questions intended to motivate a discussion of market oversight issues, are available for review and comment on the WCI website. These draft principles and questions were discussed at a stakeholder meeting in Seattle on April 9. The Markets Committee also hosted a teleconference on April 22 to gather information on market monitoring and oversight. The presentation from the April 22 teleconference is available on the WCI website.

Offsets Committee Teleconferences on Organizations and Institutions Which Conduct Offset Protocol Reviews

Per Task 3.1 of the WCI Offsets Committee's work plan, the Committee asked five organizations which may have the capacity or structures to perform the protocol review and recommendation process to make a presentation to the Committee and interested stakeholders. Teleconferences with four of the organizations occurred on April 21 and 22. The fifth and final presentation will occur April 28 at 10:00 am Pacific (see WCI website for details). The presentation from each organization will be posted to the WCI website.

Partners meeting, the CSAD Committee will host a workshop to discuss offset limits, early reduction allowances, and competiveness issues on the morning of May 28. This workshop will also be held at the Grand Hyatt Hotel in downtown Seattle. Further details will be posted to the WCI website and sent to the listserv soon, including draft white papers on offset limits and early reduction allowances.

Nova Scotia Joins the WCI as an Observer

The province of Nova Scotia has joined the WCI as an Observer. WCI Observers now include two Canadian provinces, six U.S. states, and six Mexican states.

The Climate Trust Project and Methodology Experience

Presented to

WCI Offsets Committee

April 28, 2009

The Climate Trust

Introduction to The Climate Trust

- Non-profit based in Portland, Oregon
- Only state-recognized supplier of regulatory-grade offsets
- Experienced offset practitioner: Since 1999
- Portfolio: 18 projects, $9 million, 3 million tons CO_2
- Quality reputation with regulators, business, and environmental groups

The Climate Trust

Regulatory Programs

- Oregon
  - Only qualified organization under state CO_2 Standard for power plants
- Washington State
  - Recognized Independent Qualified Organization under CO_2 Standard
- Massachusetts
  - Department of Environmental Protection
- Montana
  - Department of Environmental Quality

The Climate Trust

Voluntary Programs

- Colorado Carbon Fund
  - Initiated by the Governor's Energy Office
  - Focused on in-state offset projects
- Northwest Natural Smart Energy Program
  - Portland's natural gas utility
  - Focused on regional livestock methane projects
- Responsible for program design, project acquisition, fund management

The Climate Trust

Sampling of Project Portfolio

Oregon CO_2 Standard

- New power plants must offset a significant portion (~17%) of their CO2 emissions
- Climate Trust has unique non-profit role
- Developer can comply by paying a per-ton fee to The Climate Trust
- Trust reports to Energy Facility Siting Council

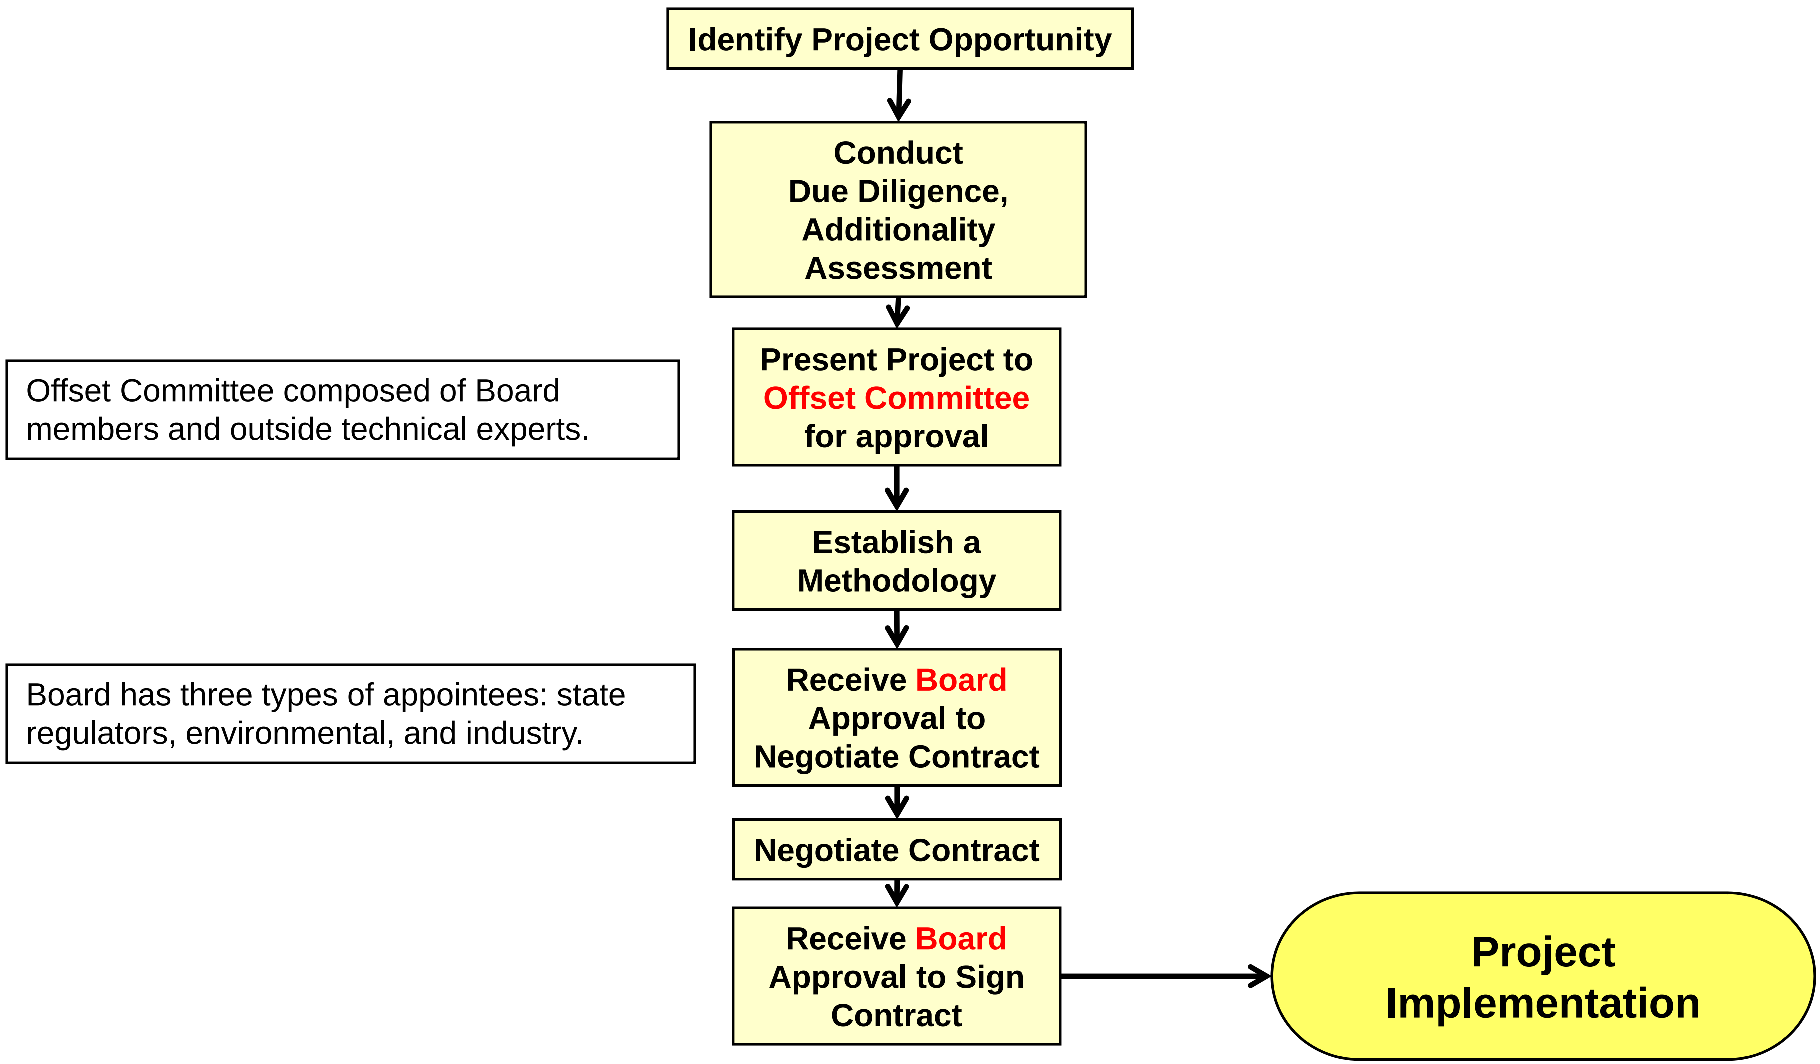
The Climate Trust

Capabilities/Capacity

- Offset project acquisition
- Offset project development
- Project management
- Methodology development
- Carbon contracting

The Climate Trust

Project Acquisition Process



Methodology Development

- **Methodologies developed in coordination with:**
  - **Outside technical experts**
  - **Climate Trust Offset Committee**
  - **Climate Trust Board of Directors**
- **Majority of existing portfolio pre-dates existing methodologies**
- **Outside methodologies used when available**

The Climate Trust

Project to Protocol

- Priority is identification of high-quality offset projects
- Project-specific methodology developed
- Most similar to CDM, VCS process
- Allows for market-based project solutions
- Can work in concert with sector methodologies

The Climate Trust

Developing an Offset Program Administrator

- Develop and evaluate methodologies and protocols
- Project to protocol process
- Early action implementation
- Evaluate projects or operate a third-party certifier system
- Administer project registry

The Climate Trust

Thank you

Sean Clark

Director of Offset Programs

The Climate Trust

Attachment 5: Adipic Acid Manufacturing

§ WCI.XX0 ADIPIC ACID MANUFACTURING

§ WCI.XX1 Source Category Definition

Adipic acid ($HOOC(CH_2)_4COOH$) is a dicarboxylic acid used in the production of a large number of products including synthetic fibers (primarily nylon 6,6), coatings, plastics, urethane foams, and synthetic lubricants. Adipic acid is produced by oxidizing a mixture of cyclohexanone ($(CH_2)_5CO$) and cyclohexanol ($(CH_2)_5CHOH$) with nitric acid in the presence of a catalyst; nitrous oxide (N_2O) is formed as an unwanted by-product.

§ WCI.XX2 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of N_2O at the facility level (metric tons)

(b) Total quantity of adipic acid production (metric tons)

(c) Facility-specific N_2O emission factor derived from periodic emissions monitoring or irregular emissions sampling (metric tons N_2O per metric ton of adipic acid)

(d) Destruction factor for facility-specific abatement technology (e.g., catalytic destruction, thermal destruction, nitric acid recycling, adipic acid recycling, etc.)

(e) Abatement system utilization factor for facility-specific abatement technology

(f) CO_2, N_2O, and CH_4 emissions from stationary combustion units as specified in WCI.20

§ WCI.XX3 Calculation of N_2O Emissions

(a) Process N_2O emissions. Determine process N_2O emissions as specified under either paragraph (1) or (2) of this section.

(1) Continuous emissions monitoring systems (CEMS).
(2) Calculation methodologies specified in paragraph (b) of this section.

(b) Process N_2O Emissions Calculation Methodology. Calculate total N_2O process emissions using the following equation:

$$E_{N2O} = EF \times AAP \times (1 - DF \times ASUF)$$

Equation XX0-1

Where:

E_{N2O}	=	Emissions of N_2O from adipic acid production (metric tons);
EF	=	N_2O emission factor (metric tons N_2O/metric ton of adipic acid produced) derived from periodic emissions monitoring or irregular emissions sampling;
AAP	=	Adipic acid production (metric tons);
DF	=	Destruction factor (dimensionless);
ASUF	=	Abatement system utilization factor (dimensionless).

§ WCI.XX4 Sampling, Analysis, and Measurement Requirements

The following measurement methods shall be used.

(a) Facility N_2O emissions tests. All facilities must conduct testing using:

(1) U.S. EPA Method 320 (40 CFR part 63, Appendix A) or ASTM D6348-03; or
(This is a possible change for WCI based on §98.54 of the Mandatory Reporting Rule);

(2) Continuous emissions monitor system (CEMS) to determine either the uncontrolled emissions to derive an emission factor (for use with the documented abator destruction efficiency), or the controlled emissions. The CEMS shall be operated in accordance with quality assurance and quality control program approved by the [jurisdiction].

(b) Adipic acid production rates. Production rates may be determined through sales records, or through direct measurement using flow meters or weigh scales.

Attachment 6: Primary Aluminum Production

§ WCI.70 PRIMARY ALUMINUM PRODUCTION

§ WCI.71 Source Category Definition

A primary aluminum production process converts alumina mineral to aluminum metal using electrolysis.

§ WCI.72 Greenhouse Gas Reporting Requirements

For each facility that includes a primary aluminum production process, the emissions data report must contain the following information:

(a) CO_2 emissions from anode consumption from prebaked and Søderberg electrolysis cells.

(b) CO_2 emissions from anode and cathode baking.

(c) CF_4 and C_2F_6 emissions for anode effects.

(d) CO_2 emissions from green coke calcination.

(e) SF_6 emissions from cover gas consumption.

(f) CO_2, N_2O, and CH_4 emissions from stationary combustion units as specified in WCI.20.

(g) Annual aluminum production.

§ WCI.73 Calculation of GHG Emissions

(a) Calculate CO_2 emissions from anode consumption using either Equation 70-1 or 70-2, as applicable.

(1) For Prebaked Anodes:

$$E_{CO_2} = \sum_{i=1}^{12} [NCC \times MP \times \frac{(100 - S_a - Ash_a - Imp_a)}{100} \times 3.664]_i$$

Equation 70-1

Where:

E_{CO2}	=	Annual CO_2 emissions (metric tons).
NCC	=	Net anode consumption per metric ton of aluminum for month i (metric ton/ metric ton aluminum).
MP	=	Aluminum production for month i (metric ton).
S_a	=	Sulfur content in baked anodes for month i (wt %).
Ash_a	=	Ash content in baked anodes for month i (wt %).
Imp_a	=	Content of fluorine and other impurities in baked anodes for month i (wt %).
3.664	=	Conversion factor from carbon to CO_2.

(2) For Søderberg Anodes:

$$E_{CO_2} = \sum_{i=1}^{12} \left[\begin{array}{l} (PC \times MP) - \left(BSM \times \frac{MP}{1000} \right) - \left(\frac{BC}{100} \times PC \times MP \times \left(\frac{S_p + Ash_p + H_p}{100} \right) \right) \\ - \left(\frac{100 - BC}{100} \times PC \times MP \times \frac{S_c + Ash_c}{100} \right) \end{array} \right]_i \times 3.664$$

Equation 70-2

Where:

E_{CO2}	=	Annual CO_2 emissions (metric tons).
PC	=	Paste consumption for month i (metric tons paste/metric ton aluminum).
MP	=	Aluminum production for month i (metric tons).
BSM	=	Emissions of benzene-soluble matter (kilograms benzene-soluble matter/metric ton aluminum).
BC	=	Average binder (pitch) content in paste for month i (wt %).
S_p	=	Sulfur content in pitch for month i (wt %).
Ash_p	=	Ash content in pitch (wt %).
H_p	=	Hydrogen content in pitch (wt %).
S_c	=	Sulfur content in calcinated coke (wt %).
Ash_c	=	Ash content in calcinated coke (wt %).
3.664	=	Conversion factor from carbon to CO_2.

(b) If anode or cathode baking is performed onsite, calculate CO_2 emissions as specified in paragraphs (b)(1) or (2) as applicable. Total emissions as specified in paragraph (b)(3) if both (b)(1) and (2) are applicable.

(1) Calculate CO_2 emissions from packing coke using Equation 70-3.

$$EC_{CO_2} = \sum_{i=1}^{12} \left(PCC \times BAP \times \frac{100 - Ash_{pc} - S_{pc} - Imp}{100} \right)_i \times 3.664$$

Equation 70-3

Where:

EC_{CO2}	=	Annual CO_2 emissions (metric tons pre year).
PCC	=	Packing coke consumption per metric ton of baked anode for month i (metric tons coke/metric ton anodes).
BAP	=	Baked anode production for month i (metric tons).
Ash_{pc}	=	Ash content in packing coke for month i (wt %).
S_{pc}	=	Sulfur content in packing coke for month i (wt %).
Imp	=	Content of other impurities for month i (wt %).
3.664	=	Conversion factor from carbon to CO_2.

(2) Calculate CO_2 emissions from pitch coking using Equation 70-4.

$$EP_{CO_2} = \sum_{i=1}^{12} \left(GAW - BAP - \left(\frac{H_p}{100} \times \frac{PC}{100} \times GAW \right) - RT \right)_i \times 3.664$$ **Equation 70-4**

Where:

EP_{CO2}	=	CO_2 emissions (metric tons pre year).
GAW	=	Green anode consumption for month i (metric tons).
BAP	=	Baked anode production for month i (metric tons).
H_p	=	Hydrogen content in pitch for moth i (wt %).
PC	=	Pitch content in green anode for month i (wt %).
RT	=	Recovered tar for month i (metric tons).
3.664	=	Conversion factor from carbon to CO_2.

(3) Calculate total CO_2 emissions for anode baking using Equation 70-5.

$$E_{anodebaking} = EC_{CO2} + EP_{CO2}$$ **Equation 70-5**

Where:

$E_{anodebaking}$	=	Total annual CO_2 emissions from anode baking (metric tons).
EC_{CO2}	=	Annual CO_2 emissions from packing coke (metric tons).
EP_{CO2}	=	Annual CO_2 emissions from pitch coking (metric tons).

(c) Calculate CF_4 and C_2F_6 emissions from anode effects for each pot line using either the Slope Method in paragraph (c)(1) or the Pechiney Method in paragraph (c)(2).

(1) **Slope Method:** Calculate the CF_4 and C_2F_6 emissions using Equation 70-6.

$$E_{CF_4,C_2F_6} = \sum_{i=1}^{n} [slope_{CF_4,C_2F_6} \times AEF \times AED \times MP]_i$$ **Equation 70-6**

Where:

$E_{CF4,\ C2F6}$	=	Annual emissions of CF_4 or C_2F_6 (metric tons/yr).
$slope_{CF4,\ C2F6}$	=	Measured slope coefficient ([Metric tons of CF_4 or C_2F_6 /metric ton Aluminum]/[anode effect minutes/pot-days]).
AEF	=	Anode effect frequency (number of anode effects per pot per day).
AED	=	Anode effect duration (minutes per anode effect).
MP	=	Aluminum production per day (metric tons).
n	=	Number of operating days per year.

(2) **Pechiney Method:** Calculate the CF_4 and C_2F_6 emissions using Equation 70-7.

$$E_{CF_4,C_2F_6} = \sum_{i=1}^{n}[Over-voltage \quad coefficient_{CF_4,C_2F_6} \times \frac{AEO}{CE} \times MP]_i$$ **Equation 70-8**

Where:

$Emission_{CF4,\ C2F6}$	=	Emissions of CF_4 or C_2F_6 (metric tons/yr).
Over-voltage $coefficient_{CF4,\ C2F6}$	=	Experimentally measured ([Metric tons of CF_4 or C_2F_6 /metric ton Aluminum]/mV).
AEO	=	Anode effect over-voltage (millivolts per pot per day).
CE	=	Current efficiency of aluminum production process, expressed as a fraction.
MP	=	Aluminum production per day (metric tons).
n	=	Number of operating days per year.

(d) Calculate CO_2 emissions from onsite green coke calcination furnaces using Equation 70-9.

$$E_{CO_2} = \sum_{n=1}^{12}\left[\left[GC \times \frac{(100 - H_2O_{gc} - V_{gc} - S_{gc})}{100} - (CC + UCC + DE) \times \frac{(100 - S_{cc})}{100}\right] \times 3.664\right]_i + \left[GC \times 0.035 \times \frac{44}{16}\right]_i$$ **Equation 70-9**

Where:

E_{CO2}	=	CO_2 emissions (metric tons pre year).
GC	=	Green coke feed for month i (metric tons).
H_2O_{gc}	=	Humidity in green coke feed for month i (wt %).
V_{gc}	=	Volatiles in green coke feed for month i (wt %).
S_{gc}	=	Sulfur content in green coke feed in month i (wt %).
S_{cc}	=	Sulfur content in calcinated coke in month i (wt %).
CC	=	Calcinated coke produced in month i (metric tons).
UCC	=	Under-calcinated coke produced in month i (metric tons).
DE	=	Coke dust emissions for month i (metric tons).
3.664	=	Conversion factor from carbon to CO_2.
0.035	=	Assumed CH_4 and tar content in coke volatiles, contributing to CO_2 emissions.
44/16	=	Conversion factor from methane to CO_2.

(e) Calculate SF_6 emissions from cover gas consumption using one of the following methods:

(1) Calculate the annual SF_6 emissions using inventory records and Equation 70-10:

$$E_{SF6} = S_{Inv-Begin} - S_{Inv-End} + S_{Purchased} - S_{Shipped}$$ **Equation 70-10**

Where:

E_{SF6}	=	SF_6 emissions from cover gas (metric tons).

$S_{Purchased}$ = Quantity of SF_6 purchased (metric tons).
$S_{Shipped}$ = Quantity of SF_6 shipped offsite (metric tons).
$S_{Inv\text{-}Begin}$ = Quantity of SF_6 in storage at the beginning of the year, (metric tons).
$S_{Inv\text{-}End}$ = Quantity of SF_6 in storage at the end of the year (metric tons).

(2) Calculate the annual SF_6 emissions using Equation 70-11 and direct measurement of the SF6 input to electrolysis cells and the SF6 waste gases collected and transferred off-site:

$$E_{SF6} = \sum_{i=1}^{12} [(Q_{Input} \times C_{Input}) - (Q_{Output} \times C_{Output})]_i \qquad \textbf{Equation 70-11}$$

Where:
E_{SF6} = SF_6 emissions from cover gas (metric tons).
$Q_{in;put}$ = Quantity of SF_6 input to the electrolysis cell for month i (metric tons).
C_{Input} = Concentration of SF_6 input to the electrolysis cell for month i (metric tons).
Q_{Output} = Quantity of SF_6 gas collected during month i (if applicable) (metric tons).
C_{Output} = Concentration of SF_6 gas collected and sent off-site during month i (metric tons).

WCI.74 Monitoring Requirements

(a) Except as specified in paragraphs (b) through (c) of this section, all parameters must be measured monthly using methods that comply with the measurement accuracy provisions in WCI.2(g).

(b) Conduct performance tests once every 36 months to determine the slope or Pechiney coefficients for each pot line using the *Protocol for Measurement of Tetrafluoromethane and Hexafluoroethane Emissions from Primary Aluminum Production*, U.S. Environmental Protection Agency and International Aluminum Institute. April 2008. The test must be repeat whenever:

(1) Thirty-six months have passed since the last measurements;
(2) A change occurs in the control algorithm that affects the mix of types of anode effects or the nature of the anode effect termination routine; or
(3) Changes occur in the distribution of duration of anode effects (e.g. when the percentage of manual kills changes or if, over time, the number of anode effects decreases and results in a fewer number of longer anode effects) or, for Rio Tinto Alcan control technology, when the algorithm for bridge movements and anode effect overvoltage accounting changes.

(c) If using the direct measurement approach in WCI.73(e)(2) to calculate SF_6 emissions from cover gas consumption, you must measure the quantity of SF_6 gas input to the electrolysis cell month and the quantity and SF_6 concentration of any waste gas collected and sent off-site.

Monitoring methods have not been specified in the available methodologies for the aluminum industry. There are several possible approaches to specifying monitoring methods:

- *Specify the accuracy required for each datum and allow the source to select their own methodologies that meet the accuracy requirements, and require the* *verifiers to certify the accuracy requirements were achieved, [This approach is especially useful for monitoring that is currently being made with a wide variety of instruments and are likely being made with high accuracy, such as monitoring of raw material flows and product flows; however, much burden is placed on verifiers to ensure the accuracy of the methods used. This approach is used for monitoring fuel flow for combustion sources.]*

- *Specify the accuracy required for each datum and require the source to submit a monitoring plan that meets the accuracy requirements, and require the verifiers to certify the source followed the approved plan. [This approach places a lot of burden on WCI to approve individual monitoring plans.]*
- *Specify the methodologies that should be followed, selecting them from available ASTM, ISO, U.S. EPA, and EC methodologies; however, there are not e*stablished methods for all parameters. Listed below are examples of the available methodologies for monitoring the aluminum industry.

ISO 9055:1988. Carbonaceous materials for the production of aluminum -- Pitch for electrodes -- Determination of sulfur content by the bomb method.

ISO 10238:1999. Carbonaceous materials used in the production of aluminum -- Pitch for electrodes -- Determination of sulfur content by an instrumental method.

ISO 8006:1985. Carbonaceous materials used in the production of aluminum -- Pitch for electrodes -- Determination of ash.

ISO 8005-2005. Carbonaceous materials used in the production of aluminum -- Green and calcined coke -- Determination of ash content

ISO 10237-1997. Carbonaceous materials for use in the production of aluminum -- Calcined coke -- Determination of residual-hydrogen content.

ISO 5931:2000. Carbonaceous materials used in the production of aluminum -- Calcined coke and calcined carbon products -- Determination of total sulfur by the Eschka method.

Slope and Over-voltage Coefficient: *Protocol for Measurement of Tetrafluoromethane and Hexafluoroethane Emissions from Primary Aluminum Production.* U.S. Environmental Protection Agency and International Aluminum Institute. April 2008.

ASTM D3173 Test Method for Moisture in the Analysis Sample of Coal and Coke

The following parameters are not covered by a specific ASTM or ISO methodology. They are candidates for being addressed using one of the first two approaches listed above.

- Mass flow rates or consumption of aluminum, paste, carbon, anodes, coke, recovered tar, and coke dust,
- Emissions of benzene soluble matter,
- Binder content in paste,
- Pitch content in anodes,

- Current efficiency,
- Anode effect frequency,
- Anode effect duration,
- Anode effect over-voltage,
- Current efficiency,
- Volatile content in coke.

Attachment 3: General Stationary Combustion

(UNDERLINE/STRIKEOUT VERSION SHOWING CHANGES FROM JANUARY 6, 2009 RELEASE, FOLLOWED BY INTEGRATED VERSION)

§ WCI.20 GENERAL STATIONARY COMBUSTION

§ WCI.21 Source Category Definition

General stationary fuel combustion sources are devices that combust solid, liquid, or gaseous fuel for the purpose of generating steam (or providing useful heat or energy) for industrial, commercial, or institutional use; or reducing the volume of waste by removing combustible matter. General stationary combustion sources are boilers, combustion turbines, engines, incinerators, and process heaters, and any other stationary combustion device that is not specifically addressed under the provisions for another source category in this rule.

Note: The source category definition may need to be revised after the remaining ER sections are completed.

§ WCI.22 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil and biomass fuels, reported by fuel type.
~~(2) Total CO_2 emissions for all biomass fuels combined.~~
(2) Total CH_4 emissions ~~for all fuels combined~~, reported by fuel type.
(3) Total N_2O emissions ~~for all fuels combined~~, reported by fuel type.

(b) Annual fuel consumption:

(4) For gases, report in units of ~~million cubic meters~~ standard cubic feet.
(5) For liquids, report in units of ~~liters~~ gallons.
(6) For non-biomass solids, report in units of ~~metric~~ short tons.
(7) For ~~biomass-derived~~ biomass solid fuels, report in units of bone dry short tons or bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average ~~high~~ higher heating value of each fuel, ~~as~~ if used to compute CO_2 emissions.

(e) Annual steam generation in pounds or kilograms, for units that burn biomass fuels or municipal solid waste.

[Please note that most of the calculation methodologies in this section currently accommodate inputs in English units, only, and not SI units. The section will be revised to allow inputs in SI

units, as well as to provide applicable Canadian emission factors from "National Inventory Report 1990-2007: Greenhouse Gas Sources and Sinks in Canada – The Canadian Government's Submission to the UN Framework Convention on Climate Change, April 2009." (http://www.ec.gc.ca/pdb/ghg/inventory_e.cfm)]

§ WCI.23 Calculation of CO_2 Emissions

For each fuel, calculate CO_2 mass emissions using one of the four calculation methodologies specified in this section, subject to the restrictions in §WCI.23(e).

(a) Calculation Methodology 1. Calculate the annual CO_2 mass emissions by substituting a fuel-specific default CO_2 emission factor, a default ~~high~~ higher heating value, and the annual fuel consumption into the Equation 20-1:

$$CO_2 = Fuel \times HHV \times EF \times 0.001$$ **Equation 20-1**

Where:

CO_2	=	Annual CO_2 mass emissions for the specific fuel type (metric tons).
Fuel	=	Mass or volume of fuel combusted per year (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).
HHV	=	Default ~~high heat~~ higher heating value of the fuel, from column 3 of Table 20-1 (mmBtu per mass or mmBtu per volume, as applicable).
EF	=	Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 (kg CO_2/mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(b) Calculation Methodology 2. Calculate the annual CO_2 mass emissions using a default fuel-specific CO_2 emission factor, ~~and either Equation 20-2 or 20-3, as appropriate~~ a higher heating value provided by the supplier or measured by the operator, using Equation 20-2, except for emissions from the combustion of biomass fuels and municipal solid waste, for which the operator may instead elect to use the method shown in Equation 20-3.

(1) ~~Equation 20-2 of this section can be used~~ For any type of fuel for which an emission factor is provided in Tables 20-1 or 20-2, except biomass fuels and municipal solid waste when the operator elects to use the method in WCI.23(b)(2), use Equation 20-2:

$$CO_2 = \sum_{p=1}^{n} Fuel_P \times HHV_P \times EF \times 0.001$$ **Equation 20-2**

Where:

CO_2	=	Annual CO_2 mass emissions for a specific fuel type (metric tons).
n	=	Number of required heat content measurements for the year as specified in WCI.25.
$Fuel_p$	=	Mass or volume of the fuel combusted during the measurement period "p" (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).

HHV_p	=	~~High heat~~ Higher heating value of the fuel for the measurement period (mmBtu per mass or volume).
EF	=	Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 or from Table 20-2 (kg CO_2/mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(2) ~~Equation 20-3 of this section can be used~~ For biomass solid fuels and municipal solid waste ~~only~~, use either Equation 20-2 above or Equation 20-3:

$$CO_2 = Steam \times B \times EF \times 0.001$$ **Equation 20-3**

Where:

CO_2	=	Annual CO_2 mass emissions from ~~MSW~~ biomass solid fuel or municipal solid waste combustion (metric tons).
Steam	=	Total mass of steam generated by ~~MSW~~ biomass solid fuel or municipal solid waste combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's ~~maximum~~ design rated heat input capacity to its design rated steam output capacity (mmBtu/lb steam).
EF	=	Default ~~carbon content for MSW~~ emission factor for biomass solid fuel or municipal solid waste, from column 5 of Table ~~WCI.20-1~~ 20-1 (kg CO_2/mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(c) Calculation Methodology 3. Calculate the annual CO_2 mass emissions by ~~substituting measurements of fuel carbon content, molecular weight (gaseous fuels, only), and the quantity of fuel combusted into the following equations. For solid fuels, the amount of fuel combusted is obtained from company records kept as provided in this rule. For liquid and gaseous fuels, the volume of fuel combusted is measured directly, using fuel flow meters (including gas billing meters). For fuel oil, tank drop measurements may also be used~~ using measurements of fuel carbon content or molar fraction (for gaseous fuels only), conducted by the operator or provided by the fuel supplier, and the quantity of fuel combusted, using Equation 20-4. For emissions from the combustion of biomass fuels and municipal solid waste, the operator may instead elect to use the method shown in Equation 20-5.

(1) For a solid fuel, use Equation 20-4 of this section:

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times 3.664 \times \underline{0.907}$$ **Equation 20-4**

Where:

CO_2	=	Annual CO_2 mass emissions from the combustion of the specific solid fuel (metric tons).
n	=	Number of ~~monthly~~ carbon content determinations for the year.
$Fuel_i$	=	Mass of the solid fuel combusted in ~~month "n" (metric tons)~~ measurement period "i" (short tons).
CC_i	=	Carbon content of the solid fuel, from the fuel analysis results for ~~month "n"~~ measurement period "i" (percent by weight, expressed as a decimal fraction, e.g., 95% = 0.95).

3.664 = Ratio of molecular weights, CO_2 to carbon.
0.907 = Conversion factor from short tons to metric tons.

(2) For biomass fuels or municipal solid waste, use either Equation 20-4 above or Equation 20-5:

$$CO_2 = Steam \times B \times EF \times 0.001$$ **Equation 20-5**

Where:

CO_2 = Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).

Steam = Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (lb steam).

B = Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (mmBtu/lb steam).

EF = Default emission factor for biomass solid fuel or municipal solid waste, from column 5 of Table 20-1, (kg CO_2/mmBtu), adjusted no less often than every third year as provided in WCI.25(a)(5)(B).

0.001 = Conversion factor from kilograms to metric tons.

(3) For a liquid fuel, use Equation ~~20-5~~ 20-6 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times 0.001$$ **Equation 20-6**

Where:

CO_2 = Annual CO_2 mass emissions from the combustion of the specific liquid fuel (metric tons).

n = Number of required carbon content determinations for the year, as specified in WCI.25.

$Fuel_i$ = Volume of the liquid fuel combusted in ~~month "n"~~ measurement period "i" (gallons).

CC_i = Carbon content of the liquid fuel, from the fuel analysis results for ~~month "n"~~ measurement period "i" (kg C per gallon of fuel).

3.664 = Ratio of molecular weights, CO_2 to carbon.

0.001 = Conversion factor from kg to metric tons.

(4) For a gaseous fuel, use Equation ~~20-6~~ 20-7 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times \frac{MW}{MVC} \times 0.001$$ **Equation 20-7**

Where:

CO_2 = Annual CO_2 mass emissions from combustion of the specific gaseous fuel (metric tons).

n = Number of required carbon content and molecular weight determinations for the year, as specified in WCI.25.

$Fuel_i$ = Volume of the gaseous fuel combusted in period "i" (a day or month, as applicable)(scf).

CC_i = Average carbon content of the gaseous fuel, from the fuel analysis results for the period "i" (day or month, as applicable) (kg C per kg of fuel).

MW = Molecular weight of the gaseous fuel, from fuel analysis (kg/kg-mole).

MVC = Molar volume conversion factor (849.5 scf per kg-mole ~~at standard conditions~~ for STP of 20°C and 1 atmosphere or 836 scf per kg-mole for STP of 60°F, and 1 atmosphere).

3.664 = Ratio of molecular weights, CO_2 to carbon.

0.001 = Conversion factor from kg to metric tons.

(d) Calculation Methodology 4. Calculate the annual CO_2 mass emissions from all fuels combusted in a unit, by using data from continuous emission monitoring systems (CEMS) as specified in (d)(1) through (d)(7).

(1) ~~The operator of~~ For a facility that combusts fossil fuels or biomass fuels and operates CEMS in response to federal, state, provincial, or local regulation, ~~may~~ use CO_2 or O_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) The operator shall report CO_2 emissions for the ~~report~~ reporting year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(B) If the operator of a facility that combusts biomass fuels uses O_2 concentrations to calculate CO_2 concentrations, annual source testing must demonstrate that calculated CO_2 concentrations when compared to measured CO_2 concentrations meet the Relative Accuracy Test Audit (RATA) requirements in 40 CFR Part 60, Appendix B, Performance Specification 3.

(2) ~~The operators of a facility that combusts municipal solid waste or other waste-derived fuels~~ For a facility that combusts waste-derived fuels (as defined in the General Provisions and listed in Table 20-2, including municipal solid waste), and operates a CEMS in response to federal, state, provincial, or local regulations ~~must~~ use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) Annual CO_2 emissions shall be reported in metric tons based on the sum of hourly CO_2 mass emissions over the year.

(B) Emissions calculations shall not be based on O_2 concentrations.

(3) The operator of a facility that combusts ~~MSW or other~~ waste-derived fuels and calculates CO_2 emissions using the methodology provided in WCI.23(d)(2) shall determine the portion of emissions associated with the combustion of biomass-derived fuels using the method provided in WCI.23(f).

(4) An operator who uses CEMS data to report CO_2 emissions from a facility that co-fires fossil fuels with biomass fuels or waste-derived fuels that are partly biomass fuels shall determine the portion of total CO_2 emissions separately assigned to the fossil fuel and the ~~biomass-derived fuel~~ biomass fuels using the method provided in WCI.23(f), if applicable. The operator who co-fires pure biomass fuels with fossil fuels may elect to calculate CO_2 emissions for the fossil fuels using methods designated in ~~WCI.23(b)(3) by fuel type and then subtract~~ WCI.23(a) or WCI.23(b)(1), as applicable, by fuel type and then calculate biomass fuel emissions by subtracting the fossil fuel related emissions from the total CO_2 emissions determined using the CEMS based methodology.

(5) For any units for which CO_2 emissions are reported using CEMS data, the operator is relieved of the requirement to separately report process emissions from combustion emissions for that unit or to report emissions separately for different fossil fuels for that unit when only fossil fuels are co-fired. In this circumstance, operators shall still report fuel use by fuel type as otherwise required.

(6) If a facility is subject to requirements in 40 CFR Part 60 or 40 CFR Part 75 and the operator chooses to add devices to an existing ~~continuous monitoring system~~ CEMS for the purpose of measuring CO_2 concentrations or flue gas flow, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 60 or Part 75 that apply to the facility. If the facility is subject to both 40 CFR Part 60 and 40 CFR Part 75, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 75.

(7) If a facility does not have a ~~continuous emissions monitoring system~~ CEMS and the operator chooses to add one in order to measure CO_2 concentrations, the operator shall select and operate the CEMS pursuant to the requirements in 40 CFR Part 75 or equivalent requirements as applicable in Canada.

(A) The operator shall use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(B) The operator shall report CO_2 emissions for the report year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(C) Operators who add CEMS under this article are subject to specifications in WCI.23(d)(1)-(5), if applicable.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CO_2 emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) Calculation Methodology 1 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a ~~high~~ higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise, Calculation Methodology 1 may be used for any type of fuel for which a default CO_2 emission factor and a default ~~high heat~~ higher heating value for the fuel is specified in Table 20-1.

(2) Calculation Methodology 2 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a ~~high~~ higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise,

Calculation Methodology 2 may be used for any type of fuel combusted for which a default CO_2 emission factor for the fuel is specified in Table 20-1 or 20-2.

(3) Calculation Methodology 3 may be used for a unit of any size combusting any type of fuel, except when the use of Calculation Methodology 4 is required.

(4) Calculation Methodology 4 may be used for a unit of any size combusting any type of fuel, and must be used for ~~either of the following conditions:~~ a combustion unit with a CEMS that is required by any federal, state, provincial, or local regulation <u>and that includes both a stack gas volumetric flow rate monitor and a CO_2 concentration monitor</u>.

~~(ii) A municipal solid waste combustion unit that is subject to the verification requirements of WCI.8.~~

(f) ~~Biogenic CO_2 emissions. The operator that combusts fuels or fuel mixtures that contain biomass~~ <u>Mixtures of biomass fuel and fossil fuel. The owner or operator that combusts fuels or fuel mixtures for which the biomass fuel fraction is unknown or cannot be documented (for example, municipal solid waste or tire-derived fuels)</u> shall determine the ~~biomass-derived~~ <u>biomass fuel</u> portion of CO_2 emissions using ASTM D6866-06a, as specified in this paragraph. This procedure is not required for fuels that contain less than 5 percent biomass <u>fuel</u> by weight or for waste-derived fuels that are less than 30 percent ~~biomass by weight on an annual basis~~ <u>by weight of total fuels combusted in the year for which emissions are being reported, except where the operator wishes to report a biomass fuel fraction of CO_2 emissions</u>.

(1) The operator shall conduct ASTM D6866-06a analysis <u>on a representative fuel or exhaust gas sample</u> at least every three months, and shall collect ~~each gas sample for analysis during normal operating conditions~~ <u>exhaust gas samples</u> over at least 24 consecutive hours <u>following the standard practice specified by ASTM D7459-08</u>.

(2) The operator shall divide total CO_2 emissions between ~~biomass-derived emissions and non-biomass-derived emissions using the average proportionalities of the samples analyzed~~ <u>biomass fuel emissions and non-biomass fuel emissions using the average proportions of the samples analyzed for the year for which emissions are being reported</u>.

(3) If there is a common fuel source to multiple units at the facility, the operator may elect to conduct ASTM D6866-06a testing for one of the units.

§ WCI.24 Calculation of CH_4 and N_2O Emissions

Calculate the annual CH_4 and N_2O mass emissions from stationary fuel combustion sources using the procedures in paragraph (a), (b), or (c), as appropriate.

(a) If the heat content of the fuel is <u>not</u> measured <u>for CO_2 estimation</u>, calculate CH_4 and N_2O emissions ~~the following Equation 20-7~~ <u>using Equation 20-8</u>:

$$\text{deleted equation}: CH_4 \text{ or } N_2O = \sum_{1}^{n} Fuel_P \times HHV_P \times EF \times 0.001$$

$$\text{inserted equation}: CH_4 \text{ or } N_2O = Fuel \times HHV_D \times EF \times 0.001$$

Equation 20-8

Where:

CH_4 or N_2O = Combustion emissions from specific fuel type, metric tons CH_4 or N_2O per year.

~~n = Period/frequency of heat content measurements over the year (e.g. monthly n = 12).~~

~~$Fuel_p$~~ Fuel = Mass or volume of fuel combusted for the measurement period, p, specified by fuel type, units of mass or volume per unit time.

~~HHV_p~~ HHV_D = ~~High heat~~ Default higher heating value ~~measured for the measurement period~~ specified by fuel type provided in Table 20-1, MMBtu per unit of mass or volume.

EF = Default CH_4 or N_2O emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.

0.001 = Factor to convert kg to metric tons.

(b) If the heat content of the fuel is ~~not~~ measured for CO_2 estimation, calculate CH_4 and N_2O emissions using ~~the following~~ Equation 20-9:

$$deleted\ equation: CH_4\ or\ N_2O = \sum_1^n Fuel \times HHV_D \times EF \times 0.001$$

Equation 20-9

$$inserted\ equation: CH_4\ or\ N_2O = \sum_{p=1}^n Fuel_p \times HHV_p \times EF \times 0.001$$

Where:

CH_4 or N_2O = CH_4 or N_2O emissions from a specific fuel type, metric tons CH_4 or N_2O per year.

~~Fuel~~ $Fuel_p$ = Mass or volume of fuel combusted specified by fuel type, unit of mass (short tons) or volume (scf, barrel) per year.

~~HHV_D~~ HHV_p = ~~Default high heat value~~ Higher heating value measured for the measurement period, p, specified by fuel type ~~provided in Table 20-3~~, MMBtu per unit ~~of~~ mass or volume.

EF = Default emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.

0.001 = Factor to convert kg to metric tons.

(c) For biomass and municipal solid waste combustion, the operator may elect to use Equation ~~20-9~~ 20-10 of this section to estimate CH_4 and N_2O emissions:

$$CH_4\ or\ N_2O = Steam \times B \times EF \times 0.001$$

Equation 20-10

Where:

CH_4 or N_2O = Annual CH_4 or N_2O emissions from the combustion of a municipal solid waste (metric tons).

Steam = Total mass of steam generated by ~~MSW~~ municipal solid waste combustion during the reporting year (lb steam).

B = Ratio of the boiler's maximum rated heat input capacity to its design rated steam output (mmBtu/lb steam).

EF = Fuel-specific emission factor for CH_4 or N_2O, from Table WCI.20-3 of this subpart (kg CH_4 or N_2O per mmBtu).

0.001 = Conversion factor from kilograms to metric tons.

(d) The operator may elect to calculate CH_4 ~~and~~ or N_2O emissions using source-specific emission factors derived from source tests conducted at least annually under the supervision of (*jurisdiction*). Upon approval of a source test plan, the source test procedures in that plan shall be repeated in each future year to update the source specific emission factors annually.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CH_4 and N_2O emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) WCI.24(a) may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise, WCI.24(a) may be used for any type of fuel for which a default CH_4 or N_2O emission factor and a default higher heat value for the fuel is specified in Table 20-3.
(2) WCI.24(b) may be used for a unit of any size combusting any type of fuel.
(3) WCI.24(c) may only be used for biomass or municipal solid waste combustion.
(4) WCI.24(d) may be used for a unit of any size combusting any type of fuel.

§ WCI.25 Sampling, Analysis, and Measurement Requirements

(a) Fuel Sampling Requirements. Fuel sampling must be conducted or fuel sampling results must be received from the fuel supplier at the frequency specified in ~~paragraph~~ paragraphs (a)(1) through (a)(4) of this section.

(1) ~~At receipt of~~ Once for each new fuel shipment or delivery or on a monthly basis for middle distillates (diesel, gasoline, fuel oil, kerosene), residual oil, liquid waste-derived fuels, and LPG (ethane, propane, isobutene, n-butane, unspecified LPG);
(2) Monthly for natural gas, associated gas, and mixtures of low Btu gas.
(3) Monthly for gases derived from biomass including landfill gas and biogas from wastewater treatment or agricultural processes.
(4) Monthly for solid fuels, as specified below:

(A) The monthly solid fuel sample shall be a composite sample of weekly samples.
(B) The solid fuel shall be sampled at a location after all fuel treatment operations but before fuel mixing and the samples shall be representative of the fuel chemical and physical characteristics immediately prior to combustion.
(C) Each weekly sub-sample shall be collected at a time (day and hour) of the week when the fuel consumption rate is representative and unbiased.
(D) Four weekly samples (or a sample collected during each week of operation during the month) of equal mass shall be combined to form the monthly composite sample.
(E) The monthly composite sample shall be homogenized and well mixed prior to withdrawal of a sample for analysis.
(F) One in twelve composite samples shall be randomly selected for additional analysis of its ~~discreet~~ discrete constituent samples. This information will be used to monitor the homogeneity of the composite.

(5) For biomass fuels and waste-derived fuels, the following may apply in lieu of WCI.25(a)(4):

(A) If CO_2 emissions are calculated using WCI.23(c)(1), the source-specific carbon content is determined annually. Upon approval of a source test plan by [*jurisdiction*], the source test procedures in that plan shall be repeated in subsequent years to update the source specific emission factors annually.

(B) If CO_2 emissions are calculated using WCI.23(c)(2) (biomass fuels and municipal solid waste only), the operator shall adjust the emission factor, in kg CO2/MMBtu not less frequently than every third year, through a stack test measurement of CO2 and use of the applicable ASME Performance Test Code to determine heat input from all heat outputs, including the steam, flue gases, ash and losses.

(b) Fuel Consumption Monitoring Requirements.

~~(1) Facilities that are subject to the verification requirements of WCI.8 must determine annual fuel consumption by direct measurement.~~

(1) Facilities ~~that are not subject the verification requirements of WCI.8~~ may determine fuel consumption on the basis of direct measurement or recorded fuel purchase or sales invoices measuring any stock change (measured in million Btu, gallons, million standard cubic feet, short tons or bone dry short, tons) using the following equation:

Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End

(2) Fuel consumption measured in Btu values shall be converted to the required metrics of mass or volume using heat content values that are either provided by the supplier, measured by the facility, or provided in Table 20-1.

(3) All oil and gas flow meters (except for gas billing meters) shall be calibrated prior to the first year for which GHG emissions are reported under this rule, using an applicable flow meter test method listed in section WCI.6 or the calibration procedures specified by the flow meter manufacturer. Fuel flow meters shall be recalibrated either annually or at the minimum frequency specified by the manufacturer.

(4) For fuel oil, tank drop measurements may also be used.

(c) Fuel Heat Content Monitoring Requirements. ~~High heat values shall be determined using one of the following methods~~ Higher heating values shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For gases, use ASTM D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), GPA Standard 2261-00 “Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography.” The operator may alternatively elect to use on-line instrumentation that determines heating value accurate to within ± 5.0 percent. Where existing on-line instrumentation provides only low heating value, the operator shall convert the value to ~~high~~ higher heating value as ~~specified in section 95125(c)(1)(C)~~ follows:

$$inserted\ \ equation : HHV = LHV \times CF \qquad \textbf{Equation 20-11}$$

Where:

HHV = fuel or fuel mixture higher heating value (Btu/scf).
LHV = fuel or fuel mixture lower heating value (Btu/scf).
CF = conversion factor.

For natural gas, a CF of 1.11 shall be used. For refinery fuel gas and mixtures of refinery fuel gas, a weekly average fuel system-specific CF shall be derived as follows:

(A) by concurrent LHV instrumentation measurements and HHV determined by on-line instrumentation or laboratory analysis as part of the daily carbon content determination; or,

(B) by the HHV/LHV ratio obtained from the laboratory analysis of the daily samples.

(2) For middle distillates and oil, or liquid waste-derived fuels, use ASTM D240-02 (Reapproved 2007), ~~ASTM D240-87 (Reapproved 1991), ASTM D4809-00 (Reapproved 2005)~~ ASTM D4809-06 (Reapproved 2005).

(3) For solid biomass-derived fuels use ASTM D5865-07a.

(4) For waste-derived fuels use ASTM D5865-07a or ASTM D5468-02 (Reapproved 2007). Operators who combust waste-derived fuels that are ~~partly but~~ not pure biomass fuels shall determine the ~~biomass-derived~~ biomass fuel portion of CO_2 emissions using the method specified in section WCI.23(f), if applicable

(d) Fuel Carbon Content Monitoring Requirements. Fuel carbon ~~contents should be monitored in the following manner~~ content and either molecular weight or molar fraction for gaseous fuels shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For coal and coke, solid ~~biomass-derived~~ biomass fuels, and waste-derived fuels; use ~~ASTM 5373-02 (Reapproved 2007)~~ ASTM 5373-08.

(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) "Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved ~~2002~~ 2007).

(3) For gaseous fuels, use ASTM D1945-03 (Reapproved 2006) or ASTM D1946-90 (Reapproved 2006). The operator may alternatively elect to use on-line instrumentation that determines fuel carbon content accurate to ± 5 percent.

(e) Fuel Analytical Data Capture. When the applicable emissions estimation methodologies in sections WCI.20 through WCI.XXX require periodic collection of fuel analytical data for an emissions source, the operator shall demonstrate every reasonable effort to obtain a fuel analytical data capture rate of 100 percent for each report year.

(1) If the operator is unable to obtain fuel analytical data such that more than 20 percent of emissions from a source cannot be directly accounted for, the emissions from that source shall be considered unverifiable for the report year.

(2) If the fuel analytical data capture rate is at least 80 percent but less than 100 percent for any emissions source identified in sections WCI.20 through WCI.XXX, the operator shall use the mean of the fuel analytical data results captured to substitute for the missing values for the period of missing data.

(f) Procedure for Interim Fuel Analytical Data Collection.

(1) In the event of an unforeseen breakdown of fuel analytical data monitoring equipment required for the emissions estimation methodologies in sections WCI.20 through WCI.XXX, [jurisdiction] may authorize an operator to use an interim data collection procedure if [jurisdiction] determines that the operator has satisfactorily demonstrated that:

(A) The breakdown may result in a loss of more than 20 percent of the source's fuel data for the reporting year, such that emissions for the affected source could not be verified under the provisions of section WCI.8;

(B) The fuel analytical data monitoring equipment cannot be promptly repaired or replaced without shutting down a process unit significantly affecting facility operations, or that the monitoring equipment must be replaced and replacement equipment is not immediately available;

(C) The interim procedure will not remain in effect longer than is reasonably necessary for repair or replacement of the malfunctioning data monitoring equipment; and

(D) The request was submitted within 30 calendar days of the breakdown of the fuel analytical data monitoring equipment.

(2) An operator seeking approval of an interim data collection procedure must, within 30 days of the monitoring equipment breakdown, submit a written request to [jurisdiction] that includes all of the following:

(A) The proposed start date and end date of the interim procedure;

(B) A detailed description of what data are affected by the breakdown;

(C) A discussion of the accuracy of data collected during the interim procedure compared with the data collected under the operator's usual equipment-based method;

(D) A demonstration that no feasible alternative procedure exists that would provide more accurate emissions data; and

(E) A demonstration that the proposed interim procedure meets the criteria specified in section WCI.2(i)(1).

(3) [The jurisdiction] may limit the duration of the interim data collection procedure or include other conditions of approval to ensure the criteria in section WCI.2(i)(1) are met.

(4) Data collected pursuant to an approved interim data collection procedure shall be considered captured data for purposes of compliance with the capture rate requirements in section WCI.2(g). When approving an interim data collection procedure, [jurisdiction] shall determine whether the accuracy of data collected under the procedure is reasonably equivalent to data collected from properly functioning monitoring equipment, and if it is not, the relative accuracy to assign for purposes of assessing possible material misstatement under section WCI.8(q).

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type				
Fuel Type	**Carbon Content**	**~~High~~ Higher Heat Value**	**CO_2 Emission Factor**	**CO_2 Emission Factor**
Coal and Coke	**kg C / MMBtu**	**MMBtu / Short Ton**	**kg CO_2 / Short Ton**	**kg CO_2 / MMBtu**
Anthracite	28.26	25.09	2,597.94	103.54
Bituminous	25.49	24.93	2,328.35	93.40
Sub-bituminous	26.48	17.25	1,673.64	97.02
Lignite	26.30	14.21	1,369.32	96.36
Unspecified (Residential/Commercial)	26.00	22.24	2,118.67	95.26
Unspecified (Industrial Coking)	25.56	26.28	2,461.17	93.65
Unspecified (Other Industrial)	25.63	22.18	2,082.89	93.91
Unspecified (Electric Power)	25.76	19.97	1,884.86	94.38
Coke	27.85	24.80	2,530.65	102.04
Natural Gas (By Heat Content)	**kg C / MMBtu**	**Btu / Standard cubic foot**	**kg CO_2 / Standard cubic ~~ft.~~ foot**	**kg CO_2 / MMBtu**
975 to 1,000 Btu / Standard cubic foot	14.73	n/a	n/a	53.97
1000 to 1,025 Btu / Std cubic foot	14.43	n/a	n/a	52.87
1025 to 1,050 Btu / Std cubic foot	14.47	n/a	n/a	53.02
1050 to 1,075 Btu / Std cubic foot	14.58	n/a	n/a	53.42
1075 to 1,100 Btu / Std cubic foot	14.65	n/a	n/a	53.68
Greater than 1,100 Btu / Std cubic foot	14.92	n/a	n/a	54.67
Unspecified (Weighted U.S. Average)	14.47	1,027	0.0544	53.02

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type (continued)				
Petroleum Products	**kg C / MMBtu**	**MMBtu / Barrel**	**kg CO_2 / gallon**	**kg CO_2 / MMBtu**
Asphalt & Road Oil	20.62	6.636	11.94	75.55
Aviation Gasoline	18.87	5.048	8.31	69.14
Distillate Fuel Oil (#1, 2 & 4)	19.95	5.825	10.14	73.10
Jet Fuel	19.33	5.670	9.56	70.83
Kerosene	19.72	5.670	9.75	72.25
LPG (energy use)	17.19	3.861	5.79	62.98
Propane	17.20	3.824	5.74	63.02
Ethane	16.25	2.916	4.13	59.54
Isobutane	17.75	4.162	6.44	65.04
n-Butane	17.72	4.328	6.69	64.93
Lubricants	20.24	6.065	10.71	74.16
Motor Gasoline	19.33	5.218	8.80	70.83
Residual Fuel Oil (#5 & 6)	21.49	6.287	11.79	78.74

Attachment 3: General Stationary Combustion

INTEGRATED VERSION

§ WCI.20 GENERAL STATIONARY COMBUSTION

§ WCI.21 Source Category Definition

General stationary fuel combustion sources are devices that combust solid, liquid, or gaseous fuel for the purpose of generating steam (or providing useful heat or energy) for industrial, commercial, or institutional use; or reducing the volume of waste by removing combustible matter. General stationary combustion sources are boilers, combustion turbines, engines, incinerators, and process heaters, and any other stationary combustion device that is not specifically addressed under the provisions for another source category in this rule.

Note: The source category definition may need to be revised after the remaining ER sections are completed.

§ WCI.22 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil and biomass fuels, reported by fuel type.
(2) Total CH_4 emissions, reported by fuel type.
(3) Total N_2O emissions, reported by fuel type.

(b) Annual fuel consumption:

(1) For gases, report in units of standard cubic feet.
(2) For liquids, report in units of gallons.
(3) For non-biomass solids, report in units of short tons.
(4) For biomass solid fuels, report in units of bone dry short tons or bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average higher heating value of each fuel, if used to compute CO_2 emissions.

(e) Annual steam generation in pounds or kilograms, for units that burn biomass fuels or municipal solid waste.

Please note that most of the calculation methodologies in this section currently accommodate inputs in English units, only, and not SI units. The section will be revised to allow inputs in SI units, as well as to provide applicable Canadian emission factors from "National Inventory Report 1990-2007: Greenhouse Gas Sources and Sinks in Canada – The Canadian

Government's Submission to the UN Framework Convention on Climate Change, April 2009." (http://www.ec.gc.ca/pdb/ghg/inventory_e.cfm)]

§ WCI.23 Calculation of CO_2 Emissions

For each fuel, calculate CO_2 mass emissions using one of the four calculation methodologies specified in this section, subject to the restrictions in §WCI.23(e).

(a) Calculation Methodology 1. Calculate the annual CO_2 mass emissions by substituting a fuel-specific default CO_2 emission factor, a default higher heating value, and the annual fuel consumption into the Equation 20-1:

$$CO_2 = Fuel \times HHV \times EF \times 0.001$$ **Equation 20-1**

Where:

CO_2	=	Annual CO_2 mass emissions for the specific fuel type (metric tons).
Fuel	=	Mass or volume of fuel combusted per year (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).
HHV	=	Default higher heating value of the fuel, from column 3 of Table 20-1 (mmBtu per mass or mmBtu per volume, as applicable).
EF	=	Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 (kg CO_2/mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(b) Calculation Methodology 2. Calculate the annual CO_2 mass emissions using a default fuel-specific CO_2 emission factor, a higher heating value provided by the supplier or measured by the operator, using Equation 20-2, except for emissions from the combustion of biomass fuels and municipal solid waste, for which the operator may instead elect to use the method shown in Equation 20-3.

(1) For any type of fuel for which an emission factor is provided in Tables 20-1 or 20-2, except biomass fuels and municipal solid waste when the operator elects to use the method in WCI.23(b)(2), use Equation 20-2:

$$CO_2 = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.001$$ **Equation 20-2**

Where:

CO_2	=	Annual CO_2 mass emissions for a specific fuel type (metric tons).
n	=	Number of required heat content measurements for the year as specified in WCI.25.
$Fuel_p$	=	Mass or volume of the fuel combusted during the measurement period "p" (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).
HHV_p	=	Higher heating value of the fuel for the measurement period (mmBtu per mass or volume).

EF = Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 or from Table 20-2 (kg CO_2/mmBtu).
0.001 = Conversion factor from kilograms to metric tons.

(2) For biomass solid fuels and municipal solid waste, use either Equation 20-2 above or Equation 20-3:

$$CO_2 = Steam \times B \times EF \times 0.001$$ **Equation 20-3**

Where:
CO_2 = Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).
Steam = Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (lb steam).
B = Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (mmBtu/lb steam).
EF = Default emission factor for biomass solid fuel or municipal solid waste, from column 5 of Table 20-1 (kg CO_2/mmBtu).
0.001 = Conversion factor from kilograms to metric tons.

(c) Calculation Methodology 3. Calculate the annual CO_2 mass emissions by using measurements of fuel carbon content or molar fraction (for gaseous fuels only), conducted by the operator or provided by the fuel supplier, and the quantity of fuel combusted, using Equation 20-4. For emissions from the combustion of biomass fuels and municipal solid waste, the operator may instead elect to use the method shown in Equation 20-5.

(1) For a solid fuel, use Equation 20-4 of this section:

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times 3.664 \times 0.907$$ **Equation 20-4**

Where:
CO_2 = Annual CO_2 mass emissions from the combustion of the specific solid fuel (metric tons).
n = Number of carbon content determinations for the year.
$Fuel_i$ = Mass of the solid fuel combusted in measurement period "i" (short tons).
CC_i = Carbon content of the solid fuel, from the fuel analysis results for measurement period "i" (percent by weight, expressed as a decimal fraction, e.g., 95% = 0.95).
3.664 = Ratio of molecular weights, CO_2 to carbon.
0.907 = Conversion factor from short tons to metric tons.

(2) For biomass fuels or municipal solid waste, use either Equation 20-4 above or Equation 20-5:

$$CO_2 = Steam \times B \times EF \times 0.001$$ **Equation 20-5**

Where:

CO_2	=	Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).
Steam	=	Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (mmBtu/lb steam).
EF	=	Default emission factor for biomass solid fuel or municipal solid waste, from column 5 of Table 20-1, (kg CO_2/mmBtu), adjusted no less often than every third year as provided in WCI.25(a)(5)(B).
0.001	=	Conversion factor from kilograms to metric tons.

(3) For a liquid fuel, use Equation 20-6 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times 0.001$$ **Equation 20-6**

Where:

CO_2	=	Annual CO_2 mass emissions from the combustion of the specific liquid fuel (metric tons).
n	=	Number of required carbon content determinations for the year, as specified in WCI.25.
$Fuel_i$	=	Volume of the liquid fuel combusted in measurement period "i" (gallons).
CC_i	=	Carbon content of the liquid fuel, from the fuel analysis results for measurement period "i" (kg C per gallon of fuel).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.001	=	Conversion factor from kg to metric tons.

(4) For a gaseous fuel, use Equation 20-7 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times \frac{MW}{MVC} \times 0.001$$ **Equation 20-7**

Where:

CO_2	=	Annual CO_2 mass emissions from combustion of the specific gaseous fuel (metric tons).
n	=	Number of required carbon content and molecular weight determinations for the year, as specified in WCI.25.
$Fuel_i$	=	Volume of the gaseous fuel combusted in period "i" (a day or month, as applicable) (scf).
CC_i	=	Average carbon content of the gaseous fuel, from the fuel analysis results for the period "i" (day or month, as applicable) (kg C per kg of fuel).
MW	=	Molecular weight of the gaseous fuel, from fuel analysis (kg/kg-mole).
MVC	=	Molar volume conversion factor (849.5 scf per kg-mole for STP of 20°C and 1 atmosphere or 836 scf per kg-mole for STP of 60°F, and 1 atmosphere).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.001	=	Conversion factor from kg to metric tons.

(d) Calculation Methodology 4. Calculate the annual CO_2 mass emissions from all fuels combusted in a unit, by using data from continuous emission monitoring systems (CEMS) as specified in (d)(1) through (d)(7).

(1) For a facility that combusts fossil fuels or biomass fuels and operates CEMS in response to federal, state, provincial, or local regulation, use CO_2 or O_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) The operator shall report CO_2 emissions for the reporting year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(B) If the operator of a facility that combusts biomass fuels uses O_2 concentrations to calculate CO_2 concentrations, annual source testing must demonstrate that calculated CO_2 concentrations when compared to measured CO_2 concentrations meet the Relative Accuracy Test Audit (RATA) requirements in 40 CFR Part 60, Appendix B, Performance Specification 3.

(2) For a facility that combusts waste-derived fuels (as defined in the General Provisions and listed in Table 20-2, including municipal solid waste), and operates a CEMS in response to federal, state, provincial, or local regulations use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) Annual CO_2 emissions shall be reported in metric tons based on the sum of hourly CO_2 mass emissions over the year.

(B) Emissions calculations shall not be based on O_2 concentrations.

(3) The operator of a facility that combusts waste-derived fuels and calculates CO_2 emissions using the methodology provided in WCI.23(d)(2) shall determine the portion of emissions associated with the combustion of biomass-derived fuels using the method provided in WCI.23(f).

(4) An operator who uses CEMS data to report CO_2 emissions from a facility that co-fires fossil fuels with biomass fuels or waste-derived fuels that are partly biomass fuels shall determine the portion of total CO_2 emissions separately assigned to the fossil fuel and the biomass fuels using the method provided in WCI.23(f), if applicable. The operator who co-fires pure biomass fuels with fossil fuels may elect to calculate CO_2 emissions for the fossil fuels using methods designated in WCI.23(a) or WCI.23(b)(1), as applicable, by fuel type and then calculate biomass fuel emissions by subtracting the fossil fuel related emissions from the total CO_2 emissions determined using the CEMS based methodology.

(5) For any units for which CO2 emissions are reported using CEMS data, the operator is relieved of the requirement to separately report process emissions from combustion emissions for that unit or to report emissions separately for different fossil fuels for that unit when only fossil fuels are co-fired. In this circumstance, operators shall still report fuel use by fuel type as otherwise required.

(6) If a facility is subject to requirements in 40 CFR Part 60 or 40 CFR Part 75 and the operator chooses to add devices to an existing CEMS for the purpose of measuring CO2 concentrations or flue gas flow, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 60 or Part 75 that apply to the facility. If the

facility is subject to both 40 CFR Part 60 and 40 CFR Part 75, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 75.

(7) If a facility does not have a CEMS and the operator chooses to add one in order to measure CO_2 concentrations, the operator shall select and operate the CEMS pursuant to the requirements in 40 CFR Part 75 or equivalent requirements as applicable in Canada.

(A) The operator shall use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(B) The operator shall report CO_2 emissions for the report year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(C) Operators who add CEMS under this article are subject to specifications in WCI.23(d)(1)-(5), if applicable.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CO_2 emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) Calculation Methodology 1 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise, Calculation Methodology 1 may be used for any type of fuel for which a default CO2 emission factor and a default higher heating value for the fuel is specified in Table 20-1.

(2) Calculation Methodology 2 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise, Calculation Methodology 2 may be used for any type of fuel combusted for which a default CO2 emission factor for the fuel is specified in Table 20-1 or 20-2.

(3) Calculation Methodology 3 may be used for a unit of any size combusting any type of fuel, except when the use of Calculation Methodology 4 is required.

(4) Calculation Methodology 4 may be used for a unit of any size combusting any type of fuel, and must be used for: a combustion unit with a CEMS that is required by any federal, state, provincial, or local regulation and that includes both a stack gas volumetric flow rate monitor and a CO_2 concentration monitor.

(f) Mixtures of biomass fuel and fossil fuel. The owner or operator that combusts fuels or fuel mixtures for which the biomass fuel fraction is unknown or cannot be documented (for example, municipal solid waste or tire-derived fuels) shall determine the biomass fuel portion of CO_2 emissions using ASTM D6866-06a, as specified in this paragraph. This procedure is not required for fuels that contain less than 5 percent biomass fuel by weight or for waste-derived fuels that are less than 30 percent by weight of total fuels combusted in the year for which emissions are being reported, except where the operator wishes to report a biomass fuel fraction of CO_2 emissions.

(1) The operator shall conduct ASTM D6866-06a analysis on a representative fuel or exhaust gas sample at least every three months, and shall collect exhaust gas samples over at least 24 consecutive hours following the standard practice specified by ASTM D7459-08.

(2) The operator shall divide total CO_2 emissions between biomass fuel emissions and non-biomass fuel emissions using the average proportions of the samples analyzed for the year for which emissions are being reported.
(3) If there is a common fuel source to multiple units at the facility, the operator may elect to conduct ASTM D6866-06a testing for one of the units.

§ WCI.24 Calculation of CH_4 and N_2O Emissions

Calculate the annual CH_4 and N_2O mass emissions from stationary fuel combustion sources using the procedures in paragraph (a), (b), or (c), as appropriate.

(a) If the heat content of the fuel is not measured for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-8:

$$CH_4 \text{ or } N_2O = Fuel \times HHV_D \times EF \times 0.001$$ **Equation 20-8**

Where:

CH_4 or N_2O	=	Combustion emissions from specific fuel type, metric tons CH_4 or N_2O per year.
Fuel	=	Mass or volume of fuel combusted for the measurement period, p, specified by fuel type, units of mass or volume per unit time.
HHV_D	=	Default higher heating value specified by fuel type provided in Table 20-1, MMBtu per unit of mass or volume.
EF	=	Default CH_4 or N_2O emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(b) If the heat content of the fuel is measured for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-9:

$$CH_4 \text{ or } N_2O = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.001$$ **Equation 20-9**

Where:

CH_4 or N_2O	=	CH_4 or N_2O emissions from a specific fuel type, metric tons CH_4 or N_2O per year.
$Fuel_p$	=	Mass or volume of fuel combusted specified by fuel type, unit of mass (short tons) or volume (scf, barrel) per year.
HHV_p	=	Higher heating value measured for the measurement period, p, specified by fuel type, MMBtu per unit mass or volume.
EF	=	Default emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(c) For biomass and municipal solid waste combustion, the operator may elect to use Equation 20-10 of this section to estimate CH_4 and N_2O emissions:

$$CH_4 \text{ or } N_2O = Steam \times B \times EF \times 0.001$$ **Equation 20-10**

Where:

CH_4 or N_2O	=	Annual CH_4 or N_2O emissions from the combustion of a municipal solid waste (metric tons).
Steam	=	Total mass of steam generated by municipal solid waste combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's maximum rated heat input capacity to its design rated steam output (mmBtu/lb steam).
EF	=	Fuel-specific emission factor for CH_4 or N_2O, from Table WCI.20-3 of this subpart (kg CH_4 or N_2O per mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(d) The operator may elect to calculate CH_4 or N_2O emissions using source-specific emission factors derived from source tests conducted at least annually under the supervision of (*jurisdiction*). Upon approval of a source test plan, the source test procedures in that plan shall be repeated in each future year to update the source specific emission factors annually.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CH_4 and N_2O emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) WCI.24(a) may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise, WCI.24(a) may be used for any type of fuel for which a default CH_4 or N_2O emission factor and a default higher heat value for the fuel is specified in Table 20-3.
(2) WCI.24(b) may be used for a unit of any size combusting any type of fuel.
(3) WCI.24(c) may only be used for biomass or municipal solid waste combustion.
(4) WCI.24(d) may be used for a unit of any size combusting any type of fuel.

§ WCI.25 Sampling, Analysis, and Measurement Requirements

(a) Fuel Sampling Requirements. Fuel sampling must be conducted or fuel sampling results must be received from the fuel supplier at the frequency specified in paragraphs (a)(1) through (a)(4) of this section.

(1) Once for each new fuel shipment or delivery or on a monthly basis for middle distillates (diesel, gasoline, fuel oil, kerosene), residual oil, liquid waste-derived fuels, and LPG (ethane, propane, isobutene, n-butane, unspecified LPG).
(2) Monthly for natural gas, associated gas, and mixtures of low Btu gas.
(3) Monthly for gases derived from biomass including landfill gas and biogas from wastewater treatment or agricultural processes.
(4) Monthly for solid fuels, as specified below:

(A) The monthly solid fuel sample shall be a composite sample of weekly samples.
(B) The solid fuel shall be sampled at a location after all fuel treatment operations but before fuel mixing and the samples shall be representative of the fuel chemical and physical characteristics immediately prior to combustion.

(C) Each weekly sub-sample shall be collected at a time (day and hour) of the week when the fuel consumption rate is representative and unbiased.
(D) Four weekly samples (or a sample collected during each week of operation during the month) of equal mass shall be combined to form the monthly composite sample.
(E) The monthly composite sample shall be homogenized and well mixed prior to withdrawal of a sample for analysis.
(F) One in twelve composite samples shall be randomly selected for additional analysis of its discrete constituent samples. This information will be used to monitor the homogeneity of the composite.

(5) For biomass fuels and waste-derived fuels, the following may apply in lieu of WCI.25(a)(4):

(A) If CO_2 emissions are calculated using WCI.23(c)(1), the source-specific carbon content is determined annually. Upon approval of a source test plan by [*jurisdiction*], the source test procedures in that plan shall be repeated in subsequent years to update the source specific emission factors annually.
(B) If CO_2 emissions are calculated using WCI.23(c)(2) (biomass fuels and municipal solid waste only), the operator shall adjust the emission factor, in kg CO2/MMBtu not less frequently than every third year, through a stack test measurement of CO2 and use of the applicable ASME Performance Test Code to determine heat input from all heat outputs, including the steam, flue gases, ash and losses.

(b) Fuel Consumption Monitoring Requirements.

(1) Facilities may determine fuel consumption on the basis of direct measurement or recorded fuel purchase or sales invoices measuring any stock change (measured in million Btu, gallons, million standard cubic feet, short tons or bone dry short, tons) using the following equation:

Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End

(2) Fuel consumption measured in Btu values shall be converted to the required metrics of mass or volume using heat content values that are either provided by the supplier, measured by the facility, or provided in Table 20-1.
(3) All oil and gas flow meters (except for gas billing meters) shall be calibrated prior to the first year for which GHG emissions are reported under this rule, using an applicable flow meter test method listed in section WCI.6 or the calibration procedures specified by the flow meter manufacturer. Fuel flow meters shall be recalibrated either annually or at the minimum frequency specified by the manufacturer.
(4) For fuel oil, tank drop measurements may also be used.

(c) Fuel Heat Content Monitoring Requirements. Higher heating values shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For gases, use ASTM D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), GPA Standard 2261-00 “Analysis for

Natural Gas and Similar Gaseous Mixtures by Gas Chromatography." The operator may alternatively elect to use on-line instrumentation that determines heating value accurate to within ± 5.0 percent. Where existing on-line instrumentation provides only low heating value, the operator shall convert the value to higher heating value as follows:

$$HHV = LHV \times CF$$

Equation 20-11

Where:

HHV = fuel or fuel mixture higher heating value (Btu/scf).
LHV = fuel or fuel mixture lower heating value (Btu/scf).
CF = conversion factor.

For natural gas, a CF of 1.11 shall be used. For refinery fuel gas and mixtures of refinery fuel gas, a weekly average fuel system-specific CF shall be derived as follows:

(A) by concurrent LHV instrumentation measurements and HHV determined by on-line instrumentation or laboratory analysis as part of the daily carbon content determination; or,
(B) by the HHV/LHV ratio obtained from the laboratory analysis of the daily samples.

(2) For middle distillates and oil, or liquid waste-derived fuels, use ASTM D240-02 (Reapproved 2007), ASTM D4809-06 (Reapproved 2005).
(3) For solid biomass-derived fuels, use ASTM D5865-07a.
(4) For waste-derived fuels, use ASTM D5865-07a or ASTM D5468-02 (Reapproved 2007). Operators who combust waste-derived fuels that are not pure biomass fuels shall determine the biomass fuel portion of CO_2 emissions using the method specified in section WCI.23(f), if applicable

(d) Fuel Carbon Content Monitoring Requirements. Fuel carbon content and either molecular weight or molar fraction for gaseous fuels shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For coal and coke, solid biomass fuels, and waste-derived fuels; use ASTM 5373-08.
(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) "Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2007).
(3) For gaseous fuels, use ASTM D1945-03 (Reapproved 2006) or ASTM D1946-90 (Reapproved 2006). The operator may alternatively elect to use on-line instrumentation that determines fuel carbon content accurate to ± 5 percent.

(e) Fuel Analytical Data Capture. When the applicable emissions estimation methodologies in sections WCI.20 through WCI.XXX require periodic collection of fuel analytical data for an emissions source, the operator shall demonstrate every reasonable effort to obtain a fuel analytical data capture rate of 100 percent for each report year.

(1) If the operator is unable to obtain fuel analytical data such that more than 20 percent of emissions from a source cannot be directly accounted for, the emissions from that source shall be considered unverifiable for the report year.
(2) If the fuel analytical data capture rate is at least 80 percent but less than 100 percent for any emissions source identified in sections WCI.20 through WCI.XXX, the operator shall use the mean of the fuel analytical data results captured to substitute for the missing values for the period of missing data.

(f) Procedure for Interim Fuel Analytical Data Collection.

(1) In the event of an unforeseen breakdown of fuel analytical data monitoring equipment required for the emissions estimation methodologies in sections WCI.20 through WCI.XXX, [jurisdiction] may authorize an operator to use an interim data collection procedure if [jurisdiction] determines that the operator has satisfactorily demonstrated that:
(A) The breakdown may result in a loss of more than 20 percent of the source's fuel data for the reporting year, such that emissions for the affected source could not be verified under the provisions of section WCI.8;
(B) The fuel analytical data monitoring equipment cannot be promptly repaired or replaced without shutting down a process unit significantly affecting facility operations, or that the monitoring equipment must be replaced and replacement equipment is not immediately available;
(C) The interim procedure will not remain in effect longer than is reasonably necessary for repair or replacement of the malfunctioning data monitoring equipment; and
(D) The request was submitted within 30 calendar days of the breakdown of the fuel analytical data monitoring equipment.
(2) An operator seeking approval of an interim data collection procedure must, within 30 days of the monitoring equipment breakdown, submit a written request to [jurisdiction] that includes all of the following:
(A) The proposed start date and end date of the interim procedure;
(B) A detailed description of what data are affected by the breakdown;
(C) A discussion of the accuracy of data collected during the interim procedure compared with the data collected under the operator's usual equipment-based method;
(D) A demonstration that no feasible alternative procedure exists that would provide more accurate emissions data; and
(E) A demonstration that the proposed interim procedure meets the criteria specified in section WCI.2(i)(1).
(3) *[The jurisdiction]* may limit the duration of the interim data collection procedure or include other conditions of approval to ensure the criteria in section WCI.2(i)(1) are met.
(4) Data collected pursuant to an approved interim data collection procedure shall be considered captured data for purposes of compliance with the capture rate requirements in section WCI.2(g). When approving an interim data collection procedure, [jurisdiction] shall determine whether the accuracy of data collected under the procedure is reasonably equivalent to data collected from properly functioning monitoring equipment, and if it is not, the relative accuracy to assign for purposes of assessing possible material misstatement under section WCI.8(q).

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type				
Fuel Type	**Carbon Content**	**Higher Heat Value**	**CO_2 Emission Factor**	**CO_2 Emission Factor**
Coal and Coke	**kg C / MMBtu**	**MMBtu / Short Ton**	**kg CO_2 / Short Ton**	**kg CO_2 / MMBtu**
Anthracite	28.26	25.09	2,597.94	103.54
Bituminous	25.49	24.93	2,328.35	93.40
Sub-bituminous	26.48	17.25	1,673.64	97.02
Lignite	26.30	14.21	1,369.32	96.36
Unspecified (Residential/Commercial)	26.00	22.24	2,118.67	95.26
Unspecified (Industrial Coking)	25.56	26.28	2,461.17	93.65
Unspecified (Other Industrial)	25.63	22.18	2,082.89	93.91
Unspecified (Electric Power)	25.76	19.97	1,884.86	94.38
Coke	27.85	24.80	2,530.65	102.04
Natural Gas (By Heat Content)	**kg C / MMBtu**	**Btu / Standard cubic foot**	**kg CO_2 / Standard cubic foot**	**kg CO_2 / MMBtu**
975 to 1,000 Btu / Standard cubic foot	14.73	n/a	n/a	53.97
1000 to 1,025 Btu / Std cubic foot	14.43	n/a	n/a	52.87
1025 to 1,050 Btu / Std cubic foot	14.47	n/a	n/a	53.02
1050 to 1,075 Btu / Std cubic foot	14.58	n/a	n/a	53.42
1075 to 1,100 Btu / Std cubic foot	14.65	n/a	n/a	53.68
Greater than 1,100 Btu / Std cubic foot	14.92	n/a	n/a	54.67
Unspecified (Weighted U.S. Average)	14.47	1,027	0.0544	53.02

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type (continued)

Petroleum Products	kg C / MMBtu	MMBtu / Barrel	kg CO_2 / gallon	kg CO_2 / MMBtu
Asphalt & Road Oil	20.62	6.636	11.94	75.55
Aviation Gasoline	18.87	5.048	8.31	69.14
Distillate Fuel Oil (#1, 2 & 4)	19.95	5.825	10.14	73.10
Jet Fuel	19.33	5.670	9.56	70.83
Kerosene	19.72	5.670	9.75	72.25
LPG (energy use)	17.19	3.861	5.79	62.98
Propane	17.20	3.824	5.74	63.02
Ethane	16.25	2.916	4.13	59.54
Isobutane	17.75	4.162	6.44	65.04
n-Butane	17.72	4.328	6.69	64.93
Lubricants	20.24	6.065	10.71	74.16
Motor Gasoline	19.33	5.218	8.80	70.83
Residual Fuel Oil (#5 & 6)	21.49	6.287	11.79	78.74
Crude Oil	20.33	5.800	10.29	74.49
Naphtha (<401 deg. F)	18.14	5.248	8.30	66.46
Natural Gasoline	18.24	4.620	7.35	66.83
Other Oil (>401 deg. F)	19.95	5.825	10.14	73.10
Pentanes Plus	18.24	4.620	7.35	66.83
Petrochemical Feedstocks	19.37	5.428	9.17	70.97
Petroleum Coke	27.85	6.024	14.64	102.04
Still Gas	17.51	6.000	9.17	64.16
Special Naphtha	19.86	5.248	9.09	72.77
Unfinished Oils	20.33	5.825	10.33	74.49
Waxes	19.81	5.537	9.57	72.58
Other Solid Fuels	**kg C / MMBtu**	**MMBtu / Short Ton**	**kg CO_2 / Short Ton**	**kg CO_2 / MMBtu**
Biomass Derived Fuels (Solid). Wood and Wood Waste (12% moisture content) or other solid biomass fuels	25.60	15.38	1,442.62	93.80
Municipal Solid Waste (MSW)	24.74	8.7	788.7	90.65
Biomass-derived Fuels (Gas)	**kg C / MMBtu**	**Btu / Standard cubic foot**	**kg CO_2 / Standard cubic ft.**	**kg CO_2 / MMBtu**
Biogas (includes landfill gas and manure biogas)*	28.4	Varies	Varies	104.06

Note: Heat content factors are based on higher heating values (HHV).

* The emission factors for biogas include both the CO_2 from combustion and the pass-through CO_2, which are assumed to be in equal proportions.

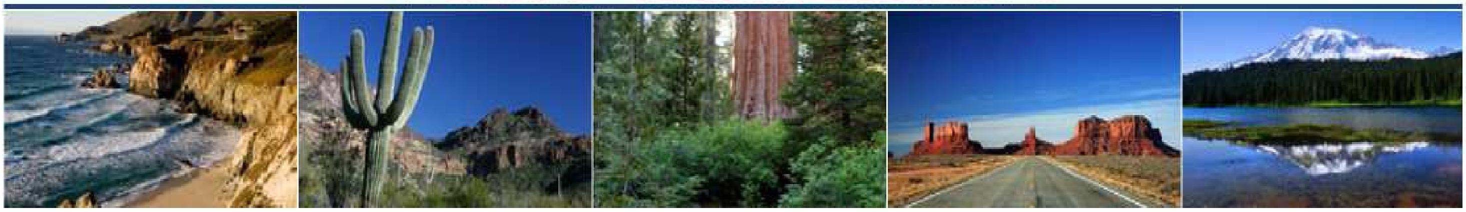
Western Climate Initiative



Suggested Essential Requirements for Reporting of Imported Electricity

§ WCI.60 IMPORTED ELECTRICITY

§ WCI.61 Definitions

"Balancing authority" means a responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports interconnection frequency in real time.

"Balancing authority area" means the collection of generation, transmission, and loads within the metered boundaries of a balancing authority. A balancing authority maintains load-resource balance within this area.

"Busbar" means a power conduit of an electricity generating facility that serves as the starting point for the electricity transmission system.

"Electricity generating facility" means a facility that generates electricity and includes one or more electricity generating units at the same location.

"Electricity importer" means [common boundary FJD] an owner of electricity generated outside the WCI region as it is delivered to the first point of delivery in the WCI Region for electricity having a final point of delivery in the WCI Region or; [individual boundary FJD] an owner of electricity generated outside the WCI region as it is delivered to the first point of delivery in the WCI Partner jurisdiction of the final point of delivery [Both definitions included until the Partners make a final decision on the boundary issue.]

"Electricity transaction" means the purchase, sale, import, export or exchange of electric power.

"Entity" means a person, firm, association, organization, partnership, business trust, corporation, limited liability company, company, or government agency.

"Exchange agreement" means a commitment between electricity market participants to swap energy for energy. Exchange transactions do not involve transfers of payment or receipts of money for the full market value of the energy being exchanged, but may include payment for net differences due to market price differences between the two parts of the transaction or to settle minor imbalances.

"Final point of delivery" means the last point of delivery for a given electricity transaction.

"First Jurisdictional Deliverer" means the owner or operator of an electricity generating facility in a WCI Partner jurisdiction or an electricity importer that is jurisdictional to the regulatory authority of a WCI Partner jurisdiction or the immediate downstream purchaser or recipient of electricity from a non-jurisdictional electricity importer.

“Gross generation” means the total electrical output of the generating unit, expressed in megawatt hours (MWh) per year.

“Imported power” means electric power generated in a non-WCI location, delivered into the WCI Region and having a final point of delivery in the WCI Region.

“Megawatt hour” or “MWh” means the electrical energy unit of measure equal to one million watts of power supplied to, or taken from, an electric circuit steadily for one hour.

“Multi-jurisdictional retail provider” means a retail provider that provides electricity to consumers in a WCI Partner jurisdiction and in one or more other non-WCI states and provinces in a contiguous service territory.

“Nameplate generating capacity” means the maximum rated output of a generator under specific conditions designated by the manufacturer, expressed in megawatts (MW) or kilowatts (kW).

“Net power generated” means the gross generation minus station service or unit service power requirements, expressed in megawatt hours (MWh) per year. In the case of cogeneration, this value is intended to include internal consumption of electricity for the purposes of a production process, as well as power put on the grid.

“NERC E-tag” means North American Electric Reliability Corporation (NERC) energy tag representing transactions on the North American bulk electricity market scheduled to flow between or across balancing authority areas.

“Point of delivery” means a point on an electricity transmission or distribution system where a power supplier delivers electricity to the receiver of that energy. This point can be an interconnection with another system or a substation where the transmission provider’s transmission and distribution systems are connected to another system, or a distribution substation where electricity is imported into the WCI region over a multi-jurisdictional retail provider’s distribution system.

“Power contract” means an arrangement for the purchase of electricity. Power contracts may be, but are not limited to, power purchase agreements and tariff provisions.

“Purchasing/selling entity” means an entity that purchases or sells energy or capacity and reserve transmission services between or among balancing authority areas.

“Renewable energy” means energy from sources that constantly renew themselves or that are regarded as practically inexhaustible. Renewable energy includes, but is not limited to, energy derived from solar, wind, geothermal, hydroelectric, wood, biomass, tidal power, sea currents, and ocean thermal gradients.

“Renewable energy certificate” means a certificate of proof issued by an approved generation information system or third-party verifier that one MWh of electricity was generated by a renewable energy source

“Retail provider” means an entity that provides electricity to retail end users in the WCI Region

“Specified source” means a specific electricity generating unit or electricity generating facility which can be matched to a reported electricity transaction due to full or partial ownership by the first jurisdictional deliverer or due to its identification in a power contract with the first jurisdictional deliverer.

"Stationary source" means any building, structure, facility, or installation that emits or may emit greenhouse gases.

"Unspecified source" means electricity generation that cannot be matched to a specific electricity generating facility or electricity generating unit. Unspecified sources of power may include power purchased from entities that own fleets of generating facilities such as independent power producers, retail providers, and federal power agencies and power purchased from electricity marketers, brokers, and markets.

"Western Climate Initiative" or "WCI" means a collaborative effort of the U.S. states and Canadian provinces that comprise the WCI Region to reduce greenhouse gas emissions in their respective jurisdictions.

"WCI Region" means the Canadian provinces of British Columbia, Manitoba, Ontario, and Quebec plus the U.S. states of Arizona, California, Montana, New Mexico, Oregon, Utah, and Washington, excluding lands that are not subject to state or provincial jurisdiction.

§ WCI.62 Greenhouse Gas Emissions Data Report: First Jurisdictional Deliverers of Imported Power

(a) General Requirements. First jurisdictional deliverers shall meet the following general requirements in preparing their greenhouse gas emissions data report for each report year. When reporting emissions and electricity transactions, first jurisdictional deliverers shall:

(1) Specify the amount of emissions;

(2) Specify the amount of electricity in MWh;

(3) Aggregate imported power by point of delivery;

(4) Report the amount of electricity as measured at the first point of delivery in the WCI Region;

(5) For electricity from unspecified sources, disaggregate imported power for each point of delivery by purchasing/seller entity from which the power was purchased, if applicable;

(6) For electricity from specified sources, specify the facility name, the facility ID, and the electricity generating unit ID for the unit generating the power, if applicable;

(7) Report the number of renewable energy certificates from sources not in the WCI region that are retired, or whose greenhouse gas source specification fields are retired, associated with unspecified imported power or specified imported power having an emission rate equal to or less than the default rate for the region where the specified generating facility is located

(8) Specify electricity imported under exchange agreements as you would other import transactions;

(9) Report quantities of imported electricity wheeled through the WCI Region to a final point of delivery outside the WCI Region as measured at the first point of delivery inside the WCI Region;

(10) Retain for purposes of verification NERC E-tags, power contracts, settlements data, and all other information needed to confirm the transactions.

(b) Report Content. First Jurisdictional Deliverers shall include the following information in the greenhouse gas emissions data report for each report year.

(1) Specified Imported Power Transactions. Electricity from specified sources for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer.

(A) Power imported into the WCI Region from a specified hydroelectric generating facility with nameplate capacity of greater than 30 MW that was operational prior to January 1, 2008 or from a specified nuclear facility that was operational prior to January 1, 2008 shall be listed as one of the following:

(i) Power purchased with a contract in effect prior to January 1, 2008 that remains in effect or has been renegotiated for the same facility for the same share or quantity of net generation within one year of contract expiration;

(ii) Power purchased not meeting (2)(A)1.a and that is not associated with an increase in the facility's generating capacity;

(iii) Power purchased not meeting (2)(A)1.a that is associated with an increase in the facility's generating capacity due to increased efficiencies or other capacity increasing actions;

(iv) Power purchased from hydroelectric generating facilities during a "spill or sell" situation where power not purchased is lost;

(v) Power purchased that does not meet (2)(A)1.a due to federal power redistribution polices for federally owned resources and not related to price bidding.

(2) Unspecified Imported Power Transactions. Electricity from unspecified sources for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer with final point of delivery in the WCI Region.

(3) Electricity Wheeled Through the WCI Region. Power imported into the WCI Region for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer with a final point of delivery outside of the WCI Region, measured at the first point of delivery in the WCI Region.

§ WCI.63 Greenhouse Gas Emissions Data Report: Additional Requirements for Retail Providers Only

Retail providers that serve consumers in the WCI Region shall include the following information in the greenhouse gas emissions data report for each report year, in addition to the information identified in the sections above.

(c) If the retail provider holds a contract that entitles the retail provider to a specified percentage of the generation in the report year from an electricity generating facility not located in the WCI Region, the retail provider shall include power purchased or sold from that facility as being from a partially owned facility.

(d) For electricity generating facilities not located in the WCI Region that are fully or partially owned by the retail provider that have CO2 emissions greater than 500 kg of CO2 per MWh based on the most recent greenhouse gas emissions data report that received a positive verification opinion or on CO2 emissions reported to U.S.EPA under 40 CFR Part 75 or reported to Environment Canada under Section 71 of the Canadian Environmental Protection Act, the retail provider shall include:

   (1) Facility name, state/province designated facility ID, state/province designated generating unit ID as applicable, percent ownership share at the facility level, ownership share at the generating unit level as applicable, and both net and gross power generated in the report year;

   (2) Quantity of power from the electricity generating facility or electricity generating unit measured at the busbar and imported into the WCI Region with a final point of delivery in the WCI Region;

   (3) Quantity of power sold by the retail provider or on behalf of the retail provider from the electricity generating facility or electricity generating unit measured at the busbar and with a final point of delivery outside the WCI Region. These quantities shall be disaggregated by purchasing counterparty.

§ WCI.64 Greenhouse Gas Emissions Data Report: Additional Requirements for Multi-Jurisdiction Retail Providers Only.

Multi-jurisdictional retail providers that import power into the WCI Region at the distribution level shall include the following information in the greenhouse gas emissions data report for each report year, in addition to the information identified in the sections above. Multi-jurisdictional retail providers meeting this condition shall provide:

(a) A report of the emissions associated with serving the load of the service territory that includes consumers in the WCI Region following the Climate Registry's Electric Power Sector Protocol or the applicable state or provincial reporting protocol for retail providers;

(b) The total retail load served by the multi-jurisdictional retail provider in the service territory that includes consumers in the WCI Region;

(c) The retail load of customers served in the WCI Region portion of the service territory; and

(d) A report on adjustments to the service territory's average emission rate that cause the average emission rate to differ among the various state or provincial portions of the service territory due to mandatory factors such as different Renewable Portfolio Standard requirements in the WCI state or province and the non-WCI state(s) or province(s).

Attachment 4: Iron and Steel Manufacturing

§ WCI.150 IRON AND STEEL MANUFACTURING

§ WCI.151 Source Category Definition

Iron and steel manufacturing comprises four categories: primary facilities that produce both iron and steel, secondary steelmaking facilities, iron production facilities, and offsite production of metallurgical coke. These processes may occur together in an "integrated" facility or they may occur in separate offsite facilities.

§ WCI.152 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2 and CH_4 in metric tons at the facility level.

(b) CO_2 and CH_4 emissions from coke production (metric tons) and the following information:

(1) Quantity of coking coal consumed in coke production (metric tons)
(2) Quantity of other process materials (e.g., natural gas, fuel oil, etc.) consumed in coke production (metric tons)
(3) Quantity of blast furnace gas consumed in coke production (metric tons)
(4) Quantity of coke produced (metric tons)
(5) Quantity of coke oven gas transferred offsite (metric tons)
(6) Quantity of other coke oven by-products (e.g., coal tar, light oil, coke breeze, etc.) transferred offsite (metric tons)
(7) Carbon content of material inputs and outputs listed in (b)(1) through (b)(6) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(c) CO_2 and CH_4 emissions from iron and steel production (metric tons) and the following information:

(1) Quantity of coke consumed in iron and steel production (excluding sinter production) (metric tons)
(2) Quantity of on-site coke oven by-products (e.g., coal tar, light oil, coke breeze, etc.) consumed in blast furnace (metric tons)
(3) Quantity of coal directly injected into blast furnace (metric tons)
(4) Quantity of limestone directly injected into blast furnace (metric tons)
(5) Quantity of dolomite directly injected into blast furnace (metric tons)
(6) Quantity of carbon electrodes consumed in EAFs (metric tons)
(7) Quantity of other carbonaceous or process material (e.g., sinter, waste plastic, etc.) consumed in iron and steel production (metric tons)
(8) Quantity of coke oven gas consume in blast furnace (metric tons)
(9) Quantity of steel produced (metric tons)
(10) Quantity of iron production not converted to steel (metric tons)

(11) Quantity of blast furnace gas transferred offsite (metric tons)
(12) Carbon content of material inputs and outputs listed in (c)(1) through (c)(11) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(d) Process CO_2 and CH_4 emissions from sinter production (metric tons) and the following information:

(1) Quantity of coke breeze (purchased and produced on-site) used for sinter production (metric tons)
(2) Quantity of coke oven gas consumed in blast furnace in sinter production (metric tons)
(3) Quantity of blast furnace gas consumed in sinter production (metric tons)
(4) Quantity of other process materials (e.g., natural gas, fuel oil, etc.) consumed in sinter production (metric tons)
(5) Quantity of sinter off gas transferred offsite (metric tons)
(6) Carbon content of material inputs and outputs listed in (d)(1) through (d)(5) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(e) Process CO_2 and CH_4 emissions from direct reduced iron production (metric tons) and the following information:

(1) Energy from natural gas used in direct reduced iron production (gigajoules [GJ])
(2) Energy from coke breeze used in direct reduced iron production (GJ)
(3) Energy from metallurgical coke used in direct reduced iron production (GJ)
(4) Carbon of material inputs listed in (e)(1) through (e)(3) (metric tons of C per GJ)

(f) CO_2, N_2O, and CH_4 emissions from stationary combustion units as specified in WCI.20.

§ WCI.153 Calculation of CO_2 Emissions

(a) Process CO_2 emissions. Determine process CO_2 emissions as specified under either paragraph (1) or (2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).
(2) Calculation methodologies specified in paragraph (b) of this section.

[CEMS and mass balance approach are based on IPCC Tier 3 methods.)

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions using the following mass balance approach:

(1) Calculate the coke production CO_2 (either within integrated facilities or at offsite facilities) emissions using Equation 150-1 (if applicable):

$$E_{coke} = \left[(CC \times C_{CC}) + \sum_a (PM_a \times C_a) + (BG \times C_{BG}) - (CO \times C_{CO}) - (COG \times C_{COG}) - \sum_b (COB_b \times C_b) \right] \times 3.664$$

Equation 150-1

Where:

E_{coke}	=	Emissions of CO_2 from coke production (metric tons);
CC	=	Quantity of coking coal (metric tons);
PM_a	=	Quantity of other process material *a* (not included as separate terms), such as natural gas or fuel oil (metric tons);
BG	=	Quantity of blast furnace gas consumed in coke ovens (metric tons);
CO	=	Quantity of coke produced (metric tons)
COG	=	Quantity of coke oven gas transferred offsite (metric tons);
COB_b	=	Quantity of coke oven by-product *b* transferred offsite (metric tons);
C_x	=	Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664	=	Conversion factor from metric tons of C to metric tons of CO_2.

(2) Calculate the iron and steel production CO_2 emissions using Equation 150-2:

$$E_{iron,steel} = \Big[(CO \times C_{CO}) + \sum_a (COB_a \times C_a) + (CI \times C_{CI}) + (L \times C_L) + (D \times C_D) + (CE \times C_{CE}) + \sum_b (O_b \times C_b) + (COG \times C_{COG}) - (S \times C_S) - (IP \times C_{IP}) - (BG \times C_{BG}) \Big] \times 3.664$$

Equation 150-2

Where:

$E_{iron,steel}$	=	Emissions of CO_2 from iron and steel production (metric tons);
CO	=	Quantity of coke consumed (excluding sinter production) (metric tons);
COB_a	=	Quantity of coke oven by-product *a* consumed in blast furnace (metric tons);
CI	=	Quantity of coal directly injected into blast furnace (metric tons);
L	=	Quantity of limestone consumed (metric tons);
D	=	Quantity of dolomite consumed (metric tons);
CE	=	Quantity of carbon electrodes consumed in EAFs (metric tons);
O_b	=	Quantity of other carbonaceous and process material *b*, such as sinter or waste plastic (metric tons);
COG	=	Quantity of coke oven gas consumed in blast furnace (metric tons);
S	=	Quantity of steel produced (metric tons);
IP	=	Quantity of iron production not converted to steel (metric tons);
BG	=	Quantity of blast furnace gas transferred offsite (metric tons);
C_x	=	Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664	=	Conversion factor from metric tons of C to metric tons of CO_2.

(3) Calculate the sinter production CO_2 emissions using Equation 150-3 (if applicable):

$$E_{sinter} = \Big[(CBR \times C_{CBR}) + (COG \times C_{COG}) + (BG \times C_{BG}) + \sum_a (PM_a \times C_a) - (SOG \times C_{SOG}) \Big] \times 3.664$$

Equation 150-3

Where:

E_{sinter} = Emissions of CO_2 from sinter production (metric tons);
CBR = Quantity of purchased and onsite produced coke breeze used for sinter production (metric tons);
COG = Quantity of coke oven gas consumed in blast furnace for sinter production (metric tons);
BG = Quantity of blast furnace gas consumed for sinter production (metric tons);
PM_a = Quantity of other process material *a* consumed for sinter production (not included as separate terms), such as natural gas or fuel oil (metric tons);
SOG = Quantity of sinter off gas transferred offsite (metric tons);
C_x = Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664 = Conversion factor from metric tons of C to metric tons of CO_2.

(4) Calculate the direct reduced iron production CO_2 emissions using Equation 150-4 (if applicable):

$$E_{DRI} = \left[\left(DRI_{NG} \times C_{NG}\right) + \left(DRI_{BZ} \times C_{BZ}\right) + \left(DRI_{CK} \times C_{CK}\right)\right] \times 3.664$$ **Equation 150-4**

Where:

E_{DRI} = Emissions of CO_2 from direct reduced iron production (metric tons);
DRI_{NG} = Energy from natural gas used in direct reduced iron production (GJ);
DRI_{BZ} = Energy from coke breeze used in direct reduced iron production (GJ);
DRI_{CK} = Energy from metallurgical coke used in direct reduced iron production (GJ);
C_{NG} = Carbon content of natural gas (metric ton C/GJ);
C_{BZ} = Carbon content of coke breeze (metric ton C/GJ);
C_{CK} = Carbon content of metallurgical coke (metric ton C/GJ);
3.664 = Conversion factor from metric tons of C to metric tons of CO_2.

(5) Calculate the total CO_2 emissions using Equation 150-5:

$$E_{CO2} = E_{coke} + E_{iron,steel} + E_{sinter} + E_{DRI}$$ **Equation 150-5**

Where:

E_{CO2} = Total CO_2 emissions (metric tons);
E_{coke} = Emissions from coke production (metric tons);
$E_{iron,steel}$ = Emissions from iron and steel production (metric tons);
E_{sinter} = Emissions from sinter production (metric tons);
E_{DRI} = Emissions from direct reduced iron production (metric tons).

§ WCI.154 Calculation of CH_4 Emissions

(a) Process CH_4 emissions. Determine process CH_4 emissions as specified under either paragraph (1) or paragraph (2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).
(2) Site-specific emission factors.

§ WCI.155 Sampling, Analysis, and Measurement Requirements

Measurements of carbon contents of the material balance input, output, and by-product materials shall be conducted as described below.

Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the iron and steel industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.

(b) Fuel Carbon Content Requirements. Fuel carbon contents should be monitored in the following manner (from § WCI.25):

(1) For coal and coke, solid biomass-derived fuels, and waste-derived fuels; use ASTM 5373-02 (Reapproved 2007).
(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) "Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2002).
(3) For gaseous fuels, use ASTM D1945-03 or ASTM D1946-90 (Reapproved 2006).

(c) By-Product Carbon Content Requirements. Carbon contents of by-products (e.g., blast furnace gas, coke oven gas, coal tar, light oil, coke breeze, sinter off gas, etc.) from all iron and steel production processes should be monitored in the following manner:

(1) [Methodology to be determined.]

(d) Flux Carbon Content Requirements. Carbon contents of fluxes (i.e., limestone and dolomite) from all iron and steel production processes should be monitored in the following manner:

(1) For limestone and dolomite, use ASTM C25-06.

(e) Electrode Carbon Content Requirements. Carbon contents of carbon electrodes used in electric arc furnaces (EAFs) should be monitored in the following manner:

(1) Vendor specifications of carbon content in EAF carbon electrodes.

(f) Finished Product Carbon Content Requirements. Carbon contents of finished products (i.e., steel, iron not converted to steel, and direct reduced iron) from all iron and steel production processes should be monitored in the following manner:

(1) For iron and steel, use ASTM E1019-08 or ASTM E351-93.

(g) Quantity Measurement Requirements. The quantities of process inputs, outputs, and by-products must be determined using the following methods:

(1) For solid process inputs, outputs, and by-products, quantities must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.
(2) For liquid process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes.
(3) For gaseous process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes.

Attachment 9: Petrochemical Manufacturing

§ WCI.300 PETROCHEMICAL MANUFACTURING

§ WCI.301 Source Category Definition

The petrochemical manufacturing source category consists of any facility that manufacturers petrochemicals, including acrylonitrile, propylene, ethylene, ethylene dichloride, ethylene oxide, or methanol, from feedstocks derived from petroleum, or petroleum and natural gas liquids.

§ WCI.302 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions report must contain the following information:

(a) CO_2, N_2O, and CH_4 emissions from combustion of fuels in the stationary combustion unit in metric tons, as specified in WCI.20.

(b) CO_2, N_2O, and CH_4 emissions from flares and other oxidizers in metric tons, as specified in WCI.303(a).

(c) CO_2, N_2O, and CH_4 emissions from process vents in metric tons, as specified in WCI.303(b).

(d) CH_4 emissions tons from equipment leaks in metric, as specified in WCI.303(c).

(e) Annual consumption of feedstock by type for all feedstocks that result in GHG emissions in million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

§ WCI.303 Calculation of GHG Emissions

(a) **Flares and Other Oxidizers.** You must calculate GHG emissions from flares and oxidation control devices as follows:

(1) Calculate CO_2, CH_4 and N_2O emissions resulting from the combustion of flare pilot and purge gas using the appropriate method(s) specified in WCI.20.

(2) Calculate CO_2 emissions for each gas destroyed in a flare or other oxidation control device using Equation 300-1.

Equation 300-1

$$CO_2 = \sum_{i=1}^{n} GV_i \times CC_i \times MW_i / MVC \times 3.664 \times 0.001$$

Where:

CO_2	=	CO_2 emissions (metric tons/year).
GV_i	=	Volume of gas *i* destroyed annually (scf/year).
CC_i	=	Average annual carbon content of gas *i* (kg C/kg fuel).
MW_i	=	Average annual molecular weight of gas *i*.

MVC	=	Molar volume conversion factor (849.5 scf/kg- mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole, for STP of 60°F, and 1 atmosphere).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.001	=	Conversion factor, kg to metric tons.
n	=	Number of gases destroyed.

(b) **Process Vents.** Except for process emissions calculated pursuant to WCI.303(a) or (c), you must calculate process emissions of CO_2, CH_4, and N_2O from process vents using Equation 300-2.

$$E_x = \sum_{i=1}^{n} VR_i \times F_{xi} \times (MW_x / MVC) \times VT_i \times 0.001$$ **Equation 300-2**

Where:

E_x	=	Emissions of x (metric tons/yr), where x = CO_2, N_2O, or CH_4.
VR_i	=	Vent rate for venting event i (scf/unit time).
F_{xi}	=	Molar fraction of x in vent gas stream during event i.
MW_x	=	Molecular weight of x (kg/kg-mole).
MVC	=	Molar volume conversion (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole for STP of 60°F, and 1 atmosphere).
VT_i	=	Time duration of venting event i (same units of time used for VR_i).
n	=	Number of venting events.
0.001	=	Conversion factor, kg to metric tons.

(c) **Equipment Leaks.** You must calculate CH_4 emissions for each valve, pump seal, connector, flange, open-ended line, and other components in natural gas, fuel gas, and off-gas systems as follows:

(1) Identify and screen each valve, pump seal, connector, flange, open-ended line, and other components in natural gas, fuel gas, and off-gas systems using the monitoring method in WCI.304. Components identified as "other" components include instruments, loading arms, pressure relief valves, vents, compressors, dump lever arms, diaphragms, drains, hatches, meters, and polished rods stuffing boxes.

(2) Use the results of the component screening and the following equations to calculate VOC emissions:

(A) For components where the measured screening value is equal to zero when corrected for background, calculate VOC emissions using Equation 300-3 and the appropriate default emission factors from Table 300-1:

$$E_{VOC-0} = \sum_{i=1}^{6} CC_i \times ZF_{i0} \times t$$ **Equation 300-3**

Where:

E_{VOC-0} = Emissions from components with a screening value equal to zero, when corrected for background (kg/screening period).

i = Component type (valve, pump seal, other, connector, flange, open-ended line).

CC_i = Number of i components where the screening value is 0.

ZF_{i0} = Default zero factor for component i from Table 300-1 (kg/hr).

t = Time since last screening (hours/screening period).

(B) For components where the measured screening value, corrected for background, is between 0 and 10,000 ppmv, calculate VOC emissions using Equation 300-4 and the appropriate default factors from Table 300-1:

$$E_{VOCL-C} = \sum_{i=1}^{6} \sum_{n=1}^{n} \left(\sigma_i \times SV_n^{\ \beta i} \right) \times t$$ **Equation 300-4**

Where:

E_{VOCL-C} = Emissions from components with screening values, corrected for background, between 0 and 10,000 (kg/screening period).

i = Component type (valve, pump seal, others, connector, flange, open ended-line).

n = Number of *i* components.

σ_i = Correlation equation coefficient for component type *i* from Table 300-1.

SV_n = Screening value for component *n.*

βi = Correlation equation exponent for component type *i* from Table 300-1.

t = Time component has been leaking (default value is time from last screening) (hours/screening period).

(C) For components where the screening value, corrected for background, is greater than or equal to 10,000 ppmv, calculate VOC emissions using Equation 300-5 and the appropriate default factors from Table 300-1:

$$E_{VOCP} = \sum_{i=1}^{6} CC_i \times PF_{iP} \times t$$ **Equation 300-5**

Where:

E_{VOCP} = Emissions from components with screening values, corrected for background, greater than or equal to 10,000 ppmv (kg/screening period).

i = Component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open-ended line).

CC_i = Number of *i* components with screening values greater than 9,999 ppmv.

PF_{iP} = VOC emission factor for component type *i* pegged over 9,999 ppmv from Table 300-1 (kg/hr).

t = Time component has been leaking (default value is time since last screening) (hours/screening period).

(3) Calculate CH_4 emissions using Equation 300-6 and either a default factor of 0.6 for CF_{VOC} or a site-specific conversion factor calculated from the composition and methane content of the gas.

$$CH_4 = \sum_{1}^{n} (E_{VOC-0} + E_{VOC-LC} + E_{VOCP})_n \times CF_{VOC} \times 0.001 \qquad \textbf{Equation 300-6}$$

Where:

CH_4	=	CH_4 emissions (metric tons/year).
n	=	Number of screenings/year.
E_{VOC-0}	=	Emissions from components with a screening value equal to zero, when corrected for background (kg/screening period).
E_{VOC-LC}	=	Emissions from components with screening values, corrected for background, between 0 and 10,000 (kg/screening period).
E_{VOCP}	=	Emissions from components with screening values, corrected for background, greater than or equal to 10,000 ppmv (kg/screening period).
CF_{VOC}	=	VOC to CH_4 conversion factor (default $CF_{VOC} = 0.6$).
0.001	=	Conversion factor (kg to metric tons).

WCI.304 Monitoring Requirements

(a) Flares and Other Oxidizers. You must measure:

(1) The volume of each gas destroyed annually determined to an accuracy of ± 5 percent.
(2) The carbon content and molecular weight of each gas quarterly using the methods specified in WCI.25 and calculate the annual average values for carbon content and molecular weight for each gas destroyed.

(b) Process **Vents.** You must measure the following parameters for each process vent, using methods that comply with the measurement accuracy provisions in WCI.2(g):

(1) The gas flow rate for each venting event.
(2) The molar fraction of CO2, N2O, and CH4 in the vent gas stream during each venting event.
(3) The duration of each venting event.

(c) **Equipment Leaks.** You must screen each valve, pump seal, connector, flange, and open-ended line used in natural gas, fuel gas, and off-gas systems using the methods specified in CAPCOA (1999) Method 3: Correlation Equation Method and an instrument capable of detecting methane. Screenings must be performed at the frequency interval required by [*insert jurisdiction*]. The instrumentation used for screening must be capable of detecting methane.

(d) **Feedstock Consumption.** You must measure the feedstock consumption using methods that comply with the measurement accuracy provisions in WCI.2(g).

Table 300-1. Fugitive Emissions from Gas Service Components			
Component Type / Service Type	**Default Zero Factor (kg/hr)**	**Correlation Equation (kg/hr)**	**Pegged Factor (kg/hr)**
	(SV = 0) Zf_{i0}	**(SV > 0 and < 10,000)** σ_i **and** β_i	**(SV ≥ 10,000)** PF_{iP-10}
Valves	7.8×10^{-6}	$2.27 \times 10^{-6}(SV)^{0.747}$	0.064
Pump seals	1.9×10^{-5}	$5.07 \times 10^{-5}(SV)^{0.622}$	0.089
Others[a]	4.0×10^{-6}	$8.69 \times 10^{-6}(SV)^{0.642}$	0.082
Connectors	7.5×10^{-6}	$1.53 \times 10^{-6}(SV)^{0.736}$	0.030
Flanges	3.1×10^{-7}	$4.53 \times 10^{-6}(SV)^{0.706}$	0.095
Open-ended lines	2.0×10^{-6}	$1.90 \times 10^{-6}(SV)^{0.724}$	0.033

[a] The "other" component type should be applied to any component type other than connectors, flanges, open-ended lines, pump seals, or valves. The "other" component type includes: instruments, loading arms, pressure relief valves, vents, compressors, dump lever arms, diaphragms, drains, hatches, meters, and polished rods stuffing boxes.

Attachment 7: Pulp and Paper

§ WCI.210 PULP AND PAPER MANUFACTURING

§ WCI.211 Source Category Definition

The pulp and paper manufacturing source category consists of facilities that produce pulp either at stand-alone pulp facilities or integrated pulp and paper mills.

§ WCI.212 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions report must contain the following information:

(a) Annual CO_2 process emissions from all recovery furnaces and kilns in metric tons, as specified in WCI.213.

(b) CO_2, N_2O, and CH_4 emissions from stationary combustion units in metric tons, as specified in WCI.23.

(c) Annual consumption of carbonate in metric tons.

(d) Annual black liquor production in metric tons.

(e) Under consideration: Annual N_2O, and CH_4 emissions from onsite wastewater treatment plants in metric tons, as specified in WCI.200(g).

§ WCI.213 Calculation of GHG Emissions

(a) You must calculate CO_2 process emissions from recovery furnaces and kilns using Equation 210-1:

$$CO_2 = \sum_{i=1}^{12} [(BL_i \times CC_i) + (\sum_{j=1}^{n} RM_j \times EF_j)_i] \qquad \textbf{Equation 210-1}$$

Where:

CO_2 = CO_2 process emissions from recovery furnaces and kilns (metric tons/year).
BL_i = Black liquor produced in month i (metric tons/month).
CC_i = Carbon content of the black liquor (percent by weight expressed as a decimal fraction).
RM_j = Amount of carbonate j consumed in month i (metric tons/month).
EF_j = Carbon content of carbonate material j for month i (percent by weight, expressed as a decimal fraction).
3.664 = Ratio of molecular weights, CO_2 to carbon.

WCI.214 Monitoring Requirements

Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the pulp and paper industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.

(a) Measure the quantity of black liquor produced each month using methods that comply with the measurement accuracy provisions in WCI.2(g)

(b) Collect monthly samples of black liquor and analyze each sample for carbon content using ASTM [*To be determined*].

(c) For the amount of carbonate material consumed, you must either use records provided by the material supplier or monitor carbonate material consumption using methods that comply with the measurement accuracy provisions in WCI.2(g).

(d) For the carbon content of each carbonate material consumed, you must either use carbon content data provided by the supplier or collect monthly samples of each carbonate material consumed and analyze each sample for carbonate content using ASTM [*To be determined*].

Attachment 8: Soda Ash Production

§ WCI.230 SODA ASH PRODUCTION

§ WCI.231 Source Category Definition

The soda ash production source category consists of facilities that produce soda ash by calcining sodium carbonate bearing ore or brine.

§ WCI.232 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions report must contain the following information:

(a) Annual CO_2 process emissions from all soda ash calcining kilns combined, as specified in WCI.233 (metric tons).

(b) CO_2, N_2O, and CH_4 emissions from combustion of fuels in the calcining kilns, as specified in WCI.20 (metric tons).

(c) Annual consumption of trona ore or sodium carbonate-rich brine (metric tons).

(d) Annual soda ash production (metric tons).

(e) Annual mass of waste material output from calcining kilns (metric tons).

(f) For plants recycling the CO_2 generated from calcination for use in the carbonation towers, report annual CO_2 recycled within the process (metric tons).

§ WCI.233 Calculation of GHG Emissions

(a) You must calculate CO_2 emissions using the methods in either paragraphs (a)(1) or (a)(2) of this section.

(1) **Continuous Emission Monitoring Systems.** The owner or operator may measure CO_2 emissions using CEMS, as specified WCI.23(d).

(2) **Feedstock Material Balance.** The owner or operator may estimate CO_2 process emissions using Equation 230-1 and the measured carbon content and feedstock input of the trona ore or carbonate-rich brine.

$$CO_2 = \sum_{j=1}^{12} (3.664)[(Ci_j \times Ti_j) - (Cs_j \times Ts_j) - (Cw_j \times Tw_j)]$$

Equation 230-1

Where:

CO_2 = CO_2 process emissions from soda ash production (metric tons/year).
Ci_j = Carbon content of feedstock (trona ore or carbonate-rich brine) input (percent by weight, expressed as a decimal fraction).
Ti_j = Weight of feedstock (trona ore or carbonate-rich brine) input (metric tons/month).
Cs_j = Carbon content of soda ash output (percent by weight, expressed as a decimal fraction).
Ts_j = Weight of soda ash output (metric tons/month).
Cw_j = Carbon content of waste material output from the kiln (i.e. kiln dust collected in control devices and not combined with the soda ash product) (percent by weight, expressed as a decimal fraction).
Tw_j = Weight of waste material output from the kiln (i.e. kiln dust collected in control devices and not combined with the soda ash product) (metric tons/month).
3.664 = Ratio of molecular weights, CO_2 to carbon.

(b) If you operate a soda ash production facility in which CO_2 generated in calcining kilns is recycled to carbonate towers for brine pre-treatment, you must calculate recycled CO_2 using Equation 230-2.

$$CO_2 = \sum_{j=1}^{12} (3.664)[(Cb_j \times Tb_j) - (Ci_j \times Ti_j)] \qquad \textbf{Equation 230-2}$$

Where:

CO_2 = Recycled CO_2 from the ore calcining kiln (metric tons/year).
Ci_j = Carbon content of ore input (percent by weight, expressed as a decimal fraction).
Ti_j = Weight of ore input (metric tons/month).
Cb_j = Carbon content of sodium carbonate-rich brine input (percent by weight, expressed as a decimal fraction).
Tb_j = Weight of sodium carbonate-rich brine input (metric tons/month).
3.664 = Ratio of molecular weights, CO_2 to carbon.

WCI.234 Monitoring Requirements

Owners and operators using the mass balance method must comply with the following monitoring requirements:

(a) Measure the quantity of ore, soda ash, waste material, and carbonate-rich brine (as applicable) by direct measurement using the same instruments used for accounting purposes.

(b) Collect monthly samples of ore, soda ash, waste material, and carbonate-rich brine (as applicable) and analyze each sample for carbon content. For the carbon content of the brine ore and carbonate-rich brine, use a total organic carbon analyzer according to the ultraviolet light/chemical (sodium persulfate) oxidation method in ASTM D4839-03. Use method ASTM E359-00(2005) for the carbon content of trona ore, soda ash, and waste material.

Western Climate Initiative

Attachment 1: General Provisions

(UNDERLINE/STRIKEOUT VERSION SHOWING CHANGES FROM JANUARY 6, 2009 RELEASE, FOLLOWED BY INTEGRATED VERSION)

GENERAL PROVISIONS

§ WCI.0 PURPOSE

§ WCI.1 APPLICABILITY

§ WCI.2 GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE

§ WCI.3 CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT

§ WCI.4 DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS

§ WCI.5 COMPLIANCE AND ENFORCEMENT

§ WCI.6 INCORPORATION BY REFERENCE

§ WCI.7 DESIGNATED REPRESENTATIVE

§ WCI.8 REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS

§ WCI.9 DEFINITIONS

§ WCI.10 GLOBAL WARMING POTENTIALS

EMISSIONS QUANTIFICATION, AND SAMPLING, ANALYSIS AND MEASUREMENT

§ WCI.20 THROUGH § WCI.XX

§ WCI.0 PURPOSE

This rule requires mandatory reporting and verification of greenhouse gas (GHG) emissions data by certain facilities that directly emit GHG, by importers of electricity, and by suppliers of fossil fuels. The GHGs that must be reported under this rule are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), and sulfur hexafluoride (SF_6).

§ WCI.1 APPLICABILITY

(a) The GHG emissions reporting requirements, and related monitoring, recordkeeping, and verification requirements of this rule apply to the owners and operators *[Each jurisdiction will select the specific terminology for the regulated persons in accordance with their customary rule-writing practices]* of any facility that meets the requirements of paragraph (a)(1) of this section; and any fuel suppliers and electricity importers that meet the requirements of paragraph (a)(2), (a)(3), or (a)(4) of this section:

(1) Any facility that emits 10,000 metric tons CO_2e or more per year in combined emissions from one or more of the source categories listed in this paragraph in any calendar year starting in 2010.

[Please note that the quantification and monitoring methods for many of these source categories are currently being assessed. Only source categories for which adequate quantification methods exist will be included in the final WCI Essential Requirements for mandatory reporting.]

Adipic acid manufacturing
Aluminum manufacturing
Ammonia manufacturing [*still being assessed*]
Carbon dioxide transfer recipients [*still being assessed*]
Cement manufacturing
Coal mine fugitive emissions (active and abandoned)
Coal storage
Cogeneration [*still being assessed*]
Electricity generation
Electronics Manufacturing [*still being assessed*]
Ferroalloy production [*still being assessed*]
General stationary fuel combustion
Glass Production and other uses of carbonates [*still being assessed*]
HCFC-22 production [*still being assessed*]
Hydrogen production
Industrial wastewater *[still being assessed for some industries]*
Iron and steel manufacturing
Lead production
Lime manufacturing
Magnesium production *[still being assessed]*
Natural gas transmission and distribution systems *[still being assessed]*
Nitric acid manufacturing *[still being assessed]*
Nonroad equipment at facilities *[still being assessed]*

Oil and gas production & gas processing *[still being assessed]*
Petrochemical production
Petroleum refineries
Phosphoric acid production *[still being assessed]*
Pulp and paper manufacturing
Refinery fuel gas
SF_6 from electrical equipment *[still being assessed]*
Soda ash manufacturing
Zinc production

(2) All importers of electricity. Importers of electricity include both retail providers and marketers that import electricity into the WCI region. *[This is preliminary language, pending definition of electricity importers by another WCI Committee.]*

(3) Any supplier that within the WCI region distributes transportation fuels in quantities that when combusted would emit 10,000 metric tons CO_2e per year or more in any calendar year starting in 2010. *[This is preliminary language, pending future determination of point of regulation for transportation fuels.]*

(4) Any supplier that distributes within the WCI region residential, commercial, and industrial fuels in quantities that when combusted would emit 10,000 metric tons CO_2e per year or more in any calendar year starting in 2010. *[This is preliminary language, pending future determination of points of regulation for these fuels.]*

(b) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold in paragraph (a)(1) of this section, the owner or operator shall calculate annual CO_2e emissions, as described in paragraphs (b)(1) through (b)(4) of this section.

(1) Estimate the annual emissions of CO_2, CH_4, N_2O, HFC, PFC, and SF_6 in metric tons for each unit, process, activity, or operation for which emission calculation methodologies are provided in sections WCI.20 through WCI.XX. The GHG emissions shall be calculated using methodologies specified in each applicable section.

(2) For stationary combustion units, carbon dioxide emissions from the combustion of biomass fuels shall be included in the calculations, with the following exceptions:

(A) Until such time as [jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, a maximum of 15,000 metric tons of carbon dioxide emissions from the combustion of pure solid biomass fuel may be excluded from calculation of GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold in paragraph (a)(1) of this section, provided that total GHG emissions including emissions from solid biomass fuel are less than 25,000 metric tons CO_2e.

(B) After such time as [jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, the carbon dioxide emissions from the combustion of those fuels may be excluded from calculation of GHG emissions for determining whether the 10,000 metric tons CO_2e per year emission threshold in paragraph (a)(1) of this section has been met.

[A WCI Partner jurisdiction may, in its discretion, choose to require carbon dioxide emissions from the combustion of biomass fuel to be included in the determination of stationary combustion units that are required to report and may require that those emissions be reported separately from emissions from fossil fuels.]

[WCI is also considering a deduction of biomass fuel combustion emissions that have occurred within a jurisdiction that has deemed them to be carbon neutral from the determination of whether the verification threshold has been met and from the scope of the verification.]

(3) Sum the total facility emissions for each GHG and calculate the metric tons of CO_2e using equation 1-1 below.

$$CO_2e = \sum_{i=1}^{n} GHG_i \times \mathrm{GWP}_i \qquad \textbf{Equation 1-1}$$

Where:

CO_2e = Carbon dioxide equivalent, metric tons/year.

GHG_i = Mass emissions of each greenhouse gas emitted, metric tons/year.

GWP_i = Global warming potential for each greenhouse gas from Table WCI.10-1 of this regulation.

n = The number of greenhouse gases emitted.

(4) For purpose of determining if an emission threshold has been exceeded, any CO_2 that is captured for on-site use, on-site storage, or transfer off-site must be included in the emissions total.

(c) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of transportation fuels in paragraphs (a)(3) of this section, the owner or operator shall follow the procedures of paragraphs (c)(1) through (c)(2) below:

(1) Calculate the total mass in metric tons per year of CO_2, CH_4, and N_2O that would result from the complete combustion or oxidation of all transportation fuels that are distributed within the WCI region. The mass of each GHG shall be calculated using any of the applicable methodologies specified in section WCI.XX [Transportation Fuels Combustion] of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO_2e using Equation 1-1 of this rule.

(d) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of residential, commercial, and industrial fuels in paragraph (a)(4) of this section, the owner or operator shall follow the procedures of paragraphs (d)(1) and (d)(2) below:

(1) Calculate the total mass in metric tons per year of CO_2, CH_4, and N_2O that would result from the complete combustion or oxidation of all residential, commercial, and industrial fuels that are distributed within the WCI region. The calculation shall exclude any fuels that are supplied to facilities that are required to report GHG emissions under section WCI.1(a)(1). *[These accounting issues will be dealt with in 2009.]* The mass of each GHG shall be calculated using any of the applicable methodologies specified in section WCI.XX [Residential, Commercial and Industrial Fuels Combustion] of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO_2e using Equation 1-1 of this rule.

(e) If the operations of a facility or fuel supplier that is subject to this rule change such that emissions fall below 10,000 metric tons CO_2e per year, then the following reporting requirements shall apply:

(1) If, prior to such emission reduction, the emissions report was subject to the verification requirements of this rule; then the owner or operator shall continue to submit ~~verified~~ emission reports until reported emissions are below 10,000 metric tons CO_2e per year for a minimum of 3 consecutive years. If reported emission are less than 10,000 metric tons CO_2 per year during 3 consecutive years, then the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(2) If, prior to such emission reduction, the emissions report was not subject to the verification requirements of this rule; then the owner or operator shall submit to the *[jurisdiction]* a signed statement certifying that emissions are less than 10,000 metric tons CO_2e during the prior year. After certifying that emissions are below 10,000 metric tons CO_2e per year for 3 consecutive years, the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(3) Notwithstanding the requirements of paragraphs (e)(1) and (2) of this section, a facility or fuel supplier that is ~~subject to an emissions limitation~~ <u>a covered entity</u> under the WCI cap-and-trade program must continue to submit ~~verified~~ annual <u>emissions</u> reports.

(f) Upon request by the [*jurisdiction*], owner or operator of any facility or fuel supply operation must submit a demonstration that emissions have not exceeded one or more of the applicability criteria specified in this section in any year since 2010. Such demonstration shall be provided to the [*jurisdiction*] within 20 working days of receipt of a written request. *[WCI is considering whether this and other deadlines for responses provide sufficient time, and whether such deadlines should be standardized across requirements.]*

§ WCI.2 GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE

[Specific requirements of this section may change based on the future final design of the marketing trading program.]

(a) General. Owners or operators that are subject to this rule must submit an annual GHG emissions report. Owners and operators must collect data; calculate GHG emissions; and follow the procedures for quality assurance, missing data, recordkeeping, and reporting as specified in these General Provisions and in each relevant section WCI.20 through WCI.XX of this rule.

(1) A facility, fuel supplier, or electricity importer that commenced operation before January 1, 2010, must report emissions beginning in 2011 for GHGs emitted in calendar year 2010.

(2) A new facility, fuel supplier, or electricity importer that commences operation on or after January 1, 2010, must report emissions for the first calendar year in which the facility operates, beginning with the first operating month and ending on December 31 of that year. Each subsequent annual report must cover emissions for the calendar year, beginning on January 1 and ending on December 31.

(b) Reporting and Verification Schedule.

(1) Annual GHG emissions reports must be submitted to [*the jurisdiction*] by April 1 of each year for emissions in the previous calendar year.

(2) Reporters subject to the verification requirements of WCI.8, must complete their verification process, including submittal of a verification statement to [*the jurisdiction*], according to the following schedule:

(A) For reporting years 2010 through 2011, September 1 of the year following the reporting year.

(B) For reporting years 2012 and later, *[date to be determined]*.

(c) Submission of GHG Emissions Report. The annual GHG emissions report must be submitted to [*the jurisdiction*] in a format [*to be specified by each jurisdiction*].

(d) Simplified Emission Calculation Methods for De Minimis Sources. The owner or operator may elect to designate as de minimis one or more sources or pollutants that collectively emit no more than 3 percent of the facility's total CO_2e emissions, but not to exceed 20,000 metric tons CO_2e. The owner or operator may estimate emissions for these de minimis sources using alternative methods to those required to be used by this rule. If verification of the emissions report is required by this rule, then the selection of any alternative GHG calculation method is subject to the concurrence of the verification team that the use of such methods provides reasonable assurance that the emissions so designated do not exceed the applicable de minimis limits. The operator shall separately identify and include in the emissions data report the emissions from designated de minimis sources.

(e) To ensure accuracy of reported data and the ability to conduct audits and/or verifications of each emissions data report, the owner or operator shall establish and maintain data acquisition and handling activities that provide for the transparency and verifiability of emissions calculations and supporting information consistent with section WCI.4 . *[As a means of assuring a smooth verification process and a positive verification opinion WCI jurisdictions may also require or advise in guidance materials that facilities have a full GHG inventory management plan.]* ~~GHG Inventory Management Plan. The owner or operator shall prepare and follow a written GHG inventory management plan that ensures that the emissions calculations and other information that is required to be reported under this rule are transparent, accurate, and independently verifiable. The owner or operator shall establish, document, implement, and maintain data acquisition and handling activities for the calculation and reporting of GHG emissions. Such activities shall include measuring, monitoring, analyzing, recording, processing and calculating the parameters specified by this rule. The owner or operator shall implement systems of internal audit, quality assurance, and quality control for the reporting program and the data reported.~~

(f) GHG Emissions Report Revisions.

(1) The owner or operator shall maintain documentation to support any revisions made to a previously submitted annual GHG emissions report. Documentation for all revisions shall be retained by the operator for 7 years.

(2) If, after the verification deadline, a report subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report

within 60 days of the finding. To the extent possible, the revised report must correct all identified errors. A revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*]. <u>[The jurisdiction] will send notification of approval or disapproval and an explanation of the reasons for any disapproval within 60 days of receipt of the revised report.</u>

(3) If, after the report submittal deadline, a report not subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report within 30 days of the finding. To the extent possible, the revised report must correct all identified errors. A revised report will be accepted only if approved by [*the jurisdiction*]. <u>[The jurisdiction] will send notification of approval or disapproval and an explanation of the reasons for any disapproval within 60 days of receipt of the revised report.</u>

(4) An owner or operator that voluntarily chooses to correct errors of 5 percent or less in total CO_2e emissions reported may do so according to the following requirements:

(A) For reports subject to verification, a revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*].

(B) For reports not subject to verification, a revised report will be accepted if approved by [*the jurisdiction*].

~~(g) Fuel Use Measurement Accuracy. The operator shall use procedures to quantify fuel use (mass or volume flow) that provide data with an accuracy within ±5 percent. All fuel use measurement devices shall be maintained and calibrated in a manner and at a frequency required to maintain this level of accuracy. The operator shall make available to the verification team documentation to support this level of accuracy. The operator who measures solid fuels shall validate fuel consumption estimates with belt or conveyor scale calibrations conducted at least quarterly, and retain record of such calibrations.~~

(g) Where this rule specifies a choice between use of a fuel-based or mass balance-based calculation or use of a continuous emissions monitoring system (CEMS) to calculate CO_2 emissions, the operator shall make this choice and continue to use the method chosen for all future emissions data reports, unless the use of the alternative calculation method is approved in advance by *[the jurisdiction]*.

§ WCI.3 CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT

Each annual GHG emissions report shall contain the following information:

(a) Facility name, identification number, physical address, mailing address, and NAICS code.

(b) Reporting year.

(c) Date of report submittal.

(d) Total facility emissions aggregated from all applicable source categories in subparts WCI.20 through WCI.XX expressed in metric tons of CO_2e calculated using Equation 1-1 of section WCI.1, excluding emissions from CO_2 that is captured and CO_2 emissions from the combustion of biomass and biomass-derived fuels, which are reported separately.

(e) Total facility emissions of CO_2 from the combustion of biomass and biomass-derived fuels.

(f) Total annual mass of CO_2 captured for on-site use, on-site storage, or transfer off site, in metric tons.

(g) For applicable fuel supplier categories in subparts WCI.XX [Transportation Fuels Combustion] and WCI.XX [Residential, Commercial and Industrial Fuels Combustion], total CO_2e emissions aggregated from all specified fuels.

(h) Emissions from each applicable source category or fuel supplier category in subparts WCI.20 through WCI.XX, expressed in metric tons per year of CO_2, CH_4, N_2O, HFC, PFC, and SF_6. CO_2 emissions from the combustion of biomass and biomass-derived fuels shall be reported separately.

(i) For electricity importers, the information required by WCI.XX [Electricity Imports].

(j) Emissions and other data for individual units, processes, activities, and operations as specified for each source category in sections WCI.20 through WCI.XX of this rule.

(k) <u>Emission factors developed or measured by the operator using approved source testing as provided under sections WCI.20 through WCI.XXX. Emission factors shall be provided in units of emissions per amount of fuel consumed, where fuel is reported in the units specified in this regulation.</u>

(l) Mass emissions from each designated de minimis source or pollutant, reported in metric tons per year of each GHG for which an alternative emission calculation method is used.

(m) Name and contact information including e-mail address and telephone number of the person primarily responsible for preparing and submitting the emissions report.

(n) <u>[only applicable in United States jurisdictions]</u> A signed and dated statement provided by the owner or operator, or their designated representative, certifying that the report has been prepared in accordance with this rule and that, subject to verification, the statements and information contained in the emissions data report are true, accurate, and complete to the best of their knowledge.

(o) <u>[only applicable in Canadian jurisdictions] A statement signed and dated by the operator's representative, certifying that:</u>

   (1) <u>the operator's representative has examined the emissions report and ensured that it is complete and accurate, and</u>

   (2) <u>the emissions report has been prepared in accordance with this rule and that the statements and information contained in the emissions report are true and fair to the best of the knowledge of the operator's representative.</u>

§ WCI.4 DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS

(a) The operator shall establish and maintain procedures for document retention and record keeping. The operator shall retain all documents regarding the design, development and maintenance of the GHG inventory in paper, electronic or other usable format for a period of not less than 7 years following submission of each emissions data report. The retained documents, including GHG emissions data, shall be sufficient to allow for the verification of each emissions data report.

(b) Upon request by *[jurisdiction]*, the operator shall provide within 10 working days all documents and data used to develop an emissions data report.

(c) In addition to information submitted as part of the emissions data report, each operator shall retain, at a minimum, the following information, if applicable, for at least 7 years after the submission of the report:

(1) A list of all GHG sources (i.e., units, operations, processes, and activities) included in the emission estimates.
(2) All ~~data~~ records and documents used to calculate emissions for each source, categorized by process and fuel or material type.
(3) Documentation of the process for collecting emissions data.
(4) Any GHG emissions calculations and methods used;
(5) All emission factors used for emission estimates, including documentation for any factors not provided in the rule.
(6) All input data used for emission estimates.
(7) Documentation of biomass fractions for specific fuels.
(8) All other data submitted to the [*jurisdiction*] under this rule, including the GHG emissions report.
(9) All computations made to gap-fill missing data.
(10) Names and documentation of key facility personnel involved in emissions calculating and reporting;
(11) Any other information that is required for the verification of the GHG emissions report.
(12) A log to be prepared for each reporting year, beginning January 1, documenting all procedural changes made in GHG accounting methods and changes to instrumentation for GHG emissions estimation.
(13) The GHG inventory data audit trail, data control policies and procedures, and supporting documentation. ~~A copy of the GHG Inventory Management Plan~~.

(d) For measurement based methodologies, the following information, if applicable,also must be retained for at least 7 years after the submission of the emissions data report:

(1) List of all emission points monitored.
(2) Collected monitoring data.
(3) Quality assurance and quality control information collected ~~under the GHG Inventory Management Plan required by section WCI.2~~ for the WCI.2(e) data audit trail and data controls section of this rule.
(4) A detailed technical description of the continuous measurement system, including documentation of any findings and approvals by federal, State or local agencies.
(5) Raw and aggregated data from the continuous measurement system.
(6) A log book of all system down-times, calibrations, servicing, and maintenance of the continuous measurement system.
(7) Documentation of any changes in the continuous measurement system over time.

§ WCI.5 COMPLIANCE AND ENFORCEMENT

(a) Submission of false or misleading information to the *[jurisdiction]* or a verification body shall constitute a single, separate violation of the requirements of this article for each day after the information has been received by the Executive Officer or verification body.

[Partners must be able to enforce this provision in the absence of evidence of intent, e.g., strict or absolute liability, depending on the jurisdiction.] ~~Knowing submission of false information to the *[jurisdiction*] or a verification body, shall constitute a single, separate violation of the requirements of this article for each day after the information has been received by the [*jurisdiction*].~~

(b) Each violation of this rule shall constitute a single, separate violation for each day the violation continues ~~beyond the specified reporting date. A violation includes failure to submit any report, failure to collect data needed to calculate GHG emissions, failure to monitor and test as required, failure to calculate GHG emissions following the methodologies specified in this rule, failure to retain required records, failure to provide all information required in the report, and failure to submit a report on time. For the purposes of this rule, "report" means any GHG emissions data report, verification statement, or other document required to be submitted by this rule~~.

§ WCI.6 INCORPORATION BY REFERENCE

The following documents are incorporated by reference into this rule. These materials are incorporated as they exist on the date this article is adopted.

(a) ~~American Society for Testing and Materials (ASTM) D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), ASTM D240-02 (Reapproved 2007), ASTM D4809-00 (Reapproved 2005), ASTM 5373-02 (Reapproved 2007), ASTM D5291-02 (Reapproved 2007), ASTM D3238-95 (Reapproved 2005), ASTM D2502-04, ASTM D2503-92 (Reapproved 2002), ASTM D1945-03, ASTM D1946-90 (Reapproved 2006), ASTM D6866-06a, ASTM D388-05, ASTM D5468-02 (Reapproved 2007), ASTM D240-87 (Reapproved 1991), ASTM D5865-07a, ASTM Specification D396-07, ASTM Specification D975-07b~~.

(a) The following materials are available for purchase from the following addresses: American Society for Testing and Material (ASTM), 100 Barr Harbor Drive, P.O. Box CB700, West Conshohocken, Pennsylvania 19428-B2959; and the University Microfilms International, 300 North Zeeb Road, Ann Arbor, Michigan 48106:

(1) ASTM D240-02, (Reapproved 2007), Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter.
(2) ASTM D388-05, Standard Classification of Coals by Rank.
(3) ASTM D396-08, Standard Specification for Fuel Oils.
(4) ASTM D975-08, Standard Specification for Diesel Fuel Oils.
(5) ASTM D1250-07, Standard Guide for Use of the Petroleum Measurement Tables.
(6) ASTM D1826-94 (Reapproved 2003), Standard Test Method for Calorific (Heating) Value of Gases in Natural Gas Range by Continuous Recording Calorimeter.
(7) ASTM Specification D1835-05 (2005).
(8) ASTM D1945-03 (Reapproved 2006), Standard Test Method for Analysis of Natural Gas by Gas Chromatography.

§ WCI.7 DESIGNATED REPRESENTATIVE (ONLY APPLICABLE TO WCI JURISDICTIONS IN THE UNITED STATES)

(a) General. Each fuel supplier, electricity importer, and owner or operator of a facility that is subject to this rule, shall select a designated representative that is responsible for certifying and submitting GHG emissions reports under this reporting rule.

(b) Authorization of a Designated Representative. The designated representative of the facility shall be selected by a certificate of representation agreement that is signed by the designated representative and owners or operators of the facility. The designated representative must be an individual having responsibility for the overall operation of the facility or activity such as the position of the plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company.

(c) Responsibility of the Designated Representative.

(1) The designated representative of the facility shall represent and by any representations, actions, inactions, or submissions, legally bind each owner and operator in all matters pertaining to this rule.
(2) Each GHG emission report submitted under this rule must be signed by the designated representative and must contain the following certification statement: "I have been authorized to make this submission on behalf of the owners and operators of the facility (or supply operation, as appropriate). I certify under penalty of law that I have personally examined the information submitted in this document. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

(d) Changing a Designated Representative. The designated representative may be changed at any time upon submission of a superseding certificate of representation. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous designated representative before time of the superseding certificate of representation shall be binding on the new designated representative and the owners and operators.

(e) Changes in Owners and Operators. In the event of any change in ownership of the facility, any new owner or operator shall be deemed to be bound by the representations, actions, inactions, and submissions of the designated representative of the facility until such time as the designated representative is changed.

(f) Certificate of Representation. A certificate of representation must be submitted to *[the jurisdiction]* and kept on location by the facility, fuel supplier, or electricity importer. The certificate shall include the following information:

(1) Identification of the facility, fuel supplier, or electricity importer for which the certificate of representation is submitted.
(2) The name, address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the designated representative.
(3) A list of the owners and operators.
(4) Certification statements that the actions of the designated representative with respect to this rule are binding on the owners and operators, and that the designated representative has the necessary authority to carry out duties and responsibilities on behalf of the owners and operators.
(5) The signature of the designated representative and owner(s) and operator(s), and the dates signed.

§WCI.8 REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS

[Replaced -- See Attachment 2 of this document.]

§ WCI.9 DEFINITIONS

[This is a partial list of definitions. Additional definitions are under development based on the Canadian regulations come from "Section 71 of the Canadian Environmental Protection Act (CEPA) 1999"and the CARB definitions come from "Title 17, Subchapter 10, Article 2, Section 95102 of the California Code of Regulations.]

"Adverse verification statement" means a verification statement rendered by a verification body stating that the verification body cannot ~~say with~~ provide reasonable assurance that the submitted emissions data report is free of material misstatement, or that it cannot provide a ~~qualifying~~ positive statement that the emissions data report conforms to the requirements of this article.

"Biomass fuels" or "biomass-derived fuels" means fuels derived entirely from biomass.

"Carbon dioxide equivalent" or "CO_2 equivalent" or "CO_2e" means a measure for comparing carbon dioxide with other GHGs, based on the quantity of those gases multiplied by the appropriate global warming potential (GWP) factor and commonly expressed as metric tons of carbon dioxide equivalent.

"Conflict of interest" means a situation in which, because of financial or other activities or relationships with other persons or organizations, a person or body is unable or potentially unable to render an impartial verification opinion of a potential client's greenhouse gas emissions, or the person or body's objectivity in performing verification services is or might be otherwise compromised.

"Continuous emissions monitoring system" or "CEMS" means the total equipment required to obtain a continuous measurement of a gas concentration or emission rate from combustion or industrial processes.

"Data check" means any independent calculation or checking of data conducted by a verifier to recreate the emissions for a discreet source included in an emissions data report.

"Electricity generating unit" or "EGU" means any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce electric power.

"Exporter" means…*[To be defined later for transportation and RCI fuels accounting]*

"Facility" means any property, plant, building, structure, stationary source, stationary equipment or grouping of stationary equipment or stationary sources located on one or more contiguous or adjacent properties, in actual physical contact or separated solely by a public roadway or other public right-of-way, under common operational control, and having the same first two digits of the Standard Industrial Classification (SIC) or same first three digits of the North American Industry Classification System (NAICS) code. *[WCI is currently working to develop a definition that will harmonize common usages of the term in the U.S. and Canada. Some special facilities, such as oil and gas production fields will have separate definitions.]*

“Fuel analytical data” means any data collected about the mass, volume, flow rate, heat content, or carbon content of a fuel.

“Full verification” means all verification services as provided in section ~~WCI.8(c)~~ WCI.8(b).

“Global warming potential” or “GWP factor” means the radiative forcing impact of one mass-based unit of a given greenhouse gas relative to an equivalent unit of carbon dioxide over a given period of time.

“Greenhouse gas”, “greenhouse gases” or “GHG” means carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs).

“Hydrofluorocarbons” or “HFCs” means a class of GHGs primarily used as refrigerants, consisting of hydrogen, fluorine, and carbon.

“Importer” means…*[To be defined later by the Electricity Committee.]*

"Impregnated saw dust" means...
[WCI is developing a definition of impregnated saw dust, which generally refers to saw dust from wood treated or impregnated with resins, glues, or other substances derived from fossil fuels.]

“Independent Peer Reviewer” means a Lead Verifier within a Verification Body who has not participated in conducting verification services for the current reporting year who provides an independent review of verification services rendered as required in section WCI.8(f).

“Lead verifier” means a person that has met all of the requirements in section WCI.8 *[TBD]*~~, and who may act as the lead verifier of a verification team providing verification services or as a lead verifier providing an independent review of verification services rendered.~~

“Less Intensive Verification” means the verification services provided in interim years between full verifications; less intensive verification only requires risk assessment and data checks on an owner or operator's emissions data report based on the most current sampling plan developed as part of the most current full verification services. This level of verification may only be used if the verifier can provide findings with a reasonable level of assurance.

“Material misstatement” means ~~one or more inaccuracies identified in the course of verification that result in the total reported emissions being outside the 95 percent accuracy required to receive a positive verification statement.~~
(a) The individual or aggregate effect (overstatements and understatements offset each other) of one or more errors, omissions or misstatements identified in the course of verification that result in the total reported emissions being outside the 95 percent accuracy required to receive a positive verification statement. Material misstatement does not include any evaluation of acceptable measurement uncertainty of the monitoring equipment or quantification methodologies, or

(b) The individual or aggregate effect of one or more errors, omissions or misstatements identified in the course of verification which make it probable that the judgment of a reasonable person judging the total reported emissions would have been changed or influenced by the error, omission or misrepresentation.

"Measurement-based" means any of the various emission quantification methodologies that involve the determination of emissions by means of direct measurement of the flue gas flow, as well as the concentration of the relevant GHG(s) in the flue gas.

“Measurement uncertainty” means the scientific uncertainty associated with measuring of GHG emissions due to limitations of monitoring equipment or quantification methodologies. The WCI allows a measurement uncertainty of ±5 % for all measuring equipment which provides information underlying emissions reporting.

"Nonroad equipment" means...
[WCI is developing a definition for nonroad equipment.]

“Owner or operator” means any person who owns, leases, operates, controls, or supervises a facility or fuel supply operation; or who imports electricity into the WCI region.

"Operator's representative" means:

(a) if the operator of the facility is an individual, the operator,

(b) if the operator of the facility is a corporation, either

   (1) any officer of the corporation, whether or not the officer is also a director of the corporation, who performs a policy making function in respect of the corporation and who has the capacity to influence the direction of the corporation, or
   (2) the individual with primary responsibility for the operations and management of the facility

(c) if the operator of the facility is not an individual or a corporation, the individual with primary responsibility for the operations and management of the facility.

“Perfluorocarbons” or “PFCs” means a class of greenhouse gases consisting on the molecular level of carbon and fluorine.

"Process emissions" means...
[WCI is developing a definition of process emissions, which generally refers to non-combustion emissions.]

“Positive verification statement” means a verification statement rendered by a verification body stating that the verification body can say with reasonable assurance that the submitted emissions data report is free of material misstatement and ~~includes a qualifying statement~~ that the emissions data report conforms to the requirements of this article.

"Pure" means consisting of at least 97 percent by mass of a specified substance. For facilities burning biomass fuels, this means the fraction of biomass carbon accounts for at least 97 percent of the total amount of carbon in the fuel burned at the facility.

"Reasonable assurance" means a high degree of confidence that submitted data and statements are valid and that the reported emissions are free from material misstatement (i.e. that the emissions report presents fairly, in all material respects, the annual emissions for the facility, fuel supplier, or electricity importer).

"Senior officer" means:

(a) the chair of the board of directors, a vice-chair of the board of directors, the president, a vice-president, the secretary, the treasurer or the general manager of a corporation or any other individual who performs functions for a corporation similar to those normally performed by an individual occupying any such office, and

(b) each of the five highest paid employees of a corporation, including any individual referred to in clause (a).

"Solid biomass fuel" means plants or parts of plants, in their natural state or mechanically modified, but not chemically altered from the natural state.

"Stationary combustion unit" means any boiler, heater, furnace, kiln, turbine, internal combustion engine, incinerator or other non-mobile source device that combusts any solid, liquid, or gaseous fuel for purposes of producing useful heat or energy for industrial, commercial, or institutional use; or for purposes of reducing the volume of waste by removing combustible material.

"Supplier" means . . . *[To be defined later for transportation and RCI fuels accounting.]*.

"Verification" means ~~the process used to ensure that an operator's emissions data report is free of material misstatement and complies with WCI's reporting procedures and methods for calculating and reporting GHG emissions~~ a systematic, independent and documented process for the evaluation of an operator's emissions data report against the WCI's reporting procedures and methods for calculating and reporting GHG emissions.

"Verification body" means a firm accredited by the [Accreditation Body TBD] and recognized by the jurisdiction or its designee, that is able to render a verification statement and provide verification services for operators subject to reporting under this article.

"Verification cycle" means ~~one year of full verification and the next consecutive two years of less intensive verification for operators subject to annual verification. For operators subject to triennial verification, a verification cycle means one year of full verification, and if elected, the next consecutive two years of less intensive verification. A verification cycle cannot exceed three calendar years~~ three years of verification activities. Each verification cycle must include at least one year of full verification, and may include two years of less intensive verification, if eligible.

"Verification statement" means the final ~~opinion rendered by a verification body attesting whether an operator's emissions data report is free of material misstatement and a qualifying statement whether the emissions data report conforms to the requirements of this article~~ written declaration rendered by a verification body attesting whether an operator's emissions data report is free of material misstatement and whether the emissions data report conforms to the requirements of this article.

"Verification services" means services provided during verification as specified in section WCI.8, including but not limited to reviewing an owner's or operator's emissions data report, verifying its accuracy according to the standards specified in this section, assessing the owner's or operator's compliance with this section, and submitting a verification statement to the *[jurisdiction or its agent]*.

"Verification team" means all of those working for a verification body, including all subcontractors, to provide verification services for an operator. ~~The lead verifier for the verification team shall be a lead verifier in the verification body.~~

"Verifier" means an individual ~~accredited by the jurisdiction or its designee~~ employed or contracted by an accredited verification body who has been deemed competent by the verification body to carry out verification services as specified in section WCI.8.

"Waste-derived fuel" means a fuel typically derived from waste and generally used as a substitute for conventional fossil fuels. Waste-derived fuels can include fossil fuels such as waste oil, plastics, or solvents; biomass such as dried sewage or impregnated saw dust; or fractions of both fossil fuels and biomass such as municipal solid waste or tires.

§ WCI.10 Global Warming Potentials

Owners and operators must use the global warming potential (GWP) values given in Table WCI.10-1 when converting emissions of greenhouse gases to metric tons of carbon dioxide equivalent (CO_2e), using Equation 1-1.

Table WCI.10-1. Global Warming Potential Factors for Greenhouse Gases			
Common Name	**Formula**	**Chemical Name**	**GWP**
Carbon dioxide	CO_2		1
Methane	CH_4		21
Nitrous oxide	N_2O		310
Sulfur hexafluoride	SF_6		23,900
Hydrofluorocarbons (HFCs)			
HFC-23	CHF_3	trifluoromethane	11,700
HFC-32	CH_2F_2	difluoromethane	650
HFC-41	CH_3F	fluoromethane	150
HFC-43-10mee	$C_5H_2F_{10}$	1,1,1,2,3,4,4,5,5,5- decafluoropentane	1,300
HFC-125	C_2HF_5	pentafluoroethane	2,800
HFC-134	$C_2H_2F_4$	1,1,2,2-tetrafluoroethane	1,000
HFC-134a	$C_2H_2F_4$	1,1,1,2-tetrafluoroethane	1,300
HFC-143	$C_2H_3F_3$	1,1,2-trifluoroethane	300
HFC-143a	$C_2H_3F_3$	1,1,1-trifluoroethane	3,800
HFC-152	$C_2H_4F_2$	1,2-difluoroethane	43
HFC-152a	$C_2H_4F_2$	1,1-difluoroethane	140
HFC-161	C_2H_5F	fluoroethane	12
HFC-227ea	C_3HF_7	1,1,1,2,3,3,3- heptafluoropropane	2,900
HFC-236cb	$C_3H_2F_6$	1,1,1,2,2,3-hexafluoropropane	1,300
HFC-236ea	$C_3H_2F_6$	1,1,1,2,3,3-hexafluoropropane	1,200
HFC-236fa	$C_3H_2F_6$	1,1,1,3,3,3-hexafluoropropane	6,300
HFC-245ca	$C_3H_3F_5$	1,1,2,2,3-pentafluoropropane	560
HFC-245fa	$C_3H_3F_5$	1,1,1,3,3-pentafluoropropane	950
HFC-365mfc	$C_4H_5F_5$	1,1,1,3,3-pentafluorobutane	890
Perfluorocarbons (PFCs)			
Perfluoromethane	CF_4	tetrafluoromethane	6,500
Perfluoroethane	C_2F_6	hexafluoroethane	9,200
Perfluoropropane	C_3F_8	octafluoropropane	7,000
Perfluorobutane	C_4F_{10}	decafluorobutane	7,000
Perfluorocyclobutane	$c\text{-}C_4F_8$	octafluorocyclobutane	8,700
Perfluoropentane	C_5F_{12}	dodecafluoropentane	7,500
Perfluorohexane	C_6F_{14}	tetradecafluorohexane	7,400

Attachment 1: General Provisions

INTEGRATED VERSION

GENERAL PROVISIONS

§ WCI.0 PURPOSE

§ WCI.1 APPLICABILITY

§ WCI.2 GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE

§ WCI.3 CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT

§ WCI.4 DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS

§ WCI.5 COMPLIANCE AND ENFORCEMENT

§ WCI.6 INCORPORATION BY REFERENCE

§ WCI.7 DESIGNATED REPRESENTATIVE

§ WCI.8 REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS

§ WCI.9 DEFINITIONS

§ WCI.10 GLOBAL WARMING POTENTIALS

EMISSIONS QUANTIFICATION, AND SAMPLING, ANALYSIS AND MEASUREMENT

§ WCI.20 THROUGH § WCI.XX

§ WCI.0 PURPOSE

This rule requires mandatory reporting and verification of greenhouse gas (GHG) emissions data by certain facilities that directly emit GHG, by importers of electricity, and by suppliers of fossil fuels. The GHGs that must be reported under this rule are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), and sulfur hexafluoride (SF_6).

§ WCI.1 APPLICABILITY

(a) The GHG emissions reporting requirements, and related monitoring, recordkeeping, and verification requirements of this rule apply to the owners and operators *[Each jurisdiction will select the specific terminology for the regulated persons in accordance with their customary rule-writing practices]* of any facility that meets the requirements of paragraph (a)(1) of this section; and any fuel suppliers and electricity importers that meet the requirements of paragraph (a)(2), (a)(3), or (a)(4) of this section:

(1) Any facility that emits 10,000 metric tons CO_2e or more per year in combined emissions from one or more of the source categories listed in this paragraph in any calendar year starting in 2010.

[Please note that the quantification and monitoring methods for many of these source categories are currently being assessed. Only source categories for which adequate quantification methods exist will be included in the final WCI Essential Requirements for mandatory reporting.]

Adipic acid manufacturing
Aluminum manufacturing
Ammonia manufacturing [*still being assessed*]
Carbon dioxide transfer recipients [*still being assessed*]
Cement manufacturing
Coal mine fugitive emissions (active and abandoned)
Coal storage
Cogeneration [*still being assessed*]
Electricity generation
Electronics Manufacturing [*still being assessed*]
Ferroalloy production [*still being assessed*]
General stationary fuel combustion
Glass Production and other uses of carbonates [*still being assessed*]
HCFC-22 production [*still being assessed*]
Hydrogen production
Industrial wastewater *[still being assessed for some industries]*
Iron and steel manufacturing
Lead production
Lime manufacturing
Magnesium production *[still being assessed]*
Natural gas transmission and distribution systems *[still being assessed]*
Nitric acid manufacturing *[still being assessed]*
Nonroad equipment at facilities *[still being assessed]*

Oil and gas production & gas processing *[still being assessed]*
Petrochemical production
Petroleum refineries
Phosphoric acid production *[still being assessed]*
Pulp and paper manufacturing
Refinery fuel gas
SF_6 from electrical equipment *[still being assessed]*
Soda ash manufacturing
Zinc production

(2) All importers of electricity. Importers of electricity include both retail providers and marketers that import electricity into the WCI region. *[This is preliminary language, pending definition of electricity importers by another WCI Committee.]*

(3) Any supplier that within the WCI region distributes transportation fuels in quantities that when combusted would emit 10,000 metric tons CO_2e per year or more in any calendar year starting in 2010. *[This is preliminary language, pending future determination of point of regulation for transportation fuels.]*

(4) Any supplier that distributes within the WCI region residential, commercial, and industrial fuels in quantities that when combusted would emit 10,000 metric tons CO_2e per year or more in any calendar year starting in 2010. *[This is preliminary language, pending future determination of points of regulation for these fuels.]*

(b) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold in paragraph (a)(1) of this section, the owner or operator shall calculate annual CO_2e emissions, as described in paragraphs (b)(1) through (b)(4) of this section.

(1) Estimate the annual emissions of CO_2, CH_4, N_2O, HFC, PFC, and SF_6 in metric tons for each unit, process, activity, or operation for which emission calculation methodologies are provided in sections WCI.20 through WCI.XX. The GHG emissions shall be calculated using methodologies specified in each applicable section.

(2) For stationary combustion units, carbon dioxide emissions from the combustion of biomass fuels shall be included in the calculations, with the following exceptions:

(A) Until such time as [jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, a maximum of 15,000 metric tons of carbon dioxide emissions from the combustion of pure solid biomass fuel may be excluded from calculation of GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold in paragraph (a)(1) of this section, provided that total GHG emissions including emissions from solid biomass fuel are less than 25,000 metric tons CO_2e.

(B) After such time as [jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, the carbon dioxide emissions from the combustion of those fuels may be excluded from calculation of GHG emissions for determining whether the 10,000 metric tons CO_2e per year emission threshold in paragraph (a)(1) of this section has been met.

[A WCI Partner jurisdiction may, in its discretion, choose to require carbon dioxide emissions from the combustion of biomass fuel to be included in the determination of stationary combustion units that are required to report and may require that those emissions be reported separately from emissions from fossil fuels.]

[WCI is also considering a deduction of biomass fuel combustion emissions that have occurred within a jurisdiction that has deemed them to be carbon neutral from the determination of whether the verification threshold has been met and from the scope of the verification.]

(3) Sum the total facility emissions for each GHG and calculate the metric tons of CO_2e using equation 1-1 below.

$$CO_2e = \sum_{i=1}^{n} GHG_i \times GWP_i \qquad \textbf{Equation 1-1}$$

Where:

CO_2e = Carbon dioxide equivalent, metric tons/year.
GHG_i = Mass emissions of each greenhouse gas emitted, metric tons/year.
GWP_i = Global warming potential for each greenhouse gas from Table WCI.10-1 of this regulation.
n = The number of greenhouse gases emitted.

(4) For purpose of determining if an emission threshold has been exceeded, any CO_2 that is captured for on-site use, on-site storage, or transfer off-site must be included in the emissions total.

(c) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of transportation fuels in paragraphs (a)(3) of this section, the owner or operator shall follow the procedures of paragraphs (c)(1) through (c)(2) below:

(1) Calculate the total mass in metric tons per year of CO_2, CH_4, and N_2O that would result from the complete combustion or oxidation of all transportation fuels that are distributed within the WCI region. The mass of each GHG shall be calculated using any of the applicable methodologies specified in section WCI.XX [Transportation Fuels Combustion] of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO_2e using Equation 1-1 of this rule.

(d) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of residential, commercial, and industrial fuels in paragraph (a)(4) of this section, the owner or operator shall follow the procedures of paragraphs (d)(1) and (d)(2) below:

(1) Calculate the total mass in metric tons per year of CO_2, CH_4, and N_2O that would result from the complete combustion or oxidation of all residential, commercial, and industrial fuels that are distributed within the WCI region. The calculation shall exclude any fuels that are supplied to facilities that are required to report GHG emissions under section WCI.1(a)(1). *[These accounting issues will be dealt with in 2009.]* The mass of each GHG shall be calculated using any of the applicable methodologies specified in section WCI.XX [Residential, Commercial and Industrial Fuels Combustion] of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO_2e using Equation 1-1 of this rule.

(e) If the operations of a facility or fuel supplier that is subject to this rule change such that emissions fall below 10,000 metric tons CO_2e per year, then the following reporting requirements shall apply:

(1) If, prior to such emission reduction, the emissions report was subject to the verification requirements of this rule; then the owner or operator shall continue to submit emission reports until reported emissions are below 10,000 metric tons CO_2e per year for a minimum of 3 consecutive years. If reported emission are less than 10,000 metric tons CO_2 per year during 3 consecutive years, then the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(2) If, prior to such emission reduction, the emissions report was not subject to the verification requirements of this rule; then the owner or operator shall submit to the *[jurisdiction]* a signed statement certifying that emissions are less than 10,000 metric tons CO_2e during the prior year. After certifying that emissions are below 10,000 metric tons CO_2e per year for 3 consecutive years, the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(3) Notwithstanding the requirements of paragraphs (e)(1) and (2) of this section, a facility or fuel supplier that is a covered entity under the WCI cap-and-trade program must continue to submit annual emissions reports.

(f) Upon request by the [*jurisdiction*], owner or operator of any facility or fuel supply operation must submit a demonstration that emissions have not exceeded one or more of the applicability criteria specified in this section in any year since 2010. Such demonstration shall be provided to the [*jurisdiction*] within 20 working days of receipt of a written request. *[WCI is considering whether this and other deadlines for responses provide sufficient time, and whether such deadlines should be standardized across requirements.]*

§ WCI.2 GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE

[Specific requirements of this section may change based on the future final design of the marketing trading program.]

(a) General. Owners or operators that are subject to this rule must submit an annual GHG emissions report. Owners and operators must collect data; calculate GHG emissions; and follow the procedures for quality assurance, missing data, recordkeeping, and reporting as specified in these General Provisions and in each relevant section WCI.20 through WCI.XX of this rule.

(1) A facility, fuel supplier, or electricity importer that commenced operation before January 1, 2010, must report emissions beginning in 2011 for GHGs emitted in calendar year 2010.

(2) A new facility, fuel supplier, or electricity importer that commences operation on or after January 1, 2010, must report emissions for the first calendar year in which the facility operates, beginning with the first operating month and ending on December 31 of that year. Each subsequent annual report must cover emissions for the calendar year, beginning on January 1 and ending on December 31.

(b) Reporting and Verification Schedule.

(1) Annual GHG emissions reports must be submitted to [*the jurisdiction*] by April 1 of each year for emissions in the previous calendar year.
(2) Reporters subject to the verification requirements of WCI.8, must complete their verification process, including submittal of a verification statement to [*the jurisdiction*], according to the following schedule:
(A) For reporting years 2010 through 2011, September 1 of the year following the reporting year.
(B) For reporting years 2012 and later, *[date to be determined]*.

(c) Submission of GHG Emissions Report. The annual GHG emissions report must be submitted to [*the jurisdiction*] in a format [*to be specified by each jurisdiction*].

(d) Simplified Emission Calculation Methods for De Minimis Sources. The owner or operator may elect to designate as de minimis one or more sources or pollutants that collectively emit no more than 3 percent of the facility's total CO_2e emissions, but not to exceed 20,000 metric tons CO_2e. The owner or operator may estimate emissions for these de minimis sources using alternative methods to those required to be used by this rule. If verification of the emissions report is required by this rule, then the selection of any alternative GHG calculation method is subject to the concurrence of the verification team that the use of such methods provides reasonable assurance that the emissions so designated do not exceed the applicable de minimis limits. The operator shall separately identify and include in the emissions data report the emissions from designated de minimis sources.

(e) To ensure accuracy of reported data and the ability to conduct audits and/or verifications of each emissions data report, the owner or operator shall establish and maintain data acquisition and handling activities that provide for the transparency and verifiability of emissions calculations and supporting information consistent with section WCI.4 .
[As a means of assuring a smooth verification process and a positive verification opinion WCI jurisdictions may also require or advise in guidance materials that facilities have a full GHG inventory management plan.]

(f) GHG Emissions Report Revisions.

(1) The owner or operator shall maintain documentation to support any revisions made to a previously submitted annual GHG emissions report. Documentation for all revisions shall be retained by the operator for 7 years.
(2) If, after the verification deadline, a report subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report within 60 days of the finding. To the extent possible, the revised report must correct all identified errors. A revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*]. [The jurisdiction] will send notification of approval or disapproval and an explanation of the reasons for any disapproval within 60 days of receipt of the revised report.
(3) If, after the report submittal deadline, a report not subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report within 30 days of the finding. To the extent possible, the revised report

must correct all identified errors. A revised report will be accepted only if approved by [*the jurisdiction*]. [The jurisdiction] will send notification of approval or disapproval and an explanation of the reasons for any disapproval within 60 days of receipt of the revised report.

(4) An owner or operator that voluntarily chooses to correct errors of 5 percent or less in total CO_2e emissions reported may do so according to the following requirements:

(A) For reports subject to verification, a revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*].

(B) For reports not subject to verification, a revised report will be accepted if approved by [*the jurisdiction*].

(g) Where this rule specifies a choice between use of a fuel-based or mass balance-based calculation or use of a continuous emissions monitoring system (CEMS) to calculate CO_2 emissions, the operator shall make this choice and continue to use the method chosen for all future emissions data reports, unless the use of the alternative calculation method is approved in advance by *[the jurisdiction]*.

§ WCI.3 CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT

Each annual GHG emissions report shall contain the following information:

(a) Facility name, identification number, physical address, mailing address, and NAICS code.

(b) Reporting year.

(c) Date of report submittal.

(d) Total facility emissions aggregated from all applicable source categories in subparts WCI.20 through WCI.XX expressed in metric tons of CO_2e calculated using Equation 1-1 of section WCI.1, excluding emissions from CO_2 that is captured and CO_2 emissions from the combustion of biomass and biomass-derived fuels, which are reported separately.

(e) Total facility emissions of CO_2 from the combustion of biomass and biomass-derived fuels.

(f) Total annual mass of CO_2 captured for on-site use, on-site storage, or transfer off site, in metric tons.

(g) For applicable fuel supplier categories in subparts WCI.XX [Transportation Fuels Combustion] and WCI.XX [Residential, Commercial and Industrial Fuels Combustion], total CO_2e emissions aggregated from all specified fuels.

(h) Emissions from each applicable source category or fuel supplier category in subparts WCI.20 through WCI.XX, expressed in metric tons per year of CO_2, CH_4, N_2O, HFC, PFC, and SF_6. CO_2 emissions from the combustion of biomass and biomass-derived fuels shall be reported separately.

(i) For electricity importers, the information required by WCI.XX [Electricity Imports].

(j) Emissions and other data for individual units, processes, activities, and operations as specified for each source category in sections WCI.20 through WCI.XX of this rule.

(k) Emission factors developed or measured by the operator using approved source testing as provided under sections WCI.20 through WCI.XXX. Emission factors shall be provided in units of emissions per amount of fuel consumed, where fuel is reported in the units specified in this regulation.

(l) Mass emissions from each designated de minimis source or pollutant, reported in metric tons per year of each GHG for which an alternative emission calculation method is used.

(m) Name and contact information including e-mail address and telephone number of the person primarily responsible for preparing and submitting the emissions report.

(n) [only applicable in United States jurisdictions] A signed and dated statement provided by the owner or operator, or their designated representative, certifying that the report has been prepared in accordance with this rule and that, subject to verification, the statements and information contained in the emissions data report are true, accurate, and complete to the best of their knowledge.

(o) [only applicable in Canadian jurisdictions] A statement signed and dated by the operator's representative, certifying that:

(1) the operator's representative has examined the emissions report and ensured that it is complete and accurate, and
(2) the emissions report has been prepared in accordance with this rule and that the statements and information contained in the emissions report are true and fair to the best of the knowledge of the operator's representative.

§ WCI.4 DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS

(a) The operator shall establish and maintain procedures for document retention and record keeping. The operator shall retain all documents regarding the design, development and maintenance of the GHG inventory in paper, electronic or other usable format for a period of not less than 7 years following submission of each emissions data report. The retained documents, including GHG emissions data, shall be sufficient to allow for the verification of each emissions data report.

(b) Upon request by *[jurisdiction]*, the operator shall provide within 10 working days all documents and data used to develop an emissions data report.

(c) In addition to information submitted as part of the emissions data report, each operator shall retain, at a minimum, the following information, if applicable, for at least 7 years after the submission of the report:

(1) A list of all GHG sources (i.e., units, operations, processes, and activities) included in the emission estimates.
(2) All records and documents used to calculate emissions for each source, categorized by process and fuel or material type.
(3) Documentation of the process for collecting emissions data.
(4) Any GHG emissions calculations and methods used;
(5) All emission factors used for emission estimates, including documentation for any factors not provided in the rule.
(6) All input data used for emission estimates.
(7) Documentation of biomass fractions for specific fuels.
(8) All other data submitted to the [*jurisdiction*] under this rule, including the GHG emissions report.

(9) All computations made to gap-fill missing data.
(10) Names and documentation of key facility personnel involved in emissions calculating and reporting;
(11) Any other information that is required for the verification of the GHG emissions report.
(12) A log to be prepared for each reporting year, beginning January 1, documenting all procedural changes made in GHG accounting methods and changes to instrumentation for GHG emissions estimation.
(13) The GHG inventory data audit trail, data control policies and procedures, and supporting documentation.

(d) For measurement based methodologies, the following information, if applicable,also must be retained for at least 7 years after the submission of the emissions data report:

(1) List of all emission points monitored.
(2) Collected monitoring data.
(3) Quality assurance and quality control information collected for the WCI.2(e) data audit trail and data controls section of this rule.
(4) A detailed technical description of the continuous measurement system, including documentation of any findings and approvals by federal, State or local agencies.
(5) Raw and aggregated data from the continuous measurement system.
(6) A log book of all system down-times, calibrations, servicing, and maintenance of the continuous measurement system.
(7) Documentation of any changes in the continuous measurement system over time.

§ WCI.5 COMPLIANCE AND ENFORCEMENT

(a) Submission of false or misleading information to the *[jurisdiction]* or a verification body shall constitute a single, separate violation of the requirements of this article for each day after the information has been received by the Executive Officer or verification body. [Partners must be able to enforce this provision in the absence of evidence of intent, e.g., strict or absolute liability, depending on the jurisdiction.]

(b) Each violation of this rule shall constitute a single, separate violation for each day the violation continues.

§ WCI.6 INCORPORATION BY REFERENCE

The following documents are incorporated by reference into this rule. These materials are incorporated as they exist on the date this article is adopted.

(a) The following materials are available for purchase from the following addresses: American Society for Testing and Material (ASTM), 100 Barr Harbor Drive, P.O. Box CB700, West Conshohocken, Pennsylvania 19428-B2959; and the University Microfilms International, 300 North Zeeb Road, Ann Arbor, Michigan 48106:

(1) ASTM D240-02, (Reapproved 2007), Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter.
(2) ASTM D388-05, Standard Classification of Coals by Rank.
(3) ASTM D396-08, Standard Specification for Fuel Oils.

(4) ASTM D975-08, Standard Specification for Diesel Fuel Oils.
(5) ASTM D1250-07, Standard Guide for Use of the Petroleum Measurement Tables.
(6) ASTM D1826-94 (Reapproved 2003), Standard Test Method for Calorific (Heating) Value of Gases in Natural Gas Range by Continuous Recording Calorimeter.
(7) ASTM Specification D1835-05 (2005).
(8) ASTM D1945-03 (Reapproved 2006), Standard Test Method for Analysis of Natural Gas by Gas Chromatography.
(9) ASTM D1946-90 (Reapproved 2006), Standard Practice for Analysis of Reformed Gas by Gas Chromatography.
(10) ASTM D2013-07, Standard Practice of Preparing Coal Samples for Analysis.
(11) ASTM D2234/D2234M-07, Standard Practice for Collection of a Gross Sample of Coal.
(12) ASTM D2502-04 (Reapproved 2002), Standard Test Method for Estimation of Molecular Weight (Relative Molecular Mass) of Petroleum Oils from Viscosity Measurements.
(13) ASTM D2503-92 (Reapproved 2007), Standard Test Method for Relative Molecular Mass (Relative Molecular Weight) of Hydrocarbons by Thermoelectric Measurement of Vapor Pressure.
(14) ASTM D2880-03, Standard Specification for Gas Turbine Fuel Oils.
(15) ASTM D3176-89 (Reapproved 2002), Standard Practice for Ultimate Analysis of Coal and Coke.
(16) ASTM D3238-95 (Reapproved 2005), Standard Test Method for Calculation of Carbon Distribution and Structural Group Analysis of Petroleum Oils by the n-d-M Method.
(17) ASTM D3588-98 (Reapproved 2003), Standard Practice for Calculating Heat Value, Compressibility Factor, and Relative Density of Gaseous Fuels.
(18) ASTM Specification D3699-07, Standard Specification for Kerosene.
(19) ASTM D4057-06, Standard Practice for Manual Sampling of Petroleum and Petroleum Products.
(20) ASTM D4809-06, Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter (Precision Method).
(21) ASTM Specification D4814-08a, Standard Specification for Automotive Spark-Ignition Engine Fuel.
(22) ASTM D4891-89 (Reapproved 2006), Standard Test Method for Heating Value of Gases in Natural Gas Range by Stoichiometric Combustion.
(23) ASTM D5291-02 (Reapproved 2007), Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants.
(24) ASTM D5373-08, Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Laboratory Samples of Coal and Coke.
(25) ASTM D5865-07a, Standard Test Method for Gross Calorific Value of Coal and Coke.
(26) ASTM D6316-04, Standard Test Method for the Determination of Total, Combustible and Carbonate Carbon in Solid Residues from Coal and Coke.
(27) ASTM D6866-06a, Standard Test Methods for Determining the Biobased Content of Natural Range Materials Using Radiocarbon and Isotope Ratio Mass Spectrometry Analysis.
(28) ASTM E1019-03, Standard Test Methods for Determination of Carbon, Sulfur, Nitrogen, and Oxygen in Steel and in Iron, Nickel, and Cobalt Alloys.
(29) ASTM E1915-07a, Standard Test Methods for Analysis of Metal Bearing Ores and Related Materials by Combustion Infrared-Absorption Spectrometry.

(30) ASTM CS-104 (1985), Carbon Steel of Medium Carbon Content.
(31) ASTM D 7459-08, Standard Practice for Collection of Integrated Samples for the Speciation of Biomass (Biogenic) and Fossil-Derived Carbon Dioxide Emitted from Stationary Emissions Sources.
(32) ASTM D6060-96(2001) Standard Practice for Sampling of Process Vents With a Portable Gas Chromatograph.
(33) ASTM D 2502-88(2004)e1 Standard Test Method for Ethylene, Other Hydrocarbons, and Carbon Dioxide in High-Purity Ethylene by Gas Chromatography.
(34) ASTM C25-06 Standard Test Method for Chemical Analysis of Limestone, quicklime, and Hydrated Lime.
(35) UOP539-97 Refinery Gas Analysis by Gas Chromatography.
(36) ASTM D5468-02 (Reapproved 2007).

(b) The following materials are available for purchase from the American Society of Mechanical Engineers (ASME), 22 Law Drive, P.O.Box 2900, Fairfield, NJ 07007-2900:

(1) ASME MFC-3M-2004, Measurement of Fluid Flow in Pipes Using Orifice, Nozzle, and Venturi.
(2) ASME MFC-4M-1986 (Reaffirmed 1997), Measurement of Gas Flow by Turbine Meters.
(3) ASME-MFC-5M-1985, (Reaffirmed 1994), Measurement of Liquid Flow in Closed Conduits Using Transit-Time Ultrasonic Flowmeters.
(4) ASME MFC-6M-1998, Measurement of Fluid Flow in Pipes Using Vortex Flowmeters.
(5) ASME MFC-7M-1987 (Reaffirmed 1992), Measurement of Gas Flow by Means of Critical Flow Venturi Nozzles.
(6) ASME MFC-9M-1988 (Reaffirmed 2001), Measurement of Liquid Flow in Closed Conduits by Weighing Method.

(c) The following materials are available for purchase from the American National Standards Institute (ANSI), 25 West 43rd Street, Fourth Floor, New York, New York 10036:

(1) ISO 8316: 1987 Measurement of Liquid Flow in Closed Conduits- Method by Collection of the Liquid in a Volumetric Tank.
(2) ISO/TR 15349-1:1998, Unalloyed steel-Determination of low carbon content. Part 1: Infrared absorption method after combustion in an electric resistance furnace (by peak separation).
(3) ISO/TR 15349-3: 1998, Unalloyed steel-Determination of low carbon content. Part 3: Infrared absorption method after combustion in an electric resistance furnace (with preheating).

(d) The following materials are available for purchase from the following address: Gas Processors Association (GPA), 6526 East 60th Street, Tulsa, Oklahoma 74143:

(1) GPA Standard 2172-96, Calculation of Gross Heating Value, Relative Density and Compressibility Factor for Natural Gas Mixtures from Compositional Analysis.
(2) GPA Standard 2261-00, Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography.

(e) The following American Gas Association materials are available for purchase from the following address: ILI Infodisk, 610 Winters Avenue, Paramus, New Jersey 07652:

(1) American Gas Association Report No. 3: Orifice Metering of Natural Gas, Part 1: General Equations and Uncertainty Guidelines (1990), Part 2: Specification and Installation Requirements (1990).

(2) American Gas Association Transmission Measurement Committee Report No. 7: Measurement of Gas by Turbine Meters (2006).

(f) The following materials are available for purchase from the following address: American Petroleum Institute, Publications Department, 1220 L Street, NW., Washington, DC 20005-4070:

(1) American Petroleum Institute (API) Manual of Petroleum Measurement Standards, Chapter 3- Tank Gauging:

(A) Section 1A, Standard Practice for the Manual Gauging of Petroleum and Petroleum Products, Second Edition, August 2005.

(B) Section 1B-Standard Practice for Level Measurement of Liquid Hydrocarbons in Stationary Tanks by Automatic Tank Gauging, Second Edition June 2001 (Reaffirmed, October 2006).

(C) Section 3-Standard Practice for Level Measurement of Liquid Hydrocarbons in Stationary Pressurized Storage Tanks by Automatic Tank Gauging, First Edition June 1996 (Reaffirmed, October 2006).

(2) Shop Testing of Automatic Liquid Level Gages, Bulletin 2509 B, December 1961 (Reaffirmed August 1987, October 1992).

(3) American Petroleum Institute (API) Manual of Petroleum Measurement Standards, Chapter 4- Proving Systems:

(A) Section 2-Displacement Provers, Third Edition, September 2003.

(B) Section 5-Master-Meter Provers, Second Edition, May 2000 (Reaffirmed, August 2005).

(4) American Petroleum Institute (API) Manual of Petroleum Measurement Standards, Chapter 22- Testing Protocol, Section 2-Differential Pressure Flow Measurement Devices, First Edition, August 2005.

(g) The following material is available for purchase from the following address: American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., 1791 Tullie Circle, NE., Atlanta, Georgia 30329: ASHRAE 41.8-1989: Standard Methods of Measurement of Flow of Liquids in Pipes Using Orifice Flowmeters.

(h) California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities, California Air Pollution Control Officers Association (CAPCOA) and California Air Resources Board (ARB), February 1999.

(i) Control of Emissions from Refinery Flares, Rule 118, South Coast Air Quality Management District, Amended November 4, 2005.

(j) U.S. EPA TANKS Version 4.09D, US Environmental Protection Agency, October 2005.

(k) Gas Processors Association (GPA) Standard 2261-00, Revised 2000.

§ WCI.7 DESIGNATED REPRESENTATIVE (ONLY APPLICABLE TO WCI JURISDICTIONS IN THE UNITED STATES)

(a) General. Each fuel supplier, electricity importer, and owner or operator of a facility that is subject to this rule, shall select a designated representative that is responsible for certifying and submitting GHG emissions reports under this reporting rule.

(b) Authorization of a Designated Representative. The designated representative of the facility shall be selected by a certificate of representation agreement that is signed by the designated representative and owners or operators of the facility. The designated representative must be an individual having responsibility for the overall operation of the facility or activity such as the position of the plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company.

(c) Responsibility of the Designated Representative.

(1) The designated representative of the facility shall represent and by any representations, actions, inactions, or submissions, legally bind each owner and operator in all matters pertaining to this rule.
(2) Each GHG emission report submitted under this rule must be signed by the designated representative and must contain the following certification statement: "I have been authorized to make this submission on behalf of the owners and operators of the facility (or supply operation, as appropriate). I certify under penalty of law that I have personally examined the information submitted in this document. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

(d) Changing a Designated Representative. The designated representative may be changed at any time upon submission of a superseding certificate of representation. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous designated representative before time of the superseding certificate of representation shall be binding on the new designated representative and the owners and operators.

(e) Changes in Owners and Operators. In the event of any change in ownership of the facility, any new owner or operator shall be deemed to be bound by the representations, actions, inactions, and submissions of the designated representative of the facility until such time as the designated representative is changed.

(f) Certificate of Representation. A certificate of representation must be submitted to *[the jurisdiction]* and kept on location by the facility, fuel supplier, or electricity importer. The certificate shall include the following information:

(1) Identification of the facility, fuel supplier, or electricity importer for which the certificate of representation is submitted.
(2) The name, address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the designated representative.
(3) A list of the owners and operators.

(4) Certification statements that the actions of the designated representative with respect to this rule are binding on the owners and operators, and that the designated representative has the necessary authority to carry out duties and responsibilities on behalf of the owners and operators.
(5) The signature of the designated representative and owner(s) and operator(s), and the dates signed.

§WCI.8 REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS

[Replaced -- See Attachment 2 of this document.]

§ WCI.9 DEFINITIONS

[This is a partial list of definitions. Additional definitions are under development based on the Canadian regulations come from "Section 71 of the Canadian Environmental Protection Act (CEPA) 1999"and the CARB definitions come from "Title 17, Subchapter 10, Article 2, Section 95102 of the California Code of Regulations.]

"Adverse verification statement" means a verification statement rendered by a verification body stating that the verification body cannot provide reasonable assurance that the submitted emissions data report is free of material misstatement, or that it cannot provide a positive statement that the emissions data report conforms to the requirements of this article.

"Biomass fuels" or "biomass-derived fuels" means fuels derived entirely from biomass.

"Carbon dioxide equivalent" or "CO_2 equivalent" or "CO_2e" means a measure for comparing carbon dioxide with other GHGs, based on the quantity of those gases multiplied by the appropriate global warming potential (GWP) factor and commonly expressed as metric tons of carbon dioxide equivalent.

"Conflict of interest" means a situation in which, because of financial or other activities or relationships with other persons or organizations, a person or body is unable or potentially unable to render an impartial verification opinion of a potential client's greenhouse gas emissions, or the person or body's objectivity in performing verification services is or might be otherwise compromised.

"Continuous emissions monitoring system" or "CEMS" means the total equipment required to obtain a continuous measurement of a gas concentration or emission rate from combustion or industrial processes.

"Data check" means any independent calculation or checking of data conducted by a verifier to recreate the emissions for a discreet source included in an emissions data report.

"Electricity generating unit" or "EGU" means any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce electric power.

“Exporter” means…*[To be defined later for transportation and RCI fuels accounting]*

“Facility” means any property, plant, building, structure, stationary source, stationary equipment or grouping of stationary equipment or stationary sources located on one or more contiguous or adjacent properties, in actual physical contact or separated solely by a public roadway or other public right-of-way, under common operational control, and having the same first two digits of the Standard Industrial Classification (SIC) or same first three digits of the North American Industry Classification System (NAICS) code. *[WCI is currently working to develop a definition that will harmonize common usages of the term in the U.S. and Canada. Some special facilities, such as oil and gas production fields will have separate definitions.]*

“Fuel analytical data” means any data collected about the mass, volume, flow rate, heat content, or carbon content of a fuel.

“Full verification” means all verification services as provided in section WCI.8(b).

“Global warming potential” or “GWP factor” means the radiative forcing impact of one mass-based unit of a given greenhouse gas relative to an equivalent unit of carbon dioxide over a given period of time.

“Greenhouse gas”, “greenhouse gases” or “GHG” means carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs).

“Hydrofluorocarbons” or “HFCs” means a class of GHGs primarily used as refrigerants, consisting of hydrogen, fluorine, and carbon.

“Importer” means…*[To be defined later by the Electricity Committee.]*

"Impregnated saw dust" means...
[WCI is developing a definition of impregnated saw dust, which generally refers to saw dust from wood treated or impregnated with resins, glues, or other substances derived from fossil fuels.]

“Independent Peer Reviewer” means a Lead Verifier within a Verification Body who has not participated in conducting verification services for the current reporting year who provides an independent review of verification services rendered as required in section WCI.8(f).

“Lead verifier” means a person that has met all of the requirements in section WCI.8 *[TBD]*.

“Less Intensive Verification” means the verification services provided in interim years between full verifications; less intensive verification only requires risk assessment and data checks on an owner or operator's emissions data report based on the most current sampling plan developed as part of the most current full verification services. This level of verification may only be used if the verifier can provide findings with a reasonable level of assurance.

“Material misstatement” means
(a) The individual or aggregate effect (overstatements and understatements offset each other) of

one or more errors, omissions or misstatements identified in the course of verification that result in the total reported emissions being outside the 95 percent accuracy required to receive a positive verification statement. Material misstatement does not include any evaluation of acceptable measurement uncertainty of the monitoring equipment or quantification methodologies, or

(b) The individual or aggregate effect of one or more errors, omissions or misstatements identified in the course of verification which make it probable that the judgment of a reasonable person judging the total reported emissions would have been changed or influenced by the error, omission or misrepresentation.

"Measurement-based" means any of the various emission quantification methodologies that involve the determination of emissions by means of direct measurement of the flue gas flow, as well as the concentration of the relevant GHG(s) in the flue gas.

“Measurement uncertainty” means the scientific uncertainty associated with measuring of GHG emissions due to limitations of monitoring equipment or quantification methodologies. The WCI allows a measurement uncertainty of ±5 % for all measuring equipment which provides information underlying emissions reporting.

"Nonroad equipment" means...
[WCI is developing a definition for nonroad equipment.]

“Owner or operator” means any person who owns, leases, operates, controls, or supervises a facility or fuel supply operation; or who imports electricity into the WCI region.

"Operator's representative" means:

(a) if the operator of the facility is an individual, the operator,

(b) if the operator of the facility is a corporation, either

  (1) any officer of the corporation, whether or not the officer is also a director of the corporation, who performs a policy making function in respect of the corporation and who has the capacity to influence the direction of the corporation, or
  (2) the individual with primary responsibility for the operations and management of the facility

(c) if the operator of the facility is not an individual or a corporation, the individual with primary responsibility for the operations and management of the facility.

“Perfluorocarbons” or “PFCs” means a class of greenhouse gases consisting on the molecular level of carbon and fluorine.

"Process emissions" means...
[WCI is developing a definition of process emissions, which generally refers to non-combustion emissions.]

“Positive verification statement” means a verification statement rendered by a verification body stating that the verification body can say with reasonable assurance that the submitted emissions data report is free of material misstatement and that the emissions data report conforms to the requirements of this article.

“Pure” means consisting of at least 97 percent by mass of a specified substance. For facilities burning biomass fuels, this means the fraction of biomass carbon accounts for at least 97 percent of the total amount of carbon in the fuel burned at the facility.

“Reasonable assurance” means a high degree of confidence that submitted data and statements are valid and that the reported emissions are free from material misstatement (i.e. that the emissions report presents fairly, in all material respects, the annual emissions for the facility, fuel supplier, or electricity importer).

"Senior officer" means:

(a) the chair of the board of directors, a vice-chair of the board of directors, the president, a vice-president, the secretary, the treasurer or the general manager of a corporation or any other individual who performs functions for a corporation similar to those normally performed by an individual occupying any such office, and

(b) each of the five highest paid employees of a corporation, including any individual referred to in clause (a).

"Solid biomass fuel" means plants or parts of plants, in their natural state or mechanically modified, but not chemically altered from the natural state.

“Stationary combustion unit” means any boiler, heater, furnace, kiln, turbine, internal combustion engine, incinerator or other non-mobile source device that combusts any solid, liquid, or gaseous fuel for purposes of producing useful heat or energy for industrial, commercial, or institutional use; or for purposes of reducing the volume of waste by removing combustible material.

“Supplier” means . . . *[To be defined later for transportation and RCI fuels accounting.]*.

“Verification” means a systematic, independent and documented process for the evaluation of an operator’s emissions data report against the WCI’s reporting procedures and methods for calculating and reporting GHG emissions.

“Verification body” means a firm accredited by the [Accreditation Body TBD] and recognized by the jurisdiction or its designee, that is able to render a verification statement and provide verification services for operators subject to reporting under this article.

“Verification cycle” means three years of verification activities. Each verification cycle must include at least one year of full verification, and may include two years of less intensive verification, if eligible.

“Verification statement” means the final written declaration rendered by a verification body attesting whether an operator’s emissions data report is free of material misstatement and whether the emissions data report conforms to the requirements of this article.

“Verification services” means services provided during verification as specified in section WCI.8, including but not limited to reviewing an owner’s or operator’s emissions data report, verifying its accuracy according to the standards specified in this section, assessing the owner’s or operator’s compliance with this section, and submitting a verification statement to the *[jurisdiction or its agent]*.

“Verification team” means all of those working for a verification body, including all subcontractors, to provide verification services for an operator.

“Verifier” means an individual employed or contracted by an accredited verification body who has been deemed competent by the verification body to carry out verification services as specified in section WCI.8.

“Waste-derived fuel” means a fuel typically derived from waste and generally used as a substitute for conventional fossil fuels. Waste-derived fuels can include fossil fuels such as waste oil, plastics, or solvents; biomass such as dried sewage or impregnated saw dust; or fractions of both fossil fuels and biomass such as municipal solid waste or tires.

§ WCI.10 Global Warming Potentials

Owners and operators must use the global warming potential (GWP) values given in Table WCI.10-1 when converting emissions of greenhouse gases to metric tons of carbon dioxide equivalent (CO_2e), using Equation 1-1.

Table WCI.10-1. Global Warming Potential Factors for Greenhouse Gases			
Common Name	**Formula**	**Chemical Name**	**GWP**
Carbon dioxide	CO_2		1
Methane	CH_4		21
Nitrous oxide	N_2O		310
Sulfur hexafluoride	SF_6		23,900
Hydrofluorocarbons (HFCs)			
HFC-23	CHF_3	trifluoromethane	11,700
HFC-32	CH_2F_2	difluoromethane	650
HFC-41	CH_3F	fluoromethane	150
HFC-43-10mee	$C_5H_2F_{10}$	1,1,1,2,3,4,4,5,5,5- decafluoropentane	1,300
HFC-125	C_2HF_5	pentafluoroethane	2,800
HFC-134	$C_2H_2F_4$	1,1,2,2-tetrafluoroethane	1,000
HFC-134a	$C_2H_2F_4$	1,1,1,2-tetrafluoroethane	1,300
HFC-143	$C_2H_3F_3$	1,1,2-trifluoroethane	300
HFC-143a	$C_2H_3F_3$	1,1,1-trifluoroethane	3,800
HFC-152	$C_2H_4F_2$	1,2-difluoroethane	43
HFC-152a	$C_2H_4F_2$	1,1-difluoroethane	140
HFC-161	C_2H_5F	fluoroethane	12
HFC-227ea	C_3HF_7	1,1,1,2,3,3,3- heptafluoropropane	2,900
HFC-236cb	$C_3H_2F_6$	1,1,1,2,2,3-hexafluoropropane	1,300
HFC-236ea	$C_3H_2F_6$	1,1,1,2,3,3-hexafluoropropane	1,200
HFC-236fa	$C_3H_2F_6$	1,1,1,3,3,3-hexafluoropropane	6,300
HFC-245ca	$C_3H_3F_5$	1,1,2,2,3-pentafluoropropane	560
HFC-245fa	$C_3H_3F_5$	1,1,1,3,3-pentafluoropropane	950
HFC-365mfc	$C_4H_5F_5$	1,1,1,3,3-pentafluorobutane	890
Perfluorocarbons (PFCs)			
Perfluoromethane	CF_4	tetrafluoromethane	6,500
Perfluoroethane	C_2F_6	hexafluoroethane	9,200
Perfluoropropane	C_3F_8	octafluoropropane	7,000
Perfluorobutane	C_4F_{10}	decafluorobutane	7,000
Perfluorocyclobutane	$c\text{-}C_4F_8$	octafluorocyclobutane	8,700
Perfluoropentane	C_5F_{12}	dodecafluoropentane	7,500
Perfluorohexane	C_6F_{14}	tetradecafluorohexane	7,400

Attachment 2: General Provisions – Verification Only

§WCI.8 REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS

Note: The verification requirements laid out in this section strive for consistency with ISO 14064-3[1] *requirements and set forth a high standard for verification that will ultimately support a WCI cap and trade program. Due to differences in rulemaking procedures between jurisdictions, Supplement 1 provides supplemental text that jurisdictions must incorporate into either the jurisdiction's prescriptive rule language, replacing more general procedural language in Section WCI.8, or into enforceable guidance documents. There are notes in WCI.8 that direct readers to appropriate text in Verification Supplement 1 when applicable. It is imperative that all jurisdictions have the same level of rigor and implementation for verification to support a WCI regional program. Reporters and verifiers with operations throughout the WCI region will benefit from a consistent approach and such an approach would facilitate administration of the verification requirements by a central body or designee.*

Note: For definitions of terms used in this section, see WCI.9 in Attachment 1.

(a) Applicability.

(1) Owners or operators [Each jurisdiction will select the specific terminology for the regulated persons in accordance with their customary rule-writing practices] are required to obtain annual verification when the reported annual emissions of the operation subject to this rule are equal to or greater than 25,000 metric tons of CO_2e in any calendar year starting in 2010.

(2) When the operation of a facility, fuel supplier, or electricity importer subject to the requirements of this section is changed such that the operator has reported less than 25,000 metric tons of CO_2e emissions for a calendar year, the operator shall obtain verification of annual emissions reports for the lesser of three subsequent calendar years or for those years remaining in the current compliance period. If CO_2e emissions of a facility, fuel supplier, or electricity importer subject to the requirements of this section again exceed 25,000 metric tons in any calendar year the provisions of WCI.8(a)(1) apply.

(3) Notwithstanding WCI.8(a)(1) and (2), any facility, fuel supplier or electricity importer included as a covered entity under the WCI cap-and-trade program shall obtain verification of reported annual emissions.

---

[1] ISO (2006) ISO 14064-3: Greenhouse Gases-Part 3: Specification with guidance for the validation and verification of greenhouse gas assertions, March, 2006, International Organization for Standardization, Switzerland.

[WCI is considering a deduction of pure biomass fuel combustion emissions that have occurred within a jurisdiction that has deemed them to be carbon neutral from the determination of whether the verification threshold has been met and from the scope of the verification when one is required.]

(b) Requirements for Annual Verification of Emissions Data Reports.

(1) Facility owners or operators, fuel suppliers, and electricity importers required to obtain annual verification shall be subject to full verification requirements in the first year that verification is required for an emissions data report. Upon completion of a positive verification statement under full verification requirements, the facility owner or operator, fuel supplier, or electricity importer may be eligible for two years of less intensive verification services as described in section WCI.9. This cycle may be repeated in subsequent three-year cycles; however, full verification requirements shall apply at least once every three years.

(2) Facility owners or operators, fuel suppliers, and electricity importers required to obtain annual verification will be required to obtain full verification services if any of the following apply:

(A) Change in the verification body from the previous year; or

(B) A verification body issued an adverse verification statement for that facility's previous year's emissions data report;

(c) Accreditation Requirements for Verification Bodies.

(1) The accreditation requirements specified in this subsection shall apply to all verification bodies, that wish to provide verification services under this rule.

(2) A verification body is qualified to conduct verification services for the WCI if it has demonstrated knowledge of the WCI reporting requirements and if it is:

(A) Accredited by the California Air Resources Board under Title 17, California Code of Regulation, section 95132, or

(B) Accredited to ISO 14065 through a program developed under ISO 17011 by an accreditation body that is a member of the International Accreditation Forum.

[Note the details of the WCI's specific accreditation process for verification bodies (which has yet to be developed) will be consistent with ISO 14065 through an accreditation program that will developed under ISO 17011 and will include demonstrated knowledge of the WCI reporting requirements. The WCI will explore additional accreditation requirements and/or other criteria for individual lead verifiers, general verifiers, and/or sector specialists.]

(C) The WCI will only grandfather in existing verification bodies that meet the requirements of WCI.8(c)(2)(A)-(B) if they are accredited by December 31, 2012 to provide verification services for programs other than the WCI.

(d) Requirements for Verification Services. Verification services shall be subject to the following requirements. The following verification services must be provided for each emissions data report.

(1) As part of the verification services, the verification team shall review documents submitted, assess risks of a material misstatement, develop a verification plan (that includes a sampling plan), evaluate the emissions data report against the verification requirements, and assess the materiality of errors, omissions and misstatements identified.
(2) The verification team shall request any information and documents needed for verification services. Such information shall include, but is not limited to original records and supporting data for the emissions data report.

(e) Level of Assurance. Verification bodies shall conduct verification processes and design verification procedures to provide a reasonable level of assurance for each separate emissions data report every year of the verification cycle.

(f) A verification team must include the following:

(1) a Lead Verifier;
(2) an Independent Peer Reviewer;
(3) at least one sector specialist with demonstrated knowledge and specific skills, if required per WCI [TBD];

[Note, the WCI will identify industrial sectors where a subject matter expert must be part of the verification team as part of development of its accreditation requirements.]

(g) Subcontracting. The following requirements shall apply to any verification body that elects to subcontract verification services.

(1) The primary verification body must assume full legal responsibility for verification services performed by subcontracted verifiers or verification bodies.
(2) A verification body or verifier acting as a subcontractor to the primary verification body will not further subcontract that same work to another firm or individual.
(3) Any verification body or verifier acting as a subcontractor is bound to all Conflict of Interest requirements in Section WCI.8(h).
(4) Must be identified by the primary verification body as part of the verification team.

(h) Conflict of Interest Requirements for Verification Bodies. The conflict of interest provisions of this section shall apply to the verification body, entities related to the verification body, and the verification team accredited according to the requirements of the WCI to perform verification services for the WCI program. Member for purposes of this section means any employee or subcontractor of the verification body or entities related to the verification body. Member also includes any individual with a majority equity share in the verification body or entities related to the verification body.

(1) Prior to commencing verification services for an owner or operator, a verification body must first be authorized in writing by [*(e.g. WCI regional administrative body or other organization to be determined) or jurisdiction in which the entity reports* (TBD)] to provide verification services. To obtain authorization the verification body shall submit to [TBD] a self-evaluation of the potential for any conflict of interest that the verification body, entities related to the verification body, and members of the verification team, including subcontractors, may have with the owner or operator or their related entities for which it will perform verification services. This self-evaluation must include evaluation of any threats to the verification body's independence including: [*note: a standardized Conflict of Interest Assessment form will be developed for the WCI*]

(A) Threats created by the reporting operation offering inducements to the verification body, subcontractors or verification team members for a positive opinion,

(B) Threats created by members of the verification body, verification team members, subcontractors, or family of subcontractors or team members having a financial interest in the reporting operation or its operator,

(C) Threats created by members of the verification body reviewing work of the verification body, subcontractors, members of the verification team, or related companies, including but not limited to any situation where the body, subcontractors, team members or companies have provided services related to greenhouse gases:

(D) Threats created by members of the verification body, verification team members, or subcontractors having a close relationship with the reporting operation, such that they might become too sympathetic to the interests of the reporting operation, or

(E) Threats created by members of the verification body, verification team members, or subcontractors being deterred from acting objectively or exercising professional skepticism by threats, actual or perceived, from the reporting operation.

(2) The verification body shall deem the potential for conflict of interest to be low if

(A) No threats as listed in WCI.8(h)(1) exist, and

(B) Any non-verification services provided by all members of the verification body the verification team to the owner or operator within the last three years are valued at less than [percent TBD] of the verification body's revenue.

(3) The verification body shall deem the potential for conflict of interest to be high if threats as listed in WCI.8(h)(1) exist, unless it is a potential for individual conflict of interest as provided in section WCI.8((h)(5) and may be mitigated per section WCI.8(h)(3)(B).

(4) The verification body shall deem the potential for a conflict of interest to be medium if

(A) the potential for a conflict of interest is not deemed to be either high or low as specified in sections WCI.8(h)(1)-(2).

(5) If a verification body deems the potential for conflict of interest to be medium and wishes to provide verification services for the owner or operator, then

(A) the verification body shall submit, in addition to the Conflict of Interest Assessment form, a plan to avoid, neutralize, or mitigate the potential conflict of interest situation.

(B) the verification body may submit a plan to neutralize a high individual conflict of interest assessed under WCI.8(h)(1)(B).

(C) the [TBD] shall evaluate the conflict of interest mitigation plan and determine whether verification services may proceed, as provided in section WCI.8(h)(4).

(6) Conflict of Interest Determinations. The *[TBD]* shall review the self-evaluation submitted by the verification body and determine whether the verification body is authorized to perform verification services for the owner or operator

(A) The *[TBD]* shall notify the verification body in writing when the conflict of interest evaluation information submitted under section WCI.8(h)(1) is deemed complete. Within *[Number of days TBD]* of deeming the evaluation information complete, *[TBD]* shall determine whether the verification body is authorized to proceed with verification and shall so notify the verification body.

(B) If *[TBD]* determines the verification body or any member of the verification team has any threats specified in section WCI.8(h)(1), *[TBD]* shall find a high potential conflict of interest and verification services may not proceed.

(C) If *[TBD]* determines that there is a low potential conflict of interest, verification services may proceed.

(D) If *[TBD]* determines that the verification body and verification team have a medium potential for a conflict of interest, *[TBD]* shall evaluate the conflict of interest mitigation plan and may request additional information from the applicant to complete the determination. In determining whether verification services may proceed, *[TBD]* may consider factors including, but not limited to, the nature of previous work performed, the current and past relationships between the verification body and its subcontractors with the owner or operator, and the cost of the verification services to be performed. If *[TBD]* determines that these factors when considered in combination with the mitigation plan demonstrate a low level of potential conflict of interest, then *[TBD]* will authorize the verification body to provide verification services.

(7) Monitoring Conflict of Interest Situations.

(A) After commencement of verification services, the verification body shall monitor and immediately make full disclosure in writing to *[TBD]* regarding any potential for a conflict of interest situation that arises. This disclosure shall include a description of actions that the verification body has taken or proposes to take to avoid, neutralize, or mitigate the potential for a conflict of interest.

(B) The verification body shall monitor arrangements or relationships that may be present for a period of one year after the completion of verification services. During that period, within 30 calendar days of any change in arrangements or relationships with the owner or operator for which the verification body has provided verification services, the verification body shall notify *[TBD]* of the change and provide a description of the nature of the change.

(C) The verification body shall report to *[WCI Regional Body or jurisdiction TBD]* any changes in its organizational structure, including mergers, acquisitions, or divestitures, for one year after completion of verification services within 30 days and submit an evaluation of how the change(s) impacts the potential for conflict of interest.

(D) *[TBD]* may invalidate a verification finding if a medium or high potential conflict of interest has arisen for the verification body or any member of the verification team. In such a case, the owner or operator shall be provided 180 calendar days to have their emissions report verified by a different verification body.

(E) If the verification body or its subcontractor(s) are found to have violated the conflict of interest requirements of this section, *[Accreditation Body TBD]* may rescind its accreditation for any appropriate period of time as provided in section WCI.8(aa) Additionally, (WCI Regional Body *[TBD]* may separately rescind its recognition of an accredited Verification Body. *[TBD – accreditation requirements]*.

(i) Notice of Verification Services. Prior to commencing verification services for a facility owner or operator, fuel supplier, and electricity importer, the verification body shall submit a notice of verification services to the *[TBD]*. Verification activities shall not proceed for 15 business days or until the verification body receives written approval to proceed from the

[TBD], whichever is earlier. If the *[TBD]* does not respond to the verification body within 15 business days, the verification body may begin to conduct verification activities.

(The NOVS form will be standardized across WCI and developed later, Supplement will include some minimum information to be contained in NOVS)

(j) Verification Plan.

(1) Accounting for requirements set by WCI.8, the verification plan shall document:
(A) the scope of the verification;
(B) the level of assurance;
(C) the verification standard;
(D) the verification criteria;
(E) the objectives of the verification;
(F) the timing of the verification, including site visits;
(G) the nature of the communications required;
(H) the resources required to conduct the verification, including the role of verification team members, and
(I) the nature, timing and extent of the verification procedures, including the sampling plan

(2) The verification body shall retain the verification plan in paper, electronic, or other format for a period of not less than seven years following the submission of each verification statement.

(k) Site visits. In years for which full verification services are required under WCI.8(b), at least one member of the verification team shall at a minimum make one onsite site visit to each facility or fuel supply location [Note that exact location of fuel supplier site visits remains TBD] for which an emissions data report is submitted. If the verification team requires a sector specialist as required (TBD through accreditation), that specialist must participate in the onsite visit(s). The verification team member(s) shall also conduct an onsite visit of the headquarters or other location of central data management, if different from the facility or fuel supply location, when the owner or operator is an electricity importer.

(l) Owners or operators shall make available to the verification team all information and documentation used to calculate and report emissions, electricity transactions, and other information required under this rule, as applicable.

(m) As applicable for electricity importers, the verification team shall review electricity transaction records, including receipts of power attributed to the Northwest or Southwest region as verifiable via North American Electric Reliability Corporation (NERC) E-Tags, settlements data, or other information as confirmation of the region of origin. [Note that this procedure is subject to change pending WCI Electricity Committee review.]

(n) Data Checks. To determine the reliability of the submitted emissions data report, the verification team shall use data checks as described in WCI.9, Definitions.

(o) Emissions Data Report Modifications. If as a result of review by the verification team and prior to completion of a verification statement the operator chooses to make improvements or corrections to the submitted emissions data report, a revised emissions data report must be submitted to [the jurisdiction] as specified by section WCI.2(f). The operator shall maintain documentation to support any revisions made to the initial emissions data report. Documentation for all emissions data report submittals shall be retained by the operator for seven years pursuant to section WCI.4.

(p) Materiality and Conformance Assessment Criteria. The verifier shall determine if the annual emissions report is prepared in such a way that it conforms to the verification criteria. To verify that the emissions data report is free of material misstatement, the verification team shall make its own determination of emissions checked based on the sampling plan and shall determine whether there is reasonable assurance if the individual or aggregate effect of any errors, omissions or misrepresentation could have resulted in an underestimation or overestimation of emissions by more than five percent of the facility's, fuel supplier's, or electricity importer's total reported CO2e emissions. To assess conformance with this rule the verification team shall review the methods and factors used to develop the emissions data report for adherence to the requirement of this rule. The verification team shall keep a log of any issues identified in the course of verification activities that may affect determinations of material misstatement and nonconformance, and how those issues were resolved.

(q) Completion of verification services shall include:

(1) Verification Statement. Upon completion of the verification services specified in sections WCI.8(d)(j)-(s), the verification body shall complete a verification statement for each emissions data report, and provide that statement to the owner or operator and [the jurisdiction or other body] according to the schedule specified in section WCI.2(b). Before that statement is completed, the verification body shall have the verification services and findings of the verification team independently reviewed and approved by an Independent Peer Reviewer.

(2) The verification body shall provide either a positive or adverse verification statement to the reporter and to the [the jurisdiction or other central body (alternatively, this could be the reporter's responsibility to submit the statement to the jurisdiction)] based on its findings during the verification process.

(3) The lead verifier in the verification team shall attest on the verification statement that the verification team has carried out all verification services as required by this rule, and the Independent Peer Reviewer shall attest to his or her independent review on behalf of the verification body and his or her concurrence with the verification findings. If the Independent Peer Reviewer does not determine that that the verification team has carried out all verification services as required by the rule or if the Independent Peer Reviewer rejects the verification team's findings, then the verification body cannot issue a positive verification statement.

(4) The verification body shall provide to the owner or operator a detailed verification report. The verification report shall at minimum include the detailed comparison of the data checks with the submitted emissions data report, errors, omissions and misstatements identified during the course of the verification, any corrections made to the original annual emissions report as a result of the verification, and observations about the data management systems that are connected to the errors, omissions and misstatements identified, as well as any qualifying comments on findings during verification services. The detailed verification report shall be made available to [*the jurisdiction*] upon request.

(r) Prior to the verification body providing an adverse verification statement to [*the* jurisdiction], the owner or operator shall be provided at least 14 working days to modify the emissions data report to correct any material misstatement or nonconformance found by the verification team. The modified report and verification statement must be submitted to [*the jurisdiction*] before the applicable verification deadline, unless the operator makes a request to [*the jurisidiction]* as follows:

(s) If the owner or operator and the verification body cannot reach agreement on modifications to the emissions data report that result in a positive verification statement, the operator may petition *[TBD]* to make a final decision as to the verifiability of the submitted emissions data report.

(1) If *[TBD]* determines that the emissions data report does not meet the standards and requirements specified in this rule, the owner or operator shall have the opportunity to submit within 60 calendar days of the date of this decision [Note that this time frame may need to be changed pending details of cap-and-trade system design and needs.] any emissions data report revisions that address *[TBD's]* determination, for re-verification of the emissions data report. In re-verifying a revised emissions data report, the verification body and verification team shall be subject to the requirements in section WCI.8(q)-(s).

(2) Upon provision of the verification statement to *[the jurisdiction]*, the emissions data report shall be considered final and no changes shall be made except as provided in section WCI.2(f). All verification requirements of this rule shall be considered complete upon provision of the verification statement.

(t) In addition to initiating WCI's dispute resolution process, the operator and verification body must inform the applicable accreditation body of the dispute.

(u) The *[TBD]* may make void the positive verification statement submitted by the verification body if:

(1) The [TBD] finds a high level of conflict of interest existed between a verification body and an owner or operator; or,

(2) An emissions data report that received a positive verification statement fails an audit by *[TBD]*.

(v) Upon request by *[TBD]*, the owner or operator shall provide the data used to generate an emissions data report, including all data available to a verifier in the conduct of verification services. *[TBD]* may also review the full verification report given by the verification body to the owner or operator. The full verification report shall be provided to the *[TBD]* upon request.

(w) Upon written notification by the *[TBD]*, the verification body shall make itself available for a verification services audit.

(x) Duration of verification services by one verification body. Facility owners or operators, fuel suppliers, or electricity importers subject to annual verification shall not use the same verification body for a period of more than six consecutive years. If a facility owner or operator, fuel supplier, or electricity importer is required or elects to contract with another verification body, they may contract verification services from the previous verification body only after not using the previous verification body for at least three years. If a verification body or verification team member has been providing verification services for a [operator/owner] in a greenhouse gas reporting or reductions program other than WCI within the previous three years, those years of services will count towards the six consecutive year limit in the WCI.

(y) Suspension of Verification Bodies. A jurisdiction may review, and for good cause, work to revoke or modify the accreditation status of a WCI-recognized verification body. If a WCI-recognized verification body is suspended in any other mandatory or voluntary GHG reporting or trading program, that verification body will not be allowed to provide any verification services under the WCI until that suspension ends. If a WCI-recognized verification body has their verification body accreditation revoked under any other mandatory or voluntary GHG reporting or trading program, that verification body will no longer be allowed to provide verification services under WCI until they are reaccredited.

NEW OR REVISED DEFINITIONS OF TERMS USED IN WCI.8 ARE SHOWN IN ATTACHMENT 1, GENERAL PROVISIONS, SECTION WCI.9.

Verification Supplement 1

Note: the additional content in this Supplement must either be included in regulatory text in the appropriate subsections of WCI.8 or enforceable guidance documents by jurisdictions. The language in this section provides further explanation of items required in WCI.8 or alternative, more prescriptive language of those requirements.

Preliminary Activities and Verification Plan

The verification team shall discuss with the owner or operator the scope and objective of the verification services and obtain information from the owner or operator necessary to develop a verification plan. Such information shall include but is not limited to:

- Information to allow the verification team to develop a general understanding of facility or entity boundaries, operations, emissions sources, electricity transactions, as applicable;
- Information about the data management system used to track GHG emissions, electricity transactions, and other required measurement data as applicable;
- Information regarding the training or qualifications of personnel involved in developing the GHG emissions data report;
- Description of the specific methodologies used to quantify and report GHG emissions, electricity transactions, and other required data as applicable;
- Records of measured data related to emissions and operations for the prior and current period;
- Inventory of sources and their associated emissions for the reporting period, and
- Any prior verification reports, if applicable.

In developing the verification plan, the verifier shall:

- Gain an understanding of the organization and the process that emit greenhouse gases;
- Conduct a risk assessment to evaluate inherent, control and detection risk;
- Conduct preliminary analytical testing to identify anomalies in the data;
- Conduct a sensitivity analysis to assess the relative contribution of each source in the inventory to the reported annual emissions, and
- Consider any other relevant developments at the facility, in the regulations, or legal environment.

Sampling Plan

As part of the verification procedures, the verification team shall develop a sampling plan that, when combined with the other verification procedures, provides sufficient and appropriate evidence to allow the verifier to arrive at a conclusion. The sampling plan shall be designed to achieve the specified verification objective. The sample plan shall consider:

- Statistical versus non-statistical approaches

- Design of the sample, including the population characteristics
- Stratification (categorization of population into subgroups)
- Emission weighted selection
- Sample size
- Sample selection

As relevant information becomes available during the course of verification activities, the verification team must modify the sampling plan as necessary to address potential issues emerge of material misstatement or nonconformance with the requirements of this rule.

Data Checks

The verification team conducts data checks throughout the verification process and shall focus first on the largest and most uncertain estimates of emissions and electricity transactions.

- In establishing the verification plan, the verification team shall use professional judgment to determine the number of data checks required for the team to conclude with reasonable assurance whether the reported emissions and transactions are free of material misstatement and the emissions data report otherwise conforms to the requirements of this rule.
- The verification team shall choose emissions sources, and electricity transactions data as applicable, for data checks based on their relative sizes and risks of material misstatement as indicated in the verification plan;
- The verification team, through the conformance assessment, shall ensure that the appropriate methodologies and emission factors have been applied for the emissions sources and electricity transactions for sampled data covered under sections WCI.20 through WCI.XX;

Site Visits

During the site visit, the verification team member(s) shall conduct the following:

- Observe whether all sources at the site are represented in the emissions report as specified in sections WCI.20 to WCI.XX as applicable to the owner or operator.
- Assess whether the source inventory is identified, categorized, and reported appropriately. Collect evidence as to explanations for data anomalies identified in the verification plan.
- Understand the data trail used by the owner or operator to measure, quantify, and report greenhouse gas emissions and, when applicable, electricity transactions.
- Understand and evaluate the associated data controls used by the owner to ensure the completeness and accuracy of the data

Materiality Assessment

In assessing whether misstatements are material, the verification team shall determine whether the total reported emissions are at least 95 percent accurate using the following equation:

Percent accuracy = 100 – (sum of (errors, omissions, misreporting) * 100 / (total reported emissions))

To assess conformance with this rule the verification team shall review the methods and factors used to develop the emissions data report for adherence to the requirement of this rule. The verification team shall keep a record of any errors, omissions or misstatements identified in the course of verification activities that may affect determinations of material misstatement and nonconformance, and how those issues were resolved.

Conflict of Interest (*could replace more general procedural language in Section WCI.8*)

(1) Conflict of Interest Submittal Requirements for Accredited Verification Bodies.

(A) Before the start of any work related to providing verification services to an owner or operator, a verification body must first be authorized in writing by *[TBD]* to provide verification services. To obtain authorization the verification body shall submit to *[TBD]* a self-evaluation of the potential for any conflict of interest that the verification body, entities related to the verification body, and members of the verification team including, subcontractors may have with the owner or operator or their related entities for which it will perform verification services. For the purposes of this section, the term member refers to staff on the verification team, in the verification body and any subcontractors. The submittal shall include the following:

i. Identification of whether the potential for conflict of interest is high, low, or medium based on factors specified in this section;

ii. An organizational chart of the business structure of the verification body, including its related entities and brief description of the primary work done by the verification body and related entities;

iii. Identification of whether any member of the verification body, entities related to the verification body, or the verification team including subcontractors has previously provided verification services for the owner or operator or its related entities and, if so, the years in which such verification services were provided;

iv. Identification of whether any member of the verification body, entities related to the verification body, or the verification team or including subcontractors has engaged in any non-verification services of any nature with the owner or operator or related entities either within or outside the WCI region during the previous three years. The verification body must also disclose any services listed under section (high COI list) it has provided to the owner or operator, regardless of when these services occurred. If non-verification services have previously been provided, the following information shall also be submitted:

- Identification of the nature and location of the work performed for the owner or operator and whether the work is similar to the type of work to be performed during verification, such as emissions inventory auditing, energy efficiency, renewable energy, or other work with implications for the operator's greenhouse gas emissions or the accounting of greenhouse gas emissions or electricity transactions;

- The nature of past, present or future relationships the verification body, entities related to the verification body, and members of the verification team including subcontractors have with the owner or operator or related entity including:
  - Instances when any member has performed or intends to perform work for the owner or operator;
  - Identification of whether work is currently being performed for the owner or operator and, if so, the nature of the work;
  - Whether any member has any contracts or other arrangements to perform work for the owner or operator or a related entity;
  - Identify how much work was performed in each of the last three years, as a percentage of the verification body's total gross income for each of the last three years;
  - Identify how much work related to greenhouse gases or electricity transactions was has performed for the owner or operator or related entities in each of the last three years, as a percentage of the verification body's income for each of the last three years;
  - Identify how much work was performed by each subcontractor for the operator in each of the last three years, as a percentage of each subcontractor's total gross income for each of the last three years.
- Explanation of how the amount and nature of work previously performed is such that any member of the verification team's credibility and lack of bias should not be under question.

v. A list of names of the verification team members that will perform verification services for the owner or operator and a description of any instances of personal or family relationships with management or employees of the owner or operator that potentially represent a conflict of interest; and,

vi. Identification of any other circumstances or relevant information known to the verification body or owner or operator that could result in a conflict of interest, or any situation where the appearance of impartiality could undermine confidence in the verification body's ability to assess the reported emissions.

(2) The potential for a conflict of interest shall be deemed to be high where:

(A) The verification body and owner or operator share any management staff or board of directors membership, or any of the management staff of the owner or operator have been employed by the verification body, or vice versa, within the previous three years; or

(B) Within the previous three years, any member of the verification body, any entity related to the verification body, and the verification team has provided to the owner or operator any of the following non-verification services:

i. Designing, developing, implementing, or maintaining an inventory or information or data management system for facility greenhouse gases, or, where applicable, electricity transactions;

ii. Developing greenhouse gas emission factors or other greenhouse gas-related engineering analysis;
iii. Designing energy efficiency, renewable power, or other projects which explicitly identify greenhouse gas reductions as a benefit;
iv. Preparing or producing greenhouse gas-related manuals, handbooks, or procedures specifically for the reporting facility;
v. Appraisal services of carbon or greenhouse gas liabilities or assets;
vi. Brokering in, advising on, or assisting in any way in carbon or greenhouse gas-related markets;
vii. Managing any health, environment or safety functions which explicitly identify greenhouse gas reductions as a benefit;
viii. Bookkeeping or other services related to the accounting records or financial statements, unless those services limited to financial auditing;
ix. Any service related to information systems, unless those systems will not be part of the verification process and excluding third-party auditor or registration services;
x. Appraisal and valuation services, both tangible and intangible related to GHG emissions or reductions inventories;
xi. Fairness opinions and contribution-in-kind reports in which the verification body has provided its opinion on the adequacy of consideration in a transaction, unless the resulting services shall not be part of the verification process;
xii. Any actuarially oriented advisory service involving the determination of amounts recorded in financial statements and related accounts;
xiii. Any internal audit service as provided under section (GHG plan) that has been outsourced by the operator that relates to the owner's or operator's internal accounting controls, financial systems or financial statements, unless no consulting or advice was provided as part of the audit;
xiv. Acting as a broker-dealer (registered or unregistered), promoter or underwriter on behalf of the owner or operator;
xv. Any legal services related to GHG emissions;
xvi. Expert services to the owner or operator or his or her legal representative for the purpose of advocating his or her's interests in litigation or in a regulatory or administrative proceeding or investigation involving GHG emissions, unless providing factual testimony.

(C) The potential for a conflict of interest shall also be deemed to be high where any staff member of the verification body, entity related to the verification body, or the verification team has provided verification services for the owner or operator for six consecutive years or within three years of the termination of a previous GHG verification contract with the owner or operator. If a verification body or verification team member has been providing verification services for a [operator/owner] in a greenhouse gas reporting or reductions program other than WCI within the past three years, those years of services will count towards the six consecutive year limit in the WCI.

(D) The potential for a conflict of interest shall be deemed high where the Independent Peer Reviewer for the verification team has provided verification or non-verification services for the operator during the current reporting year.

(3) The potential for a conflict of interest shall be deemed to be low where:

(A) No potential for a conflict of interest is found under section WCI.8(h) *(may need to be updated, depending upon final version of WCI.8)* and any non-verification services provided by all members of the verification body and the verification team to the owner or operator within the last three years are valued at less than *[Percent TBD*] of the verification body's revenue.

****

WCI.8 OPTIONAL GUIDANCE

Note: This text is supporting material and not intended as part of the essential requirements.

Collection of Evidence

The verification body shall obtain sufficient and appropriate evidence to be able to draw reasonable conclusions on which to base the verification statement. The verification body obtains evidence by performing verification procedures. Verification procedures are classified as:

- **Computation (or Recalculation)** is the checking of mathematical accuracy of documents or records
- **Observation** of a process or procedure
- **Confirmation** is obtaining representations from a third party
- **Enquiry** is seeking information from a knowledgeable person
- **Inspection** of Records or Documents/Assets
- **Re-performance** is the verifiers independent execution of procedures or controls
- **Analysis** is the evaluation of information made by studying the plausible relationships among different types of data

Some or all of these techniques can be used to obtain sufficient and appropriate evidence. Site visits are used to obtain evidence that is readily available at that location.

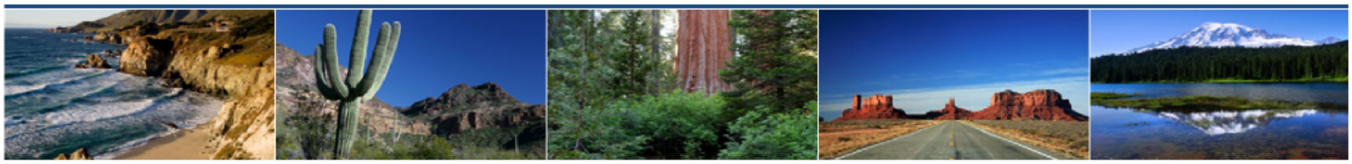
Western Climate Initiative



May 7, 2009

To All Interested Parties:

Today, the Western Climate Initiative (WCI) is releasing their document "Response to Stakeholder Comments, and Final Draft Essential Requirements of Mandatory Reporting for the Western Climate Initiative." Attached to this document are the Final Draft Essential Requirements of Mandatory Reporting which include revisions to some previously released requirements, as well as new requirements for certain source categories not previously released.

New and revised sections included in this document are as follows:

General Provisions (WCI.1-10). Note that verification requirements (WCI.8) have been substantially rewritten and are provided as a separate attachment	Revised
General Stationary Combustion (WCI.20)	Revised
Iron and Steel Manufacturing (WCI.150)	Revised
Adipic Acid Manufacturing (WCI.XX0)	New
Primary Aluminum Production (WCI.70)	New (as rule format, previously in narrative)
Pulp and Paper Manufacturing (WCI.210)	New (as rule format, previously in narrative)
Soda Ash Production (WCI.230)	New
Petrochemical Manufacturing (WCI.300)	New

Sections previously released on January 6, 2009, which remain unchanged and are not included here, are as follows:

Refinery Fuel Gas Combustion (WCI.30)	Petroleum Refineries (WCI.200)
Electricity Generation (WCI.40)	Lime Production (WCI.170)
Cement Production (WCI.90)	Zinc Production (narrative)
Coal Storage (WCI.100)	Lead Production (narrative)
Hydrogen Production (WCI.130)	Coal Mine Fugitive Emissions (narrative)

You are invited to participate in a stakeholder conference call to discuss the new and revised requirements contained in this final draft and the previously released requirements on May 19, 2009, at 1:00 – 2:30 PM Pacific Time. The call-in numbers are 1-800-868-1837 (inside U.S. and Canada) and 1-404-920-6440 (outside U.S. and Canada), participant code 659537#.

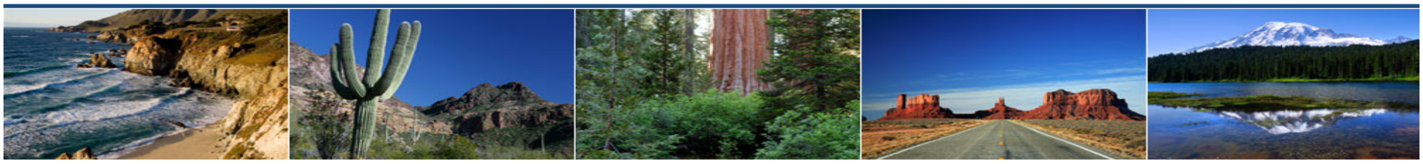
Also released on this date, as a separate document, are draft Essential Requirements for reporting for Electricity Imports. The stakeholder conference call to discuss these requirements will also be on May 19, 2009, at 11:30 AM – 12:30 PM Pacific Time, using the call-in numbers provided above.

We ask that written comments be submitted by June 4, 2009 through the WCI Website: www.westernclimateinitiative.org

Sincerely,

Jim Norton, Chair
WCI Reporting Committee
State of New Mexico

Western Climate Initiative



Response to Stakeholder Comments and Final Draft Essential Requirements of Mandatory Reporting for the Western Climate Initiative

May 7, 2009

1.0 INTRODUCTION

This document revises and expands upon the document issued in January 2009 ("Background Document and Progress Report for Essential Requirements of Mandatory Reporting for the Western Climate Initiative, Third Draft") that addressed continuing work conducted by the WCI Partner jurisdictions and the Reporting Committee. Its purposes are to: 1) respond to stakeholder comments received on the January 2009 document; 2) present proposed revisions of Essential Requirements sections previously released and identify sections that are still under review or development; 3) present proposed new Essential Requirements sections, including rule-format language for some source category requirements that were previously presented in a narrative discussion format; and 4) seek public comment on revised and new reporting Essential Requirements.

Comments on this document should be submitted in writing by June 4, 2009, through the WCI Website: www.westernclimateinitiative.org

On March 10, 2009, the U.S. EPA released the prepublication text of their proposed mandatory reporting rule (MRR) for reporting greenhouse gases (GHGs). The WCI is reviewing this proposed rule and is planning to submit comments to the U.S. EPA. WCI will also be looking at this proposed rule as a potential source for emissions quantification and/or sampling, analysis and measurement methods, just as it has reviewed other rules and protocols (e.g., California Air Resources Board [CARB], Environment Canada, Intergovernmental Panel on Climate Change [IPCC], European Union Emissions Trading Scheme [EU ETS], The Climate

Registry [TCR], World Resources Institute/World Business Council for Sustainable Development [WRI/WBCSD] Corporate Standard, industry protocols) for the same purpose.

In reviewing quantification methods in the proposed U.S. EPA rule, WCI will keep in mind that the U.S. EPA rule was designed to inform a variety of potential future policies, whereas methods for use in the WCI reporting requirements must be sufficiently accurate to support a cap-and-trade program. WCI has not had sufficient time after the release of the proposed U.S. EPA rule to incorporate a consideration of that proposed rule into the current document, but the U.S. EPA proposed rule will be considered as WCI develops the Final Essential Requirements, to be released in June 2009. WCI invites comments on which elements of U.S. EPA proposed rule might be useful for the WCI reporting requirements to support the cap-and-trade system. We urge stakeholders to provide these comments to WCI early in the comment period so that they can be considered as the WCI develops comments on the EPA rule (due June 9).

2.0 SUMMARY OF STAKEHOLDER COMMENTS AND WCI RESPONSES

This section contains a summary of the stakeholder comments received on the third draft of the reporting Essential Requirements, along with the WCI responses.[1] These are organized depending on the comments' topic or source category. The section begins by addressing comments received for which WCI will not, at this time, make changes to the reporting Essential Requirements (ERs); these include comments addressing design components of the cap-and-trade program or issues to be addressed in the future (e.g., source categories, such as fuel suppliers, for which WCI has not yet proposed reporting requirements), and comments simply not requiring a response. The next topic of comments and responses pertains to the part of the ERs known as "General Provisions." The last set of comments and responses covers the source category-specific ERs.

2.1 Comments on WCI Design Elements and Future Issues

This section summarizes comments and responses related to design elements, and future issues to be addressed under reporting and other subject areas within WCI.

[1] Where this document refers to "WCI", it represents a perspective that the WCI Partner jurisdictions have reached through consensus building.

2.1.1 Design Element Comments

Many stakeholders commented on WCI program design elements that were presented for comment in documents released earlier, prior to the January 6, 2009 "Background Document and Progress Report for Essential Requirements of Mandatory Reporting for the Western Climate Initiative, Third Draft" (Third Draft Essential Requirements). Many of these early design recommendations were presented in the "Design Recommendations for the WCI Regional Cap-and-Trade Program" released September 23, 2008, and others were first presented in early public releases related to mandatory reporting.

Verification

Many commenters questioned the need for third party verification of emissions reports (Design Recommendation 10.3 in the September 23, 2008 document). A general discussion of the value and necessity of third party verification is included elsewhere within this document as part of the responses to comments on WCI.8 relating to verification.

Thresholds

Many commenters expressed the view that thresholds for reporting and/or verification were too low. These thresholds were recommended in the September 23, 2008 document: 25,000 metric tons CO_2e per year for the cap-and-trade program (Recommendation 3.1) and 10,000 metric tons CO_2e per year for mandatory emissions reporting (Recommendation 10.2). The choice of the cap-and-trade program threshold was made after analysis of estimated facility-level emissions and was designed to ensure capture of 85-90% of WCI Partner jurisdiction emissions. Raising this threshold to 50,000 or 100,000 metric tons CO_2e as recommended by some commenters would create the potential for serious inequity among facilities in some industries, and would incentivize "leakage" of emissions to smaller facilities within an industry. The reporting threshold was set at a lower level to allow monitoring of uncapped sources for "leakage', to allow WCI Partner jurisdictions to check for avoidance of the cap by facilities underestimating their emissions, and to allow more accurate jurisdictional emissions inventories. WCI expects that many of the facilities with emissions in the 10,000 to 25,000 metric tons CO_2e emissions range will have only simple combustion sources and that emissions quantification for these facilities will be fairly simple.

Biomass in Thresholds

Many commenters, especially those in forest products industries, questioned the inclusion of biomass combustion emissions of CO_2 in determining whether a facility exceeded the thresholds for reporting or for the cap and verification. Commenters noted that these emissions are excluded from accounting or reporting under other GHG protocols such as EU ETS, WRI/WBCSD, IPCC, and Environment Canada, under the assumption that such emissions are carbon neutral. Commenters also noted that national and some jurisdictional programs encourage the substitution of biomass and biofuels for fossil fuels.

WCI Design Recommendation 1.3 calls for reporting of biomass combustion CO_2 emissions, but specifies that such emissions that are determined by the WCI Partner jurisdiction to be carbon neutral are not included in the cap-and-trade program (i.e., subject to the cap). Design Recommendation 1.4 says that CO_2 emissions from combustion of biofuels (pure, or as a fraction of blended fuels such as B20 or E85) are to be reported, but are not included in the cap-and-trade program. Design Recommendation 1.5 says that "Prior to program start, the WCI Partner jurisdictions will assess whether and how to include upstream emissions from biofuel and fossil fuel production, taking into consideration the potential for emissions leakage, the potential role of other policies (such as a low carbon fuel standard), consistent treatment among fuels, and other factors (such as practicality of implementation)." These earlier recommendations were based in part on the recognition that biomass or biofuel combustion CO_2 emissions may not be carbon neutral under all circumstances. For example, forest biomass harvesting that is not sustainable and results in a net long-term decrease in forest carbon stocks is not carbon neutral, and the use of fossil fuel combustion in the process of biofuel production is not carbon neutral if the production takes place outside the program boundaries and fossil fuel emissions are therefore not accounted for.

Inclusion of those biomass and biofuel combustion CO_2 emissions not yet deemed carbon neutral in the reporting threshold will ensure that these emissions are accounted for pending future decisions on carbon neutrality, low carbon fuel standard, and other related policies. WCI supports more reliance on biomass fuels as substitutions for fossil fuels when net GHG reductions can be achieved. WCI believes it is important to track the growth in biomass fuels usage at facilities subject to mandatory reporting, both to monitor the success of reduction strategies and to ensure rigorous and consistent emissions accounting as required in the ER.

At the same time, WCI recognizes the burdens that may be imposed on small facilities burning mostly pure biomass, such as those in the forest products industry. A provision allowing exclusion of up to 15,000 metric tons of CO_2 from the combustion of pure solid biomass has therefore been added to WCI.1(b). Furthermore, this exclusion will apply to all carbon-neutral biomass, after a WCI Partner jurisdiction has made a determination regarding the carbon neutrality of any biomass fuels. WCI is also considering an exclusion of carbon dioxide from biomass combustion emissions for purposes of determining verification applicability and from the scope of verification when one is required.

Consistency and Overlap of Reporting Requirements

Several commenters expressed concern that the reporting requirements of WCI Partner jurisdictions should be consistent, to avoid creating a patchwork of requirements across the region. This concern arises from the Design Recommendation 10.6, which states that "Nothing in the WCI program design limits the discretion of any WCI Partner jurisdiction to require reporting earlier, at lower thresholds, or for entities and facilities not covered by the cap-and-trade program." This recommendation was made in recognition that individual jurisdictions may have policies and programs in addition to the cap-and-trade program that require reporting beyond the coverage of the WCI Essential Requirements. WCI expects that any extension of reporting beyond the Essential Requirements would not be arbitrary, but would be based on the necessity of such additional reporting to support other programs and policies of the WCI Partner jurisdiction. The role envisioned for other policies is described in Design Recommendations 1.6, 5.1 and 5.2.

Some commenters also urged that WCI emissions reporting be consistent with existing or future national reporting requirements. WCI notes that the current U.S. national reporting of GHGs is limited to a small number of very large sources in the Acid Rain Program (see above for WCI comments on the recently released U.S. EPA rule proposal for GHG Reporting). WCI also notes that Environment Canada describes their current reporting program as preliminary and limited in scope: "Focusing on a limited number of emitters and basic reporting requirements, this system will serve to lay the foundation for a fully developed system".[2] The Environment Canada reporting program allows reporters to choose among multiple quantification

[2] Facility Greenhouse Gas Emissions Reporting Program, Overview of the Reported 2007 Greenhouse Gas Emissions, www.ec.gc.ca/pdb/ghg/onlineData/downloadDB_e.cfm, accessed March 9, 2009.

methodologies. Neither the U.S. nor Canadian national programs were designed to support an economy-wide cap-and-trade program such as that being developed by WCI. WCI reporting must not only cover a more comprehensive range of sources, but must also be more prescriptive in regard to emissions quantification methods to ensure equity and the integrity of the market program. WCI Partner jurisdictions do of course recognize the value of consistency with federal programs, and intend to promote and influence federal GHG emissions reduction programs that are consistent with the WCI cap-and-trade design principles and ensure that those programs translate into absolute GHG reductions.

Many commenters also urged that WCI reporting requirements be consistent with various existing GHG protocols such as WRI/WBCSD, IPCC, TCR, and/or protocols developed by industry associations. In developing these Essential Requirements, WCI has drawn upon these protocols as a source of information and methodologies. However, these protocols are not sufficiently prescriptive as to methodologies to support a market system. As noted in the WRI/WBCSD Corporate Standard GHG Protocol:

"GHG trading programs are likely to impose additional layers of accounting specificity relating to which approach is used for setting organizational boundaries; which GHG and sources are addressed; how base years are established; the type of calculation methodology used; the choice of emissions factors; and the monitoring and verification approaches employed."[3]

Starting Year for Reporting

Some commenters expressed concern that setting 2010 as the initial year for which emissions would be reported would not allow sufficient time for reporters to prepare to collect the necessary data. Design Recommendation 10.1 set this as the initial emissions year to be reported so that data would be available in 2011 to inform cap setting and allowance distribution prior to the first year (2012) of the first compliance period. While WCI recognizes that this is an aggressive schedule, requirements are unlikely to change substantially during the period when jurisdictions are in their rulemaking process to incorporate the Essential Requirements, so there is less uncertainty regarding the final form of the requirements than there might otherwise be. WCI Partner jurisdictions need not wait until jurisdictional rules are finally and officially promulgated before beginning planning for the necessary measurement and monitoring.

[3] "The Greenhouse Gas Protocol, A Corporate Accounting and Reporting Standard, Revised Edition", 2004, WRI/WBCSD, p. 14.

Electricity Use and Other Scope 2 Indirect Emissions

Some commenters recommended that facility reporting include the emissions associated with purchased electricity, heat and steam. WCI has recommended that emissions associated with electricity be covered at level of the generator or the importer of electricity for consumption within the WCI Partner jurisdiction (Design Recommendation 1.2.1). The present document does not include reporting for electricity importers, but these requirements will be addressed in future releases.

2.1.2 Future-Issue Comments

Many comments were received regarding source categories or issues that will be addressed in the future. Source categories that will be addressed in the future include oil and gas production and gas processing, electricity importers, and suppliers of residential, commercial, industrial and transportation fuels. References to these source categories in this and earlier versions of the Essential Requirements should be considered as placeholders pending a full consideration of the source categories later in the process.

Comments were also received regarding various aspects of market design and functioning. These included questions on how caps and allowances will be applied to facilities substituting on-site electricity generation from combined heat and power for purchased electricity, how allowances will be available to new sources, the kinds of projects available for offset credits, and the treatment of waste-to-energy and lifecycle emissions under the cap. These and other market-related issues are being or will be addressed by other WCI Committees.

WCI's Work Plan for 2009-10, which is available on the WCI web site (www.westernclimateinitiative.org), may be consulted for the scheduled time frames when these source categories and issues will be addressed. Comments already received on these issues will be retained and consulted as appropriate when these issues are addressed later.

2.2 General Provisions Comments

2.2.1 Applicability

This section addresses comments received on topics concerning discontinuation of reporting when facility emissions drop below the 10,000 metric ton CO_2e per year threshold, definitions used in the reporting Essential Requirements, CO_2 capture and transfer, and other miscellaneous topics related to facility/source applicability.

Discontinuation of Reporting

Several commenters objected to the provisions in paragraph WCI.1(e) relating to discontinuation of reporting. Many of these commenters said that it was unreasonable to require reporting for an additional three years after emissions drop below the reporting threshold of 10,000 metric tons CO_2e per year, and suggested that the previous year's emission level should be used to determine whether reporting was required the following year.

WCI clarifies that, for a facility not previously required to verify emissions, complete reporting of emissions is not required when emissions drop below the reporting threshold. All that is required is a certified statement that emissions were below 10,000 metric tons CO_2e for the year that emissions first drop below this level. After three consecutive years of such certified statements, the requirement ends, until and unless emissions again equal or exceed the threshold level. Without this requirement, the WCI Partner jurisdiction would be unable to distinguish between sources failing to report and sources not reporting because they fell below the threshold.

For facilities that exceeded the verification threshold in any previous year and then drop below the 10,000 metric ton threshold, full emissions reports must be submitted until three consecutive years of such reports have been submitted. The continuation of full reporting in this case is to ensure that all emissions within the compliance period are covered.

These provisions were proposed in lieu of the much simpler and easier to administer "once-in-always-in" approach. In addition, when a facility's operation has changed such that the operator has reported less than 25,000 metric tons of CO_2e emissions for a calendar year, the WCI has added a provision that will allow for verification, but not reporting, to be discontinued after the lesser of three subsequent calendar years or those years remaining in the current compliance period. Some commenters expressed support for such a provision.

Some commenters said that a provision was needed to address plant shutdown. WCI notes that temporary plant closures or shutdowns followed by restarting may vary in duration from less than a year to multiple years. WCI believes the three year sun-setting provisions are sufficient to address temporary closures or shutdowns, and note that verification costs would be trivial for any year that the facility would completely shut down.

Definitions

Several comments were received regarding the definition of "facility." WCI is currently working to develop a definition that will harmonize common usages of the term in the U.S. and Canada.

One commenter requested a definition of "operator" be added. WCI notes that "owner or operator" is defined, and each WCI Partner jurisdiction will select the specific terminology for regulated persons that is in accordance with its rule language conventions.

One commenter requested that WCI add a definition for "source category". WCI believes that the term is defined by its initial use in WCI.1(a)(1), and that a definition would be circular in that it would refer to the list in this paragraph.

One commenter questioned the use of the defined term "material misstatement" because it could imply that the misstatement was intentional, and suggested that this be replaced by "material error" or "material inaccuracy". WCI notes that the word "misstatement" does not imply intent. The word "material" also does not imply intent, but refers to the quantitative significance of the misstatement, as indicated in the present definition. Also, WCI points out that the question of intent need not be determined for civil liability under the standards of strict liability (U.S.) or absolute liability (Canada).

One commenter asked that definitions of "biomass" and "process emissions" be added. WCI continues to work on developing a comprehensive definition of biomass, and will take note of the more detailed comments regarding biomass as it does so. WCI is working to develop a definition of "process emissions" that will harmonize slightly different existing definitions in other rules and voluntary GHG protocols.

One commenter requested that a definition of "impregnated saw dust" be added. WCI is working to develop a definition, which will generally refer to saw dust from wood treated or impregnated with resins or glues derived from fossil hydrocarbons.

CO_2 Capture and Transfer

Several commenters objected to the inclusion of captured or transferred CO_2 in the emissions totals used to determine whether an emissions threshold (for reporting or verification) has been exceeded [WCI.1(b)(4)], on the basis that this CO_2 is not emitted. WCI believes that inclusion of captured CO_2 in the thresholds is necessary to ensure that jurisdictional audit or third party verification can be performed to verify that the reported capture amount was valid. The Reporting Committee does not expect that captured and transferred or stored CO_2 would be subject to the cap.

Miscellaneous Applicability Issues

One commenter asked that WCI clarify whether sources that WCI later determines are not covered by the cap will then no longer be required to report emissions. WCI cannot say at this time, because it depends on the specifics of the source category, and WCI Partner jurisdictions would individually have the option to require continued reporting to provide data needed for a jurisdictional policy or program.

One commenter understands that WCI will sum reported emissions to obtain a regional total, and asks that WCI specify that jurisdictional totals be calculated. WCI can clarify that this is an intermediate step that is necessary for cap setting and allowance distribution. It is not specified in the Essential Requirements, which are requirements for reporters and verifiers, not WCI Partner jurisdictions.

One commenter recommends that the reporting program allow companies with multiple facilities to compile and submit one aggregated report with facility level emissions to TCR. WCI can clarify that emissions will be reported facility by facility and that reports will be submitted to each WCI Partner jurisdiction. However, WCI will work to ensure the greatest consistency possible between the reporting tools of different jurisdictions. Work to develop the regional emissions database and the jurisdictional reporting tools will begin later in 2009, and stakeholders will be given the opportunity to comment on their design.

One commenter recommends that, for industry sectors with emissions that are well characterized, emissions reporting should be limited to only those sources that are significant. WCI notes that the de minimis provisions of WCI.2(d) allow for use of simplified methods for estimating emissions from small sources that collectively account for less than 3% of the facility emissions total, not to exceed 20,000 metric tons CO_2e. This de minimis provision is intended to address concerns regarding the burden of estimating emissions from sources that contribute little to the facility total emissions.

One commenter asks whether companies are required to report GHG emissions from the electricity used at their facility. WCI can clarify that these emissions are not required to be reported, in contrast to some voluntary GHG protocols. Emissions associated with electricity will be covered by the cap, but the covered entities will be generators and electricity importers. Requirements for electricity importers are under development, and draft recommendations will be released later in 2009.

2.2.2 Administrative Requirements

The comments related to administrative requirements covered the nine topics summarized below: content of report, confidentiality, compliance and enforcement, designated representative, document retention, GHG inventory management plan, report revisions, reporting (general), and report deadlines.

Content of Report

Many commenters expressed concern that the information required in emissions reports for individual units, processes, sources, fuel types, activities and operations is excessive and unnecessary. This concern was expressed in comments regarding both the general requirements in WCI.3 and regarding source category specific requirements. For some commenters, the concern about the level of detail in reports was in part a concern about confidential business information (CBI). Also, several commenters felt that third party verification would provide sufficient confidence in reported data, therefore, detailed reporting (e.g., at the unit, process level) is overkill, and potentially redundant.

The reporting of data for "individual units, processes, activities and operations" in WCI.3(j) depends upon the requirements of the source-category specific quantification method. Where such data is needed for a WCI Partner jurisdiction to properly assess and perform quality assurance on a facility's emissions report, the data is required, but may not be made public if it qualifies as CBI under laws and regulations of that jurisdiction. In other cases, such as for general stationary combustion, reporting is only designed to be for specific fuels, not at the unit or process level. Unit-level reporting and providing detailed data as part of the emissions report helps to facilitate verification and agency audits; verification should not take the place of detailed reporting. It is noted that the proposed U.S. EPA mandatory GHG reporting rule has more detailed specifications than does the current WCI reporting requirements.

One commenter states that reporting by "non-capped facilities" should be simplified both in determining if they meet thresholds, and in actual reporting requirements, as using simplified methods for these purposes does not compromise the effectiveness of the cap-and-trade program. WCI notes that most emissions from non-capped sources will be from general stationary combustion, and these facilities without the need to verify can use fairly simple calculations (either equation 20-1 or equation 20-2 in WCI.20) to determine emission levels. Reporting for these types of sources is intended to be for total emissions (by fuel and GHG) at the facility level.

One commenter states that the WCI methods require unreasonable effort to quantify sources that are smaller than the inaccuracies in more significant sources (in addition to requiring an unnecessary level of reporting detail.) WCI understands that uncertainties for some larger emission sources at a facility may be greater than total emissions from smaller sources; however, it is necessary to receive a complete emission profile for reporters. Which sources are smaller and which are larger may vary substantially between facilities; therefore, emission sources that fall within the de minimis specification of 3% of total emissions (see WCI.2(d)) may be estimated using alternative GHG estimation methods that will reduce the reporting burden.

Confidentiality

Many commenters raised concerns about maintaining the confidentiality of data included in GHG emissions reports to be submitted under the WCI program. Some commenters maintained that the separate reporting and public disclosure of emissions from different units or processes would be tantamount to the divulgence of confidential business information (CBI) because it would allow competitors to reverse engineer the commenter's process. Other commenters were concerned about the possible public disclosure of CBI used to calculate emissions, such as "physical fuel information."

The commenters offered two different solutions to this problem. Some advocated restrictions on the disclosure of data to the public. Others believed it necessary to withhold information from the WCI Partner jurisdictions themselves in order to protect CBI. One commenter, for example, stated that for combustion emissions the WCI should require the submission of only emissions rates, not the fuel-use data employed to calculate those rates. Many of the commenters advocating this approach maintained that the third party verification requirement would provide sufficient assurance of the reliability of emissions reports and therefore obviated the need to submit the underlying data to WCI Partner jurisdictions.

Some of the comments argued that reports to the WCI Partner jurisdictions or the data available to the public should be limited to aggregate emissions.

One commenter asserted that the treatment of data submitted by Canadian entities should be governed by Canadian, not U.S. law. In contrast, many other comments complained about the failure of the Essential Requirements to address confidentiality and asked WCI to include a common approach to public disclosure.

WCI's response is that, in general, confidentiality will be governed by laws and regulations of the WCI Partner jurisdiction where the data are reported. WCI is a regional organization for cooperation, and does not have the power to direct jurisdictions on how to apply their existing laws regarding disclosure and non-disclosure. WCI policy calls for public disclosure of facility-level aggregate emissions data in order to ensure market transparency. Jurisdictional laws and regulations govern whether disaggregated emissions data and ancillary data may be considered confidential. In at least some WCI Partner jurisdictions, the reporting and public disclosure of disaggregated emissions data has been required for decades with no reported adverse effect on the industries subject to those requirements. Section 114(c) of the Clean Air Act, for example, provides that U.S. EPA may not consider any emission data to be confidential.

The laws of the WCI Partner jurisdiction typically specify the procedures by which data submitted to an environmental agency may be judged to be confidential and withheld from the public, and these procedures vary widely from jurisdiction to jurisdiction.

Confidential data submitted to jurisdictions and then transferred to the regional database within TCR will not be subject to public records laws, because TCR is a private organization, acting in essence as a contractor to the jurisdiction. The data will be available only through each WCI Partner jurisdiction.

Comments advocating restrictions on the data submitted to WCI are addressed elsewhere in the response document.

Compliance and Enforcement

<u>List of Violations.</u> Several comments objected to the provision in WCI.5(b) that "[e]ach violation of this rule shall constitute a single, separate violation for each day beyond the specified reporting date" and the subsequent list of types. A number of comments urged WCI to follow California's example and argued that WCI.5(b) was more stringent than section 95107 of the California GHG reporting rule. Two commenters maintained that the potential penalty exposure under the WCI approach could be "many times higher" than under section 95107. According to these comments, under section 95107, the failure to include all information required allegedly would be "considered only one daily violation, irrespective of the quantity of information omitted" under section 95107 but could be considered multiple violations under WCI.5(b). One comment argued that "WCI should not extend compliance and enforcement actions beyond the submittal of the GHG emissions report and verification according to the deadlines established."

WCI disagrees with the approach advocated by these comments and in fact has revised WCI.5(b) to ensure that it is not given an unduly narrow interpretation. The list of violations has been removed because it may be mistakenly interpreted as an exclusive list. Failure to comply with any requirement of the rule is potentially a violation. The revised language for WCI.5 is substantively similar to the effect of California law taken as a whole, including section 95107.

<u>Leaving Compliance and Enforcement Issues to the Individual Jurisdictions.</u> A number of commenters urged WCI to leave the scope of enforcement authority and potential penalties to each WCI Partner jurisdiction. WCI believes this essential requirement is necessary, in addition to existing jurisdictional rules and mechanisms for enforcement and compliance and notes that many WCI Partner jurisdictions already have statutory enforcement authority similar to that contemplated by the ERs for violations of their existing rules.

<u>The Relationship of Enforcement to Third-Party Verification.</u> A number of comments argued that provisions for enforcement were unwarranted in light of the expansive, third-party verification program already required of reporting facilities. WCI believes that jurisdictional enforcement is a key component to the integrity of the WCI cap-and-trade program. Third party verification, though a powerful means of ensuring the accuracy of reported data, is not an enforcement activity. The third party verification process identifies non-compliance issues; it

does not prescribe or take enforcement action. Also, under the WCI program not all facilities will be required to have third party verification. WCI Partner jurisdictions need to have enforcement tools besides market remedies to insure program compliance.

Choice of Methodologies. The comments were that it is unreasonable not to allow choice of alternative data or methodologies for GHG calculation for certain specific sources. Such calculation and methodology should be justified with documentation by the reporter and verified by the verifier. WCI believes that allowing unlimited choice of data or methodologies would not ensure the consistency in reported emissions required for a market program, and could allow methodology choices to be made to over- or underestimate emissions for market advantage.

Standard for Liability. The comment was that WCI should limit the compliance and enforcement actions related to GHG reporting to submittal of the emissions reports and any willful falsification of these documents. WCI disagrees. Strict liability (U.S.) or absolute liability (Canada) is the normal standard for the imposition of civil liability in environmental regulatory programs. WCI.5(a) has been revised to make it clear that a strict or absolute liability standard is imposed, depending on whether the jurisdiction is U.S. or Canadian.

Fines. The comment was that fines for violations do not need to be consistent across states and should be subject to implementation by the individual states and provinces as appropriate. However, WCI.5 does not specify that fines for violations be consistent across WCI Partner jurisdictions.

Missing Data and Data Capture. Commenters stated that there are two vital provisions missing in the WCI reporting requirements that are linked with the compliance and enforcement requirements in WCI.5:

1. There needs to be provisions to address equipment breakdowns or other types of malfunctions when data cannot be physically; and
2. There needs to be provisions for defining data capture requirements.

In response to this comment, new sections, based on the referenced sections of the California mandatory GHG reporting rule, have been added to the ERs.

Deferral of Enforcement. The commenter stated that that reporting facilities should be given sufficient time to rectify any concerns with respect to reported emissions prior to having penalties imposed on them. WCI Partner jurisdictions will likely provide compliance assistance to reporters to answer questions about measurement and reporting. However, adding this suggested provision would release reporters from the responsibility to ensure that the reported emissions are correct when submitted.

Designated Representative

Certification Requirement. A number of commenters objected to the requirement in WCI.7(b) to prepare and submit to the WCI Partner jurisdiction a certificate or representation agreement selecting the designated representative. Some argued that the requirements was "not consistent to other instruments which the designated representative must certify" under Canadian programs. Others maintained that requirements for designated representatives should be set by the individual WCI Partner jurisdictions.

WCI recognizes that the concept of a "designated representative" is an unprecedented concept in the Canadian context. Therefore, WCI.7 will only be applicable in the U.S. WCI Partner jurisdictions. For the certification statement language in WCI.3, there are now two alternatives for the U.S. and Canadian jurisdictions respectively [WCI.3(n) and WCI.3(o)], with the U.S. language referencing the Designated Representative of WCI.7 and the Canadian language requiring certification by the "operator's representative." The "operator's representative" provision is meant to have the same effect as the designated representative provision, but follows precedent that has been set in other Canadian and provincial statutes and regulations whereby the representative is based on either the corporate structure or the management of the operation.

Liability for Acts of Previous Designated Representative. Several commenters objected that WCI.7(e) could be interpreted to impose personal liability on a subsequent representative for the representations, actions, inactions, and submissions of the prior representatives.

To clarify the meaning of this section: Owners and operators will be liable for compliance with the monitoring and reporting requirements. Until the U.S. WCI Partner jurisdiction receives the new certificate, the facility is bound by the actions of the existing Designated Representative. The binding language does not create personal liability for the proposed new Designated Representative; it only prevents the new Designated Representative from repudiating the actions of the existing Designated Representative. That is, the representations of the previous Designated Representative are not invalidated simply because there is a new Designated Representative.

Consistency with Title V. A number of commenters urged WCI to model the designated representative requirements on the "responsible official" provisions of rules adopted under Title V of the Clean Air Act. A number of these comments noted that there was no requirement to certify in Title V. One comment noted that there was such a requirement in the U.S. Acid Rain program, but argued that "the circumstances are different in that it applies exclusively to large power plants" and that "these plants often have divided ownership with different utilities owning percentages of different turbines at the same plant."

WCI points out that the Title V provisions are not designed to support an emissions trading program. WCI.7 requirements are modeled instead on provisions of the U.S. EPA Acid Rain program which, as an emissions trading program, is a closer analogy to the WCI program. The intent is to ensure that upper level management attention is paid to ensuring that all the necessary systems are in place to ensure accuracy of the reported data, which is convertible to a financial obligation or benefit, and that there is a single person responsible for certifying the reported data.

Consistency with Part 75. Commenters stated that the proposed ERs are much more stringent than the existing Part 75 certification requirements for designated representatives, and add undue burdens to business operations by controlling how businesses delegate authority and manage operational responsibilities.

WCI disagrees. WCI.7 is modeled on and closely follows the designated representative provisions of the Acid Rain rules (which appear in 40 C.F.R. Part 72, rather than Part 75).

Qualifying Officers. Commenters stated that the ERs should allow any corporate officer to be a designated representative. In addition, corporate staff other than the environmental director should be eligible to be a designated representative (e.g., the director of sustainable development).

WCI points out that the intent of WCI.7 is to ensure that upper level management attention is paid to ensuring that all the necessary systems are in place to ensure accuracy of the reported data, which is convertible to a financial obligation or benefit. The language does not require that the individual have the title of "environmental director", and it is possible that other persons, such as the person holding the title of "director of sustainable development" might qualify to be the designated representative, depending on their duties and responsibilities.

Definitions. The comment requested to include definitions of the terms “certificate of representation” and “Designated Representative” in the General Provisions section. WCI believes these terms are fully described in WCI.7, and that any definition would simply refer to that section and would thus be circular rather than adding meaning.

Document Retention

7-Year Retention Period. Several comments objected to the proposed requirement to retain records relating to GHG monitoring for 7 years. Many of these comments urged consistency with the five-year record retention requirement found in U.S. EPA's Title V permit program, many state air quality permit programs and The Climate Registry's General Verification Protocol. Some argued that the additional two-years of retention time would impose significant burdens, such as “costly and unnecessary re-programming of CEMS hardware and software systems” and the additional cost “to maintain the space for hard records and electronic storage for electronic records.” One commenter questioned “the need for 7-year data retention for CEMS CO_2 data that has been reported annually to EPA's Clean Air Markets Division (“CAMD”) and which data submittals must pass EPA's data submittal standards and filtering requirements each year upon submittal.” Two comments agreed with the 7-year retention requirement.

WCI believes that 7 years is a reasonable retention period in the context of this program. The key compliance transaction is surrender of allowances in Year 4 (if the first year of a compliance period is designated Year 1). The 7-year retention requirement ensures that all the emissions records which are supporting data for this compliance transaction are retained for an additional 3 years after the transaction. WCI notes that 7-year retention periods are not unusual in guidelines for retention of supporting documents for tax and financial purposes.

Logging Requirements. Two comments maintained that the requirement for a single log that tracks both procedural and instrument changes is counter productive. They noted that typically, this information is individually managed in either document control portions of procedures or in instrumentation calibration logs.

WCI believes that auditing of multiple logs without a master list would be extremely difficult. A master log could reference other logs for details.

Another comment requested that WCI should delete the provision to maintain a log of procedural revisions in GHG accounting or recommend that this is a voluntary recommended measure, not subject to an enforcement action. It has been our experience that the verifiers will request such information, but to have a company face an enforcement action for missing a single log entry is an example of the unintended consequences of such provisions.

Under the WCI reporting program, WCI Partner jurisdictions retain the authority to audit any emissions reports, as a check on the validity of the verification report and for reports which are not required to be verified. If records of changes in instrumentation or calculation methods are lacking, it will be extremely challenging to determine the accuracy of the emissions report. WCI Partner jurisdictions may use discretion in taking enforcement action for inconsequential violations.

<u>Key Personnel.</u> The commenter states that the requirement in Section WCI.4(c)(10) to retain the names and "documentation of key personnel involved in emissions calculating" is vague. In particular, the reference to "documentation" is vague and should be limited to relevant emissions related documentation, or should be stricken entirely, given that subsection (c) lists the documents to be retained.

WCI believes that it is clear from the context of this language that the documentation referred to is that relating to emissions calculation and reporting.

<u>Certificates of Representation.</u> The commenter stated that the information listed in WCI.4(c)(10) should include all Certificates of Representation. However, certificates of Representation are submitted as part of the emissions data report, and therefore do not need to be listed separately here (see WCI.4(c) introductory phrase).

<u>Applicability.</u> The commenter stated that information retention requirements should be qualified to clearly reflect that they are applicable only if appropriate. For example the retention requirement language in subsections (c) and (d) could be revised as follows: "the following information, 'if applicable' . . ." This qualification is particularly important for the record keeping requirements specified under WCI.4(c)(7), WCI.4(c)(9), WCI.4(d)1, WCI.4(d).

WCI agrees. This phrase has been added to the referenced sections.

One commenter believes that the requirement in WCI.4(c)(3) to keep documentation of the process for collection of emissions data is excessive. There is little purpose served by the source having to maintain a document identifying that it collected its fuel usage data (assuming that is what is meant by emissions data) from its fuel meter or purchase records. This will be self-evident from the records themselves. WCI.4(c)(7) requires "documentation of biomass fractions for specific fuels." It is unclear what is meant by this. If the requirement is for sources to differentiate between and record white wood, bark, shavings and sawdust consumption, the commenter fails to see the benefit and questions the typical source's capability to report this data. This requirement also seems to contradict the intent of WCI.23(b)(2), which indicates that a biomass source need not monitor fuel usage if it instead monitors steam production.

WCI believes that documentation of the process for collection of emissions data need not be complex for reports using simple methods and with few emitting units. Documentation of biomass fractions would not be applicable for pure biomass. The introductory phrase will be revised to indicate that only those items on the list that are applicable must be retained.

GHG Inventory Management Plan

Numerous commenters objected to the proposed requirement in WCI.2(e) that the owner or operator prepare and implement a GHG Inventory Management Plan. The commenters contended that the requirement would be costly and time-consuming, would constitute an unnecessary intrusion into the internal management of regulated facilities and would provide no additional benefits beyond those that would otherwise be achieved by the ERs. Many comments stated that it would be more appropriate to recommend the adoption of a GHG Inventory Management Plan in guidance. A few comments stated that a GHG Inventory Management Plan should not be imposed if third party verification is required.

WCI has carefully considered the requirements for a GHG Inventory Management Plan and has decided that a requirement for the owner or operator to establish and maintain data acquisition and handling activities that provide for the transparency and verifiability of emissions calculations will instead best serve the function of ensuring that verifiers and auditors can review and confirm a facility's GHG emission calculations and documentation in the most efficient manner (thereby reducing total costs). This requirement will also help to ensure that GHG emissions reports parallel the accuracy and transparency found in corporate financial reports and records, and will help to ensure compatibility with international carbon markets, such as the EU-ETS. A formal GHG inventory management plan is, however, a recommended best practice for facilities and will likely be outlined in guidance documents.

Report Revisions

Revision Submittal Deadlines. A commenter stated that WCI.2(f) contains revision submittal deadlines of 30 to 60 days, on top of requiring pre-approval of those revisions by the jurisdictional authority. These deadlines may be beyond the control of reporters given the jurisdictional authority approval step. Reporters cannot be held responsible for deadlines they cannot control.

WCI points out that jurisdictional review and approval does not begin until after resubmissions of revised reports. Therefore the 30- and 60-day periods do not include this step. Jurisdictional "acceptance" means that the WCI Partner jurisdiction agrees that the data originally reported may be replaced by the revised data. WCI thinks the language is clear on this point.

One commenter suggested that report corrections should be allowed up until the final date of annual compliance certification under the cap-and-trade program. However, WCI believes that for proper market functioning, it is important that publicly available emissions reports be corrected in a timely manner, not just immediately prior to the allowance surrender date.

Another commenter requested that WCI should consider modifying subsection WCI.2(f)(3) to allow 60 days for filing corrected reports not subject to verification. Additionally, both subsection (f)(2) and (f)(3) should include language to clarify that the time period for reporting corrections applies to the time frame in which the report must be filed within the applicable WCI Partner jurisdiction.

WCI points out that the longer timeframe for submitting revisions to reports subject to verification is to allow extra time for the verification of the revised data. This additional time is not needed for unverified reports. WCI believes the language in (f)(2) and (f)(3) is clear that the 30 and 60 day timeframes refer to the maximum time between finding the error and submission of the revised data to the WCI Partner jurisdiction.

Deadline for Jurisdiction Approval of Revised Reports. One commenter urged adoption of a deadline for the WCI Partner jurisdiction to take action on a revised report and suggested that the proposed ERs be reworded such that the revised reports are deemed accepted and approved within 30 days of filing unless the jurisdiction has notified the reporter that the revisions have not been accepted and approved.

WCI understands the need for Partner jurisdictions to approve or disapprove revised reports submitted under WCI.2(f) in a timely manner and therefore has added a deadline for the jurisdiction to take action. At the same time, because of the paramount need for data accuracy, it would not be appropriate to provide for approval by default, as suggested in the comment. Rather, reporters will have to avail themselves of whatever existing remedies the law of the WCI Partner jurisdiction provides to compel an administrative agency to comply with a regulatory deadline. In addition, WCI believes, given the likely complexity of many report revisions, that 60, rather than 30, days would be the appropriate time frame for the agency response.

Revisions in Initial Cycle. One commenter recommended that, in the initial years of reporting, errors be corrected as part of the next reporting cycle, not within the 30 or 60 days as proposed. WCI points out that for proper market functioning, it is important that publicly available emissions reports be corrected in a timely manner.

Reporting (General)

Minimizing Complexity and Cost. WCI recognizes that many reporters see these draft Essential Requirements of mandatory reporting as unfamiliar, complex and difficult to follow. The WCI Partner jurisdictions will work to provide outreach, training and compliance assistance to reporters.

Several stakeholders expressed concern with the administrative and real cost burdens that they may incur to comply with the reporting requirements as drafted. They requested that effort be made ensure the reporting needs do not go beyond what is required for a properly functioning cap-and-trade system. One commenter specifically requested an assessment of the total cost of compliance with the proposed reporting and monitoring requirements compared against alternatives to find a balance between data accuracy and the level of effort/cost of compliance.

The costs of inaccurate emissions data are impossible to quantify, because the impacts are on the integrity and functioning of the allowance trading system, which will be a substantial market. WCI has been working to incorporate specific improvements suggested by stakeholders and has attempted to minimize the complexity and burden to the extent possible without jeopardizing the integrity of the data and the market system. WCI believes that revisions and clarifications made in this version may reduce burdens.

Submission Process. A commenter requested clarification as to whether those with reporting requirements would only be required to report their emissions once to either the WCI or The Climate Registry (TCR). Another stakeholder recommended that the development of reporting through the TCR be harmonized with other existing mandatory reports in WCI Partner jurisdictions, to limit the reporting burden on regulated entities.

Emissions reports will be submitted to the WCI Partner jurisdiction, as specified by WCI.2(b)(1). Some jurisdictions may choose to develop an independent reporting tool and database, and then transfer the data to the WCI regional database to be developed by TCR. Other jurisdictions may choose to adopt and customize a reporting tool hosted by TCR but under the control of the jurisdiction. A WCI Partner jurisdiction would ideally be able to harmonize reporting requirements to a certain extent to streamline the requirements on reporters within its jurisdiction.

Drawing on Existing Protocols. Three commenters from the forest industry expressed concern about the extent and complexity of monitoring, calculation and reporting required in the draft Essential Requirements of Mandatory Reporting. They recommended that WCI follow existing internationally accepted protocols that streamline accounting and reporting requirements.

Where possible, the WCI has attempted to reduce the level of reporting burden for the forest industry through revisions and clarifications. A certain level of consistency and accuracy is required to operate a market-based program. Existing protocols that the WCI looked at that did not provide for those requirements were not recommended.

Distinguishing Reporting Applicability from Other Aspects of Cap-and-Trade Applicability. One commenter requested the draft Essential Requirements of Mandatory Reporting recognize of the benefit of waste-to-energy by excluding it from the requirements.

WCI points out that the requirements set out in the draft Essential Requirements of mandatory reporting are for reporting only. Many of the emissions sources that are required to report may have environmental benefits, but those benefits should be recognized and encouraged through policies other than a waiver of reporting requirements. For waste-to-energy specifically, WCI recognizes that there are multiple issues to be considered in evaluating the overall environmental impacts

Refinery Requirements. One commenter from the oil and gas industry requested that the WCI only require the use of best available data to report 2010 calendar year emissions, expressing concern about the time to prepare for any new programs or measurement equipment, and associated training, required to meet the reporting requirements during the first year.

The reporting requirements for refineries build off of existing measurement and reporting requirements. WCI believes it should be possible for refineries to begin preparing for the implementation of the reporting rules before promulgation of final rules. WCI will address requirements for other segments of the oil and gas industry later this year.

Cogeneration Requirements. One commenter expressed disagreement with the forest product industry cogeneration facilities being included under WCI.50 with the dedicated electric generation units. Regarding pulp and paper manufacturing, the commenter has concerns about the mass balance approach proposed and pointed to the tools for recovery boiler reporting the industry developed with the help of WRI.

Requirements for recovery boilers have been revised, utilizing information provided by industry commenters.

Weigh Feeder Terminology. One commenter suggested that, in regard to validating fuel consumption estimates, the more general terminology of weigh feeder, which includes weigh belts, conveyor scales, and other devices, be used.

WCI agrees with this interpretation, which may be provided in guidance documents if not incorporated into the language in WCI.2.

Stakeholder Input. A stakeholder association felt that it had not been given the opportunity to provide comprehensive input into the WCI proposals and requested that industry have an opportunity to provide meaningful input on the proposals.

WCI recognizes the importance of stakeholder engagement in design of the cap-and-trade system and is interested in learning from others' experience. Stakeholders are being requested to provide input on the final draft Essential Requirements and additional opportunities for input will be available at the jurisdictional level.

Report Deadlines

April 1 Deadline for Submission of Reports. Several comments requested a deadline for the submission of emission reports later than the April 1 date specified in WCI.2(b)(1). Many of these comments contended that it would not be feasible to compile the necessary data, prepare the reports and conduct internal QA/QC by April 1. Others noted that data needed to develop GHG emissions reports would in some instances not be available until some time after the end of the calendar year.

Some comments advocated an alternative deadline of June 1, because it would provide "a reasonable balance as among the various existing or proposed mandatory GHG reporting deadlines for WCI Partner jurisdictions" or "to maintain consistency with other reporting requirements in other Canadian jurisdictions." Others advocated a deadline of July 1, in order to give reporters additional time after the existing Canadian deadlines to work on their GHG inventories or to be consistent with the U.S. toxic release inventory deadline.

The WCI reporting deadline of April 1 is driven by the need for verification to be completed before July 1, to meet Design Element 12.2, which requires allowances for the first compliance period to be surrendered by July 1 of following year.

20 Days to Respond to Requests for Verification of Applicability. A number of commenters contended that the 20-day timeframe specified in WCI.1(f) for responding to a request to demonstrate that emissions have not exceeded one or more of the applicability criteria was too short.

WCI believes that a 20-day time frame is appropriate for operators to demonstrate they have not exceeded one or more of the applicability thresholds. In a market system timely compliance reviews will be paramount to the proper function of the market. For reporting operators this documentation and data was the foundation of the submitted emissions report and should have been previously assembled and retained. Operators outside the reporting requirement should have relatively simple data and should have documentation from the preliminary estimate to determine if they were subject to the reporting requirements. In addition, these comments failed to note that the ERs specify 20 *working* days.

10 Days to Respond to Requests for Supporting Data. Several commenters also questioned the reasonableness of the 10-day timeframe specified in WCI.4(f) for responding to a WCI Partner jurisdiction's request for the data records supporting an emissions report.

WCI believes this deadline is reasonable because it applies to the submission of records that the facility should already be keeping. In addition, these comments failed to note that the ERs specify 10 *working* days.

Strict Compliance. A commenter stated that given that the WCI Partner jurisdictions will not have reporting regulations in place until late 2009 at the earliest, it is unreasonable that reporting in strict compliance with the reporting regulations be required in 2011 for the 2010 emission year. Emitters will require time to develop GHG management plans, modify processes and purchase and install sample ports, sampling devices and measuring devices as required by the reporting regulations. Reporting in strict compliance with the reporting regulations should only commence for the emission year that is two years following the year reporting regulations are adopted. This will allow emitters the necessary time to put appropriate equipment and emission measurement systems in place prior to having to meet specific sampling and measurement requirements. Reporting with less stringent requirements beginning in 2011 for the 2010 emission year is reasonable.

WCI points out that problems in the European Union Emissions Trading Scheme (EU ETS) show the importance of using good data to determine allowances and caps. 2010 emissions data will be used, along with other information, in setting allowances and caps for the first compliance period. Using data that is incomplete or not strictly comparable to compliance period data could compromise market functioning.

2.2.3 Verification Requirements

A substantial volume of stakeholders provided input on WCI.8, the Essential Requirements for verification. Many stakeholders expressed strong opposition to the requirement for facility owners or operators to obtain third party verification of their emissions reports. Certain stakeholders expressed opposition to specific components of the verification requirements such as the level of assurance or the timing of verification statement submissions. Some stakeholders were in favor of regulatory agency review of reported emissions in place of verification, relying on a system similar to that used for other types of contaminant reporting. Other stakeholders expressed a desire for clarification of certain elements of the verification process. A number of stakeholders also expressed support for verification, accreditation requirements and a three-year verification cycle. Just fewer than 40 stakeholders provided feedback on the topic of verification.

The WCI appreciates the input from stakeholders on the topic of verification and has considered each comment received, making an effort to understand the reasons behind the concerns expressed. The WCI has made significant modifications to WCI.8 in response to the comments received but still firmly believes that third party verification is necessary for the cap-and-trade program. The discussion below describes the reasons the WCI believes third party verification is necessary and responds to the comments received on verification. The discussion also indicates how WCI.8 has been modified, and provides rationale for decisions WCI has made regarding the content of the verification requirements.

Rationale for Third Party Verification

In deciding to require third party verification of reported emissions, the WCI considered a number of factors, including:

- Experience of verification and verification requirements of other programs, such as those from Alberta, California and the European Union;
- Costs of verification;
- Alternatives to verification, and
- The unique nature of reporting for cap-and-trade.

By examining the experience of other GHG programs, WCI has found that third party verification is a cornerstone of national and international GHG reporting protocols. Internationally, third-party verification has been employed by several GHG programs, including the United Nations Framework Convention on Climate Change (UNFCCC) Clean Development Mechanism (CDM), European Union's Emissions Trading System (EU ETS), the United Kingdom's GHG Emissions Trading System, and Alberta's Specified Gas Emitters Program. Within WCI Partner jurisdictions, California's mandatory GHG reporting rule (AB 32) requires third party verification of reported data to ensure high quality and accurate reporting. The Climate Registry also requires third-party verification for its voluntary reporting program.

In general, GHG emissions are calculated from fuel and other data and not directly measured, as is often the case with criteria air contaminants for "traditional" environmental reporting. Some of the methods for calculating GHG emissions can be complex and potentially subject to reporting errors. Experience with both voluntary and mandatory GHG reporting programs shows that errors are quite common in the development of GHG inventories. Third-party verification provides an independent evaluation of the GHG calculation process and helps to ensure all specified methods are complied with in calculating GHG emissions. Having an independent third party evaluate the completeness of emission reports and compliance with reporting requirements substantially enhances the value and credibility of submitted emissions reports.

WCI is proposing to require a verification process that is based on financial auditing practices, consistent with international best practice for GHG programs, and already in use in existing voluntary and mandatory programs. In order for WCI Partner jurisdictions to provide this quality and level of assurance of reported GHG data, additional staff resources and funding would be needed.

Accreditation of verifiers provides a systematic consistent approach which may not be available using a "qualified professions" approach, as recommended by some commenters. The resources available to support rigorous agency review would vary by department, division, jurisdiction, etc. Thus, variability in how agency reviews are conducted, especially across jurisdictional borders, would be expected. The use of verifiers that are trained and accredited under a common framework will provide consistency that agency review lacks. The use of accredited, independent third-party verifiers is the most cost effective mechanism to remain consistent with international best practices and assure high quality data.

Accurate emissions data are especially important if the reported emissions are used to determine compliance with a cap-and-trade program because the reported emissions will be reconciled with allowances to determine program compliance. Entities will account for allowances as “assets” and emissions as “liabilities” on their financial statements. In a future cap-and-trade market, it is particularly important to remove any appearance of conflict of interest that would arise with facility operators verifying their own emissions reports, especially when those data take on monetary value.

The advent of GHG information carrying financial value has spurred conversations between financial auditors and GHG verification bodies to work to consolidate GHG assessments so that financial institutions can rely upon verification bodies' findings rather than duplicating the GHG assessments. This reconciliation effort, which is underway, speaks to the importance of high quality GHG data for financial applications such as regulatory compliance and market transactions. Most financial institutions believe it is critical to have confidence in reported emissions within a cap-and-trade program for the financial implications if for nothing else.

However, the WCI recognizes that it is important to evaluate and balance the degree of assurance required for the program to operate effectively in comparison with the costs associated with achieving that level of assurance. The WCI looked at a cost evaluation of verification in an existing voluntary program, the California Climate Action Registry (CCAR). The verification costs were determined to be relatively minor for the types and sizes of the facilities subject to the regulation. The costs were determined to be pennies on the metric ton. In comparison, the current costs for purchasing a metric ton of CO_2 in either a voluntary or compliance market range anywhere from US$ 3 to US$ 40.

The CCAR program has found that third party verification adds value to the process of accurately accounting for GHG emissions. On average, due to the complicated nature of GHG emissions, entities usually have to make corrections to their initial emission reports before they are able to successfully submit them to GHG programs for review and acceptance. As a result of errors identified during verification, entities have generally found that the verification process plays a key role in helping to strengthen their internal GHG data and management processes. CCAR has over four years of experience using third-party verification for its voluntary GHG reporting program. Over that period of time, over 200 entities have successfully completed the verification process. One common occurrence throughout the process is that entities gain significant benefit, in terms of data accuracy, from third-party verification. Almost all initial entity reports are changed as a result of verification.

In reviewing the CCAR verification process, only two emission reports out of 600 did not ultimately receive an acceptable verification finding in their first year of reporting. In both cases the entities did not have the appropriate data available to support their reported emissions. Also, in both instances, the entities were small organizations where mobile sources represented a significant portion of the inventory, and the emissions data from the mobile sources was not adequately tracked to be confirmed and reported.

In looking at other GHG programs, the WCI also determined that the cost of verification activities can vary significantly based on a number of key factors associated with a facility's emissions. Note that a facility can control two of the three factors:

1. Organization of Data: Since verification bodies must survey and review a facility's emissions inventory in order to develop a sampling plan and conduct verification activities, the organization of a facility's data is a critical determinant of cost. Well organized data will generally be centrally collected and stored, automated to the extent possible, and representative of the organization it describes. If data is not centralized, disorganized, or incomplete, the cost of verification will rise significantly.
2. Quality of Data Collected: If GHG data is well documented such that it is transparent, and can be easily assessed (and re-calculated) by a Verification Body, it will help to reduce the costs of verification.
3. Complexity of Emissions: If the nature of the reported GHG emissions is complex, verification activities to confirm compliance of complicated emissions and complex organizational structures will generally require more technical analysis, which will likely cost more than the assessment of simple GHG emissions.

Generally, the cost to verify emissions for the first year is higher than subsequent years, as a facility often is not sure how to best organize and collect their GHG data until they have experienced the verification process first hand. As data collection and quality improves, and as a verification body becomes familiar with a facility's operations, the cost of verification usually decreases. Also, facility training in GHG data organization, monitoring, and emissions quantification methods can result in better quality reports that are more easily verified.

Two stakeholders were particularly interested in how the WCI had considered the verification program in Alberta and whether the WCI could adopt the CCAR or TCR verification protocols.

The CCAR and TCR protocols and verification requirements support a voluntary facility-based reporting program. Since WCI is proposing a mandatory facility level reporting program to support a regional market cap-and-trade program, individual site visits are required, consistent with other mandatory facility GHG reporting programs. Also, the WCI reporting requirements will be in the form of regulatory language and not protocols. The exact calculation methods will involve the reporting of stationary combustion, process, and fugitive emissions where WCI will provide all methods to calculate and report those emissions. Some of those methods may overlap with the TCR protocol, but WCI will not be relying on the TCR protocols. WCI is committed to consistency in implementation of its regional program across all of the WCI Partner jurisdictions. As discussed in the "Background Document and Progress Report for Essential Requirements of Mandatory Reporting for the Western Climate Initiative, Third Draft", released for stakeholder input on January 6, 2009, the WCI may delegate certain functions to a regional body or designee such as TCR. However, WCI Partner jurisdictions are ultimately responsible for the enforcement of their programs, a responsibility and that cannot be delegated to a third party such as TCR.

WCI learned from its observations of the implementation of verification in Alberta that there is value in: (1) ensuring that verification requirements are set out clearly and supporting guidance is as comprehensive as possible at the program start to achieve consistency in implementation, since third party verification is being recommended as a means to obtain reliable, high-quality data across the region; (2) setting common standards and conflict-of-interest requirements for verifiers in order to communicate expectations clearly and establish a rigorous process for gathering important market information; (3) ensuring there is a sufficient pool of verifiers at the program start for the program to operate efficiently and to avoid excessive transaction costs. Areas in which the WCI draft recommendation differs from the Alberta Specified Gas (GHG) program include: (i) WCI's use of the accredited verification body approach compared to Alberta's use of the qualified professional approach; (ii) reasonable compared to limited level of assurance; and (iii) Alberta's requirement for verification to include production information needed for the intensity approach.

Entities participating in CCAR have shared the following thoughts regarding verification, and have found that third-party verification:

- Provides entities a new perspective on existing problems.
- Has encouraged entities to look at data differently, and more comprehensively. It has led to company teams interacting with one another in ways they have not previously (EHS, Facilities, and Accounting working together, for instance).

- Has resulted in cost savings. (For example, entities discovered that they were paying for things that are no longer in their inventory).
- Helps to identify operational inefficiencies by comparing emissions across a facility's operations.
- Requires that entities look at processes they may not have previously examined.
- Helps entities to better understand their GHG emissions and have confidence in their reporting. Some entities were surprised that their largest emission sources were not what they expected.

Stakeholder Comments and WCI Responses on Specific Components of the Proposed Verification Requirements

Responsibility for errors. One commenter stated that the verifier and regulatory agency should be responsible for errors made during verification. This topic will be addressed with other compliance provisions when the WCI further develops the verification and accreditation programs.

Materiality. Several commenters provided feedback on the discussion of materiality in WCI.8. The WCI recognizes the concerns expressed and has made changes to WCI.8 to provide better clarity. Stakeholders should refer to the revised description and definition of materiality in WCI.8.

Support of phase-in of verification requirements. Two commenters voiced support for a phase-in of verification requirements, including a transition period for facilities installing CEMs equipment, extended or staggered deadlines, requiring verification for combustion sources only and reduced COI checks. The timing of verification requirements was determined to provide high quality assurance of data during a pre-market period. This will be essential to generate accurate information as allocations and caps are being set. Verification will provide that quality assurance.

Supply of verifiers. Numerous stakeholders were also concerned about an adequate pool of accredited verification bodies available to offer services when reporting requirements commence. The WCI understands that an adequate supply of verification bodies will be necessary to create competition in the verification services market and keep verification costs at a reasonable level. Commenters voiced this concern in the context of the COI requirements, the timing of verification requirements and the competencies and accreditation requirements for verification bodies. One commenter also urged that accreditation requirements be finalized as soon as possible to provide verifiers adequate time to prepare for and obtain accreditation.

WCI will have verification bodies available through recognition of existing ANSI and CARB (and future SCC) accredited verification bodies that demonstrate familiarity with the WCI program. Many existing verification bodies are multinational companies with offices all over the world. WCI is committed to provide a sufficient number of verifiers through a continuous accreditation process. The supply of verification bodies will be a key consideration as the accreditation system is developed and implemented in 2009. Continued stakeholder input will be valuable during the further development of verification and accreditation systems during 2009.

More intensive verification years in the beginning of the program are expected, however, WCI also expects the balance of work to even out over time. Verification cycles will increasingly vary over time due to a variety of factors including changes in verification body utilized, phase-in of new facilities, the desire to obtain a positive verification opinion following an adverse opinion, and changes in facility operations.

<u>Conflict of Interest.</u> Numerous stakeholders also provided comments specifically addressing the COI requirements described in WCI.8. As noted above, stakeholders expressed concern that the COI requirements would limit the competitiveness of the verification market and restrict their ability to hire a verification body of their selection. The WCI does not intend to express distrust of facilities subject to GHG reporting. The COI requirements are in response to observations of other GHG programs and are based on requirements in existing EPA programs, Kyoto requirements, US federal legislation of Sarbanes and Oxley and the Canadian Institute of Chartered Accountants' independence guidance. The requirements are designed to protect the WCI market system from a minority of reporters and verifiers who may attempt to gain from situations involving high threats to independence.

One commenter objected to the triggering of full verification requirements when a reporter elects to engage a new verification body. For each annual verification, a verification body must provide reasonable assurance that a reporter's inventory is accurate and complies with the WCI ERs. In order for a verification body to be able to provide reasonable assurance, they must conduct a full verification in the first year of the verification cycle and form a verification opinion based on the findings of their own verification team's assessment. The reporter could choose to follow the primary contact to the new Verification Body; however, a full verification would be required. If due to the departure of the primary contact, the original verification body does not retain the necessary technical expertise (or sector accreditation) to continue to provide verification services to the reporter, then the reporter must retain a different, qualified verification body. If the original verification body retains the necessary technical expertise (or sector accreditation), then the quality of the verification should not be compromised.

When a reporter's primary contact at a Verification Body changes places of employment, this individual may retain some background knowledge about the reporter's inventory. However, in most cases, when an individual changes places of employment, they are not allowed to access, copy, or remove the verification records from their former employer.

In response to comments regarding subsection WCI.8 (e)(2)(B)vii, the WCI agrees with this comment and is including appropriate wording in WCI.8.

Commenters also objected to the six-year limit on a reporter's continuous reliance on a single verifier, particularly in light of the specialized technical expertise required for verification of certain facilities. In response to these concerns, the limit provides a mechanism for a new set of eyes to review the data for a reporter and protect against complacency on the part of the existing verifier. The six-year limit also limits the financial relationship from progressing to a level where a potential for high conflict of interest could occur.

One commenter recommended allowing a verification body to defend its verification statement and COI situation before a positive verification statement is disallowed. The WCI intends that within the verification program a mechanism will exist for a reporter to defend their verification statement and conflict of interest determination. It may be up to each WCI Partner jurisdiction on how to deal with this issue or it may be handled through a regional body. This process will have to be developed in 2009 to account for timely responses in a market program and as enforcement actions and penalty decisions are finalized.

One commenter expressed support for a principles-based rather than prescriptive approach to COI. The WCI has added consideration of the principles of independence to WCI.8 to support the framework for COI.

Stakeholders should also note that some revisions to the COI section of WCI.8 have been made in response to other technical details raised by stakeholders. While it may be standard practice for some Canadian provinces to take a standards-based approach, some U.S. jurisdictions may be held to a more prescriptive approach in their individual rule-making process. The Essential Requirements document provides consistent language for both types of approaches.

CEMS. Three commenters advocated that quality assurance steps which already exist in Canada and the US for reported emissions from CEMS equipment be relied on in place of verification under WCI. In Canada, "Protocols and Performance Specifications for Continuous Monitoring of Gaseous Emissions from Thermal Power Generation" (1/PG/7) guides the selection, installation, and operation of CEMS. In the US, 40 CFR 75 establishes requirements for the monitoring, recordkeeping, and reporting of contaminants and other data under the Acid Rain Program. While the term "verification" is used to describe the quality assurance measures required for CEMS equipment in the context of US and Canadian federal requirements, "verification" as described in WCI.8 is a broader, internationally accepted, and more comprehensive assurance step for greenhouse gas emissions reporting. The current federal quality assurance requirements for CEMS equipment will support verification for WCI emissions reports, but cannot be relied on as a substitute for verification under WCI.8. Also, not all facilities have CEMS, some may optionally add CEMS. Not all sources at a facility can be covered by a CEMS system, such as some process and fugitive emissions. Third party verification will ensure that all sources of emissions subject to reporting at a facility are correctly identified and reported, and provide for checks on CEMS systems that are not part of any existing regulatory program.

Consistency across jurisdictions. Three commenters urged the WCI to ensure consistency in verification protocols and implementation across WCI Partner jurisdictions to support a sufficient pool of competent verifiers and future compatibility with other programs.

As described in the rationale for verification, WCI is committed to consistency in implementation of its regional program across all of the WCI Partner jurisdictions. This includes the verification process and accreditation requirements to facilitate the availability of accredited verifiers throughout the entire region.

Applicability. Several stakeholders commented on the applicability of verification in terms of sources that should or should not contribute to the threshold for verification. While this topic is still under review by the WCI, commenters should refer to changes made to the applicability discussion in WCI.8.

Role of technical experts and accreditation. A few commenters provided input on the specialized technical expertise required for verification teams as well as on the accreditation requirements for verification bodies under WCI.8. The accreditation program and competency requirements will be further developed in 2009, as described in a note under the January 6 version of WCI.8(c)(2)(E), which states: "[Note that other source-category specialist skills may be required. These requirements are being discussed by the WCI, as are any additional accreditation requirements for individual lead verifiers, general verifiers, or sector specialists.]" It is intended that if the verification team requires a source category specific person, that person must be part of the site visit team.

Confidentiality. Stakeholders also expressed concern about the capacity for confidentiality to be maintained during verification, in the context of agency oversight of verification, the role of "TBD" and information that would be made public. To complement the protection of confidential information under the laws of individual WCI Partner jurisdictions, provisions for confidentiality in the context of WCI verification will be further developed in 2009 as the role of a potential regional body is determined. Stakeholders should note that the accreditation process under SCC and ANSI is rigorous and requirements of professional conduct as verification bodies will involve stringent confidentiality procedures.

Regarding agency oversight of verification, WCI Partner jurisdictions may defer enforcement action until verification is complete. Third party verification is a rigorous systematic review requiring highly trained and accredited personnel. As such it is an important element in the compliance structure and a verifier's issue log could be used as one of the elements used in an enforcement case. Issues in the log may include areas of concern that do not constitute a violation, but, in general, any credible evidence may be used for enforcement.

Regarding information that will be available to the public, it is essential that facility (or other reporting entity) emissions totals be shared across jurisdictions and made public to facilitate allowance market functioning. Other reported data used to calculate emissions may be subject to confidentiality requests, which could prevent such data from being shared with other jurisdictions and the public.

Three-year verification cycle. Some commenters expressed a desire for clarification of the requirements for full and less intense verification, and how this relates to the ability of a verification body to provide a reasonable level of assurance. Several stakeholders expressed support for the three-year verification cycle, with full verification occurring in the first year and less intense verification occurring in the second and third years. In response to these comments, the descriptions and definitions of full and less intense verification in WCI.8 have been revised.

Timing of verification requirements. One stakeholder expressed concern about meeting the April 1st deadline due to unavailability of some supporting internal data until second quarter of each calendar year. The stakeholder recommends adopting the current Canadian federal GHG reporting submission deadline of June 1st. WCI acknowledges that one submission deadline is desirable; however, the April 1st submission deadline is required to facilitate timely allowance retirement and distribution. Existing emission trading systems in Ontario and Alberta already have a reporting/retirement timeline of March 31st.

Verification Integrity. One stakeholder advised that a panel may be useful to oversee the development of requirements for reporting and third party verification and to maintain a pool of accredited verifiers that meet the WCI conflict of interest requirements. The WCI is considering the role of such a panel and the potential for a regional administrative body to help coordinate the WCI Partner jurisdictions in addressing emerging issues that require their attention.

Verification Statement. The WCI will provide stakeholders with an opportunity to provide comment on any standardized verification statement template that it develops and will look to verification experts for feedback.

Notice of Verification Services. One stakeholder expressed concern that verifiers must first receive approval in response to their notice of verification services before commencing those activities. In fact, verification services may commence upon receipt of a positive response to the notice, or fifteen days following submission of the notice, whichever comes first. The notification of verification services allows for a jurisdiction to make arrangements to audit a particular verification service, should the WCI Partner jurisdiction choose to do so. Auditing is an important component of overseeing a verifier accreditation program. The notification of verification services also allows for a jurisdiction to check that the verification team has the appropriate skill set to provide verification services for a facility of a particular source category.

Conformance Check. The conformance check is used to determine whether the reporting rule requirements have been met and is therefore within the scope of the role of the verification body.

Consistency in Professional Determinations. One commenter's suggestion that there should be room for differences in professional opinion without resulting in an adverse verification finding cannot be the case for a market-based system. The WCI aims to provide a consistent, clear standard for reporting that will help ensure that a "ton is a ton" across the WCI.

Reverification. One commenter expressed concern about a hypothetical circumstance in which an emissions report cannot be reverified due to an historic non-conformance to the reporting rule. If an emissions report cannot pass verification, whether the first time or second time, an adverse verification statement will be issued, thus completing the reporting and verification requirements for that year.

Verification Plan and Sampling Plan. The requirements of a verification plan and sampling plan and related references have been revised in the final draft to provide further clarity. The verification plan is shared with the owner or operator. However, the sampling plan, which identifies what areas are subject to data checks, is retained by the verification body and may not be shared with the owner or operator. The use of a log of issues has also been clarified.

2.2.4 General Quantification and GHG Measurements

There were over 100 stakeholder comments relating to the general quantification and measurement requirements of emissions from facilities (not including comments relating to quantification or measurement requirements specific source categories, such as petroleum refineries, cement plants, etc., which are addressed in Section 2.3 of this document). This section addresses only general requirements applicable to all types of facilities.

Comments and responses are separated into five categories based on subject matter: de minimis thresholds, quantification methods, measurement accuracy, fuel use measurement accuracy, and miscellaneous comments.

Many stakeholders expressed strong opposition to the de minimis requirement of 3% for emissions reporting and its lack of harmonization to the 5% materiality threshold for verification. Many stakeholders expressed strong opposition to the periodic fuel sampling requirements to determine higher heating value and carbon content, particularly when such data may already be provided by the fuel supplier. In addition, many stakeholders felt that the 5% fuel measurement accuracy for fuels is unattainable and cannot be met.

The WCI appreciates the input from stakeholders on the topic of quantification and measurement and has considered each comment received, making an effort to understand the reasons behind the concerns expressed. Changes to the reporting ERs based on stakeholder feedback are still under discussion by the WCI and have not been made at this time.

The following sections summarize comments and feedback in each of the five categories specified above.

De Minimis Thresholds

A summary of stakeholder comments pertaining to de minimis thresholds is as follows:

- The 3% de minimis threshold has not been justified, is unnecessarily onerous and would place significant cost and resource burdens on facilities
- The alternative 20,000 metric tons CO_2e threshold is not justified and should be removed
- The 3% de minimis threshold and the 5% materiality threshold for verification should be harmonized
- There should be a list of negligible emission sources (e.g. portable propane-fired space heaters) which need not be tracked under the WCI
- Clarification is needed between a de minimis 'source' and a 'source category'

WCI responses to these comments are as follows:

- WCI is examining whether the de minimis threshold (currently 3%) and materiality threshold for verification (currently 5%) need to be harmonized.
- The 3% and 20,000 metric tons CO_2e thresholds are based on the CARB regulation; justification for these values and their applicability to other WCI Partner jurisdictions is being examined
- The WCI will consider providing a list of smaller emission sources for which emissions need not be tracked

- The WCI will require a sufficient number of significant digits to ensure accurate reporting of emissions

Quantification Methods

A summary of stakeholder comments pertaining to quantification methods is as follows:

- Quantification methods, such as stack sampling, are overly burdensome and are key departures from established methods.
- Facilities should have flexibility in the use of quantification methods not prescribed by WCI, provided these methods can be shown to fall within an established level of accuracy.
- WCI proposed requirements do not appear to follow established methodologies or protocols for GHG emissions quantification. Sources for quantification methods should be indicated in an Appendix to each source category.
- The WCI needs to establish a system to account for updated emission factors and calculation methodologies, and the extent to which emission reports are back-dated to reflect these updates.
- The term 'adequate quantification method' is not defined.

WCI responses to these comments are as follows:

- In order to maintain the integrity of the WCI cap-and-trade program, it is necessary to use more accurate inventory methods than for voluntary reporting. WCI believe the proposed protocols provide the necessary level of accuracy, but it is reviewing the accuracy of less burdensome methods.
- In order to maintain the integrity of the WCI cap-and-trade program it is necessary for all covered sources to calculate and report emissions using the same methodology. Therefore, a facility cannot use its own quantification methods to calculate emissions.
- The WCI reporting methods are based on established protocols used by voluntary and mandatory reporting systems around the world. WCI consulted Canadian sources including Section 71 of the Canadian Environmental Protection Act, as well as U.S sources and international sources like the IPCC and TCR when developing our methods. The final methodologies are those that WCI believes are rigorous enough to support the WCI cap-and-trade program.
- The WCI will develop a system that accounts for updated emission factors. The extent of back-calculating of previous emissions is currently being examined.
- The WCI will consider the addition of an Appendix to each Reporting section in the Essential Requirements which lists data sources. A list of data sources has been added to the tables in the General Stationary Combustion rule.
- 'Adequate quantification methods' are methods that estimate emissions within an established threshold of accuracy.

Measurement Accuracy

A summary of stakeholder comments pertaining to measurement accuracy are as follows:

- Internationally or nationally recognized default emission factors should be sufficient for emissions quantification.
- WCI should allow for more frequent periodic sampling if desired by the facility.
- WCI should accommodate upstream fuel sampling if this provides a more accurate measurement of heat value or carbon content.

WCI responses to these comments are as follows:

- In order to maintain the integrity of the WCI cap-and-trade program it is necessary to use more accurate inventory methods than for voluntary reporting. WCI believe the proposed protocols provide the necessary level of accuracy.
- WCI will consider increased frequency of periodic sampling if desired by the facility. However, WCI must also consider the need for all facilities to report using the same methodology.
- WCI will consider cases where upstream sampling may provide a more accurate measurement of heat value or carbon content.

Fuel Measurement Accuracy

A summary of stakeholder comments pertaining to fuel measurement accuracy are as follows:

- Fuel use measurement devices for natural gas are typically owned by the utility company. It is impractical, illegal and even impossible for a facility to maintain and calibrate these measurement devices.
- Established periodic calibration requirements are burdensome in several cases, due to the need to shut down operation of kilns, smelters, etc. in order to calibrate measurement devices. Less frequent calibration requirements would be preferable.
- In some cases, measurements are required for fuel or other feedstock though these measurements are not used to calculate emissions. Measurement in these cases should not be required.
- Provisions should be made in cases where measurement equipment malfunctions; otherwise, failure to report under the Essential Requirements will be a violation.

WCI responses to these comments are as follows:

- The WCI is developing draft language on metered natural gas billing data along with utility supplied higher heating value and content of natural gas being an allowable quantification method so long that the metering and carbon dioxide testing methods meet appropriate standards.

- The WCI is considering whether fuel use need be reported if not used to calculate emissions.
- The WCI is considering provisions in the case of equipment malfunctions or other problems preventing physical measurements

Miscellaneous

A summary of stakeholder comments pertaining to other miscellaneous comments are as follows:

- Emissions should be reported to at least two significant digits.
- Switching from one calculation methodology for fuel combustion emissions to CEMS should not require advance approval from WCI.
- List of source categories include those with inadequate or non-existent quantification methods. Such categories should be removed from consideration in the WCI.
- WCI protocols should be as consistent as possible with other widely accepted protocols.
- WCI should use appropriate and consistent units of measure both whether in imperial or metric units and allow for conversions between units at appropriate places.
- Clarification is needed in WCI.8 regarding the term ‘actual.’

WCI responses to these comments are as follows:

- WCI will ensure a sufficient number of significant digits are included in emission totals to ensure accuracy.
- Although an administrative step, advance approval is viewed as necessary to ensure that facilities do not use equipment change as a way to modify total reported emissions in their favor.
- The WCI does not include source categories that lack adequate quantification methods. Therefore, if the source category is included, WCI believes adequate quantification methods do exist.
- WCI has attempted to make reporting requirements as consistent as possible with other international protocols, and differs when it is felt these protocols do not provide adequate quantification of emissions to be used in a cap-and-trade system.
- WCI will ensure the use of and conversion between units is consistent and does not burden the facility.
- The use of the term ‘actual’ in WCI.8 will be reviewed and modified if appropriate.

2.3 Source Category-Specific Comments

The following comments and responses pertain to specific source categories mainly for which quantification and reporting requirements were proposed in the third draft of the ERs.

2.3.1 Adipic Acid

One comment was submitted regarding the methodology for estimating N_2O emissions from adipic acid manufacturing. The commenter put forth a method which has been accepted by Environment Canada. This method is basically the IPCC Tier 2 methodology (i.e., emission factor of 0.3 tons N_2O/ton adipic acid) and has an estimated uncertainty of ±10%.

WCI is proposing, for the first time in this document, reporting requirements and a GHG methodology for adipic acid. Based on a meeting held between commenter (INVISTA) and a WCI Partner jurisdiction (Ontario Ministry of Environment and Energy), the proposed WCI method for adipic acid will allow either (1) the IPCC Tier 3 methodology (i.e., direct measurement), which has an estimated uncertainty of ±5%, or (2) the option of doing stack testing, or use of a jurisdiction approved CEMs, to calculate the uncontrolled emission factor to within 5% accuracy.

2.3.2 Aluminum

WCI's proposed method is based on the Environment Canada document "Aluminum Production – Guidance Manual for Estimating Greenhouse Gas Emissions," March 2004. This method is same as the IPCC Tier 3 methodology, which is also the same methodology as contained in the International Aluminum Institute (IAI) protocol. WCI prefers the IPCC Tier 3 methodology for its better accuracy as compared to the IPCC Tier 2 methodology (i.e., technology based emission factors).

Several commenters said that any GHG method for aluminum should reference the IAI protocol. Although not specifically cited, the proposed WCI method is the same as the method contained in the IAI protocol (as stated above). Also, several commenters requested that the IPCC Tier 3 method be used; this is what is recommended by WCI.

Several commenters requested specific methods for estimating PFC emissions from pot startups, and on how to handle historical data/coefficient changes. WCI investigated this issue, and it could not identify any existing methods for quantification of PFCs from pot startups; therefore, WCI will not include these in the reporting requirements at this time.

Several commenters requested more specific guidance on sampling frequency and data requirements to establish Tier 3 coefficients. WCI has included specific sampling frequencies, however, more work is needed (with input from industry) in order to identify the most appropriate sampling requirements for all parameters.

One commenter requested CEMS to be added to the calculation methods. The aluminum method now directs the facility to WCI.20 (General Stationary Combustion) for requirements pertaining to use of CEMS on combustion equipment.

One commenter requested that some issues be resolved though an Aluminum Work Group or Task Force that would include industry experts. The WCI is taking this under advisement.

Finally, a comment requesting more specific guidance on the SF6 estimation method resulted in changes to these to be more detailed and specific in the revised aluminum reporting requirements. A new file is included with these ERs in rule format.

2.3.3 Cement

The majority of stakeholder input on WCI.90 (Cement Manufacturing) was from the respective U.S. and Canadian associations, with some comments provided by individual companies. The WCI appreciates the input from stakeholders on these ERs and has considered each comment received, making every effort to understand the reasons behind the concerns expressed.

Where the WCI agrees with the comments and rationale, the appropriate sections of WCI.90 have been revised. However, where comments or suggested changes to the protocols have not been incorporated, the WCI provides rationale behind these decisions below.

The reporting ERs pertaining to cement manufacturing are based on California's mandatory GHG reporting rule, which in turn was primarily derived from the California Climate Action Registry and the Cement Sustainability Initiative's (CSI) Cement CO_2 Protocol, a recognized worldwide methodology for calculating CO_2 emissions from cement manufacturing. The association comments appeared to agree with the WCI's choice of the CSI protocol as the basis for WCI.90.

Below is summary of stakeholder input along with the WCI responses. Comments that have an overreaching theme applicable to the entire protocol are addressed first, followed by section specific issues.

'Standalone' Reporting Protocol

Several comments received by stakeholders suggested that the cement sector should not be required to report coal storage CO_2 emissions or other non-process emissions, until it is included in their CSI protocol from which the WCI protocol was derived.

Paramount to an effective cap-and-trade program is the assurance that all substantial emissions sources are accounted for using established quantification methods where available. Coal storage is one such emission source, and a common activity at cement manufacturing facilities. Therefore, the WCI requires that cement facilities, along with any other sector use the WCI.100 protocol to estimate coal storage emissions as opposed to incorporating this quantification method repeatedly into the sectors to which it would apply.

WCI's rationale also applies to estimating CO_2 emissions from general stationary combustion, since this occurs across many sectors. Prescribed methodologies for calculation of combustion emissions are detailed in the WCI.20 and can easily be applied by any and all sectors.

CH_4 and N_2O Emissions from Calcination

Comments received indicated that there are negligible CH_4 and N_2O emissions associated with the calcination process and therefore they should not be required to report these.

The WCI only requires reporting of N_2O and CH_4 for fuel combustion in kilns and other combustion units. The protocol will be revised to clearly reflect this.

Uniform Cement GHG Performance Standard

One stakeholder requested that WCI consider establishing target / allowance requirements on the basis of a uniform cement GHG performance standard.

Allowance requirements will be established in a separate WCI Essential Elements document. For inventory purposes the WCI must have an account of total emissions. However, WCI also requires reporting of annual production so that the WCI records will have information related to intensity.

WCI.92 Greenhouse Gas Reporting Requirements

One comment received indicated that the WCI.92(b)(2) requirement to report a plant specific CKD calcination rate as well as direct measurement of the CKD discard rate would be difficult as this data is not collected and there is no direct measurement of CKD discard rates.

It is the WCI's understanding that the CSI protocol on which this protocol is based requires the same parameters/information and recommends using plant-specific data, with one exception. The CSI protocol allows a default value of 2% for CKD if it is not available. This default value was derived from the IPCC Tier 1 method. The WCI has chosen the Tier 3 method from IPCC for better accuracy.

WCI.93 Calculation of GHG Emissions from Kilns

Several stakeholders commented that the requirement for monthly calculations of key factors (e.g. clinker emission factor, CKD emission factor, and organic content of raw material) is not administratively efficient and that although supporting data collection is conducted on a monthly basis, calculating these key factors should only be undertaken annually.

The WCI feels that because kiln conditions, production rates and feed material may change at any time during the year, once a year sampling would only capture immediate conditions which may not represent the whole year. Monthly sampling and emission calculation marries a monthly chemical analysis with a production for the same month.

WCI.94 Sampling, Analysis, and Measurement Requirements

Stakeholders were asked to provide feedback on this topic and provide proposals from those with expertise in the industry related sampling, analysis and measurement procedures already in use at facilities for the material and quantities and/or concentrations in protocol.

Stakeholders stressed that several of the required parameters would be difficult to collect. A specific example is the requirement to determine the uncalcined MgO, which would require X-Ray diffraction, not a recognized analytical procedure and currently considered experimental.

It is the WCI's understanding that X-ray diffraction is a well established analytical method which has been used for many years in material analysis. It is not as common in the cement industry as other methods, but its acceptance has been growing rapidly and is now in use by numerous cement plants. Other analytical methods with equivalent accuracy can be allowed if the WCI desires.

Objections were also raised by stakeholders to the proposed direct weight measurement of clinker using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh conveyors. Stakeholders informed WCI that very few cement plants use direct measurement of clinker from the kilns and that most, if not all, cement plants rely on a physical inventory measurement instead. Requiring other measure to be installed would be financially burdensome.

With regard to this issue, it is the WCI's understanding that the vast majority of the protocols require direct measurement of clinker, which must be conducted prior to milling and blending. Thus, product output via truck scales or some similar measure of cement or blended product and not clinker, will not provide the parameters required for the accepted protocols. However, WCI can allow a measurement device other than just the two mentioned above, if it is of equivalent accuracy and is measuring clinker production.

The WCI will take all comments regarding this section under advisement as it further evaluates options for sampling, analysis and measurement essential requirements for reporting.

2.3.4 Coal Mines

The basis for WCI's recommended quantification method for coal mines is IPCC Tier 3 methodology. The applicability is limited to underground coal mine fugitive CH_4 emissions, and will exclude the following sources due to lack of quantification methods, highly inaccurate quantification methods, and/or difficulty in measuring GHG emissions from the particular sources:

- Post-mining operations (subsequent handling, processing, and transportation of coal);
- Low temperature oxidation (oxidation of coal when exposed to oxygen in air);
- Uncontrolled combustion (active fire caused by trapped heat and increased temperature from low temperature oxidation); and
- Abandoned mines.

All of the commenters referred to the methodology paper discussion on surfacing mining category and suggested that the Tier 2 method discussed in the methodology paper should not be used due to its high uncertainty. In fact, WCI does not intend to include surface coal mining for this reason, and furthermore narrows the reporting Requirements as follows: "Annual CH_4 emissions will be reported for each specific underground mine using the Tier 3 methodology."

2.3.5 Electric Generating Units

WCI received only one comment directly related to the electric generating units (EGUs), while nearly 80 comments made by EGU industry commenters were related to other areas (e.g., verification, general reporting requirements, general stationary combustion). The commenter stated that WCI should allow the use of alternative monitoring methods (i.e. predictive emissions monitoring systems). WCI is currently discussing the option of allowing alternative EGU monitoring methods.

2.3.6 General Stationary Combustion

WCI received approximately 80 individual comments related to general stationary combustion (GSC) emissions quantification methodologies. These comments were divided into five summary topics: equations and tables, fuel sampling, fuel use measurement, monitoring and source testing, and edits to specific ER language. The common theme with the comments is that WCI reporting requirements for GSC are too inflexible. Commenters said that the GSC methodology needs to include more alternatives in estimation, monitoring and source testing, and fuel sampling procedures.

WCI appreciates stakeholders reviewing and making comment on the GSC methodologies and related documents. The following section includes a summary of all comments and WCI's response. WCI has made numerous revisions to the ERs in response to the comments in order to increase the flexibility WCI.20.

Equations and Tables

The first recurring topic of comments related to GSC addressed the equations and tables in WCI.20.

<u>Cite References.</u> WCI received several comments requesting that references be cited for where and how equations in the GSC method were developed. In addition, commenters asked that WCI identify where the default values (i.e. carbon content, high heating values, and emissions factors, etc.) for Tables 20-1 through 20-3 were derived.

WCI has added the references for the various emission factors and default values to the end of the tables.

<u>Emission Factor Errors.</u> WCI received a few comments that indicated the N_2O emission factor for natural gas is off by a factor of 100 and needs to be confirmed.

After reviewing Table 20-3 in response to these comments, WCI determined that several of the emission factors for N_2O were incorrect because of a failure to convert from grams to kilograms. These values have been corrected in the Final Draft.

Exclusion of Certain Fuel Types. Some commenters felt that WCI was excluding certain fuels from Table 20-1 through 20-3 which already have established greenhouse gas emission factors (i.e. IPCC or WRI). WCI will investigate whether additional factors are now available and augment the tables as appropriate in the future.

Use of Alternative Quantification Methodologies, Emission Factors, Default Values, or Units of Measure. There were several comments requesting that WCI allow the use of alternative quantification methods, emission factors, default values, and units of measure. Specifically:

- WCI needs to allow the use of alternative CH_4 and N_2O emission factors and calculation methods where the alternative factors are more conservative and therefore would result in higher emissions.

  WCI did not make this change, because the objective of the reporting rules will be to produce the most accurate emissions estimates possible, not the most conservative.

- WCI should refrain from using different units of measure for the same fuel type across multiple equations such as using cubic meters in one equation but using cubic feet in another equation.

  WCI agrees with this comment and has attempted to make the units of measurement in the ERs consistent.

- WCI should allow the use of mole fractions of gas components to calculate a site-specific CO_2 emission factor.

  WCI agrees and has modified the ERs to make it clear that this is allowed.

- WCI should allow the use of LHV in place of HHV (i.e. cement manufacturing industry).

  For purposes of common currency WCI has kept all values to HHV. It is possible for the reporter to convert LHV to HHV.

- Commenter requested that WCI provide alternative units of measure for gaseous fuels.

  WCI believes that the ERs and reporting will be less confusing if consistent units of measurement are employed. The ERs will be revised in the future, however, to include metric alternatives to English units.

- In WCI.23(b)(2): The boiler "design" rated heat input capacity should be used in B not the "maximum" rated heat capacity.

  WCI agrees and has made this change.

- WCI needs to clarify the meaning of "12% moisture" for wood fuels.

The source for this figure is U.S. EPA Inventory of Emissions and Sinks, 1990-2007 (2009). WCI does not require a correction for moisture content.

- WCI should allow the use of alternative established emission estimation tools and quantification methods from other greenhouse gas protocols sources such as WRI, WBC/SD, IPCC, EPA, Environment Canada, etc.

  WCI has reviewed all of these sources of emission estimation techniques and has chosen the methods that it believes to be the most reliable and reasonable for reporters.

- Canadian emission factors and quantification methodologies should be considered.

  WCI will include additional emission factors for Canadian fuels in the future.

Use of CH_4 and N_2O Calculation Methodologies

WCI.24 describes four calculation methodologies that can be used to calculate CH_4 and N_2O emissions from fuel combustion (WCI.24(a) through (d)). The January 6 version of the draft General Stationary Combustion protocol did not specify the conditions under which operators would be required to use each calculation methodology. These requirements are now described in WCI.24(e) and align with the requirements for CO_2 combustion outlined in WCI.23(e).

Fuel Sampling

The second recurring topic of comments related to GSC addressed fuel sampling methods and accuracy. New sections have been added on fuel analytical data capture [WCI.2(g)] and procedures for interim fuel analytical data collection in case of breakdown [WCI.2(i)] have been added.

Numerous commenters recommended that reporters should be allowed to use fuel vendor information rather than being required to sample and test fuels at the facility. They argued that the requirement to sample and test for all reporters subject to verification would be unduly burdensome and costly and pointed to examples of other programs where on-site fuel sampling and testing was not required.

After considering these comments, WCI has determined that the use of vendor-supplied data on carbon content and heating value should be allowed and has amended the ERs accordingly. The ERs have been modified to allow for this, provided fuel suppliers use the fuel analysis methods specified for operators.

Other related issues that were raised, included the following:

- Weekly and monthly fuel sampling frequencies are too extreme. WCI should consider relaxed sampling requirements for fuel types that consists of <10% of the total heat input.

  WCI made changes so that fuel sampling requirements now allow the use of analysis results provided by the fuel supplier. Sampling frequencies were carefully considered and reflect fuel-specific variation in carbon content.

- Suggest using sampling and analytical equipment such as gas chromatographs and online instrumentation instead of ASTM methods.

  WCI has made changes so that the ERs now allow for this where recognized sampling, analysis and measurement requirements exist.

- WCI should allow the use of ASTM methods in addition to those listed in the ERs.

  WCI has expanded the list of ASTM methods allowed to include all those referenced in the EPA's proposed MRR. Additional methods, including recognized Canadian standard methods, will be added in the future.

- Measurement accuracy for HHVs to within 5% is not reasonable.

  WCI has replaced this with specified calibration requirements, in addition to measurement accuracy requirements in the applicable ASTM methods

- WCI.24 should allow testing of one gas (say CH_4) and use of the default for the other gas (i.e., N_2O).

  This change was made**.**

- WCI language should be modified to allow reporting entities to extend the ASTM methods to adequately capture Olefins compounds to avoid underreporting.

  WCI agrees and has made this change.

Fuel Use Measurement

Several comments objected to the direct fuel-use measurement requirement. They argued that most "regulated facilities have internal control procedures to determine which method is the most consistent and accurate for its operations given its fuels and fuel systems and multiple data analysis and reporting requirements" and that "adding another layer of monitoring and recordkeeping is redundant with no added value."

WCI agrees and has modified the ERs to allow the use of recorded fuel purchase or sales invoices for all reporters.

Monitoring and Source Testing

The fourth recurring topic of comments related to GSC addressed the requirements pertaining to monitoring and source testing (i.e., sampling, analysis, and measurements) requirements in WCI.20. Several comments noted that regulatory monitoring and reporting requirements for CEMS may not include the necessary measurements required by the ERs (e.g. CO_2 concentration measurements or stack gas flow measurements). They argued that requiring installation of these additional CEMS components where they are lacking would be extremely onerous and expensive without improving overall accuracy.

WCI agrees, and has amended the language of the ERs to require the use of CEMS only where existing regulatory requirements already require stack gas flow and CO_2 concentration measurements.

Other comments in this area:

- WCI.24 allows for development of CH_4 and N_2O site-specific emission factors through annual source testing in place of default emission factors. The commenter felt that since CH_4 and N_2O emissions are influenced by choice of combustion equipment it would be more reasonable and cost-efficient to remove the annual testing requirement and to only require additional source testing upon changes to the combustion equipment.

  WCI notes that emissions are also influenced by fuel choice, and fuels may change annually or even seasonally; no change is recommended at this time.

- In WCI.23(d)(2)(B): There is no technical or scientific basis for this exclusion if the conditions of WCI.23(d)(1)(B) are met.

  WCI notes that waste has a greater variability than biomass and contains fossil as well as biomass sources of carbon. It is conceivable that waste might meet the relative accuracy test audit requirements of WCI.23(d)(1)(B) when the test is conducted, and not meet the relative accuracy requirements during the remainder of the year. Thus, using O_2 as a surrogate for CO_2 is disallowed for waste fuels in WCI.23(d)(2)(B).

Miscellaneous Edits to WCI.20

The fourth recurring topic of comments related to GSC addressed miscellaneous edits to the language of the reporting requirements in WCI.20. These are summarized and responded to below.

A commenter noted that WCI.23(b)(2) appears to be missing critical language that needs to be corrected. The equation variables define municipal solid waste combustors but not biomass for calculating emissions based on steam generation. WCI agrees and has made this change.

A commenter noted that WCI.23(d)(4) references WCI.123(b)(3) but there is no (3) under WCI.123(b). WCI has changed this reference to "WCI.23(a) or (b)(1), as applicable."

A commenter stated that there is confusion over the organization of the four GSC calculation methods and how to determine who uses which of four GSC methods. It was suggested that WCI create a simplified flow chart or process diagram that would help facilities determine which of the four GSC methods they would need to use. Also, maybe WCI needs to reorganize this section so it is clearer, even if it makes it less compact. WCI has attempted to improve the organization of the GSC methods.

A commenter stated that the word “immediately” should be deleted from WCI.25(a)(4) because it may be construed to mean that taking fuel samples from the feeder or belt leading to (in contrast to after) the coal mill would not meet the standard. Because fuel is dried in the grinding mill, some VOCs may volatilize there. If coal is sampled after the mill (i.e., “immediately” before combustion), carbon in the gas that had volatilized in the mill would not be captured in the sample. The sample would understate, and thus not be “representative” of the total carbon content of the fuel. Weekly samples should be expressed as the minimum sampling frequency in order to allow for more frequent sampling. WCI has added clarifying language to address this issue.

2.3.7 Iron and Steel

The basis for WCI’s recommended quantification method for iron and steel manufacturing is IPCC Tier 3 methodology. One commenter expressed concern that the level of uncertainty with the proposed method was ±10%, however, WCI believes the commenter misunderstood the method proposed, which is estimated to have a ±5% uncertainty (according to IPCC). Also, another commenter requested that Environment Canada guidance document for estimating emissions from iron and steel production be applied to WCI. WCI feels that there is no guarantee that this guidance would be applicable under the Canadian framework. WCI reviewed the Section 17 requirements, and these allow a full range of options of quantification for GHG emissions estimation (e.g., CEMS, to default emission factors, to engineering estimates); these are not prescriptive enough and many are not accurate enough for reporting GHGs under WCI’s cap-and-trade program.

One commenter stated that methods for estimating GHG emissions from melting scrap in EAFs and monitoring carbon content of electrodes used in EAFs were missing. WCI is not aware of a reliable method to sample carbon content of scrap metal, which seems to only be viable after the material is molten when some of the carbon is lost. WCI did add a provision for using vendor data for determining carbon content of electrodes; see WCI.155(e).

Several commenters requested information on the source of the methods proposed for estimating CO_2, and requested an alternative method other than CEMS for estimating CH_4 emissions. A reference was added to WCI.153(b) indicating the basis is the IPCC Tier 3 methodology, and an option for use of facility-specific emission factors was added to WCI.154(2).

One commenter requested that the carbon content of the inputs and outputs be determined on a percentage of carbon by weight (in addition to tons of carbon per unit of material). This option was added to the relevant WCI.152 subsections.

One commenter, the owner/operator of an iron and steel facility in Quebec, stated that the WCI emission quantification methods do not address all technologies. The commenter goes on to suggest that reporters be allowed to participate in the development of methodologies. WCI is attempting to contact this commenter to discuss future development of methods for specialized technologies and processes.

2.3.8 Lime

The majority of stakeholder input on WCI.170 (Lime Manufacturing) was from the respective U.S. and Canadian associations, with some comments provided by individual companies. The WCI appreciates the input from stakeholders on the protocol and has considered each comment received, making every effort to understand the reasons behind the concerns expressed.

Where the WCI agrees with the comments and rationale, the appropriate sections of WCI.170 will be revised. However, where comments or suggested changes to the protocols have not been incorporated, the WCI provides the rationale behind these decisions below.

The lime manufacturing protocol is based on the National Lime Association's "CO_2 Emissions Calculation Protocol for the Lime Industry English Units Version", February 5, 2008

Revision (http://www.climatevision.gov/sectors/lime/pdfs/lime_protocol.pdf) ("NLA Protocol"), which is a recognized protocol accepted and applied by association members in the US and Canada.

Below is summary of stakeholder input along with the WCI responses. Comments that have an overreaching theme applicable to the entire protocol are addressed first, followed by section specific issues.

Emission Reporting by Type of Lime

A recurring comment was that the lime industry produces several types of lime (and associated LKD) which have different process emission factors, and by extension different process emissions. It was therefore recommended by stakeholders that the WCI protocol require CO_2 process emissions and emission factors be determined by lime type and type of LKD produced. Suggestions were made to revise all sections of the protocol to reflect this (information required in section WCI.172; Equation 170-1).

The WCI gave serious consideration to adding a requirement to calculate process CO_2 emissions for each type of lime and TKD produced both for the reasons offered by the comments and because this approach would achieve consistency with EPA's proposed MRR. *See* EPA, *Proposed Mandatory GHG Reporting Rule Text (full version)* § 98.193(b)(1), at 316 (http://www.epa.gov/climatechange/emissions/downloads/MRR-Rule.pdf).

The WCI has concluded, however, that this approach presents practical difficulties. There are infinite blends of calcium and dolomitic lime and infinite degrees of calcination (i.e. soft burnt and hard burnt and in-between). A facility may choose to produce more than one of these products at any time.

This fact is reflected in the industry's own inconsistency in classifying lime products. While the comments maintain that there are two types of lime and LKD—high-calcium and dolomite—the NLA Protocol identifies four—"soft burned high calcium, hard burned high calcium, soft burned dolomitic and dead burned dolomitic." The NLA's answers to Frequently Asked Questions (http://www.lime.org/faqs.html) provide yet a third list:

- *High calcium quicklime*--derived from limestone containing 0 to 5 percent magnesium carbonate.

- *Magnesian quicklime*--derived from limestone containing 5 to 35 percent magnesium carbonate.
- *Dolomitic quicklime*--derived from limestone containing 35 to 46 percent magnesium carbonate

Although, as noted, the MRR requires separate emission factors for different lime types, it does not even identify, let alone define, lime or LKD types, but simply requires different emission factors for each type at each kiln. This opens the door to inconsistent approaches among lime manufacturing plants.

On the other hand, by requiring CO_2 calculations for each kiln and by month, the changes in either degree of calcination or type of lime are automatically accounted for in the protocol. The WCI therefore does not intend to add a reporting-by-type requirement to the ERs. It should be noted that this approach is consistent with the spreadsheet accompanying the NLA Protocol. Although the protocol discusses the calculation of different emission factors for different lime types, the spreadsheet accommodates the entry of only one set of percentages of CaO and MgO produced for each kiln.

Emission reporting by kiln

Stakeholders comments, including comments submitted by the NLA, indicated strong opposition to reporting by kiln, since different facilities have different material handling configurations which may prevent them from determining quantities of lime or LKD produced at a specific kiln (i.e. one or more kilns may feed into one single storage area).

Reporting by kiln is consistent with the NLA Protocol. On page 2, the protocol states:

> *"[Process] emissions result from the production of quicklime* at each kiln *at the plant, as well as from calcined byproducts/wastes. Emission calculations are based on tonnage of each type of quicklime and calcined byproducts/wastes produced at* the kiln.
>
> *The NLA spreadsheet includes separate worksheets for quicklime and for calcined byproduct/wastes and further instructs tha*t *the relevant kiln is clearly identified so that kiln-by-kiln intensities and efficiencies can be calculated."*

In the spreadsheet, the worksheet for calculating quicklime emissions includes cells for inputting the CaO and MgO content and capacity for each kiln. Based on these inputs, the spreadsheet calculates a separate emission factor and CO_2 emission estimate for each kiln. There is a link to additional worksheets for plants with more than five kilns.

EPA's proposed MRR, which is based on the NLA protocol, also requires reporting by kiln. *See* EPA, *Proposed Mandatory GHG Reporting Rule Text (full version)* § 98.193(b)(1), at 316 (http://www.epa.gov/climatechange/emissions/downloads/MRR-Rule.pdf); EPA, *Technical Support Document for the Lime Manufacturing Sector: Proposed Rule for Mandatory Reporting of Greenhouse Gases* 9, 13 (January 22, 2009) (Technical Support Document for the Lime Manufacturing Sector).

Maintaining CO_2 calculation by individual kiln in WCI.170 will assure consistency between the WCI and U.S federal reporting programs. The WCI is therefore retaining the requirement to report process emissions for each lime kiln at a lime manufacturing plant.

Uncalcined CaO

One commenter requested that WCI replace all occurrences of "uncalcined CaO" with "weight fraction of CaO in uncalcined carbonate." The WCI acknowledges that there are multiple terms used by industry and it will include multiple terms in the protocol to clearly convey the meaning of each parameter.

Uncalcined MgO

Stakeholder comments consistently indicated that all magnesium oxide in raw feed material is calcined during the process, since the reaction occurs at much lower temperatures than calcium oxide, therefore the need to report uncalcined MgO is not necessary or relevant. The WCI agrees with this suggestion and will incorporate into the revised protocol the option of allowing the reporting facility to assume all Mg has been calcined to MgO.

Lime Kiln Dust Discarded

Stakeholder comments consistently indicated that any reference to lime kiln dust (LKD) should refer to it as "produced " and not "discarded" since LKD is not a waste product but generally sold for agricultural use and other applications. WCI agrees with this recommendation and the protocol will be revised. Clarifying language will be added to assure that only LKD not recycled to the kiln is counted in determining process CO_2 emissions.

WCI.173 - Calculation of GHG Emissions from Kilns

It was noted that in WCI.173(c) the word “Pure” appears as a definition only and does not appear in the text. This was an omission and the requirements have been modified to include the word "pure" in the paragraph.

WCI.174 - Sampling, Analysis and Measurement Requirements

Stakeholders were asked to provide feedback on this topic and provide proposals from those with expertise in the industry related sampling, analysis and measurement procedures already in use at facilities for the material and quantities and/or concentrations in protocol.

Many of the comments received indicated that measurement for accounting and inventory purposes at lime facilities generally centered on lime and lime kiln dust (LKD) produced and sold. Accordingly, measuring raw material consumed is not a common practice at lime facilities and requiring facilities to do so under WCI.174(d) would result in expensive process modifications.

Comments were also received on sampling and analysis procedures and essentially stakeholders do not concur with WCI’s approach of prescribing sampling, analysis and measurement methods. The WCI will take all these comments under advisement and will need to further evaluate these areas of the protocol before responding.

2.3.9 Pulp and Paper Manufacturing, Biomass

Many comments were received on the quantification methods for the pulp and paper industry. Also, comments from the pulp and paper industry addressed biomass emissions quantification.

Fuel Distribution

Several stakeholders expressed concern about the potential inclusion of biomass-based fuels in reporting by fuel distributors and the risk of double-counting emissions, given that wood products facilities supply biomass fuels to other consumers. This issue will be taken up later (late 2009, or 2010) when WCI addresses suppliers of residential, commercial and industrial fuels.

Inclusion of Biomass-Derived Emissions for Reporting

Numerous stakeholders were opposed to the inclusion in the reporting requirements of biomass-derived emissions. Stakeholders argued that only carbon dioxide from fossil sources, and fossil- and biomass-derived methane and nitrous oxide from stationary combustion devices be included in the reporting requirements and thresholds for determining reporting obligations. Commenters were also concerned about requirements for fuel testing for facility- or fuel-specific CO_2 emission factors. Stakeholders pointed to the carbon-neutrality of CO_2 from biomass and the requirements of other programs and protocols. The comments received also expressed concern about burdening small facilities.

IPCC guidance indicates that forestry practices resulting in net decrease in carbon stocks are not carbon-neutral. WCI Partners have recommended that biomass and biofuel carbon dioxide emissions should be reported (September 23, 2008 Design Recommendations 1.3 and 1.4). Carbon dioxide emissions from biomass/biofuel combustion may in the future be determined by some WCI Partner jurisdictions not to be carbon-neutral, and therefore subject to the cap (Design Recommendation 1.5). Jurisdictions promoting the substitution of carbon-neutral biomass for fossil fuels can use the biomass carbon dioxide emissions data to monitor progress.

As noted in section 2.1.1 above, WCI has added a provision to WCI.1(b) affecting applicability determinations, allowing the exclusion of up to 15,000 metric tons of CO_2 from the combustion of pure solid biomass, prior to determination of a fuel's carbon neutrality by a WCI Partner jurisdiction. This exclusion will apply to all carbon-neutral biomass once the jurisdiction has defined that term and made that determination by fuel type. Jurisdictions retain discretion to require consideration of biomass fuel emissions in determining applicability. WCI is also considering the exclusion of biomass combustion emissions for purposes of determining verification applicability and from the scope of verification when one is required.

One commenter suggested that facilities that do not have sufficient data to determine quantities of biomass fuel combusted should be allowed to back-calculate fuel combustion quantities based on boiler steam generation quantities, and boiler steam generation efficiencies. These back-calculated biomass fuel consumption quantities could then be used in conjunction with default emission factors to estimate biomass CO_2 emissions. WCI agrees. The last draft of WCI.23 allowed the use of this method for facilities that are not required to verify. The new draft has added a provision that allows the use of the same method at facilities required to verify, provided that the emission factor is updated every three years on the basis of source-specific testing.

Several commenters objected to the requirement in WCI.23(f) for stack testing and radiocarbon dating for facilities to quantify the biomass derived portion of CO_2 emissions, as applied to facilities combusting wood and other forest products. Other commenters argued that these methods should not be required at a facility that can employ a mass balance approach. WCI agrees and therefore has amended WCI.23(f) to require the use of testing and radiocarbon dating only for facilities that cannot determine and document the biomass fraction of the fuel combusted.

Black Liquor Boiler and Lime Kiln Emissions

Stakeholders recommended including spent pulping liquor as a biomass-derived fuel and also noted the potential to combine reporting of biogenic carbon dioxide from the recovery boiler and lime kiln.

The WCI has revised its consideration of black liquor boiler and lime kiln emissions reporting, based on the technical advice and resources referenced in the comments received. Stakeholders should refer to the new requirements regarding emissions from the black liquor boiler in Attachment 7 to this document.

Also, in response to comments, WCI will add black liquor CH_4 and N_2O emission factors to the GSC emission factor table (Table 20-3) in the future.

Wastewater treatment

Stakeholders also commented on emissions from waste and wastewater treatment. As the revised methodology in Attachment 7 notes, this topic is still under consideration.

Offsets

A number of stakeholders provided feedback on the topic of offsets in relation to the forest industry and forest carbon measurement. This topic is beyond the scope of the ER. These comments will be taken into consideration by the WCI Offset Committee.

Definitions

A number of comments discussed definitions related to biomass such as "waste derived fuel". The WCI is considering the comments received and will determine at a later date appropriate definitions for inclusion in the ER, as part of the broader discussion on biomass-derived fuels. WCI requests further clarification on the nature of this concern.

A commenter requested a definition for “impregnated sawdust”, and others recommended that this material be excluded from the definition of "waste-derived fuel". WCI will develop a definition for "impregnated saw dust" in the future. This definition will refer to sawdust from wood impregnated or treated with resins or glues derived from fossil hydrocarbons, and would not include wood from raw trees and untreated lumber. "Impregnated saw dust" has been included in the definition of "waste-derived fuel" because this is a category of fuel that contains fossil hydrocarbons and thus has special emissions quantification methods. The definition of "waste-derived fuel" in these Essential Requirements is for the purposes of these requirements only and may be different from definitions of "waste" in various other existing regulations.

2.3.10 Refineries and Refinery Fuel Gas

WCI received wide-ranging stakeholder comments concerning WCI proposals for the determination of GHG emissions from Petroleum Refineries (WCI.200), and Refinery Fuel Gas Combustion (WCI.30). The major comment topic areas are listed and discussed below.

Use of CEMS to Determine Combustion and Process Emissions. The reporting committee agrees that facilities should have the option to use appropriate CEMS for the determination of refinery combustion and process emissions. However, CEMS must be installed, calibrated and maintained in a consistent manner. The reporting committee is currently examining U.S. and Canadian CEMS regulations.

Addition of standard conversion factors consistent with industry standard temperature and pressure condition. Molar volume conversion factors will be provided that are appropriate to the standard temperature and pressure conditions typically used at Canadian and U.S. industry facilities

Appropriateness of WCI Fugitive Emission Calculation Methodologies. The WCI Reporting Committee recognizes that there are many different regional and national regulations and requirements currently in-place dealing with the measurement and control of equipment fugitive emissions (e.g. Leak Detection and Repair Programs – LDAR). Provisions in the recently released draft U.S. EPA Reporting are being examined to determine if the approach proposed by the U.S. EPA would provide consistent and accurate data.

De Minimis Sources and Accuracy Requirements. Reporters currently are allowed to use best available methods for the determination of emissions reported as de minimis. In this case fuel accuracy requirements would not apply.

Determination of Variables Required for the Determination of Process Emissions Related to Fluid Catalytic Cracking Units and Catalyst Regeneration. All U.S. petroleum refineries are currently required to measure all of the variables specified in WCI.203. WCI is in the process of determining if these measurement criteria are also applicable to Canadian refiners.

Frequency of Determination of Refinery Fuel Gas Composition. Refinery fuel gas is a major source of combustion in US and Canadian petroleum refineries. Furthermore refinery fuel gas composition can vary widely within a refinery and from refinery to refinery. For these reasons stringent and consistent methods are required to quantify this emission source. WCI has endeavored to provide regulatory flexibility which will provide reporters with several quantification procedures. The reporting committee acknowledges the fact that in some refineries, refinery fuel gas may have been monitored (flow rate and composition) only for process control purposes in the past. This process control data may not meet the minimum requirements for the accurate and consistent determination of this important GHG source and thus upgrading or installation of equipment flow and composition instrumentation will be necessary.

Accuracy of the Specified SRU "Molecular Fraction Value." The regulation allows reporters to use site specific molecular fraction data determined using methods approved by the jurisdictional authorities if they feel that the default value is not appropriate.

Definition and Clarification of Terminology. Additional definitions will be added where required.

Appropriateness of Fugitive Emission Methodologies (i.e., Equipment and Storage Tank Emissions). The WCI is currently examining the draft U.S. EPA Greenhouse Gas regulation to determine if the methods contained in this regulation can be used by WCI. Similar to WCI the

EPA regulation does require the use of the TANKS model to determine emissions from storage tanks.

Methods for the Determination of Flaring Emissions. The current U.S. EPA draft rule allows the use of flow meters, HHV and carbon content or engineering approaches to determine flare emissions. WCI is currently examining the applicability of these requirements for Canadian refineries and will adopt US EPA methods if warranted.

Difficulties Complying with Fuel Use and HHV Accuracy Requirements. The WCI recognizes that installation of flow meters and HHV analyzers will be required. The necessity of accurate and consistent data makes this necessary.

2.3.11 Landfills and Wastewater Treatment

WCI methods for industrial landfills and wastewater treatment are defined for the refinery category, and are under investigation for the pulp and paper category. The only comments received on industrial landfills and wastewater treatment pertained to these sources located at pulp and paper facilities. All comments cited a NCASI special report which studied the methane emissions from pulp and paper mill landfills and wastewater treatment and found these to be "essentially zero" according to the commenters. WCI is continuing to investigate the applicability of these sources at pulp and paper mills.

3.0 NEW AND REVISED ESSENTIAL REQUIREMENTS

Based on on-going work conducted by WCI's Reporting Committee since the third draft of the reporting Essential Requirements (January 6, 2009), and in response to comments received by stakeholders on that third draft, WCI has revised some reporting Essential Requirements previously contained in the third draft, and developed new requirements for source categories not previously included in the Essential Requirements. The revised and new requirements are contained in the following attachments to this document:

- Revised section file names (Attachments 1 through 4):
  - WCI_FinalDraft_GPs_050709_att01.doc
  - WCI_FinalDraft_GPs_Verification_050709_att02.doc
  - WCI_FinalDraft_20_Combustion__0507099_att03.doc
  - WCI_FinalDraft_150_Iron_Steel_050709_att04.doc

- New section files names (first time in rule format; Attachments 4 through 8):
  - WCI_FinalDraft_XX0_Adipic Acid_050709_att05.doc
  - WCI_FinalDraft_70_Primary Aluminum_050709_att06.doc (previously reviewed by stakeholders in narrative format)
  - WCI_FinalDraft_210_Pulp_Paper_050709_att07.doc
  - WCI_FinalDraft_230_Soda Ash_050709_att08.doc
  - WCI_FinalDraft_300_Petrochemical_050709_att09.doc

Western Climate Initiative

Cap Setting and Allowance Distribution Stakeholder Workshop

Committee Overview

May 28, 2009

Seattle, Washington

www.westernclimateinitiative.org

Committee Mission

- The Cap Setting and Allowance Distribution Committee (CSAD) has been formed to recommend methodologies for establishing:
  - The regional WCI GHG emissions cap
  - Each WCI Partner jurisdiction's allowance budgets
  - Allowance distribution guidelines
- The work of CSAD will help to ensure:
  - The data being used to inform these decisions are as accurate as possible
  - The approach taken addresses competitiveness issues
  - The methodologies are applied consistently to achieve each WCI Partner jurisdiction's specific goal as well as the WCI regional goal

CSAD Tasks

- Task 1: Data Review and Collection
- Task 2: Cap and Budget Setting
- Task 3: Competitiveness Analysis
- Task 4: 2012 One-Time Budget Adjustments
- Task 5: Offsets Compliance Limit
- Task 6: Early Reduction Allowances (ERAs)

CSAD Committee Output

- A common consistent emission projection methodology to enable 2012 and 2015 estimates for use in setting caps and budgets
- A methodology for establishing the:
  - Aggregate regional cap for 2012 to 2020,
  - Each WCI Partner jurisdiction's budget for 2012 to 2020, and
  - Process to review the budgets and regional cap to 2020 and make adjustments at the end of each compliance period.
- Competitive Analysis
  - Process to review and perform analyses on competitiveness issues from sectors or sources, and
  - A common allowances distribution system, where appropriate, to address competitiveness, for consideration by Partner jurisdictions

CSAD Committee Output

- A methodology for the distribution of the one-time, one percent contribution from jurisdictions of the 2012 budget
- A methodology for implementing the offset limit of no more than 49% of the total emission reductions from 2012-2020, including:
  - Options and recommendations on implementing the limit
- The elements of an Early Reduction Allowances (ERAs) approach, including:
  - Criteria for eligibility
  - Entities eligible
  - Process for issuing ERAs

Stakeholder Interaction

- Workshops:
- Conference calls and webinars
- Joint educational opportunities
- Written comment:
  - White papers
  - Draft recommendations
- Individual jurisdictions' stakeholder processes

Remainder of Today's Workshop

1. Offset Limit – White Paper
   - Offset limit used in other systems
   - Criteria for evaluating limits
   - Options for limits
2. ERAs – White Paper
   - Review of other systems
   - General design issues
3. Competitiveness Analysis
   - Principles for analysis of competitiveness issues

Western Climate Initiative

Cap Setting and Allowance Distribution
Stakeholder Workshop

CSAD Task 5: Offset Limits

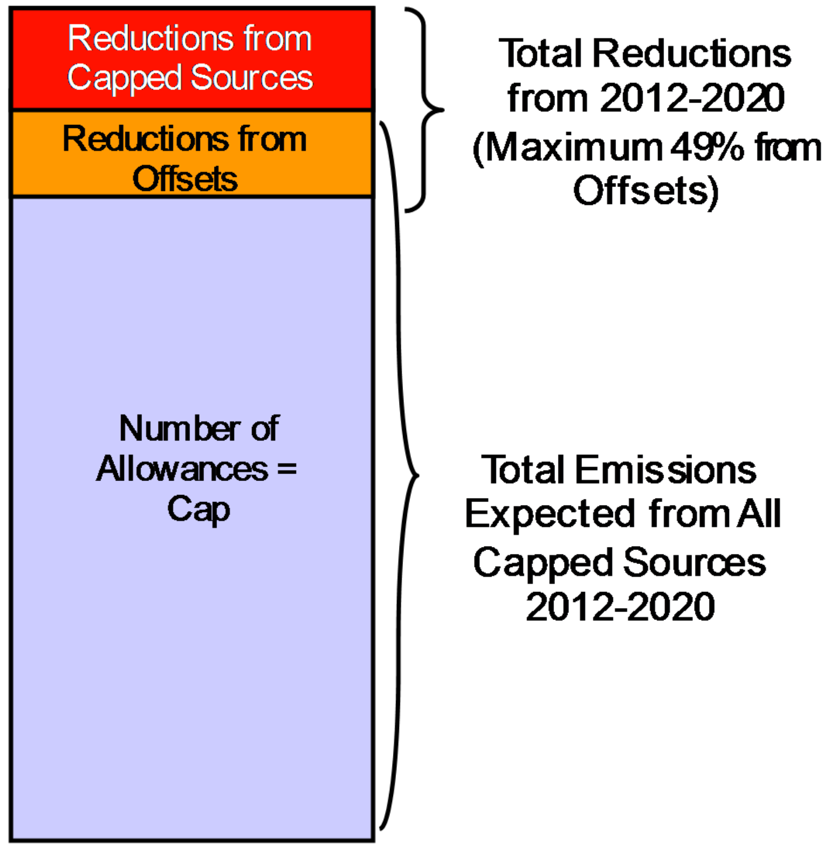
May 28, 2009
Seattle, Washington

Background

- The WCI Design Recommendations (September, 2008)
  - Specify that a majority of emission reductions required under the program occur at covered entities and facilities
  - Consequently, WCI Partner jurisdictions set a limit on the use of offset credits issued by WCI Partner jurisdictions, as well as the use of offset credits and allowances from other GHG emission trading systems that are recognized by the WCI Partner jurisdictions to more than 49 percent of the total emission reductions from 2012 to 2020

  - Note that "offset limit" is inclusive of the use of allowances issued by other GHG emission trading systems

Illustration of the WCI Offset Limit



Objectives for CSAD Task 5

- Review options for implementing an offset limit
    - *Consider offset limit approaches used in other emissions trading systems*

- Develop and recommend a methodology for implementing the offset limit

Work Plan & Timing for CSAD Task 5

- Design Development/Consultation
  - May 20 - Release of White Paper
    - Review of other programs
    - Key issues for discussions
  - May 28 - Workshop
  - June 19 - Deadline for comments
- Summer – Draft Recommendations
- Fall – Final Recommendations

Offset Limit White Paper

- Three key questions
  1. What mechanism should be used to impose the limit?
  2. How should the offset limit be applied across jurisdictions?
  3. How should the limit be applied across compliance periods?

Principles to Consider in Evaluating Options

- Fairness
- Economic efficiency
- Cost containment
- Effectiveness and enforceability
- Administrative cost and simplicity

Other Offset Limit Approaches Reviewed

- Regional Greenhouse Gas Initiative (RGGI)
- European Union Emission Trading Scheme
- Limits proposed in US National Cap-and-Trade Legislation
  - Waxman-Markey Discussion Bill
  - Dingell-Boucher Discussion Bill
  - Boxer Substitute of Lieberman-Warner (S. 3036)
  - Lieberman-Warner Climate Security Act (S. 2191)

What Mechanism Should Be Used to Impose the Limit?

- Should the offset limit be applied on
  - **offset use** (e.g., the amount of offsets covered entities can surrender for compliance purposes) or
  - **offset supply** (e.g., the overall amount of offsets issued in a given period of time)?
- If the limit is based on use, what is the preferred mechanism?
- If the limit is based on supply, what is the preferred mechanism?
- Should access to offsets be linked with the distribution of allowances, and if so in what manner?

Options Under Consideration

- Percentage use limit
  - Based on compliance obligations (RGGI, EU ETS, Dingell-Boucher, Waxman-Markey, L-W)
  - Based on distributed allowances (some EU ETS member states; could be a “tonnage” limit instead)
- Offset surrender certificate
- Supply (issuance) limit (Boxer amendment)
- Other options?

How Should the Offset Limit Be Applied Across Jurisdictions?

- Should the limit be applied on a **common** or **differentiated** basis?
  - If the limit is differentiated by Partner jurisdiction, what factor(s) should be the basis of differentiation? (e.g., differences in emission reduction targets, marginal abatement costs, or other factors across jurisdictions)

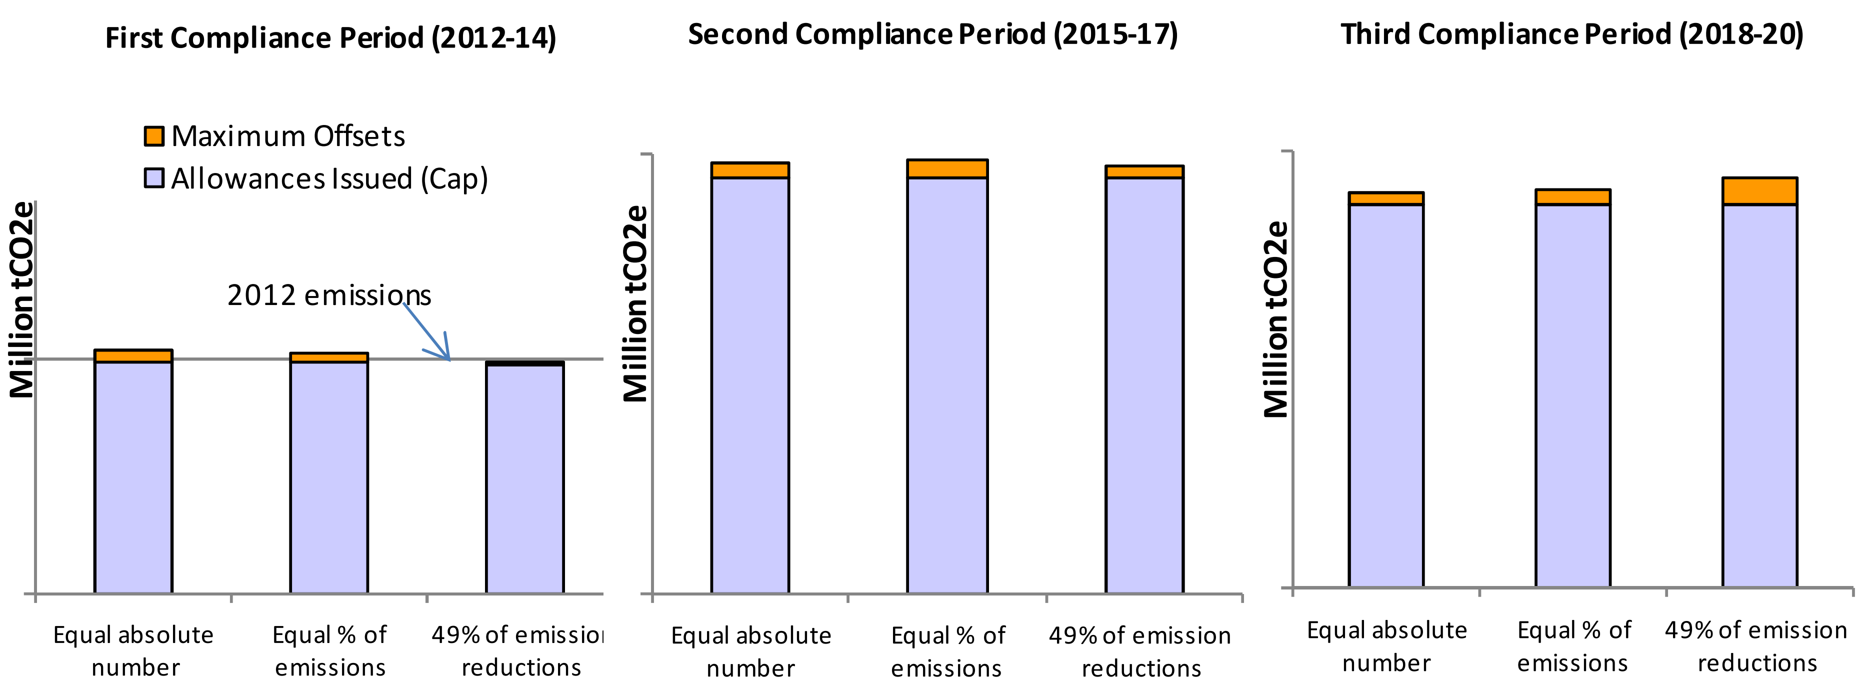
Comparison of Common and Differentiated Use Limits

Option:	Common % Use	Differentiated % Use
Example	X% of compliance obligations in all jurisdictions	49% of emission reductions in each jurisdiction translated to percentages of compliance obligation
Fairness	Entities that emit more GHGs could use more offset credits for compliance.	Emitters from jurisdictions that have a deeper reduction goal for 2020 relative to a base year would be allowed a higher percentage of offsets.
Efficiency	To the extent that offset use falls short of the overall limit as a result of the mechanism used to implement the offset limit, opportunities for efficiency gains may be unrealized.	
Cost Containment	The relative cost containment impact of each option remains to be evaluated.	
Effectiveness and Enforceability	WCI region-wide limit met. Individual partner limits may not be met.	WCI region-wide limit could be exceeded if individual Partners' limits are specified as a percent of compliance obligations.
Administrative Simplicity	Administratively simple to implement.	Slightly more complex to implement

How Should the Limit Be Applied Across Compliance Periods?

- Equal absolute number of offsets in each compliance period (Waxman-Markey)
- Equal percent of use across compliance periods (RGGI, L-W)
- 49% of Emission Reductions in each period
- No restrictions across compliance periods
- Other Ramp Up (Dingell-Boucher bill) or Ramp Down
- Carry-over (Boxer, EU Phase III)

Offset Limit Options Across Periods: Illustration



- Other options not depicted: No restrictions across time periods (supply limit); other ramp up/ramp down; carry over

Closer View of Relative Offset Amounts

Cap Setting and Allowance Distribution Stakeholder Workshop

CSAD Task 6: Early Reduction Allowances

May 28, 2009
Seattle, Washington

Background

- WCI Design Recommendation (8.11.1 to 8.11.3):
  - Each jurisdiction may issue Early Reduction Allowances (ERAs) for certain emission reductions at covered entities and facilities that are achieved after Jan. 1, 2008 and before January 1, 2012.
  - By the end of 2009, establish criteria to determine which early reductions will be eligible for ERAs.
  - Each jurisdiction that issues ERAs will do so in 2012. Any ERAs will be issued in addition to each Partner's 2012 allowance budget.
- CSAD Task 6 to develop the elements of the program including:
  - Criteria for awarding ERAs
  - Process for issuing ERAs.

ERA Work Plan

- Design Development/Consultation
  - May 15 - Release of White Paper
    - Review of other programs
    - Key issues for discussions
  - May 28 – Workshop
  - June 19 Deadline for comments
  - Summer – Draft Design Recommendation
  - Late Fall – final Design Recommendation

ERA Jurisdiction Scan

- Key Programs reviewed
  - RGGI
  - US NOx SIP Call
  - US Proposals:
    - Waxman-Markey
    - Lieberman-Warner
    - Dingell-Boucher
  - EU-ETS
  - Canada: Turning the Corner

Key Observations from Scan

- Stakeholder input into the development of an ERA approach is critical.
- Criteria for determining the nature of verified and credible emission reductions is central to the legitimacy of the ERA.
- Most initiatives placed an upper limit or time restriction on the amount of ERA available.
- Need for clear eligibility guidelines and a sufficient timeframe for regulated sector to respond to ERA opportunities.
- Administration of the program, including determining allocation of ERA can be very rigorous and resource-intensive.
- Allowance allocation design can remove any disadvantage from taking early action, and reduce or eliminate the need to consider ERA.

ERA Approaches

- Which approach should we pursue for ERAs?
  - Programmatic – with application and evaluation against applicable criteria (e.g., like an offset)
  - Baseline approach – based on streamlined evaluation of baseline emissions/reductions and selected criteria

- What ERA approach best fulfills WCI's goal to encourage emissions reductions prior to the cap and trade program start in 2012?
  - Is there a hybrid approach that could be developed reflecting the best of both options?
  - Should there be general guidance rather than project protocols?
  - How should the baseline be established for ERAs?

Other Issues for Consultation

- Eligibility criteria
  - How should we define additionality?
  - Should government funded projects be eligible?
  - What is the balance between administration cost and quality of the ERAs?
  - Reductions at facilities are eligible for ERAs
    - Should reductions be considered across a corporation?
    - How should the electricity generation sector be considered in light of changing mix in generation and conservation programs?

Other Issues for Consultation

- Should there be a limit on ERAs and if so, what should it be based on?
  - Will limits discourage early actions?
  - Do limits introduce competitive issues?
  - Will limits help with addressing gaming?
  - Can you limit ERAs through other means such as stringent criteria or rigorous quantification requirements?

Other Issues for Consultation

- How should we treat the transportation, residential and commercial fuel sector
  - What criteria should we use?
  - How to quantify reductions?

- ERAs are issued by jurisdiction, are there functions that should be done by a regional body?

Immediate Next Steps

- June 19 - Deadline for comments on white paper
  - Review and consider comments
  - Develop draft recommendations

Western Climate Initiative

CSAD Task 3 Competitiveness Update

May 28. 2009

www.westernclimateinitiative.org

Background to CSAD Task 3

- February 19, 2009 CSAD Work Plan: the allocation and cap setting approach will address competitiveness concerns.
- Task 3 Competitive Issues task group created to:
  - Seek, receive, review and perform analyses on competitiveness issues, from sectors or sources that have been identified and/or that self-identify as having competitiveness issues related to cap-and-trade.
  - Assess how WCI Partner jurisdictions should address competitiveness
    - Among the identified industries, and
    - Within each identified industry. If a common allowance distribution method is recommended, CSAD will recommend a distribution method for consideration by WCI Partner jurisdictions.

Objectives for CSAD Task 3

- Characterize risk of carbon and economic leakage related to cost impacts attributable to WCI
- Develop recommendations to Partners for mitigating carbon and economic leakage related to cost impacts attributable to WCI

Work Plan and Timing

2009-10 Work Plan sets out 5 Tasks under CSAD 3:

Subtasks	Deliverables	Dates
3.1	**Competitiveness evaluation and Statement of Principle** • Identify competitiveness issues and existing methodologies; and, • Develop principles to guide the WCI competitiveness evaluation process	2009 Q2
3.2	**Solicit Information from industry** • Emitters from covered sectors provide information related to their competitiveness risks • Finalize WCI process to assess competitiveness exposure and initiate analyses	2009 Q3-4 (2009 Q2)
3.3	**Create Workgroups to review industry information** • Creation of sector specific workgroups, as needed, to review industry information and engage with stakeholders	2009 Q3-4 (2009 Q2)
3.4	**Competitiveness analysis** • Finalize competitiveness exposure analyses, including review of independent analyses	2010 Q1
3.5	**Options to address competitiveness** • Task 3 workgroup will provide recommendations to the Partners for addressing forecasted competitiveness impacts to covered sectors	2010 Q2

First Steps: Ensure a Consistent Approach with other Major Carbon Initiatives

WCI comparison to other programs:

	Waxman-Markey	RGGI	EU	Australia	WCI
Characterize Economic and Carbon Leakage Risks to Covered Sectors	✓	✓	✓	✓	✓
Assess Covered Sectors Risk Levels	✓	✓	✓	✓	✓
Recommended Strategies to Address Leakage	✓	✓	✓	✓	✓

Approaches of other Major Carbon Initiatives

Two main objectives in other programs:

1. **Avoid carbon leakage stemming from cost impacts**
2. **Smooth the transition when competitiveness risks exist**

Examples from other programs:

- **EU Phase III:**
    - Identify sectors with “significant risk of carbon leakage”
    - For significant risks, 100% free allowances “to the extent that they use the most efficient technology”. Phase in auction for others.
- **Australia**. Address transitional challenges faced by emissions-intensive, trade-exposed industries with free allocations

Approaches of other Major Carbon Initiatives

- **Waxman-Markey.** "carbon leakage …substantial increase in GHG by manufacturing entities located in countries without commensurate GHG regulation, provided that such increase is caused ... from the implementation of title VII of the Clean Air Act".
  - Compensate the owners and operators of entities in eligible domestic industrial sectors and subsectors for carbon emission costs incurred.
  - Eliminate or reduce distribution of rebates when such distribution is no longer necessary to prevent carbon leakage
- **RGGI**. "A cost increase due to a carbon cap could drive geographic changes in the operation of the electric power system…a scenario where RGGI sunsets once a national program is implemented, would obviate any potential for emissions leakage"

Subtask 1: Competitiveness Evaluation and Statement of Principle

- Review information from WCI jurisdictions, and what other analyses, proposals, and programs say about:
  1. How to define, measuring and determine competitiveness impacts. (e.g., using carbon costs relative to sales and value added; defining trade exposure; etc.)
  2. How to mitigate potential impacts. (e.g., allowance distribution method; thresholds; tariffs)
- Statement of Principle – Core concepts to guide the WCI competitiveness evaluation process (released to Stakeholders)
- Use stakeholder feedback in designing Subtask 2 (the process by which the WCI will solicit industry input to help identify and characterize competitiveness issues).

Questions for Stakeholders

1. What principles should govern how the WCI Partner jurisdictions evaluate and address potential competitiveness impacts of the WCI regional cap-and-trade program ?

2. What aspects of the WCI cap-and-trade program have the potential to cause intra-WCI competitiveness impacts (i.e., among businesses within the WCI Partner jurisdictions that compete with each other)? How significant are the potential intra-WCI competitiveness impacts compared to potential impacts arising from competition with businesses located outside the WCI Partner jurisdictions ?

Questions for Stakeholders

3. How can the WCI Partner jurisdictions best anticipate potential U.S. and Canadian federal efforts to address competitiveness impacts associated with climate policies, such as cap-and-trade? To what extent should the WCI Partner jurisdictions strive to harmonize with current federal proposals to address these impacts? With those currently employed in the European Union? What competitiveness issues should the WCI Partner jurisdictions emphasize in communications with the two federal governments ?

4. What opportunities and/or challenges, in terms of competitiveness of the covered sectors, might the WCI cap-and-trade program present as the region emerges from the current economic downturn? What other factors might interact with the cap-and-trade program to enhance or hinder the competitiveness of covered sectors within a jurisdiction?

Questions for Stakeholders

5. For those sectors for which internalizing the cost of carbon through a cap-and-trade program presents competitiveness risks, which options should the WCI Partner jurisdictions consider to address those potential impacts ?

Questions for Stakeholders

1. Principles to govern WCI evaluation
2. Intra-WCI vs. External competition
3. Federal Interaction
4. Economic Downturn & Other Factors (Positive & Negative)
5. Options for addressing competitiveness risks

Additional Details on Existing or Proposed Early Reduction Recognition Programs 14

1 Purpose and Objective of Early Reductions

As part of the *Design Recommendations for the WCI Regional Cap-and-Trade Program*, the WCI Partners may issue Early Reduction Allowances (ERAs). ERAs are used to recognize emissions reductions at facilities covered by the cap occurring between January 1, 2008 and January 1, 2012. This approach is intended to provide an additional incentive for covered entities and facilities to invest in projects that reduce emissions before the beginning of the WCI cap-and-trade program, rather than waiting to implement emissions reduction projects until the program is underway.

The WCI Partners have a number of options they can use to recognize early actions. In the case of auctioned allowances, early reduction activity would lead to lower costs for the covered entity or facility undertaking the early action. If allowances were issued based on industry-specific benchmarks, the basic allocation approach would reward facilities that have reduced their emissions below the identified benchmark. If allowances are distributed based on historical emission levels (sometimes called grandfathering) partners could consider distributing allowances based on historic emission levels, which means entities that have taken early action have more allowances compared to their emissions. .

According to the Sept. 23, 2008 WCI Design Recommendation Background report (Section 1.10.4), ERAs could be issued by each Partner jurisdiction in 2012 to facilities and entities covered by the cap that have made eligible emissions reductions. Any facility covered by the cap in either 2012 or 2015 will be eligible to receive ERAs. Once issued, ERAs can be traded or used for compliance purposes, equivalent to any other WCI emissions allowance.

The WCI plans to issue ERAs in addition to each Partner's allowance budget. This is based on the assumption that any emissions reductions qualifying for ERAs will lead to a lower emissions cap in 2012. Without a means to encourage emission reductions in advance of the program, there may be a perverse incentive for facilities to wait until the cap-and-trade program begins before investing in emission reducing technology or even increase their emissions to get more allowances if allowance distribution is based on best estimates of 2012 emissions.

If properly designed, ERAs will encourage real reductions prior to the start of the cap-and-trade system in 2012. However, if significant amounts of ERAs are rewarded for reductions not fully reflected in the level at which the cap is set, some jurisdictions have expressed concerns that ERAs could diminish the intended level of allowance scarcity. In order to prevent such an over allocation and to ensure the quality of the reductions, ERAs will have to be issued based on clearly established criteria to ensure that reductions are voluntary, additional, real, verifiable, permanent and enforceable.

There are different approaches on how to issue ERAs in 2012. In a programmatic approach, there would be an application process and determination of ERAs to be issued, similar to offset projects. An alternative is the baseline approach, where the ERAs are calculated based on verified emission reductions between 2008 and 2012 submitted by the entity using the same reporting infrastructure of the WCI.

The Cap Setting and Allowance Distribution (CSAD) Committee received the mandate to develop the methodology for implementing the WCI ERA approach. As part of this work the CSAD Committee seeks input on answering the following questions. More detailed questions are posed throughout the document on each topic.

1. What ERA approach best fulfills WCI's goal to encourage emissions reductions prior to the cap and trade program start in 2012?
2. In the programmatic approach to ERAs:
    a. What criteria should WCI Partners use to evaluate ERA projects?
    b. Will it be necessary to establish an application process for ERAs prior to the final regulation in 2010/11 in order to issue ERAs in 2012?
    c. Should the WCI develop general guidance documents to ensure consistency in the implementation of the program (rather than develop project specific protocols)?
3. Under an ERA baseline approach, what documentation should be required to establish the baseline?
4. ERAs are administered by the jurisdictions. Are there functions that would benefit from being coordinated through the regional administrative body? If so, which ones?
5. Should there be a limit on the number of ERAs issued? If so, what should the limits be based on?

This white paper seeks stakeholder input on these, and other, issues related to the ERA program. First, we briefly outline similar approaches from other cap-and-trade systems currently in operation or under development in jurisdictions around the world. Then we present a number of issues for discussion in establishing a successful ERA approach. Finally, we provide information on how stakeholders can provide input to the CSAD Committee as it drafts recommendations for Early Reduction Allowances.

2 Jurisdictional Scan of Approaches to Early Reduction Recognition Under Other Trading Systems

The WCI Cap Setting and Allowance Distribution Task Group 6 "Emission Reductions Allowances" reviewed several existing and proposed emission trading systems to inform the WCI ERA design process. The review considered the Regional Greenhouse Gas Initiative, the European Union Emissions Trading System, the NOx SIP Call, the Canadian Regulatory Framework on Air Emissions, the proposed Australian Carbon Pollution Reduction Scheme, and four proposed U.S. federal acts – the Dingell-Boucher Discussion Draft, the Bingaman-Specter Low Carbon Economy Act, the Lieberman-Warner Climate Security Act, and the Waxman-Markey Discussion Draft. The recommendations of the U.S Climate Action Partnership were also considered. The table below provides an overview of the key elements found in other approaches to recognizing early action. Detailed information on the approaches reviewed is provided in Appendix 1.

The review of the approaches surveyed above highlights some key lessons that should be considered by the WCI partners as they develop the design details of any Early Reduction Allowance program:

- An appropriate allowance allocation design can remove any disadvantage from taking early action, and hence reduce or eliminate the need to consider ERAs.
- The majority of the initiatives placed an upper limit or time restriction on the amount of ERAs available to capped entities and facilities.
- The criteria for determining the exact nature of verified and credible emission reductions is central to the legitimacy of the ERAs.
- Capped entities and facilities will require clear eligibility guidelines and a sufficient timeframe to respond to ERA opportunities.
- Stakeholder input into the development of an ERA approach is critical.
- Administration of the program, including determining the allocation of ERAs can be very rigorous and resource-intensive.

Table A. Summary of Programs Reviewed

Trading System/Bill Name	Sectors/ Sources covered	Explicit early action approach?	Years Eligible for Consideration	ERAs in addition to the "Cap"?	Limit on ERAs Issued?	Additionality and other key criteria	Method to quantify early reductions
RGGI	Electricity	Yes	2006-2008	Yes. Awarded directly to the CO2 budget source, are not included in the auction, and are in addition to the cap.	No	No requirement to show financial additionality or that action taken exceeded existing regulation	Two different formula developed for quantification
EU ETS	Large GHG emitters including electricity and industrial sectors CO2 emissions only	Yes, but up to individual Member States. Some member states believe early reduction rewards are already in the program design.	Determined by member state but based on EU Directives	No. Limited to reductions of covered emissions beyond reductions made pursuant to legislation, or to actions undertaken in the absence of any such legislation. Implies fewer allowances available to installations not taking early action.		Varies by jurisdiction. For example, Germany uses a number of criteria including minimum percentage reduction before rewarding early reduction allowances.	Varies by jurisdiction
US EPA NOx SIP Call	Large electricity generating sources/large combustion point sources of NOx	Yes	2003 and 2004 ozone season	Can be issued if reduction surplus to regulatory requirement	Cannot be greater than the compliance Supplement Pool (CSP).	Reductions beyond a benchmark (NOx intensity) or an absolute reduction.	Follow SIP protocols and approved by EPA

Trading System/Bill Name	Sectors/ Sources covered	Explicit early action approach?	Years Eligible for Consideration	ERAs in addition to the "Cap"?	Limit on ERAs Issued?	Additionality and other key criteria	Method to quantify early reductions
Canadian Regulatory Framework	Electricity generation from combustion oil; oil and gas; smelting and refining; iron and steel; mining; cement; lime; chemicals Kyoto GHGs	Yes	1992 to 2006		Yes	Incremental to regulatory requirements, beyond standard improvements and beyond actions resulting from government incentive programs.	Defined in "Guidance Manual for Applicants for Early Reduction Credits".
Canadian Baseline Protection Initiative	Designed to reduce impacts of regulation on entities that took early action	Yes	1990 to 2000				
Australian Carbon Pollution Reduction Scheme		No					
Dingell-Boucher Discussion Draft	Limited detail available	Yes					
Bingaman-Specter Low Carbon Economy Act	Limited Detail available	Yes					

Trading System/Bill Name	Sectors/ Sources covered	Explicit early action approach?	Years Eligible for Consideration	ERAs in addition to the “Cap”?	Limit on ERAs Issued?	Additionality and other key criteria	Method to quantify early reductions
Lieberman-Warner Climate Security Act	Limited detail available	Yes					
US-CAP		Yes	No earlier than 1995 (given as an example) until enactment date of mandatory program		“adequate set aside of allowances under the cap”	“Financial additionality not an appropriate criterion”	Not defined
Waxman-Markey Discussion Draft	Limited detail available	Bill does not address allowance distribution issues at this time					

3 Issues for discussion

A framework for ERAs requires certain essential elements including defining additionality; identification of project types and entities that could apply for ERAs; and clarity on acceptable methods for quantifying reductions, administration of ERA distribution and linkages to the broader WCI program. In designing the ERA approach, there has to be consideration given to how an ERA program will interact with the setting of caps/budgets at the beginning of the cap and trade program and their potential effects on the emission trading market.

3.1 Additionality

The WCI ERA approach, as described in the Design Recommendations, is intended to incent voluntary reductions within the covered sectors of the cap-and-trade system. Aside from being voluntary, the Design Recommendations also indicate that the emission reductions must also be additional, real, verifiable, permanent and enforceable.

Additionality is one of the key criteria in designing an ERA approach. Some commonly applied criteria would likely be part of the WCI definition including: surplus to regulatory requirements; reductions not due to decreases in production or shut downs and reductions that are not supplanted by transferring activities or production to other facilities.[1] Other additionality criteria such as beyond business as usual; financial additionality[2]; and projects that are not the result of government funded projects, will be reviewed and evaluated in developing the WCI recommendations.

Defining additionality within the context of an ERA approach requires sensitivity to many of the same issues that arise when applying additionality tests to offsets. Any effort to determine additionality in an ERA approach will need to balance administrative efficiency and cost with overall effectiveness and stringency. WCI Partners and stakeholders have a range of issues to address, from essential definitions to broader implementation-related concerns including:

- How is additionality defined in an ERA programmatic approach? Is it as simple as, 'without the ERA, the project would not proceed' or 'without the ERA, the project would be delayed until after the cap is in place'? Alternately, should it be based on a more general criterion such as a minimum absolute reduction?

---

[1] Supplantation can occur within the same corporation, or within or outside of the WCI region. Supplantation may be allowed if a demonstration is made of a net reduction in GHG emissions as a result of the curtailment or shut down.

[2] A project-specific assessment that considers the total cost of a reduction project, the financial rationale for undertaking or rejecting the project and assesses whether the value of potential ERAs would make the project financially viable, making the case to proceed.

- Should government funded projects be eligible for ERAs?
- Once a basic definition is settled upon, what "additionality tests" (financial, project-by-project BAU, benchmarking, barrier, etc.) are best suited for assessing additionality in a WCI ERA approach?
- What is the right balance of stringency and transparency in additionality testing?
- What is the balance between high administrative costs to ensure high quality ERAs and minimization of costs to encourage early reductions?

3.2 Entities that are eligible for ERAs

The design recommendation indicates each WCI Partner may issue ERAs for reductions at covered entities and facilities within its jurisdiction for reductions between January 1, 2008 and January 1, 2012. Covered sources would include electricity generation (including electricity imported into a Partner jurisdiction), industrial and commercial facilities which emit at least 25,000 tonnes of CO2e annually. In addition, covered entities would include the providers of transportation, residential, commercial and industrial fuel regulated at a point upstream of combustion. The covered sources may be controlled or owned by a range of entities including publicly traded companies/corporations, private owners, government owned utilities, government corporations, government agencies, state/provincial government, regional or municipal governments.

Reduction at individual facilities will be eligible for ERA provided they meet the applicable criteria. However, in many cases corporations may operate a number of facilities within the WCI jurisdictions.

- Should reductions be considered across the entire corporation provided there is a demonstration of net GHG reductions (e.g., for cases where inefficient production is closed at one site and moved to sites with less GHG-intensive operations?

For the electricity generation sector, a jurisdiction can have a mix of different types of generation. As the mix is changed towards lower carbon or zero carbon generation:

- How should the electricity sector be handled in light of mandated or non-mandated changes and/or energy efficiency programs intended to advance this transition?

3.3 Potential limits on total ERA issued

Our review of ERA approaches clearly indicates that there is no single, standard approach to placing limits on early action credits in cap-and-trade systems. So WCI partners will only be able to look to these other approaches for limited guidance in determining the potential limits on total ERAs issued.

While a well designed ERA program should not lead to over-allocation over the long term, there could be effects on the market in the early compliance periods. The availability of a large volume of ERAs at the start of the first compliance period could be a key cost containment mechanism; however, excessive amounts of ERAs could affect the market and lead to an unintended reduction in the price of allowances. In order to determine the limit level that may be applied (or if there should be a limit at all) to the system, Partners and stakeholders should consider the following:

- What are the options and impacts of different limits levels?
  - Do limits introduce competitive advantages or disadvantages into the system, and who are the affected parties?
  - Will limits reduce concerns of system gaming?
  - Will limits disincent early action in covered sectors?
- Could a limit on ERAs be achieved through other means such as a stringent program design – either through stringent criteria for specific eligible actions or a rigorous quantification methods?

3.4 Relationship of ERA and 2012 allowance budget

Section 1.7.2 of the WCI Background Report on the Design Recommendations notes that voluntary reductions recognized under ERAs be reflected in the estimates of the 2012 allowance budget. Section 1.10.4 of the Background Report suggests that an ERA approach "will not result in an over-allocation of allowances because the Early Reduction Allowances will apply to reductions of emissions that would have otherwise been included in each Partner's 2012 allowance budget." The report cites both the Northeast NOx Budget Cap-and-Trade Program and the U.S. Environmental Protection Agency (EPA) NOx SIP-Call Program as supporting the workability of this recommendation. If the mechanism developed to reconcile 2012 allowance budgets for each Partner is to be based on either of the two programs noted above, then Partners and stakeholders will have to consider:

- Does the broad scope of the WCI cap-and-trade system make it too complicated to develop an ERA mechanism similar to those used in the USEPA NOx programs, which primarily covered the electricity sector?
- How should the emission reductions achieved by ERAs be coordinated with the setting of caps/budgets for 2012/15 and issuances of allowances by each jurisdiction?

3.5 Coordination of Implementation of ERA

The ERA process will likely be included as part of the essential elements to be adopted by jurisdictions in their emissions trading regulations. The regulation would provide authority for the jurisdiction to issue ERAs and the conditions that must be met before they are issued. Individual jurisdictions are most familiar with their industries, which provide for easier interactions with potential applicants.

Each WCI Partner jurisdiction can issue ERAs in 2012. In a programmatic approach, there is a need for an ERA application process as early as possible and likely before the finalization of the final regulations in 2010/11. This would allow the jurisdiction to obtain the information to make the determination of ERAs to be issued in 2012. An alternative is the baseline approach, where the reductions and ERAs are calculated based on verified emission reductions between 2008 and 2012 submitted by the entity using the same reporting infrastructure of the WCI.

A large number of entities, industries and types of projects may apply for ERA, which may make it impractical to develop protocols/methods for all the types of projects that are eligible (unlike offsets). However, under a more programmatic approach, some general guidance would still be required to ensure consistency in the application, evaluation and final determinations of allowances to be issued. In particular the transportation, residential and commercial fuel sectors would need clear guidance on the types of activities that would be eligible and how the reductions should be quantified.

WCI is seeking stakeholders' views on:

- The use of a programmatic approach with an application process or a baseline approach for ERAs prior to the final regulation.
- The use of general guidance documents to ensure consistency in the implementation of the approach (rather than project specific protocols).
- Should ERA distribution be administered by the jurisdictions or through a central administrative body?
- What criteria should be used to determine the types of activities that are eligible for ERAs in the transportation, residential and commercial fuel sectors? How should the reductions be quantified?

4 Next steps

WCI has released this White Paper to provide background on the approach to the Early Reduction Allowances. The Paper reviewed existing approaches and identified some key questions to provide common foundation for the design of the ERA approach.

WCI is seeking stakeholder input on the White Paper. We ask that written comments be submitted through the WCI website by June 19, 2009 (www.westernclimateinitiative.org).

You are also invited to participate in a stakeholder meeting (and/or webinar) to discuss the White Paper on May 28, 2009 at Seattle, Washington http://www.westernclimateinitiative.org/WCI_Meetings_Events.cfm.

The input provided by stakeholders will be considered by WCI and inform the development of draft recommendations on ERAs for further stakeholder input in early Fall 2009.

Appendix 1: Additional Details on Existing or Proposed Early Reduction Recognition Programs

Regional Greenhouse Gas Initiative

The Regional Greenhouse Gas Initiative (RGGI) covers carbon dioxide emissions from the electricity sector in ten North-Eastern and Mid-Atlantic states. The RGGI Model Rule allows participating states to award ERAs entities that make voluntary emission reductions prior to the beginning of the first compliance period. Early reductions made during 2006-2008 are eligible for early reduction allowances.[3] Entities must include all CO_2 units for which they were responsible under the 2002-2004 baseline in order to verify their reductions, as well as accounting for new units added since the baseline period. Reductions resulting from operation shutdowns are not eligible for ERAs. In order to receive ERAs entities must demonstrate that the reductions occurred relative to the baseline period (2002-2004). ERAs are distributed in addition to each state's allowance budget and there is no limit on the number of ERAs that can be issued.

The Model Rule does not require entities seeking early action reductions to demonstrate that their reductions are financially additional or exceed new regulatory requirements. Two formulas are used to determine the amount of ERAs an entity can receive. The first formula is for entities that experienced an increase in total heat output from their baseline levels. These entities calculate the total tonnage of CO2 emissions during the ERA period and subtract the amount from the baseline period CO2 emissions. Entities that experience a decline in total heat input between the baseline period and the early action period use a more complex formula that must demonstrate a decrease in carbon intensity (lbs. CO2 per MWh) in order to receive allowances.

Applications from entities seeking ERAs are submitted to the state's designated regulatory agency, which evaluates applications to determine if the ERA criteria are met. The deadline for submission of applications established in the Model Rule is May 1, 2009 and regulating agencies must distribute all early reduction allowances by December 31.

[3] As of May 2008, Vermont did not include early reduction allowances in its implementation rule.

European Union Emissions Trading System

The European Union Emissions Trading System (EU ETS) is the cornerstone of the EU's strategy to help Member States and EU achieve compliance with their commitment under Kyoto Protocol, and to promote reductions of GHG emissions in a cost-effective and economically efficient manner. The EU ETS is a GHG cap- and-trade Scheme covering large emitters, including the electricity and industrial sectors. The EU ETS was established officially by Directive 2003/87/EC of the European Parliament and of the Council of 13 October 2003, which sets the rules to put in place and implement the Scheme. EU ETS started out on January 1, 2005, with the first compliance period (2005-2007). The second compliance period is currently under way (2008-2012). The directive establishing the EU ETS refers to all six Kyoto GHGs but regulation only applies to emissions of CO2.

For the first two compliance periods, each Member State developed a National Allocation Plan (NAP) stating the total quantity of allowances that it intends to allocate for that period and how it proposes to allocate them among the installations which are subject to the Scheme. When summed the allowance numbers specified in these NAPs are equal to the total 'cap' for the program. The NAP process was based on objective and transparent criteria, including those listed in Annex III of Directive 2003/87/EC.

One of these criteria, Criterion 7, pertains to early action, and says:
The plan may accommodate early action and shall contain information on the manner in which early action is taken into account. Benchmarks derived from reference documents concerning the best available technologies may be employed by Member States in developing their National Allocation Plans, and these benchmarks can incorporate an element of accommodating early action.

Therefore, this was an optional criterion: Member States did not have to recognize or accommodate early action.

In order to assist Member States in the implementation of the criteria listed in Annex III, European Commission issued on 27 January 2004, a communication (COM (2003) 830 final) giving guidance, among others, on the Criterion 7 (Early Action), which can be summarised as followed:

- The accommodation of early action was considered desirable from a fairness point of view.
- Early action was limited to reductions of covered emissions beyond reductions made pursuant to Community or national legislation, or to actions undertaken in the absence of any such legislation.

- The application of this criterion necessarily implied fewer allowances available for installations that did not undertake early action (to prevent over-allocation all early action was rewarded from within the total quantity of allowances to be allocated).
- Three methods were possible for Member States to accommodate early action (the Commission can also assess others) :
    - choosing an early base period
    - making a two-round allocation at installation level
    - using benchmarks

The European Commission issued another important communication in 2005 giving guidance to Member States on developing NAP for the second compliance period (COM (2005) 703 final). However, this communication doesn't give further information on early action.

Therefore, at the European level, there is no specific early action program allocating ERAs. However, Member States may recognize or accommodate early reductions in their NAP within their cap.

The National Action Plans of three of the six largest emitter Member States in EU ETS (France, United Kingdom and Germany) are reviewed below.

<u>France</u>: accommodates early action using the "early base period" method:

- In NAP I (2005-2007), early action is accommodated in two ways:
    - In allowances distribution from the cap to Sectors budget, using the average 1998-2001 period for the base specific emissions;
    - In allowances distribution from Sectors budget to Installations, using a base year or period that can go back to 1996.
- In NAP II (2008-2012), early action is accommodated in one way:
    - In allowances distribution from Sectors budget to Installations, using a base year or period that can go back to 1996.
    - It is clearly mentioned that taking into account early action doesn't change the total quantity of allowances to be allocated (the cap).

<u>United Kingdom</u>: does not consider that it is appropriate to reward early action specifically in the Phase II NAP (2008-2012).

This is because it considers that it is very difficult to identify instances of early action other than those undertaken either:

- In compliance with relevant legislation or other policies, which the Commission guidance makes clear is not covered by the definition of early action; or

- For economic reasons, for which there would appear to be little justification for additional award.

However, the use of average emissions data from 2000-2003 to distribute allowances to individual installations takes some account of major decreases in emissions during later years by incorporating data for early years, and therefore rewards an operator who took early action during the baseline period. It also avoids the penalty for early action that would result from basing allocations on a single recent year (e.g. 2003) or on individual forecasts of emissions.

Germany: accommodates and recognizes early action using a mixed method in NAP I (2005-2007).

First of all, Germany carries out the allocation to installations in its NAP I based on grandfathering (allocation based on an installation's historical emissions in a reference period) and benchmarking (allocation based on the average specific emissions of a product category).

The allocation to an individual installation is calculated using:

- CO_2 emissions from the installation in the reference period 2000-2002; and
- The compliance factor.

The compliance factor is always equal to or less than 1; a factor less than one implies a reduction burden. As for early action recognition, two ways are used. The first is by using an early reference period (2000-2002) to calculate the allocation. The second way is an early action mechanism (special allocation rules), which enables qualified installations to be entitled to apply a compliance factor of 1 (no reduction burden). A compliance factor of 1 could be applied to existing installations which were modernised and to newly built installations if (re-)commissioning occurred between 1 January 1994 and 31 December 2002.

Existing installations qualify as early action installations if they can demonstrate a predefined reduction in specific CO_2 emissions, provided that these reductions were not achieved simply by decommissioning the plant and/or a decline in productive output. These specific emissions reductions have to range from 8 to 14% depending on the year commissioned. Moreover, measures to reduce specific emissions will not be ranked as early action measures if they were substantially funded by public means or if they would have been required in any case due to legal stipulations.

If an installation was newly commissioned between 1 January 1994 and 31 December 2002, it is assumed to have achieved at least the defined reduction in specific emissions. There is, therefore, no need to supply evidence.

Applications for a compliance factor of 1 could be made for a period of 12 years after the completion of the modernisation.

The greater the number of early action installations that would be entitled to apply a compliance factor of 1, the higher the reduction burden would be for the other emitters. That is what happened on 21 April 2004 when the German government adopted an Act to amend NAP I before coming into force, modifying the general compliance factor for 0.9755 (emissions to be reduced by 2.45%), in order to recognize more early actions. The initial general compliance factor was 0.9765 (emissions to be reduced by 2.35%).

United States Environmental Protection Agency NOx SIP call

The United States EPA NOx SIP call is a NOx Budget Trading program (NBP) implemented in 2003 for Midwest and North-Eastern States in order to reduce NOx emissions enabling the States to attain national ambient air quality standards for ozone. The Budget Trading Program covered large electricity generating units (EGUs> 25 MW) and other large combustion point sources (non-EGUs >250 mmBTU/hour). NOx Budgets were established for each State, along with a Compliance Supplement Pool (CSP) to support efforts to encourage early reductions.

States could issue early reduction credits if the reduction was surplus to regulatory requirements in the SIP or the Clean Air Act (CAA), as well as verifiable and quantifiable. States could also develop an early action program to provide for additional early reduction credits; but, the total amount of early action credits must not be greater than the CSP.

USEPA established a NOx Budget Trading program which could be adopted by individual States (23 in total, including D.C.) in their State Implementation Plan (SIP). The NBP includes a budget for each State in the period starting in 2003 and a compliance supplement pool (CSP). The CSP can be used by States to encourage early action, or to reduce the reliability risk of the electricity supply and provide flexibility for facilities that cannot meet the requirements in the early years. The CSP can also be used to integrate the earlier Ozone Transport Commissions (OTC) NOx trading program (started in 1999) into NBP – by carrying all of the banked OTC NOx allowances into the NBP.

In order to issue CSP for early action, the State must meet the following provisions:

- Complete the issuance prior to May 1, 2003 (in the first compliance period);
- Emission reduction must not be required by SIP or CAA (e.g., surplus to regulatory requirements);

- Emission reductions must be verified as having occurred in the ozone season;
- An optional method is to require emissions reductions that are no less than 20% below the year 2000 emission rate, and the amount of allowances will be equal to the difference between a benchmark and the actual emission rate;
- Emission reductions must be quantified according to the SIP and approved by EPA; and
- The CSP credits may be traded with other sources in the trading program.

Allowances issued under the CSP could only be used to demonstrate compliance in the 2003 and 2004 ozone season, meaning they must have been used in the first two compliance periods and could not be banked for future use. A total of 200,000 tons of CSP allowances were set out by USEPA in the rule, 170,192 CSP allowances were issued/retired according to Clean Air Markets. The total NOx Budget for EGU and non-EGU sources is 1,102,443 tons. The CSP is approximately 18% of the EGU/Non-EGU budget.

Under the USEPA model program, each NOx Budget source is required to have a federally enforceable permit; such permits include a NOx budget permit. The permit may be a Title V or a non-Title V permit provided it include provisions for addressing permit application, permit duration, permit issuance, etc. The permitting authority allocates NOx allowances to each Budget unit and also submits to the Administrator (US EPA) the NOx allowance allocation. The Administrator establishes appropriate account(s) for each NOx Budget Unit, and records the allocations of the allowances into the account.

A review of selected State regulation shows Pennsylvania (PA) does not mention allocations through the permitting process, whereas New York (NY) does issue allowances through the permitting process. PA and NY both issued early reduction allowances that are actually transfers of banked allowances from the OTC trading program. PA also allocated CSP based on reductions below a NOx benchmark and emissions that are 20% below the 2000 emissions.

Canadian Regulatory Framework on Air Emissions

The Canadian Regulatory Framework on Air Emissions or *Turning the Corner* was released in April 2007. It provides a regulatory framework for short-term industrial emission greenhouse gas (GHG) reduction targets, and sets medium- and long-term national targets. Targets are based on a 2006 baseline. The Framework sets out emission-intensity reduction targets for industrial sectors that will come into force in 2010. The targets shift from intensity-based to absolute in 2020. The Regulatory Framework covers facilities in the following sectors: electricity generation produced by combustion; oil and gas; forest products; smelting and refining; iron and steel; some mining; and cement, lime and chemicals.

The framework includes a one-time allocation of Credits for Early Action. There is a maximum allocation of 15 MT and only 5 MT can be used each year (for 3 years). If total tonnage of eligible emission reductions were to exceed 15Mt, the credits would be distributed to individual firms in proportion to their contribution to the total emission reduction achieved. The eligibility criteria for the Credit for Early Action Program includes actions that are incremental to regulatory requirements, beyond standard improvements and beyond actions that result from the receipt of a direct federal or provincial/territorial climate change incentive.

The Credit for Early Action Program is intended to address the disadvantage that a firm could incur for having undertaken an incremental action to reduce GHGs before the regulatory regime was set out. It is a one-time allocation of credits to those firms covered by the proposed regulations that took verified action to reduce their GHG emissions between 1992 and 2006.

The *Credit for Early Action Program – Final Program Guide* provides the direction for submitting an application for early action recognition. The program requires that evidence of emission reductions be audited.

Six eligibility criteria must be met in order to qualify for Credit for Early Action:

1. The action reduced emissions in the facility of one or more GHGs: carbon dioxide (CO2), methane (CH4), nitrous oxide (N20), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs) and sulphur hexafluoride (SF6).
2. The action occurred in a "facility" as defined in the Final Program Guide.
3. The action occurred in a facility where the emissions from or capacity of the facility in 2006 exceeded a minimum threshold specified in the Final Program Guide.
4. The initial GHG reductions from the action occurred in 1992 or later, and the reductions continued at least until December 31, 2006.
5. The GHG reductions from the action are unique (the firm has not received a GHG credit through a mandatory program or in a voluntary system).
6. The action was incremental, that is, beyond usual business conditions, when the GHG reductions first occurred. There are two options to demonstrate an action is incremental. An applicant can show intensity reductions and cumulative improvements are more than 1% per year, or they may submit information to show the action is surplus to beyond standard improvements (e.g., not a result of capital turnover, financial barriers that prevent others from such actions, etc.)

Actions that are ineligible for Credits for Early Action are also defined. These include: reductions that were a result of reductions in production or shut-downs; actions implemented outside a facility's boundary; emissions that were reduced by moving production off-site (displacement instead of reduction); GHGs being captured / recovered and sequestered, moved off-site or sold to another facility; reductions resulting from an energy efficiency improvement that reduced the emissions of another facility (e.g. an action reduced the electricity, steam or heat consumption of the facility but these inputs were purchased from a grid or another facility); the action reduced emissions from a fixed process; or the action reduced fugitive emissions.

The program has a three phase implementation process:

- Phase I: "Initial information submission phase." Completion and submission of a Notice of Interest" and a "Phase I Submission" template.
- Phase II: "Final submission phase." Applicants provide the information needed for the final allocation decisions. Details for the Phase II application process have not yet been released, but it is expected to have requirements for acceptable evidence of reductions, acceptable approaches to establishing a baseline, acceptable quantification approaches, qualifications for third-party verifiers and information for verifiers regarding their roles and responsibilities in the verification process. Phase I must be completed successfully in order to participate in Phase II.
- Phase III: "Allocation of Early Action Credits." The government will allocate entitlement to early action credits.

The industrial air emissions regulations proposed in the Regulatory Framework will set out the conditions under which regulated entities will be able to use Early Action Credits to comply with their compliance obligations.

Early action credits will have the following characteristics:

- Unique: Each will have a unique serial number and will be tracked from issuance to retirement or cancellation. Each will represent one whole tonne of carbon dioxide equivalent
- Earned: Allocation and issuance will only occur when GHG reductions can be demonstrated in accordance with the Program requirements
- Uses for regulatory compliance: Proposed industrial GHG regulations will set out conditions for use of Early Action Credits to comply with their obligations.
- Tradable: Credits can be traded among facilities as well as other market participants
- Bankable: It is anticipated that the proposed regulations will not impose any restrictions on the banking of credits for future use.

The Final Program Guide also introduces a number of technical issues regarding the quantification of GHG reductions. These will be addressed in more detail in the forthcoming "Guidance Manual for Applicants for Early Action Credits." The Manual will provide technical guidance to applicants, and will include requirements for acceptable third-party verifiers and guidance for undertaking verifications.

It should also be noted that the intensity target for emissions from adipic acid production will be set to recognize voluntary early action by industry. This is separate from the Credit for Early Action Program.

Canadian National Implementation Strategy on Climate Change – Baseline Protection Initiative

In January 2000, federal, provincial and territorial Ministers of Energy and the Environment announced a Baseline Protection Initiative under the National Implementation Strategy on Climate Change. Beginning March 2001, Canadian emitters were able to register eligible greenhouse gas emission reductions through the Voluntary Challenge Registry and, in Quebec, through ÉcoGESte.

The Baseline Protection Initiative (BPI) was intended to remove a significant disincentive for early action by emitters. Without baseline protection, a compliance requirement based on emissions in a future year would significantly disadvantage early actors. For example, a requirement to reduce emissions by 10% would mean that emitters that had voluntarily reduced their emissions before the regulation would have to make further reductions at additional cost. Emitters that did not take early action would be required to reduce their emissions only once. With baseline protection early reducers would be deemed to have the same emissions as if they had not voluntarily reduced their emissions before the regulation was introduced. Their early emission reductions can then be applied towards the reduction requirements contained in the new regulation, ensuring fair treatment of all emitters.

To be eligible for baseline protection, the BPI required that emission reduction actions must have been implemented since January 1, 1990. They must have resulted in real, net reductions, i.e., emission reductions or avoided emissions that are directly attributable to specific, identifiable actions.

The Baseline Protection Initiative was discontinued prior to the introduction of the Canadian Regulatory Framework on Air Emissions.

Australian Carbon Pollution Reduction Scheme

The Australian Carbon Pollution Reduction Scheme is the federal Australian cap-and-trade system for greenhouse gases expected to commence July 1, 2010. The current design of the scheme does not provide any explicit reward or credit for early action.

As part of the cap-and-trade program design process the Australian government considered a program to reward early action in the discussion paper entitled *Abatement Incentives Prior to the Commencement of the Australian Emissions Trading Scheme*.

The Australian government eventually chose not to set up an early action program to explicitly reward early action at capped facilities for the following reasons:

- Given the proposed allocation strategy (a gradual progression to high levels of auction) businesses are likely to seek to reduce emissions in preparation for the commencement of trading. Thus, the cap and trade scheme will implicitly reward early action by reducing the number of permits that a business will be required to surrender.
- Given the substantial work involved in establishing early action arrangements, there was a risk that resources could be diverted from core scheme design and implementation tasks. Early action arrangements would increase administrative complexity and raise implementation risks for business and the Government at a time when preparing for the Carbon Pollution Reduction Scheme is a critical challenge.

Key Proposed U.S. Cap-and-Trade Bills

This paper also briefly examines three proposed U.S. federal acts – the Dingell-Boucher Discussion Draft, the Bingaman-Specter Low Carbon Economy Act and the Lieberman-Warner Climate Security Act – as well as the USCAP Blueprint and the Waxman-Markey American Clean Energy and Security Act to determine the extent to which ERAs are included in their design, as these acts may provide some clues to what could be included in the legislation that will eventually be voted on by Congress.

The **Dingell-Boucher Discussion Draft** recognizes early action credits using 3% of allowances in 2012-2013 and 2% of allowances in 2014-2026. The proposed system would pre-empt state and regional systems. Holders of allowances from state or regional systems would be compensated based on the costs of purchasing and holding allowances rather than by a pre-determined conversion factor. If demand for early action credits was higher than available supply, state and regional allowance holders would be compensated first.

The **Bingaman-Specter Low Carbon Economy Act** would allocate 1% of total allowances to entities and facilities undertaking early actions. According to the bill text, entities applying for ERAs must provide information that verifies that an actual reduction in GHG emissions has been achieved “relative to the historic emission levels of the entity; and taking into consideration any increase in any other GHG emissions of the entity; and if the reduction exceeds the net reduction of direct greenhouse gas emission of the entity, the entity reported a reduction that was adjusted so as to not exceed the net reduction”.

The **Lieberman-Warner Climate Security Act** stipulates that no later than two years after the date of enactment the Administrator of the EPA will recognize early actions regulated entities have taken since January 1994 resulting in “verified and credible reductions of greenhouse gas emissions” by allocating five percent of the emissions allowances established for 2012, four percent for 2013, three percent for 2014, 2 percent for 2015 and 1 percent for 2016. Four methods for registering “verified and credible” reductions are identified in the act, but all reductions must be registered before the act comes into effect. The four methods are:

- The Climate Leaders Program or other voluntary GHG reduction program of the EPA or the DoE
- The Voluntary Reporting of GHGs Program of the EIA
- State or regional GHG emission reduction programs that incorporate systems for tracking and verifying GHG emission reductions
- Voluntary entity programs resulting in entity-wide GHG reductions.

The **United States Climate Action Partnership: Blueprint for Legislative Action** was released in January 2009 by a group of businesses and leading environmental organizations. The Blueprint provides a broad range of principles and recommendations to inform the development of US federal climate legislation. It suggests that credit for early action is, when allowances are freely allocated, an important cost containment tool for addressing competitive imbalances for early actors. The Blueprint recommends that credit for early action be rewarded from within a specifically created set-aside (from within the cap), that the EPA establish by rule the criteria and procedures for awarding early action, that reductions must be real and verifiable and additional, but that financial additionality is not an acceptable criterion for recognition, the administrative burden and complexity of an early action program should be minimal and where possible the program should recognize the actions undertaken in voluntary programs like the EPA Climate Leaders as long the programs meet the criteria the early action program establishes.

The **Waxman-Markey American Clean Energy and Security Act of 2009** was released in discussion draft form on March 11, 2009. While the bill addresses many cap and trade design elements in great detail it does not provide any guidance on the allocation of allowances. This issue and other related issues (possibly including early reduction allowances) will be addressed through discussions among Energy and Commerce Committee members during the upcoming bill mark up periods.

European Union Emission Trading Scheme 16

Limits proposed in US National Cap-and-Trade Legislation 18

1 Background and Purpose

As part of the design for the WCI Regional Cap-and-Trade Program, the WCI Partner jurisdictions recommended that a rigorous offset system be developed and implemented. The purpose of the offset system is to reduce compliance costs while encouraging emission reductions, innovation, and technology development for sources and sinks not covered by the cap-and-trade program.

Offsets are GHG emission reductions, GHG emissions avoided, or GHG removals from the atmosphere, measured in metric tons of CO2e. Offsets are achieved through activities that are often referred to as "offset projects." Offset credits (also measured in metric tons of CO2e) are issued for offsets that are achieved by offset projects that meet certain criteria. Offset credits can be traded and can be used for compliance purposes or as part of voluntary actions. When used within a cap-and-trade program, offset credits used for compliance purposes come from emission sources or sinks not covered by the cap.

The Design Recommendations for the WCI Regional Cap-and-Trade Program specify that a majority of emission reductions required under the program occur at covered entities and facilities. Consequently, for compliance purposes, the WCI Partner jurisdictions set a limit on the use of offset credits issued by WCI Partner jurisdictions, as well as the use of offset credits and allowances from other GHG emission trading systems that are recognized by the WCI Partner jurisdictions, to no more than 49 percent of the total emission reductions from 2012 to 2020.[1] This limit and rationale are established in the WCI's Design Recommendations (September 23, 2008). This paper addresses how this limit could be implemented, rather than discussing the limit itself.

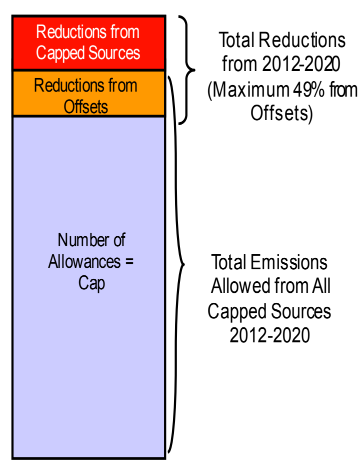

Figure 1. Illustration of the WCI Offset Limit

The offset limit is conceptually illustrated in Figure 1. The bar is comprised of three pieces. The bottom part of the bar is the total number of emission allowances issued from 2012 to 2020, a direct reflection of the emissions cap. The top two pieces combined are the total emission reductions required of the

[1] It is important to note that while we refer to the "offset limit" throughout this paper, it should be understood to encompass not only offsets issued by WCI Partner jurisdictions, but also offsets and allowances issued by other GHG emission trading systems approved for use in the system by the WCI Partner jurisdictions.

covered entities and facilities for the period 2012 to 2020. The total emission reductions are divided into two parts: the top part is the total emission reduction achieved at the covered entities and facilities; the second part is the total emission reduction that was achieved through offsets or allowances form other GHG emission trading systems. As specified in the program design recommendations, this second part, the offsets and allowances from other systems, can be no more than 49 percent of the total emission reductions.

As part of its work on the offset limit, the WCI Cap Setting and Allowance Distribution (CSAD) Committee seeks to answer the following questions:

1. What mechanism should be used to impose the limit?
2. How should the offset limit be applied across jurisdictions?
3. How should the limit be applied across compliance periods?

The purpose of this white paper is to seek stakeholders' input on these questions and on the principles that should be used to guide the decision-making process.

2 Offset Limits in Other Trading Schemes

The CSAD Committee has undertaken a review of how other existing or proposed cap-and-trade programs limit offsets. This review will help the committee to identify options for implementing the offset limit and the implications of these options. In our review, we considered the following programs and federal proposals:

- Regional Greenhouse Gas Initiative
- European Union Emissions Trading Scheme
- Waxman-Markey Discussion Draft
- Dingell-Boucher Discussion Draft
- Boxer substitute of Lieberman-Warner (S. 3036)
- Lieberman-Warner Climate Security Act (S.2191)
- US Climate Action Partnership Proposal

Table 1 summarizes how offset limits were designed or proposed in these programs and proposals. As illustrated in Table 1, there is wide variation in how the limits would be applied and how the availability of offsets changes over time. More detailed descriptions of these offset programs and proposals can be found in the Annex to this paper.

Table 1. Summary of Offset Limit Provisions of Cap-and-Trade Systems and Proposals

<table>
<tr><th>Cap-and-trade program or proposed legislation</th><th>Overall limit description and mechanism of application</th><th>Difference in limit across jurisdictions</th><th>Change in limit over time</th></tr>
<tr><td colspan="4">US Regional</td></tr>
<tr><td>Regional GHG Initiative (RGGI)</td><td>3.3% of a covered entity's emissions (in order to contain allowance price, overall offset limit increases as the allowance price exceeds threshold levels)</td><td>No difference</td><td>No change in % over time (unless price triggers increase limit). Absolute amount of allowable offsets decreases as the number of allowances available decreases.</td></tr>
<tr><td colspan="4">European Union</td></tr>
<tr><td>EU Emissions Trading System (EU ETS)</td><td>No more than 50% of emission reductions, EU-wide, typically implemented by member states as a percentage of covered entities' emissions (e.g., as a percentage of allowances distributed).</td><td>Phase II (2008-2012): Varies across member states from 0% to 20% of allowances distributed</td><td>Phase II (2008-2012): Based on National Allocation Plans (NAPs)
Phase III (2013-2020): NAPs replaced by EU-wide caps and allocation rules.</td></tr>
<tr><td colspan="4">US National Legislation and Proposals</td></tr>

USCAP is "an expanding alliance of major businesses and leading climate and environmental groups that have come together to call on the federal government to enact legislation requiring significant reductions of greenhouse gas emissions." http://www.us-cap.org/about/index.asp

3 Principles in Evaluating Offset Limit Options

The CSAD committee is considering the following principles in defining the design and operation of an offset limit:

- **Fairness**: An offset limit should be implemented in a manner that provides fair access to offset markets by offset project developers and covered entities, as well as other market participants. An offset limit should be designed to apply fairly to covered entities and not create competitiveness concerns.
- **Economic efficiency**: An offset limit should be implemented so that the market operates efficiently and that greenhouse gas emission reductions can be achieved at the least cost. An offset limit should not unduly inhibit the realization of the least-cost offsets.
- **Cost Containment**: The offset limit should be implemented in a manner that helps to contain compliance costs and maintains offset fungibility across the WCI. Recognizing that offset supply is essential for achieving cost containment, the offset limit should not unduly restrict the ability of offset project proponents to finance and develop prospective projects, the ability of jurisdictions to issue, or market participants to acquire, offsets in a timely manner.
- **Effectiveness and enforceability**: The offset limit should be implemented to ensure that the limit is enforceable and is effective at achieving the WCI goal that offsets are supplemental to emission reductions at covered sources, and thus that no more than 49% of total emissions reductions 2012-2020 are achieved by the use of offsets (and allowances and offsets from other emission trading systems).
- **Administrative simplicity and cost**: Implementation of the limit should provide as clear a path forward as possible for all parties, including administrative bodies, offset project developers, and covered entities. Administrative costs and transaction costs should be minimized for all parties, consistent with the need to ensure effective limit compliance.

4 Options for Implementing the Limit across Jurisdictions

While the WCI design document specifies a limit on the amount of offsets credits that may be used for compliance purposes in the WCI regional cap-and-trade program, it does not indicate how such a limit might be implemented among the WCI Partner jurisdictions. The question of jurisdictional limits is unique to multi-jurisdictional emission trading programs, such as RGGI, the EU ETS and WCI.

There are two approaches Partners could employ to limit the total amount of offsets used. They could either limit the *use* of offsets (e.g., the number of offset credits a covered entity can use for compliance) or they could limit the *supply* of offsets (e.g., the total number of offset credits available to use for compliance). Within these two categories many detailed mechanisms are conceivable. This paper will consider four detailed mechanisms: three that we categorize as usage limits ('percentage limits' based on actual emissions, 'percentage limits' based on freely distributed allowances, and 'offset surrender certificates') and one as a supply limit ('first-come, first-issued'). For each of these approaches there are also two broad options for addressing offset limits across jurisdictions: a *common* or a *differentiated* offset limit and multiple ways in which the limits could change over time.

Limiting the *use* of offsets

The offset limit could be set as a *percentage use limit* at the individual entity with a compliance obligation. The limit could be applied on a *common* basis across all jurisdictions, whereby the same entity-based percentage limit would apply across jurisdictions to any WCI-covered entity. Under this option, a common entity-based offset use limit specified as a percent of total compliance obligations (or as a percent of distributed allowances) would be applied across the WCI. This is the approach taken by RGGI. The common percentage use limit would be calculated by dividing the total offsets allowed by total number of allowances to be issued (or distributed) within a given time period (see next section).

Alternatively, the WCI could adopt jurisdictionally *differentiated* percentage use limits, whereby the limit in each jurisdiction would differ based on one or more factors, such as the emission reductions below 2012 (or 2005) levels represented by a partner's emission goal. An example of the latter would be to apply the WCI-wide limit—no more than 49% of emission reductions between 2012-2020 from offsets—at the individual partner level. In such a case, jurisdictions with deeper targets relative to a base year level would allow proportionately more offset use per entity.

With a differentiated percentage-use approach, there is a risk that the total regional limit could be exceeded if the limit is specified as a percent of the total compliance obligation (i.e., emissions). This risk occurs because allowances can be traded among jurisdictions, thus actual emissions that will occur in a given jurisdiction—and the corresponding amount of offsets allowed—cannot be known in advance.[3]

An alternative would be to specify the offset limit in tons individually for covered entities, computed as a percent of the number of allowances that are distributed directly to covered entities within a given Partner jurisdiction. This way, the risk of exceedance would be avoided, since the number of free allowances and corresponding number of allowable offsets would be specified in advance.[4] This approach would provide access to offset use only to covered entities that receive allowances directly (and in some proportion to allowances received).

The EU has, thus far, largely taken a differentiated percentage use approach to offset use limits.[5] As noted in the Annex, in Phase II of the EU ETS each member state was allowed to propose an offset limit as part of its National Allocation Plan. These plans are then subject to EU review and approval. As a result, the fraction of compliance obligations that emitters can fulfill using offsets varies from country to country.

The choice between common and differentiated percentage approaches to jurisdictional limits has implications in terms of how offset opportunities and risks are distributed across partners. This comparison is summarized in Table 2.

---

[3] The following provides an example of how exceedance might occur. Assume, for instance, that the total number of offsets to be allowed is 5 tons for a two-jurisdiction region (with total emissions of 100 tons). Jurisdiction K is allowed 4 tons of offsets (with emissions of 50 tons), and jurisdiction L is allowed 1 ton (with emissions of 50 tons):

- The region-wide offset use rate would be 5/100 = 5%.
- The offset use rate for jurisdiction K would be 4/50 =8%, and for jurisdiction L it would be 1/50= 2%. Let's say jurisdiction K has a much deeper reduction target, and thus a higher offset use rate.

If no allowances are traded between jurisdictions K and L, the overall offset limit will be respected [0.08*50 + 0.02*50 = 5 tons]. If emitters from jurisdiction K buys allowance from emitters from jurisdiction L, say 14 tons (jurisdiction K now holds allowances for 60 tons and jurisdiction L 35 tons), then the overall offset limit will be exceeded [0.08*60 + 0.02*35 = 4.8 + 0.8 = 5.6 tons]. The opposite is also true if jurisdiction L buys allowances from jurisdiction K.

[4] Using the example described in footnote 3, if we apply the limit to the number of allowances that were initially distributed in each jurisdiction, then emitters from jurisdiction K would be allowed 4 tons (.08*50) of offset credits and jurisdiction L 1 ton of offset credits (.02*50) regardless of allowance transactions between the two jurisdictions, thus ensuring the overall limit is not exceeded.

[5] The EU percentage use limit is specified as the percent of allowance received for free by any given regulated emitter rather than as a percentage of compliance obligations.

Table 2. Comparison of Jurisdictional Percentage Use Offset Limit Options and Implications

Option:	Common % Use	Differentiated % Use
Example	X% of compliance obligations in all jurisdictions	49% of emission reductions in each jurisdiction translated to different percentages of compliance obligation in each jurisdiction
Fairness	Covered entities can use the same percentage of offset across the WCI region. Entities that emit more GHGs could use more offset credits for compliance.	Emitters from jurisdictions that have a deeper reduction goal for 2020 relative to a base year would be allowed a higher percentage of offsets. Within a given jurisdiction, entities that emit more GHGs could use more offset credits for compliance. If the limit is based on allowance distribution (rather than only % of compliance obligation), then entities receiving more free allowances would have greater access to offsets.
Efficiency	To the extent that offset use falls short of the overall limit as a result of the mechanism used to implement the offset limit, opportunities for efficiency gains may be unrealized. The relative efficiency impact of each option remains to be evaluated.	
Cost Containment	The relative cost containment impact of each option remains to be evaluated.	
Effectiveness and Enforceability	WCI region-wide limit met. Individual partner limits may not be met.	WCI region-wide limit could be exceeded if individual Partners' limits are specified as a percent of compliance obligations.
Administrative Simplicity	Administratively simple to implement.	Slightly more complex to implement than the common % use approach.

As an alternative to the percentage use limit, the WCI Partner jurisdictions could choose to employ a usage limit which we will refer to as the *offset surrender certificates* mechanism. In this approach, the WCI Partner jurisdictions would issue and distribute (auction, sell or give for free) a number of certificates equal to the offset limit in tons. Covered entities would have to surrender one certificate for each offset credit they desire to use for compliance.

Under this mechanism, individual entities need not be limited by a percentage limit on their use of offsets. This approach could simplify the implementation of limits differentiated at the jurisdictional level and ensure that any regional limit on offsets would be maintained. This mechanism would also increase the likelihood that the full allowed amount of offsets (49% of emission reductions) would be used; under a percentage use limit, all entities not in need of offsets would need to engage in allowance-to-offset arbitrage in order to make the full amount of offsets available.[6]

[6] Assuming that offset credits are available for less than allowance prices, under a percent use approach an arbitrage opportunity could arise. If an individual entity does not need to use the maximum amount of offsets allowed (perhaps due to a generous free allocation of allowances), this entity would have the opportunity to acquire offsets (not needed for its own compliance purposes) up to the percentage limit and free up allowances to trade to others.. However, there is no guarantee that this action would be taken by all market participants. If this

In contrast to limits on supply (see below), the offset surrender certificate approach would not inhibit the creation of offset projects or issuance of credits. However, the surrender certificate approach creates an additional market of compliance instruments which would be accompanied by increases in complexity, transaction costs, and associated concerns related to topics such as market manipulation.

Limiting the *supply* of offsets

Another option is to limit the supply of offset credits. Under a common supply limit, the same pool of offset credits would be available to any covered entity in the WCI region. Under a differentiated supply limit, each Partner would have its own pool of offset credits and those offset credits could either be restricted to their covered entities or could be available for any covered entities throughout the WCI Partner jurisdictions.

Conceptually, a supply limit approach would simplify the implementation of jurisdictional differentiated limits. However, limiting the issuance of offset credits especially through a *first-come, first-issued*, mechanism could create significant uncertainty for offset project developers. There is also no guarantee that the lowest cost projects would be the first to enter the market. Furthermore, a supply limit may hamper a regulated entity's ability to ensure that an offset supplier can deliver in a specific year (due to first come, first serve basis).

Similar to the surrender certificate approach described above, individual entities need not have a percentage limit on the number of offsets used for compliance and a supply limit would ensure that no amount of offsets available under the limit would be left on the table due to the lack of allowance-to-offset arbitrage by individual entities. Unlike all of the use approaches described above, a supply limit would allow individual entities to treat offset credits and allowances as perfect substitutes.

---

opportunity was not acted on by all entities, some offsets could be"left on the table" from a system-wide viewpoint.

5 Application of the Offset Limit over Time

The offset limit could be set at a common level across all three compliance periods or it could be designed to vary over time. Some stakeholders have argued for more offsets in early years in case rapid reductions prove difficult to implement; it has also been suggested that offsets may be more valuable in early years as emerging low-GHG technologies mature and their costs decline. Other stakeholders have argued for greater offsets in later years to provide cost containment as emission caps are tightened and allowance prices might be expected to rise. Another rationale for greater offset availability in later years is that offsets could be more abundant and reliable as offset markets and rules mature over time.

Regardless of the specific offset use limit mechanism chosen (see Section 4), there are several options for addressing variation in time, including, but not limited to, the following:

- **Equal absolute number of offsets in each compliance period:** This is the approach embodied in the US CAP proposal and conceptually in the Waxman-Markey bill formula described in Table 1.
- **Equal percent of use across compliance periods.** This approach is used by RGGI and was proposed in the Lieberman-Warner Bill (S.2191). While the fraction of emissions that could be covered by offsets would remain constant, the absolute amount of offsets that could be used would decline if the number of available allowances declines over time.[7]
- **49% of Emission Reductions in each period.** This option would impose a different absolute or percent offset limit for each compliance period in order to ensure that no more than 49% of emission reductions are in the form of offsets in every period. Since the amount of needed emission reductions from 2012 levels increases over time as the cap declines, so would the amount of offsets available.[8]
- **No restrictions across compliance periods:** This approach would provide the most flexibility by imposing no restrictions across compliance periods. The total amount of offset credits that can be used under the limit could be available for use in any compliance period. Entities with compliance obligations would decide when they want

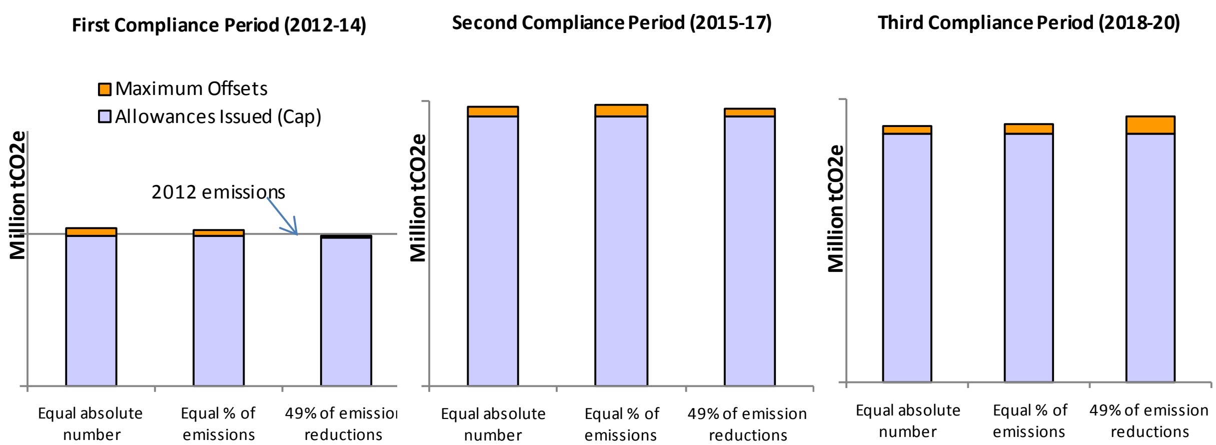
[7] In the case of the WCI, the introduction of transportation, residential, and commercial fuels leads to an increase in the emissions cap in 2015, and the absolute amount of allowable offsets would increase significantly from the first (2012-2014) to the second (2015-2017) compliance period.
[8] The increase in the 2015-2017 will be even greater due to the introduction of transportation, residential, and commercial fuels in 2015.

to use offset credits, so that the distribution of offset credit use over time would be determined by the market as a whole.[9]

- **Other Ramp Up or Ramp Down:** There are other options for specifying increases or decreases in the amount of allowable offsets over time. For example, the Dingell-Boucher draft discussion bill provided a schedule for increasing the percentage of offsets that could be used over time (see Table 1).
- **Carry-over:** Any unused or unissued offsets (under the limit) could carry over to next compliance period and be added to that period's offset limit. This approach, included in the Boxer amendment (S.3036) and in EU Phase III proposal, could be implemented in conjunction with any options above.

Figure 2 provides a visual comparison of the differences in offsets over time among the first three temporal options listed above, relative to the overall emissions budgets for the three compliance periods and assuming no carry-over. Figure 3 zooms in on the allowable offsets for each option, for each compliance period. (The charts shown are illustrative only, since precise cap levels have yet to be established.) As shown, the equal absolute number and equal percentage limit options allow greater offset availability in early periods. As illustrated in Figure 2, these options would allow emissions to exceed 2012 levels in the first compliance period.

Figure 2. Illustration of offset limit options across compliance periods



(The higher bars in the 2nd and 3rd compliance periods reflect the expansion of program scope in 2015. All figures shown are illustrative)

[9] This option could be implemented using a supply limit, a certificate surrender mechanism, or by an offset use limit expressed in tons rather than % use (e.g. if offset use were linked with allowance distribution). It would be incompatible with a straight percentage use limit.

Figure 3. Illustration of offset limit options across compliance periods (zoom-in on offset amounts)

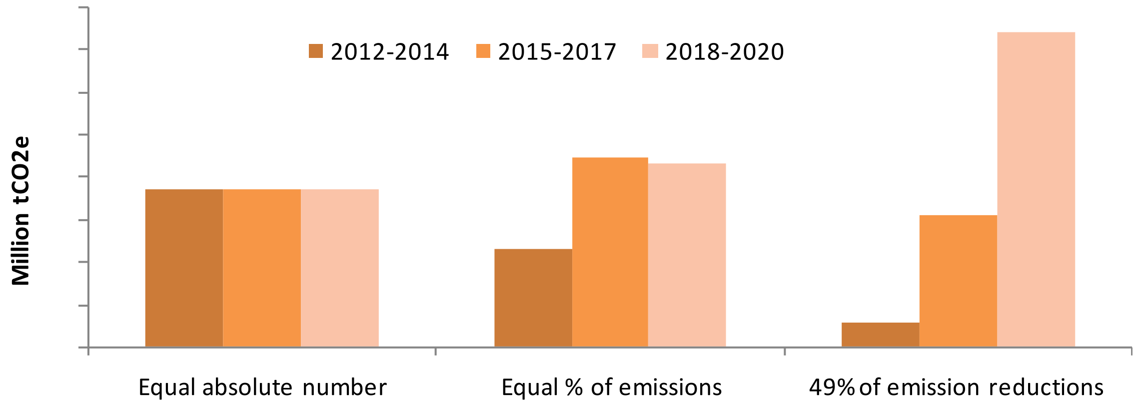


Table 3 compares each of the three options depicted above in terms of the principles listed in Section 3. In terms of fairness, the differences are a matter of perspective: the first two approaches would make more offsets available to covered sources that enter the program in 2012, whereas the third approach shown (49% of emissions reductions in each period) would distribute offset availability in accordance with the extent of emission reductions needed (more in last period when deeper reductions are required). With respect to cost containment, as described in the table, the optimal approach will depend on future allowance prices. In terms of effectiveness, each of the first two options (equal absolute number and equal % of emissions) would allow more than 49% of emission reductions to come from offsets during the first two compliance periods. While this outcome could be avoided by setting the limit at 49% of emission reductions in each period (the third option), depending on how the limit is implemented (see previous section) this option could enable total emission reductions met by offsets to exceed 49% under the percentage use limit in some circumstances.

While all options shown in the table should be similar in terms of enforceability and administrative simplicity and cost, the carry-over approach noted above might require added administrative effort in the case of the percentage use mechanism and create some added uncertainty for the offset market. Data on the total amount of offsets used during a prior compliance period would be needed before setting the offset limit for the current period, and this information might not be fully available for several months into the period. Either a supply limit or the surrender certificate mechanism could address concerns about carry-over of excess offset capacity between compliance periods in a more straightforward way.

Table 3. Comparison of options for limiting offsets across compliance periods

Option→ ↓ Principle	Equal absolute number of offsets in each period	Equal % of emissions in each period	49% of emission reductions in each period
Fairness	Would make more offsets available to entities covered in the first compliance period (relative to other options)	Would make more offsets available to entities covered in first compliance period, but less so than the "equal absolute" option	Would make offsets available to covered entities in accordance with the extent of emission reductions required in a given period.
Economic Efficiency	Any proscription of offset use by compliance period has the potential to lead to unrealized efficiency gains.		
Cost Containment	Might provide greater cost containment if internal emission reductions turn out to be more costly in the early period (s).		Might provide greater cost containment if internal emission reductions turn out to be more costly in the final period.
Effectiveness and Enforceability	Would meet WCI 49% limit across all periods, but could exceed it in first and second compliance periods if sufficient offsets are available and are extensively used.		Could exceed overall 49% limit (across 2012-2020) under the percentage use limit, if allowances are banked in early periods and used in later periods when the percentage of allowed offsets is higher. Exceedance could be avoided through a supply limit or surrender certificate approach or linking offset use to allowance distribution (see Section 4).
Administrative Simplicity and Cost	No significant difference among options		

If a supply limit or surrender certificate use limit is chosen instead of a percentage use limit (see Section 4), then the options for spreading offset availability across compliance periods could be set by how certificates are distributed or offsets issued in each period. As noted above, these options could more easily allow for the full targeted amount of offsets to be available across all three periods.

6 Stakeholder Involvement and Next Steps

The WCI Partner jurisdictions invite stakeholders to provide written comments on the different options presented in this white paper or any other alternative options.

We would appreciate comments structured around the primary questions the CSAD Committee seeks to answer on this topic:

1. What mechanism should be used to impose the limit?
    a. Should the offset limit be applied on offset use (e.g., the amount of offsets covered entities can surrender for compliance purposes) or on offset supply (e.g., the overall amount of offsets issued in a given period of time)?
    b. If the limit is based on use, what is the preferred mechanism for limiting use? If the limit is based on supply, what is the preferred mechanism for limiting supply?
    c. Should access to offsets be linked with the distribution of allowances, and if so in what manner?
2. How should the offset limit be applied across jurisdictions?
    a. Should the limit be applied on a common or differentiated basis?
    b. If the limit is differentiated by Partner jurisdiction, what factor(s) should be the basis of differentiation? (e.g., differences in emission reduction targets, marginal abatement costs, or other factors across jurisdictions)
3. How should the limit be applied across compliance periods?
4. Please describe any competiveness impacts, such as differences in the cost of compliance, you believe the Committee should consider in evaluating options to apply the offset limit.

We invite stakeholders to discuss with us and provide their comments in person during a stakeholder event in Seattle on May 28th, 2009. Registration is free. Stakeholders can register online on the Western Climate Initiative website (www.westernclimateinitiative.org).

Written comments can be submitted via the Western Climate Initiative website until June 19, 2009.

Annex 1: Detailed Description of Offset Limits in Other Trading Schemes

Regional Greenhouse Gas Initiative (RGGI)[10]

Limits: The Regional Greenhouse Gas Initiative (RGGI) allows entities to use carbon offsets to cover a portion of their compliance obligation. Entities can use offsets to cover up to 3.3% of their total compliance obligation. This limit increases to 5% if the carbon price is over $7 per ton, and further increases to 10% if the allowance price exceeds $10 per ton.

Project Eligibility: The RGGI Model Rule identifies five project types that are eligible for offsets:

- Landfill methane capture
- Sulfur hexafluoride (SF6) capture
- Forest sequestration
- Energy efficiency for natural gas, propane and heating oil
- Animal methane management

New project categories will be adopted if they are approved by each of the RGGI states.

In order to receive offset credit, emission reductions from these project types must be:

- Real and quantifiable
- Additional beyond business as usual assumptions
- Verifiable
- Permanent
- Enforceable

Offset Limit Methodology: In order to strike a balance between achieving real emission reductions in covered sectors and providing entities with a flexible compliance option, RGGI states decided that offset use should be limited to 50% of the total emission reduction amount. According to the Staff Working Group (SWG) analysis, the 50% goal was not viewed as a hard target, but rather as a guiding principle in determining a quantitative offset limit. The SWG recommended an entity level offset limit, rather than a state-wide or system-wide limit. The SWG modeled the impact of different offset limit amounts to determine an entity level limit that would approximate the 50% goal. The final SWG analysis recommended limiting offsets to

---

[10] Sources for this section include: Regional Greenhouse Gas Initiative Model Rule (12/31/08 final with corrections. (www.rggi.org); Analysis Supporting Offsets Limit Recommendation (5.1.06). (www.rggi.org); Offsets Summary: the Regional Greenhouse Gas Initiative. Environment Northeast (http://www.env-ne.org/public/resources/pdf/ENE_RGGI_offset-design.pdf)

3.3% of an entities' total compliance obligation. This recommendation was adopted in the RGGI Model Rule.

The price trigger provision recognizes this modeling uncertainty by making the offset limit a function of the factors that drive price increases. Allowance price increases are partially a factor of the trajectory and the starting cap—allowing the offset limit to increase when the price increases serves as a means of correcting for inaccuracies in setting of these factors. This allows the offset limit to more closely align with the overall RGGI goal of controlling compliance costs.

European Union Emission Trading Scheme

Summary of Limits: The European Union Emissions Trading Scheme (EU ETS) imposes limits on the amount of offset credits that may be used for compliance in both Phase II and III. These limits are percentage use limits applied at the facility level.

The actual limit is different in each phase, for each Member State, and may differ by type of installation. The Phase III limits are likely to be more stringent than the Phase II limits and may be harmonized across the EU; actual limits for Phase III are contingent on the results of international climate change negotiations.

Project Eligibility and Geographic Limitations:
Phase II: The permissible offset credits in Phase II are certified emission reductions (CERs) from the clean development mechanism (CDM) and emission reduction units (ERUs) from joint implementation (JI) projects.[11]

Phase III: Limits on the use of CERs and ERUs in Phase III are contingent on the evolution of these programs as a result of international negotiations. The EU may also begin to explore other types of domestic offsets.[12]

Offset Limit Methodology:
Phase II: In international climate negotiations it was decided that internal (domestic) abatement of emissions should take precedent over external participation in flexible

[11] For a list of approved CDM methodologies see:
http://cdm.unfccc.int/methodologies/PAmethodologies/approved.html

[12] See point 22 of the following document:
http://europa.eu/rapid/pressReleasesAction.do?reference=MEMO/08/796&format=HTML&aged=0&language=EN&guiLanguage=en

mechanisms such as the CDM and JI.[13] In the context of the Kyoto Protocol this concept is referred to as "supplementarity."

The requirement to take significant action domestically was included in the international agreements partially at the behest of European nations. Therefore, the concept of prioritizing domestic action (from capped sources located in the EU) was included in the design of the EU ETS.

Each member state in the EU ETS has a different limit on the use of offsets credits from the international flexible mechanisms (CDM and JI credits) in the second phase of the EU ETS.[14] These limits are usually specified as a percentage of the total amount of allowances freely allocated to an installation.[15]

There is currently no EU-wide agreement on the definition of supplementarity. It is roughly interpreted that at least 50% of reductions (also referred to as the "level of effort") should be met by direct reductions at covered facilities. However, in actual implementation it appears that the levels set for use of offsets in Phase II may allow for more than 50% of reductions to be met through offsets.[16]

Wide discretion was given to the Member States as limits on the use of CDM/JI credits were set in Phase II. The European Commission considered that, as a rule of thumb, installations should be allowed to use JI and CDM credits to supplement their allowance allocation by up to 10%.[17] However, each member state set the actual binding limit in its national allocation plan, which was then subject to approval by the Commission. Some approved limits were 20% and above.[18] In aggregate these limits would allow operators in the EU ETS to import approximately 1.4 billion metric tons of credits from 2008-2012.[19]

---

[13] See the Kyoto Protocol. Available from: http://unfccc.int/resource/docs/convkp/kpeng.pdf

[14] Phase II of the EU ETS runs from 2008-2012.

[15] For example, the United Kingdom limits on project credits in Phase II is 9.3% of allocation for large electricity producers and 8% of allocation for all other installations. See page 16 of the DEFRA's *An Operator's Guide to the EU Emissions Trading System* available from: http://www.defra.gov.uk/environment/climatechange/trading/eu/pdf/events-guide.pdf

[16] Some environmental groups estimate that between 88-100% of the emission reductions required under the combined cap for the EU ETS could theoretically take place outside of the EU through the use of offset credits. See for example, WWF, *Emission Impossible: access to JI/CDM credits in phase II of the EU Emissions Trading Scheme* June 2007. Available from: http://assets.panda.org/downloads/emission_impossible___final_.pdf

[17] European Commission. *Questions and Answers on Emissions Trading and National Allocation Plans from 2008 to 2012*. Page 4. Available from: http://ec.europa.eu/environment/climat/pdf/m06_452_en.pdf

[18] According to the WWF analysis, Irelands limit is 21.9%, Spain and Germany's limit is 20%. See each country's Phase II NAP for more details.

[19] The Carbon Trust (2008) *Cutting Carbon in Europe: The 2020 plans and the future of the EU ETS* Available from: http://www.carbontrust.co.uk/publications/publicationdetail.htm?productid=CTC734

Phase III: The EU has recognized that the level of offsets allowed in Phase II is likely to prevent achievement of the supplementarity goal and has proposed changes to prevent this in Phase III of the EU ETS. Beyond the supplementarity considerations, motivations for this increase in stringency are strategic in nature. The EU is attempting to use the EU ETS's influence on the demand for CERs as a tool in the international negations. The goal is to motivate large-emitting non-annex 1 countries (e.g., China) to increase action on climate change, including considering firm caps on emissions.

The rules for Phase III have recently been established as part of a comprehensive Climate and Energy Package.[20, 21] This package specifies that the level and type of offset credits allowed in Phase III is contingent on a successful implementation of an international agreement on climate change that will cover this period (post-2012). In the absence of an international agreement, the offset limit will be much tighter than in Phase II.

Limits proposed in US National Cap-and-Trade Legislation

Lieberman-Warner Climate Security Act (US Senate Bill 2191, 110th Congress)[22]

Senators Lieberman and Warner introduced the Climate Security Act, which was referred to the Environment and Public Works Committee, on October 18, 2007. Hearings were held to discuss the bill at the subcommittee and committee level in the fall of 2007.

Summary of limits: The Lieberman-Warner Climate Security Act stipulates that the owner or operator of a covered entity may meet up to 15% of their total compliance obligation using offset allowances. This percentage use limit is applied to each year or each compliance period. The limit does not change from year to year and there is no roll-over option for unused allowances to be used in future years or compliance periods.

Offset limit methodology: Covered entities may submit offset allowances that satisfy up to 15% of their total allowance submission requirement each year. These offsets must be generated in accordance with the bill—specifically the eligibility criteria and provisions in

Subtitle D (the offsets section). This option may be provided as a means to contain cost while also creating an administratively simple offsets program.

Boxer Substitute of the Lieberman-Warner Climate Security Act (US Senate Bill 3036, 110th Congress)[23]

The Boxer Substitute of Lieberman-Warner's Climate Security Act (S. 3036) was reported to the US Senate on May 20, 2008. The Boxer Substitute made considerable changes to the Climate Security Act in general and specifically the offsets provisions in the original bill. The Boxer Substitute was debated on the US Senate in the summer of 2008 and did not pass on the floor. The Boxer version shifted to an aggregate supply limit on total offsets allowed in the market, rather than a use based limit.

Summary of limits: The Boxer Substitute sets a supply limit on offsets allowed in the proposed cap-and-trade system. The supply limit would allow EPA to control the issuance of offset credits and cap the total supply to the cap-and-trade market. Language in the bill places an aggregate limit on how many offsets are available for purchase from three categories: domestic, international, and forestry offsets. The total supply limit for each of these categories is 30%: 15% domestic, 5% international, and 10% international forest offsets. The bill proposes the following:

- EPA limits the creation of ***domestic offsets*** to 15% of the total quantity of emission allowances issued in each year. The limit applies to the total number of offsets, not to an individual entity's compliance obligation.
    - Any unissued portion of the offsets for one year may be added to the 15% limit for the following year.
    - Offsets will be issued (at an appropriate discount rate determined by EPA) for each offset issued under RGGI.
- EPA limits the use of ***international offsets*** to 5% of the total quantity of emission allowances.
    - Any unused portion of international offsets may be added to the 5% limit for the following year.
    - International offsets from a project at a facility that competes directly with a US facility will not be allowed.
- EPA limits the use of ***international forest offsets*** to 10% of the total quantity of emission allowances for each year.

[23] S.3030 bill http://thomas.loc.gov/cgi-bin/query/z?c110:S.3036; ; Summary of S. 2191: Lieberman-Warner Climate Security Act of 2008 Manager's Substitute Amendment by the World Resources Institute. URL: http://www.wri.org/publication/summary_lieberman_warner_climate_security_act_2008_substitute_managers_amendment

- Forest offsets can be generated from reductions in deforestation and forest degradation as compared to caps or reference scenarios used by foreign countries.
- After enactment of the bill, EPA will periodically review the performance of the forestry offset program.
- Ten years after enactment, the EPA may discount offset credits from countries that have not reduced total emissions from forests.

Project eligibility: Section 2403 lists projects eligible to generate offset allowances, including:

- Afforestation and reforestation
- Altered tillage practices
- Capture of fugitive emissions
- Capture or combustion of methane at non-agricultural facilities
- Conversion of cropland to rangeland or grassland
- Cover cropping
- Forest management
- Manure management
- Reduced carbon emissions from organic soils
- Reduction of fertilizer use
- Rice-paddy flood management

Offset limit methodology: The Boxer Substitute creates flexibility for covered entities to use offset credits from a variety of projects and locations. The issuance limit was designed to increase the supply of offsets and thus, reduce costs for those sources that have a compliance obligation. By allowing more project types, international offsets, and a roll over clause—the bill seeks to create a large supply of offsets and contain costs.

Dingell-Boucher Draft Discussion Bill (House Draft Bill)[24]

The draft Dingell-Boucher bill was released to the public for discussion purposes by the US House Committee on Energy and Commerce in October 2008. The bill has not been officially introduced in the US House of Representatives.

Summary of limits: Regulated entities may use verified domestic or international offsets for a portion of surrendered allowances rising from 5% starting in 2013 up to 35% by 2024. The percentage of allowable domestic and international offsets increases in each compliance period.

[24] energycommerce.house.gov/images/stories/Documents/PDF/selected_legislation/clim08_001_xml.pdf

Project eligibility: The draft bill permits regulated entities to purchase EPA-approved offset credits for domestic and international emission reduction projects. The proposal requires EPA to recognize domestic offset credits for

- Afforestation or reforestation on acreage not forested after January 1, 2008
- Landfill methane
- Manure management
- Methane collection at coal mines

Other project types will be reviewed for future consideration in the offsets program:

- Controlled wastewater treatment
- Conversion of cropland to rangeland or grassland
- Forest management resulting in an additional increase in forest stand volume
- Methane reduction from reclamation of abandoned surface mines
- Practices that increase agricultural soil carbon sequestration
- Recycling and waste minimization
- Reduced deforestation
- Reduction of nitrogen fertilizer or increase in nitrogen use efficiency

Offset limit methodology: Offsets play a greater role in each compliance period. Covered entities will submit offset allowances that represent up to 5%-35% of their total submission requirement during each compliance period:

- Up to 5% (domestic or international) in 2013-2017
- Up to 15% (domestic or international) in 2018-2020
- Up to 30% in 2021-2024 (15% domestic/15% international)
- Up to 35% in 2025-2050 (20% domestic/15% international)

Waxman-Markey Draft Discussion Bill (House Draft Bill)

Summary of limits: The Waxman-Markey discussion bill establishes an entity-based limit that is calculated on an annual basis, such that the total offsets available will be approximately 2 billion tons annually. The use limit is split evenly between domestic and international offsets each. Lastly, for every tonne of an entity's compliance obligation, an entity is required to turn in 1.25 offsets. Therefore, the effective limit is 2.5 billion tons.

Project eligibility: Additionality is determined by the following criteria: 1) not required by law or regulation, 2) not commenced prior to January 1, 2009, and 3) based on activity baselines based on a standardized baseline that reflect "a conservative estimate of business as usual" performance or practice.

Other key project eligibility criteria include:

- Accounting for leakage
- Activity baselines
- Addressing reversals
- Approval via crediting periods
- Auditing
- Verification and verification accreditation

Offset project types will be reviewed and approved within two years with consultation from the offset integrity advisory board. This board will prioritize offset project types for consideration.

Offset limit methodology: Offsets could play a greater role over time in the proposed program—increasing from a 30% use limit to approximately 65% in the later years. The formula to calculate the use limit requires EPA to divide the number 2 billion by 2 billion plus the emission allowances available in the previous year and multiply by 100 (for a percentage limit). For 2013 this results in limit that is 30% of an entity's compliance obligation. In addition, the program will recognize offsets for reduced deforestation that meet specific eligibility criteria. According to Congressional committee staff, international deforestation credits may result in about 6% or more of the total offset credits available.

Stakeholder Discussion Questions on Competitiveness

May 19, 2009

The following questions are intended to motivate a discussion of how the WCI can evaluate and address competitiveness impacts of the WCI cap-and-trade program. These questions will be discussed at the May 28 stakeholder workshop in Seattle. Stakeholders may also submit written comments via the WCI website through June 19, 2009. For further background, please see the CSAD Committee portion of the WCI Work Plan, which is posted on the WCI website.

1. What principles should govern how the WCI Partner jurisdictions evaluate and address potential competitiveness impacts of the WCI regional cap-and-trade program?

2. What aspects of the WCI cap-and-trade program have the potential to cause intra-WCI competitiveness impacts (i.e., among businesses within the WCI Partner jurisdictions that compete with each other)? How significant are the potential intra-WCI competitiveness impacts compared to potential impacts arising from competition with businesses located outside the WCI Partner jurisdictions?

3. How can the WCI Partner jurisdictions best anticipate potential U.S. and Canadian federal efforts to address competitiveness impacts associated with climate policies, such as cap-and-trade? To what extent should the WCI Partner jurisdictions strive to harmonize with current federal proposals to address these impacts? With those currently employed in the European Union? What competitiveness issues should the WCI Partner jurisdictions emphasize in communications with the two federal governments?

4. What opportunities and/or challenges, in terms of competitiveness of the covered sectors, might the WCI cap-and-trade program present as the region emerges from the current economic downturn? What other factors might interact with the cap-and-trade program to enhance or hinder the competitiveness of covered sectors within a jurisdiction?

5. For those sectors for which internalizing the cost of carbon through a cap-and-trade program presents competitiveness risks, which options should the WCI Partner jurisdictions consider to address those potential impacts?

National Clean Car Standards

WCI Partners Meeting
Seattle, WA
May 27, 2009

www.westernclimateinitiative.org

Introduction

- An agreement was successfully struck between the Obama administration, the auto makers and the California Air Resources Board.
- The agreement was announced by President Obama on May 19, 2009.

Three Part Agreement

- The agreement has three parts:
  - Federal notice of intent for joint rulemaking by the U.S. Environmental Protection Agency (EPA) and National Highway Traffic Safety Administration (NHTSA).
  - A commitment letter from the California Air Resources Board.
  - Commitment letters from each auto manufacturer and their industry groups.

Overview of the Agreement

- The national 50 states GHG standards will be developed by EPA and NHTSA and will start in model-year 2012, and go to 2016.
- In 2016, the national standard will be the same as the California (Pavley) standard.
- It is expected that California's waiver for model-years 2009 to 2016 will be approved by EPA by the end of June.

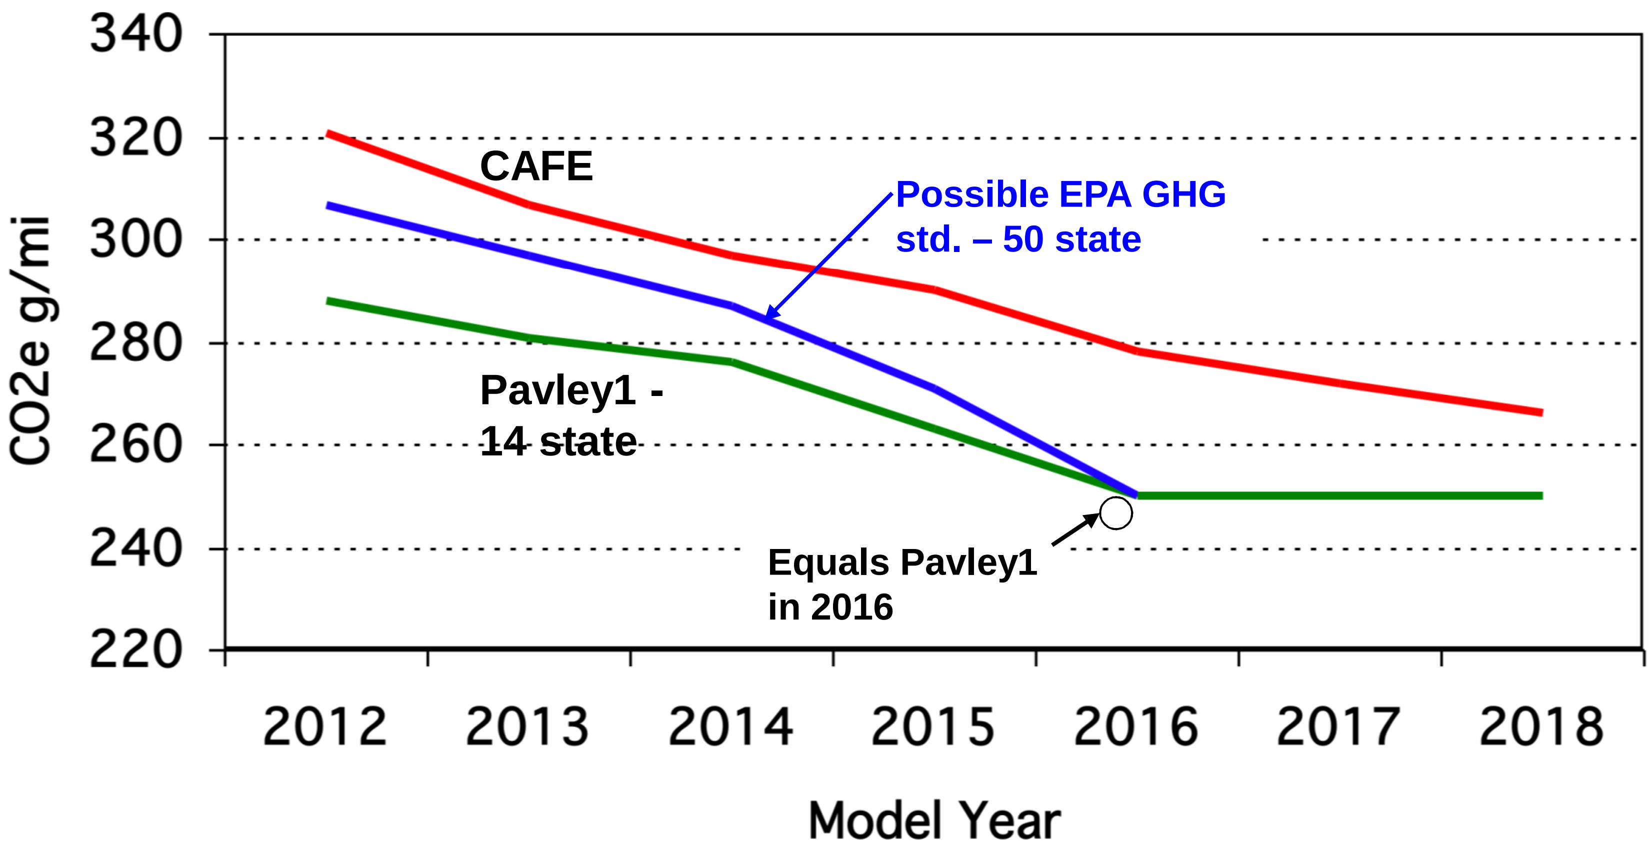
Overview of the Agreement (con't)

- California does not give up any authority under the Clean Air Act.
- California will amend its rule to allow compliance with the national standard between 2012 and 2016 to be recognized as complying with the California (Pavley) standard.
- The auto industry will drop its lawsuits challenging the California (Pavley) standards.

GHG Reductions Impact

- Once the waiver is granted, California will enforce the standards for model-years 2009 to 2011.
- For model-years 2012 to 2016, the national GHG standards developed jointly by EPA and NHTSA will be in effect.
- In 2016 the California (Pavley) standard and the national standard will be the same (250 g/pm).

Pavley 1 – CAFÉ - National GHG Comparison of Stringency



Pavley II

- ARB staff is developing standards for the 2017 model-year and beyond
- Staff expects to bring the new standards to the Board in the summer of 2010.

Federal Climate Change Policy Update

WCI Meeting
Seattle, Washington
May 27, 2009

Judi Greenwald
Vice President, Innovative Solutions
Pew Center on Global Climate Change
www.pewclimate.org

The Political Landscape

Obama is Determined to Lead at Home and Abroad; Reframes Cost Debate

My presidency will mark a *new chapter in America's leadership on climate change* that will strengthen our security and create millions of new jobs in the process. That will start with a *federal cap and trade system*. We will establish strong annual targets that set us on a course to reduce emissions to their 1990 levels by 2020 and reduce them an additional 80% by 2050.

Further, *we will invest $15 billion each year to catalyze private sector efforts* to build a clean energy future…This investment will not only help us *reduce our dependence on foreign oil*, making the United States more secure. And it will not only help us bring about a clean energy future, saving our planet. It will also help us *transform our industries* and steer our country out of this economic crisis by generating five million new green jobs that pay well and can't be outsourced.

And once I take office, you can be sure that *the United States will once again* engage vigorously in these [international] negotiations, and help *lead the world* toward a new era of global cooperation on climate change.

… Statement to Bi-Partisan Governors Summit, November 2008

Obama: climate/energy top priority

- Appointed a White House lead on energy/climate
- Appointed special envoy for international climate negotiations
- Forged agreement between U.S. EPA, U.S. DOT, State of California, and automakers on vehicle standards for GHG emissions and fuel economy
- Supported billions in stimulus package for renewable and low-carbon energy infrastructure and R&D
- Strong proponent of cap and trade

Some of Obama's Climate Team

Carol Browner Assistant to the President for Energy and Climate Change	**Nancy Sutley** Chair, White House Council on Environmental Quality	**John Holdren** Director, White House Office of Science and Technology Policy
Hillary Clinton Secretary of State		**Todd Stern** Special Envoy on Climate Change
Steven Chu Secretary of Energy	**Lisa Jackson** EPA Administrator	**Jane Lubchenco** NOAA Administrator

U.S. EPA

PEW CENTER ON Global CLIMATE CHANGE

- EPA proposed rule requiring GHG reporting, to be final for 2010 reporting
- Supreme Court in *Mass vs EPA*: Determined GHGs could be regulated under existing CAA; ordered EPA to determine if they should be
- EPA has recognized that GHG emissions can endanger public health and welfare
- EPA has a number of options for moving forward
- Key questions:
  - How fast will EPA act?
  - Which parts of the Clean Air Act will it use?
- EPA has clear authority to do GHG standards; may be able to do cap and trade, but would be constrained
- Threat of EPA action may drive legislation

U.S. Congress

SENATE

59-40 D Senate majority

(1 still undecided)

Majority Leader Reid

EPW Chairman Boxer

Need 60 votes for a bill

Need 67 votes for treaty

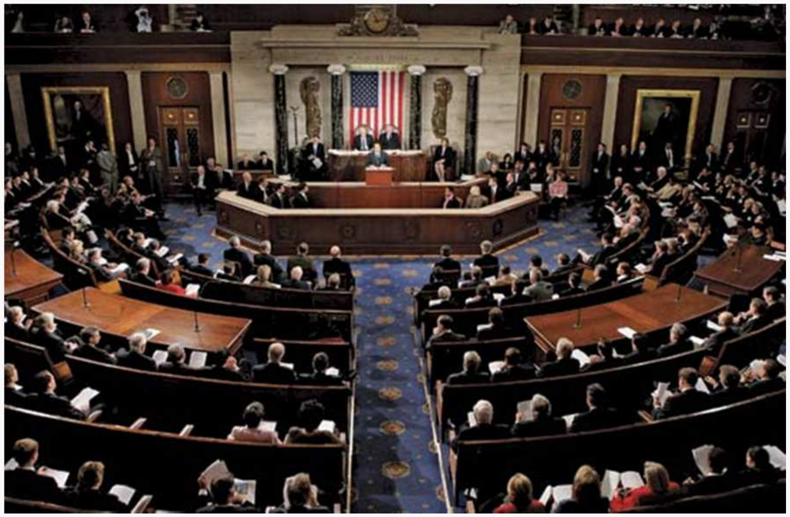
HOUSE OF REPRESENTATIVES

256-178 D House majority

Speaker Pelosi

E&C Chairman Waxman

Need 218 votes for a bill



Legislative Process

- House Energy and Commerce Committee reported bill (May 22)
- Other House Committees have referrals (Agriculture, Natural Resources, Science, Ways and Means)
- Full House vote (possibly Summer 2009)
- Senate committee action (possibly in 2009)
- Full Senate vote (2009 or 2010)
- House-Senate Conference (2009 or 2010)
- President's signature (2009 or 2010)

House Committee on Energy and Commerce

- Chairman Waxman (D-CA)
- Subcommittee Chairman Markey (D-MA)
- 59 members
- After roughly 37 hours and 94 amendments, the panel approved the bill, 33-25.
- Bono Mack only Republican to vote Yes

House Committee on Energy and Commerce

YES VOTES:

Waxman (D-CA), Dingell (D-MI), Markey (D-MA), Boucher (D-VA), Pallone (D-NJ), Gordon (D-TN), Rush (D-IL), Eshoo (D-CA), Stupak (D-MI), Engel (D-NY), Green (D-TX), DeGette (D-CO), Capps (D-CA), Doyle (D-PA), Harman (D-CA), Schakowsky (D-IL), Gonzalez (D-TX), Inslee (D-WA), Baldwin (D-WI), Weiner (D-NY), Butterfield (D-NC), Hill (D-IN), Matsui (D-CA), Christensen (D-VI), Castor (D-FL), Sarbanes (D-MD), Murphy (D-CT), Space (D-OH), McNerney (D-CA), Sutton (D-OH), Braley (D-IA), Welch (D-VT), Bono Mack (R-CA)

NO VOTES:

Barton (R-TX), Upton (R-MI), Hall (R-TX), Stearns (R-FL), [Deal (R-GA)], Whitfield (R-KY), Shimkus (R-IL), Shadegg (R-AZ), Blunt (R-MO), Buyer (R-IN), Radanovich (R-CA), Pitts (R-PA) Walden (R-OR), Terry (R-NE), Rogers (R-MI), Myrick (R-NC), Sullivan (R-OK), Murphy (R-PA), Burgess (R-TX), Blackburn (R-TN), Gingrey (R-GA), Scalise (R-LA), Ross (D-AR), Matheson (D-UT), Melancon (D-LA), Barrow (D-GA)

Waxman-Markey Bill Highlights

- Coverage: 85% of U.S. emissions through cap-and-trade
- Cap: 17% below 2005 levels by 2020; 83% below by 2050
- Threshold: Cover entities >25K tons CO_2e; EPA may lower to 10K after 2020
- Offsets: 2 billion tons domestic & int'l
- Cost containment: Strategic reserve of 2.5 billion allowances available if allowances prices rise above trigger price
- Clean Air Act limitation: GHGs not regulated as criteria pollutants or hazardous air pollutants under CAA
- State role: GHG cap-and-trade programs on hold for 5 years; other state programs unaffected
- Allowance distribution: Used for consumer protection, industry and worker transition assistance, technology innovation, and adaptation (initially 85% free allocation/15% auction; shift to auction over time)
- Many USCAP Recommendations in Waxman-Markey Bill

Waxman- Markey Complementary Policies

PEW CENTER ON Global CLIMATE CHANGE

- Efficiency and Renewable Portfolio Standard (20% by 2020)
- Coal measures (CCS deployment strategy and funding, performance standards for new plants, etc.)
- Energy efficiency measures: building efficiency codes, energy efficiency resource standard, etc.
- Transportation: PHEV planning and incentives, states and MPOs to develop GHG reduction plans
- GHG performance standards
- Transmission planning, smart grid advancement, green jobs and worker transition, etc.

Allowance Allocation to States

- Renewables and energy efficiency: starts at 9.5%; 4.5% after 2021)
- Home heating oil and propane users: starts at 1.875%, declining to 0.3% in 2029.
- Other purposes if eligibility requirements met:
  - Building efficiency codes: 0.5% initially
  - Adaptation: Starts at 0.9% for domestic adaptation; 0.385% for natural resources adaptation; increases over time.
- Holders of allowances issued by California, RGGI or WCI before 12/31/11 may exchange these for federal allowances.
- Other funds for states: Funds raised through the federal ERES are given directly to states for use in renewable energy and energy efficiency programs.
- States can set up State Energy & Environment Development (SEED) Funds to combine federal clean energy/climate assistance

Additional Detail

Coverage

- Covers 7 GHGs: Carbon dioxide (CO_2), Methane (CH_4), Nitrous oxide (N_2O), Sulfur hexaflouride (SF_6), hydrofluorocarbons (HFCs) emitted as a byproduct, perfluorocarbons (PFC), nitrogen trifluoride (NF_3), and any other anthropogenic gas EPA finds has GWP equal to or greater than CO_2.
- Coverage is phased
  - 2012: Electricity and transportation
  - 2014: Industrial processes and combustors
  - 2016: Residential/commercial/small industrial natural gas consumption at LDC
- Separate cap and trade program for HFCs

Cost Containment

- Full trading and banking of allowances; unlimited next-year borrowing; limited borrowing for 2-5 years in the future w/8% interest.
- Domestic & international offsets are permitted; 2 billion tpy system-wide
  - Up to 1bn dom/1bn int'l; if < 1bn dom; EPA can increase int'l up to 1.5 billion
  - Domestic can be used 1:1 for compliance; international can be used 1:1 until 2018 and then discounted 20%
  - Firm-level limits set by formula; % compliance w/ offsets increases over time.
  - President may recommend Congress alter total # of offsets up or down.
  - EPA will list w/in 1 yr accepted project types based on recommendations from Offset Integrity Advisory Board
  - Methane emissions (other than from agriculture) may be covered by performance standards and thus ineligible as offsets unless below standard. EPA must assess impact on offset supply.
- International emission allowances from countries with absolute caps, subject to approval from the EPA, are permitted without limit.

Cost Containment (cont'd)

PEW CENTER ON Global CLIMATE CHANGE

- Strategic allowance reserve created from future year allowances:
  - 1% each year from 2012-2019; 2% from 2020-2029 ; 3% from 2030-2050.
- EPA conducts quarterly strategic reserve auctions (SRAs) open only to covered entities.
- Minimum SRA price:
  - 2012: $28/ton; 2013-2014: the previous year's auction price increased by inflation plus 5%; after 2014: 60% above 36-month rolling average.
- Maximum number of SRA allowances:
  - 2012-2016, no more than a quantity equal to 5% of annual allowances issued for a given year ; 2017 onwards: 10%
- No entity may purchase from SRA more than 20% of its obligation.
- Forest carbon tons sold on consignment by private entities if SRA tons exhausted and 80% of allowed system offsets to be utilized that year.
- SRA proceeds used to purchase international forest carbon tons to replenish the reserve at a 20% discount

Competitiveness

- Output-based allowance distribution approach is primary mechanism to deal with competitiveness, w/ International Reserve Allowance program—requiring allowances for imported goods' embodied GHG emissions – as a backstop.
- Distributes emission allowances to energy-intensive, trade-exposed industries. Sets criteria which would make sectors and subsectors presumptively eligible, and allows the EPA to designate more.
- Allowances compensate for direct and indirect carbon costs; firms do not have to be covered to qualify.
- Distribution would begin phasing out by 10% each year starting in 2026 (pending Presidential review).
- In 2022, President is required to make a finding that could trigger International Reserve Allowance program for particular sector or subsectors (this program would begin no earlier than 2025).

Complementary Measures for Coal

- Federal agencies to develop national strategy for CCS deployment
- EPA Administrator ordered to develop regulations for geologic sequestration sites
- Boucher CCS trust fund for early stage deployment
- Performance standard for new coal power plants and financial incentives for CCS deployment
  - Similar but not identical to USCAP *BLA*
  - New facilities permitted in 2020 must reduce annual CO_2 emissions by 65% compared to operation without CCS. Plants permitted between 2009 and 2019 subject to 50% reduction
  - Plants permitted 2009-2019 must comply by the earlier of January 1, 2025 or 4 years after deployment of at least 4 GW of CCS in the U.S.
  - Authorizes rebate for early large scale deployment (and specifies rebate values for first 6 GW of CCS capacity)
  - After initial 6 GW of CCS, bonus allowances to be awarded via reverse auction or via first-come, first-served program, if the Administrator deems the latter to be more effective.

Adaptation

- Establishes National Climate Change Adaptation Program within USGCRP.
- Requires President to develop and implement Natural Resources Climate Change Adaptation Strategy.
- Requires states and federal agencies to develop natural resource adaptation plans.
- Establishes Natural Resources Climate Change Adaptation Fund in the Treasury. States could apply for these funds if they have prepared a natural resources adaptation plan.
- Provides 2% of allowance value increasing over time for domestic adaptation (much of that goes to states)
- Provides 1% of allowance value increasing over time for international adaptation.

Renewable Energy and Efficiency

- Combined Efficiency and Renewable Electricity Standard
  - Standard starts at 6% of sales in 2012 and rises to 20% in 2020
  - Up to one quarter of the requirement can be automatically met with electricity savings. Upon petition by a state's governor, FERC can allow a state's utilities to use electricity savings to meet up to two fifths of the standard
  - New nuclear and CCS generation do not increase requirements for efficiency and renewables
- Promotes energy efficiency in new and retrofitted buildings
  - Establishes national building energy efficiency codes
  - Establishes a building retrofits program
  - Establishes a program to upgrade inefficient manufactured homes
  - Establishes a model building energy performance labeling program
- New efficiency standards for lighting and other appliances, including financial incentives to retailers who sell high volumes of "Best-in-Class" appliances.

Some other provisions

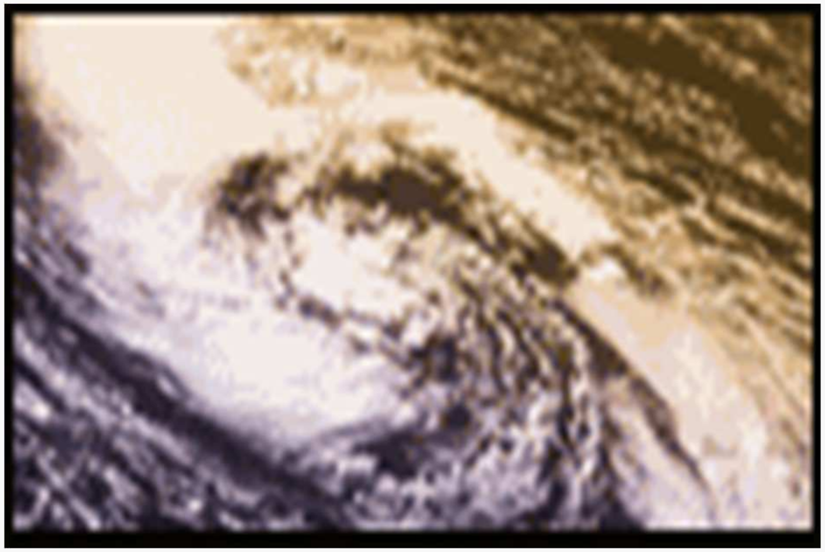
Targets beyond cap and trade: same as cap and trade except 20% below 2005 levels in 2020

Allowance distribution:

- Consumers: To LDCs for electric and gas, to states for heating oil and propane; federal rebates for low and moderate income families
- Supplemental reductions: 10% (720 mtCO_2e) below 2005 levels by 2020 (cumulatively 6 btCO_2e by 2025) thru sale of 5% of allowances to fund REDD.
- Competitiveness, workers, EERE investment, adaptation, international programs
- Provides 1% of allowance value increasing over time for International Clean Technology Fund in Treasury

For More Information

www.pewclimate.org



USCAP

Why would businesses want urgent enactment of climate legislation?

- Cost of regulatory uncertainty
- Supreme Court has effectively ordered EPA to regulate GHGs
- State action: 24 states developing GHG cap (1/2 population)
- GHG regulation in place in Europe
- Want US to influence post-2012 international climate negotiations
- Convinced by climate science, concerned by increasing risk from climate impacts

Coverage in 2012

- All electricity sources
- Producers and importers of liquid fuels whose combustion will emit more than 25,000 tons of CO_2e
- Producers and importers of fluorinated gases (except HFCs)
- Geological sequestration sites
- Electricity sources not required to submit allowances for emissions resulting from the use of petroleum-based or coal-based liquid fuel; biomass; petroleum coke; or HFCs, PFCs, SF_6, NF_3, or any other fluorinated gas that is a GHG.

Coverage in 2014 (Industry)

PEW CENTER ON Global CLIMATE CHANGE

- Producers and manufacturers of: adipic acid; primary aluminum; ammonia; cement, excluding grinding-only operations; HCFCs; lime; nitric acid; petroleum refining; phosphoric acid; silicon carbide; soda ash; titanium dioxide; coal-based liquid or gaseous fuel production
- Manufacturers of acrylonitrile, carbon black, ethylene, ethylene dichloride, ethylene oxide, or methanol; or manufacturers of a petrochemical product not manufactured as of the date of enactment, if EPA determined that manufacturing that product results in annual process emissions of 25,000 or more tons of CO_2e in 2008 or after.
- Producers and manufacturers of ethanol, ferroalloy, glass, hydrogen, iron and steel, lead, kraft pulp and paper, zinc, and food processors that have emitted 25,000 or more tons of CO_2e in 2008 or any subsequent year.
- Any fossil fuel-fired combustion device or grouping of such devices that is all or part of an industrial source not specified above; and has emitted 25,000 or more tons of CO_2e in 2008 or any subsequent year.

Coverage – More detail (cont'd)

- In 2016: Emissions from the combustion of natural gas for residential, commercial and small industrial use would also be covered at local distribution companies (LDCs) which deliver 460,000,000 cubic feet or more of natural gas annually.

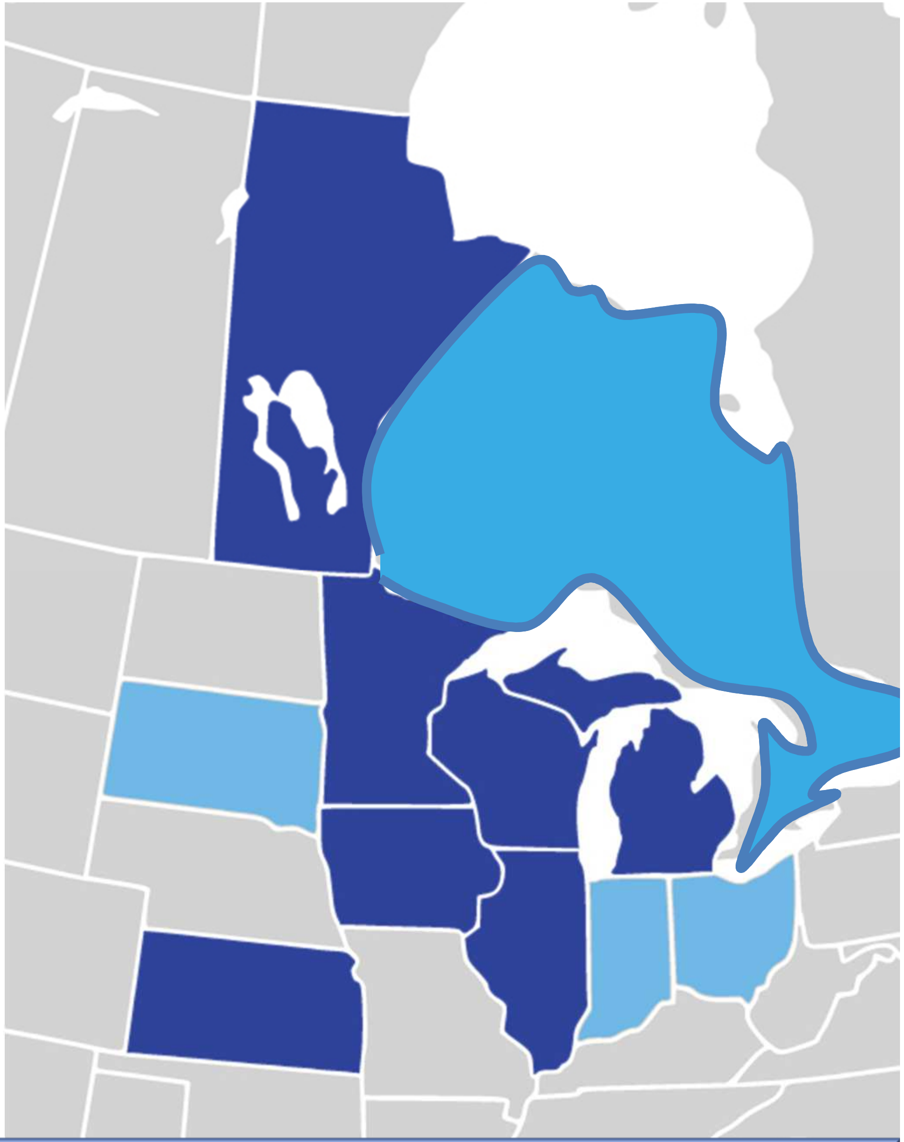
- In 2012. HFCs covered by separate cap-and-trade program and a tax. The draft would set an emissions baseline derived from the average annual importation and production of HFCs from 2004-2006, and a target range of reducing HFC emissions to 85% below the baseline by 2032.

- EPA to promulgate regs to reduce domestic black carbon emissions

USCAP Recommendations

- Targets
  - 100-105% of today's levels within five years
  - 90-100% of today's levels within 10 years
  - 70-90% of today's levels within 15 years
  - Goal of 60-80% reduction by 2050 (~450-550 ppm)
- Economy-wide cap-and-trade system is essential to create market price signal for GHGs
- Additional policies/measures where price signal alone is not sufficient
  - Transportation
  - Power generation
  - Energy efficiency
- Technology research, development, demonstration, and deployment
- Need for renewed U.S. leadership in international efforts

Midwestern Greenhouse Gas Reduction Accord



Draft Final Recommendations
May 2009

Process Overview

- November 2007: Governors' and Premier's Summit in Milwaukee, Wisconsin
- Accord Advisory Group created by Governors
  - Includes Executive Committee comprised of Governors'/Premiers' Reps
  - Stakeholders
- Draft Recommendations November 2008
- Draft Final Recommendations May 2009
- Governors' and Premier's Summit October 2009

Process Note

- Not a consensus effort
- The final draft recommendations have general support of the Advisory Group, but not unanimous support.
- No votes taken, but an effort was made to strike a balance between different interests on each issue
- Recommendations have unanimous support of the participating states and province.

Program Feature	Midwestern Accord Approach
Reductions and Timetables	• Program starts in 2012; • 18 to 20% below 2005 levels by 2020; • 80% below 2005 levels by 2050.
Scope	• Electricity combustion, including imports; • Industrial combustion and process emissions; • Transportation fuels (phased in 2nd period for MB); • Residential, commercial and industrial (RCI) fuels not otherwise covered at emissions source (phased in 2nd period for MB) • Biomass emissions are exempt
Point of Regulation	• Electricity and industrial sources at point of emissions; • Transportation fuels at the point where the fuels enter the participating jurisdiction; • RCI fuels where the fuels enter the participating jurisdiction.
Threshold for coverage	• 25,000 metric tons of annual emissions • 3-year rolling average; once-in, always in. • Electric generators with nameplate capacity under 25 megawatts exempt

Program Feature	Midwestern Accord Approach
Distributing Allowances	• Up to States and Province, but Advisory Group recommends: • Approximately 33% auction; 67% sold for a fee: • All transportation and merchant power generator allowances will be auctioned; • 5% of other sectors' allowances will be auctioned with proceeds to a Technology Fund, with rest <u>sold</u> for modest fee. • Transition to 100% beginning in 4th compliance period.
Offsets	• Offsets may be used to cover up to 20% of each entity's compliance obligation. • Offsets from region, plus states & provinces with MOU
Reporting	• Commence in 2011 • Threshold: 20,000 metric tons annual emissions
Share of Reductions from Capped Sectors	• Capped sectors will provide their proportional share of reductions

Program Feature	Midwestern Accord Approach

Cost Containment	• Compliance period 3 years
	• Banking allowed
	• Borrowing allowed two years into next compliance period
	• Establish regional Market Advisory and Cost Containment Committee (MACCC):
	  • 2% allowance reserve pool, to be released as follows:
	    • MACCC to establish a price “collar” with a low price and high price;
	    • If allowance price substantially exceeds the high price, then allowances will be released from the 2% allowance reserve pool.
	  • MACCC will also monitor the market for signs of gaming or manipulation

Next Steps

- Influence the federal cap and trade discussion, while moving forward with development of a regional program as backstop

- Complete REMI modeling of jobs and macroeconomic impacts prior to issuing final design recommendations, with modeling results later in the summer.

- Model Rule development has commenced (on schedule for completion in September 2009)

- Governors and Premier Summit in October 2009

May 27 WCI Partners Meeting Highlights

CSAD Releases White Papers, Hosts Workshop

Complementary Policies Committee Underway

Comments on U.S. EPA's Proposed Endangerment Finding

Upcoming Events

June 8: Presentation to the WCI Markets Committee

Michael Sheehan of the New York State Dept. of Environmental Conservation will have a discussion with the Markets Committee Compliance, Verification and Enforcement (CV&E) Task Group regarding NY state CV&E in the RGGI system on Monday, June 8 from 8:30 - 10:00 a.m. (Pacific). Details are posted on the WCI website.

June 18: Stakeholder Update Call

The next stakeholder update call will be Thursday, June 18 from 12:30 - 2:00 p.m. (Pacific). To join the call, dial 1.800.868.1837 (toll free) or 1.404.920.6440 (direct dial), and enter participant code 659537#. These bi-monthly calls provide an opportunity for stakeholder updates and discussions between Partner meetings, which also occur bi-monthly.

June 22: Presentation to the WCI Markets Committee

Rob Gemmill of the

May 27 WCI Partners Meeting Highlights

The WCI Partners meeting on May 27 included three presentations to the WCI Partners, as well as updates from the WCI Committees. The presentations on Waxman-Markey, the Midwest Greenhouse Gas Accord, and the new National Clean Car Standards are available on the WCI website. Highlights of the Committee updates include:

- The **Markets Committee** is currently reviewing comments received on the principles and discussion questions it released in April, as well as developing a series of white papers.
- The **Reporting Committee** encourages submission of public comments on its final draft essential requirements by June 4. The Committee will be reviewing these comments as it finalizes the requirements, to be released at the end of June. The Committee is also finalizing comments on the U.S. EPA's proposed mandatory greenhouse gas reporting rule and is working with The Climate Registry to develop a reporting database that will serve as a repository for the WCI Partners' regional emissions data.
- The **Offsets Committee**, having completed a series of public webinars on approaches to developing offset protocols and the structure and capacity of existing organizations, is drafting options for Partners to consider as they determine how to proceed, including examining options to fast-track approval of existing protocols. The Committee will also be releasing a white paper for stakeholder input that defines an offset and discusses potential WCI eligibility criteria.
- The **Electricity Committee** has been working with the Reporting Committee in finalizing the essential elements for reporting for the electricity sector. These elements are posted for stakeholder comment on the WCI website. The

Environment Agency for England and Wales will be giving a presentation to the Markets Committee Verification and Enforcement Task Group regarding monitoring, verification and enforcement in the EU ETS on Monday, June 22 from 8:30 - 9:30 a.m. (Pacific). Details are posted on the WCI website.

Release of Offsets White Paper

The Offsets Committee will be releasing a white paper in June regarding offset definition and eligibility criteria. An announcement will be made via the WCI listserv when it is available and posted on the WCI website.

July 21: WCI Partners Meeting

The next WCI Partners meeting will be in Portland, Oregon on Tuesday, July 21. Details regarding the agenda and public participation will be distributed when available.

Committee will provide an update to stakeholders this summer on its work to incorporate electricity imports in WCI's cap-and-trade program design.

- The **Economic Modeling Team** is completing its third phase of ENERGY 2020 modeling (expected to be available in July) and is preparing to use these results to analyze the macroeconomic impacts of the WCI's cap-and-trade program.

Cap Setting & Allowance Distribution (CSAD) Releases White Papers, Hosts Workshop

On May 21, the CSAD Committee released white papers on offset limits and early reduction allowances, as well as discussion questions regarding competitiveness. This material was the subject of a May 28 workshop in Seattle. The material and workshop presentations are available on the WCI website. There is also a link on the website for submitting comments. Comments should be submitted by June 19.

Complementary Policies Committee Underway

The WCI Partners approved a work plan for the Complementary Policies Committee. The work plan was summarized at the May 27 WCI Partners meeting and will be publicly available soon. The Committee will focus on policies where coordination and harmonization would be useful among the WCI Partner jurisdictions and recommend to the Partners those policies that will aid in achieving regional emissions reduction goals across all sectors of the economy.

Oral Comments on U.S. EPA's Proposed Endangerment Finding

On Thursday, May 21, U.S. Co-Chair Janice Adair (Washington Department of Ecology) provided testimony on behalf of the WCI to the U.S. EPA regarding its proposed greenhouse gas endangerment finding hearing, which was held in Seattle. For a copy of the testimony, click here.

The EU Emissions Trading Scheme: MRVCE

Rob Gemmill
Technical Advisor
WCI Markets Task 2 (22nd June 2009)

Outline

- Background/Scene Setting
- Main components
- Most important MRVCE requirements
- UK implementation/good practice
- Latest EU ETS developments
- Compliance and Enforcement Issues
- Initiatives promoting greater consistency

The Environment Agency for England &Wales (Proposed Strategy 2010-2015)

We are a regulator, assessor, advisor, promoter

Our aim

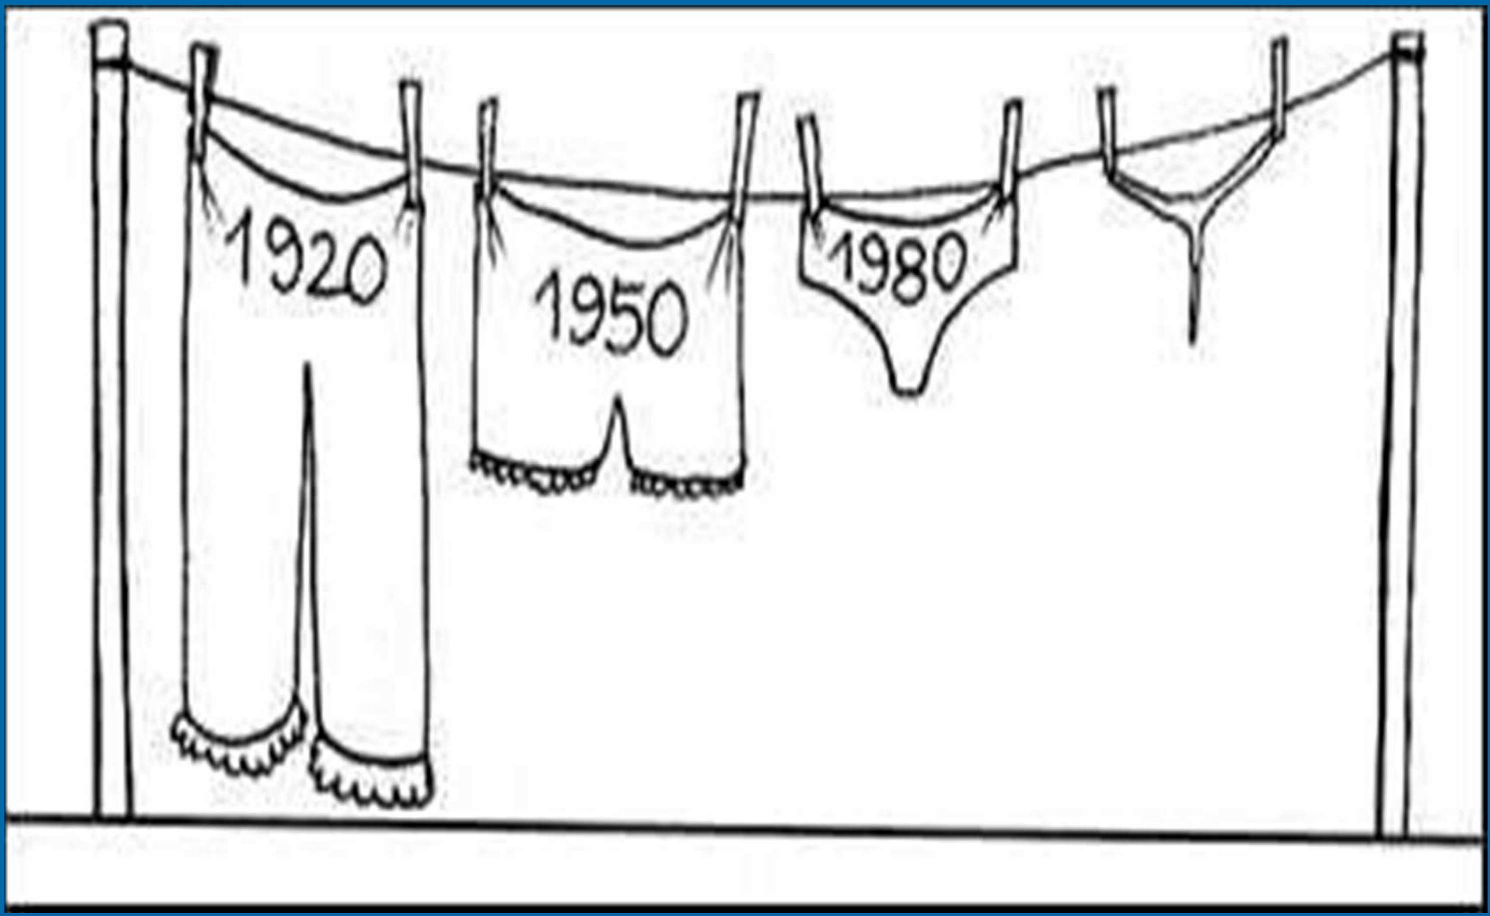
- *A better place for people and wildlife, now and in the future*

To achieve this we will:

- *Act to reduce climate change and its consequences*
- *Protect and improve air, land and water quality*
- *Put people and communities at the heart of what we do*
- *Work with businesses and the public sector to use resources wisely*
- *Be the best we can*

Environment Agency

Evidence of climate change



Environment Agency

International Policy Action

- United Nations Framework Convention on Climate Change signed at the Earth Summit, Rio de Janeiro, 1992
- Kyoto Protocol, 1997 - Some developed countries agreed targets to reduce overall emissions of carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons and sulphur hexafluoride by 5.2 % below 1990 levels by 2008 -2012
- EU ETS part of EC commitment to meet a Kyoto Commitment to reduce all Greenhouse Gases by 8% based on 1990 levels by 2008 - 2012 (UK: 12.5%)
- COP 15, Copenhagen (December 2009)

Environment Agency

EU ETS Directive

- Directive 2003/87/EC of 13 October 2003 *establishing a scheme for GHG emission allowance trading within the Community and amending Council Directive 96/61/EC*
- Article 1: *This Directive establishes a scheme for greenhouse gas emission allowance trading within the Community* ***in order to promote reductions of greenhouse gas emissions in a cost-effective and economically effective manner***
- Cap and trade - emissions cut wherever cheapest
- Predicted to deliver EU Kyoto target at a cost of €2.9-3.7 billion annually (<0.1% EU GDP - compared €6.8 billion/year compliance costs without the scheme)

Environment Agency

Main Components (of cap and trade)

- Cap overall emissions (UK Phase 2: 1,230MtCO_2; 246/year)
  - Prescribed activities (Annex I)
  - National allocation plan (Article 9)
- Distribute allowances to installation operators (Articles 10 & 11)
  - one allowance = one tonne of CO_2 equivalent
- Impose obligations
  - Permits/Monitoring Plans (Articles 4, 5, 6)
  - Monitoring and reporting of emissions (Article 14 & Annex IV)
  - Verification of emissions (Article 15 & Annex V)
  - Surrender of allowances (Article 12)
- Trading mechanism/Registry
  - Buying and selling as appropriate (Articles 12 & 19)

The "MRG" (Commission Decision 2007/589/EC)

Guidelines for M&R of emissions from activities listed in Annex I of EU ETS Directive

- Annex I: Definitions; Principles; Monitoring (calculation and measurement options); Uncertainty requirements; Reporting; Retention (of information); Control and Verification; Reference emission factors; Biomass; Activity-specific data/factors; Reporting format; Reporting categories; Small emitters
- Annexes II-XI: Sector specific guidelines
- Annex XII: Guidelines for CEMS

- Annex XIII (N_2O), Annexes XIV & XV (Aviation), Annexes XVI-XVIII (CCS)

Environment Agency

Main MRG Monitoring Requirements

- Determination of emissions by calculation; or measurement (CEMS) if it reliably results in a more accurate determination of annual emissions
- By approved monitoring plans (Annex I, Section 4.3)
- Calculation based on:

  CO_2 emissions = activity data * emission factor * oxidation/conversion factor
- Tier-based approach (Annex I, Section 5.2)
  - Highest tier default (for larger emitters), minimum set by Annex I, Table 1
  - Activity data tiers set according to uncertainty thresholds
  - Other inputs based on IPCC factors, country-specific factors, and installation-specific determinations (frequency of determination & ISO 17025 issues)
- Fall-back approach (Annex I, Section 5.3) – last resort (overall uncertainty threshold requirement)
- Control requirements (Annex I, Section 10)

Control Requirements (QA/QC)

- Operator required to maintain written procedures covering:
  - Data flow (acquisition and handling), including methods of calculation
  - Assessment of risks to misstatement (errors, misrepresentations or omissions) in the annual emissions report, or non-conformity with the approved monitoring plan, permit or MRG
  - Management of competences for assigned responsibilities
  - QA of measuring equipment and IT
  - Internal review of reported data (validation – vertical/horizontal checks)
  - Outsourcing
  - Corrections and corrective action
  - Records
  - Any other control activities required to mitigate identified risks (under the control system risk assessment)

Environment Agency

EU ETS Verification (Third Party)

- To confirm reliability, credibility and accuracy of monitoring systems and reported data (further contribution to EU ETS integrity)
- Contracted between operator and verifier in the UK (permit requirement to submit a verified annual emission report)
- Scope of work:
  - Strategic analysis, risk assessment, verification, internal and external verification reports (MRG Annex I, Section 10.4)
  - Annual emissions report verified as satisfactory *if the total emissions are not materially misstated, and if, in the opinion of the verifier there are no material non-conformities* (based on reasonable assurance, i.e. a high level of certainty)
  - Misstatements, non-conformities and recommended improvements reported
- In the UK, “Verifier” means *a verification body or person accredited (and, if required, endorsed by UKAS) to carry out the verification requirements of Article 15 of the Directive. In this context, “accredited” means accredited by a member of the ‘European Co-operation for Accreditation’ having regard to the latter’s greenhouse gas verification guidance* [reference to EA-6/03]

Environment Agency

EA-6/03

- EU ETS applicable (European Accreditation Regulation applicable)
- Based on requirements of international standards (ISO14065; or EN45011 and EA-6/01; ISO17020 and IAF/ILAC A4)
- Provides for mutual recognition of Member State verifiers
- Key elements:
  - ‘Reasonable assurance’ approach
  - Based on verifier’s assessment of verification risk
  - Thorough and auditable documentation
  - Prescription of the entire EU ETS verification process
  - Identification of verifier competence requirements
  - Identification of technical competence requirements
  - Normative requirements for ‘impartiality and independence’
  - Additional informative guidance on ‘materiality, uncertainty, and examples of verification opinion’, ‘verification plan details’, ‘verification effort and repeat verifications within the same installation’, ‘factors for allocating time and determining the data sampling plan’, the ‘scope of accreditation’, ‘content of the verifier’s internal verification documentation’, ‘content of the verification report’, ‘misstatements and non-conformities’, ‘site visits’

Summary of UK Implementation

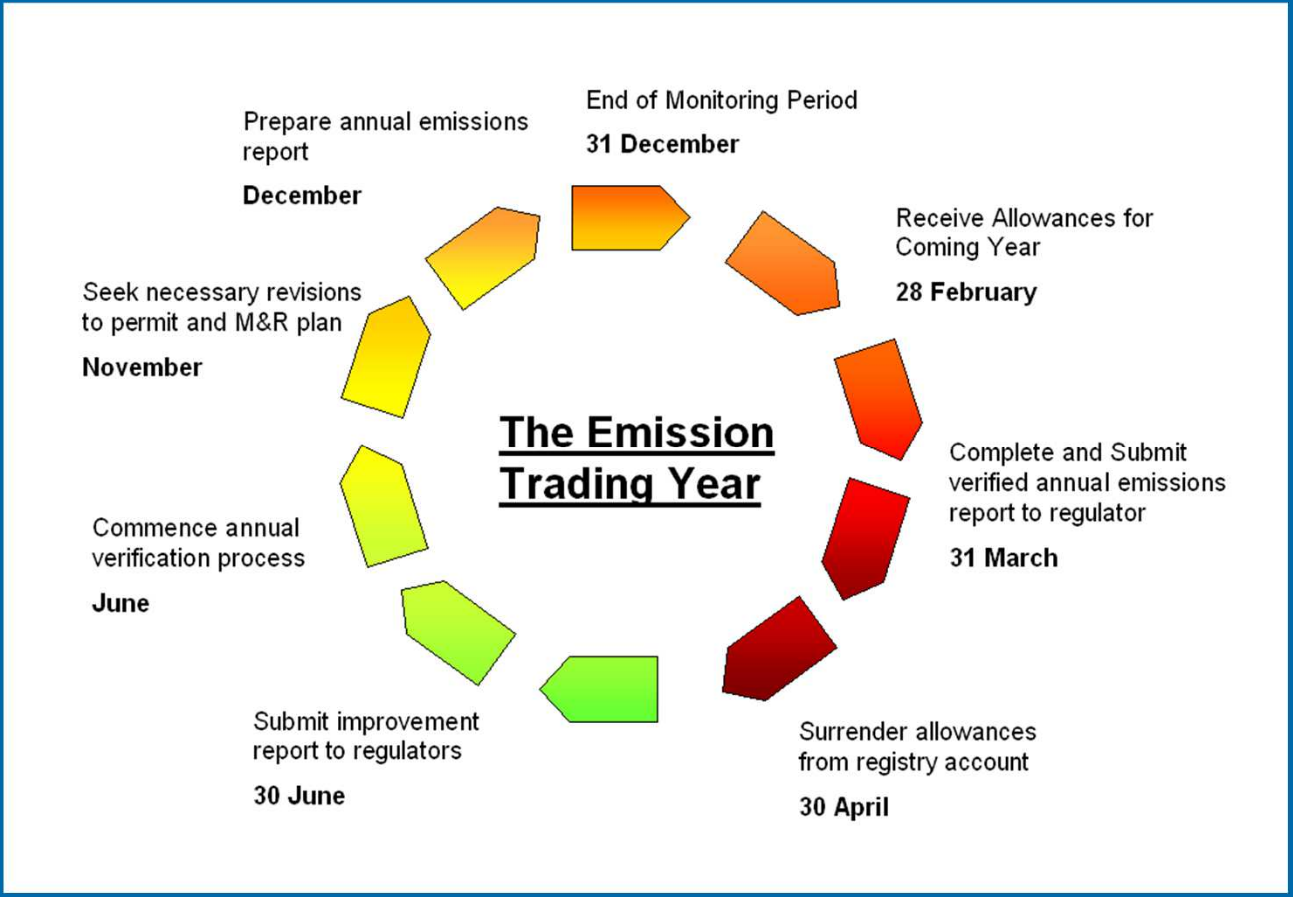
- Directive (2003/87/EEC): October 2003
- UK GHG Emissions Trading Scheme Regulations entered into force 31st December 2003
- Commission Decision establishing guidelines for M&R of GHG Emissions 29th January 2004
- 1,100 permits including approved M&R plans issued by 31st December 2004
- Re-issue of Consolidated Regulations 2005
- Start of Phase 1 on 1st January 2005 - just CO_2
- Revised Commission Decision for M&R of 18th July 2007
- Permits re-issued for Phase 2 (2008-2012) by 31st December 2007
  - ca. 900 permitted installations
  - still just CO_2

Environment Agency

Key Roles

- DECC (DEFRA, BERR), DfT - Development of Regulations, policy, and the national allocation plans
- Regulators (Environment Agency, SEPA, EANI, DECC Offshore) - Permitting, Enforcement, Inspection
- Environment Agency operates the UK Registry
- Operators - Permits to operate, M&R, and surrendering sufficient allowances
- Verifiers (accredited by UKAS or a fellow member of the European co-operation for Accreditation according to EA-6/03)
- Traders/Brokers - EU ETS Registry

Our Annual EU ETS Compliance Cycle



Environment Agency

UK Good Practice

- Dedicated “National Once Task and Finish Groups” established
- Strong coordination/communications between Government, Regulators, Verifiers and Industry:
  - Emissions Trading Group (also MRV and Regulators Groups)
  - Consultations/workshops
- Electronic Application and Permitting System
- Helpdesks and websites for queries and products/guidance. Standard Forms
- Avoiding duplication: costs kept down

EU Emissions Trading Scheme

Want to know more about the EU Emmissions Trading Scheme? This section will give you all the information you need including how to make an application.

What is the EU Emissions Trading Scheme (EU ETS)?

The scheme is one of the policies introduced across the European Union (EU) to help it meet its greenhouse gas emissions reduction target under the Kyoto Protocol. The EU has to make an eight per cent reduction on 1990 levels by the first Kyoto Protocol commitment period (2008 - 2012).

The UK Kyoto target is 12.5 per cent. The EU ETS will also contribute to delivering the UK's domestic goal of a 20 per cent reduction in CO2 emissions by 2010.

Using Kyoto units in the European Union Emissions Trading Scheme (PDF, 206KB)

How the EU ETS works

The scheme is cost-effective and operates by the allocation and trading of greenhouse gas emissions allowances throughout the EU - one allowance represents one tonne of carbon dioxide equivalent.

An overall limit, or 'cap', is set by Member State's Governments on the total amount of emissions allowed from all the installations covered by the scheme. The allowances are then distributed to the installations in the scheme.

At the end of each year, operators are required to ensure they have enough allowances to cover their installation's emissions. They have the flexibility to buy additional allowances (on top of their free allocation), or to sell any surplus allowances generated from reducing their emissions.

These options create a flexible compliance regime for operators and also ensures emissions are effectively capped across the EU.

The scheme currently has two operating phases:

- Phase 1 from 1 January 2005 to 31 December 2007
- Phase 2 from 1 January 2008 to 31 December 2012

Installations covered by the EU ETS are those which carry out activities listed in Annex I of the EU ETS Directive. These include energy activities, production and processing of ferrous metals, mineral industries and pulp and paper industries.

What the EU ETS means for your business

The EU ETS Directive requires all installations carrying out activities listed in Annex I to hold a greenhouse gas emissions permit. The conditions of the permit will require installations to monitor and report emissions in accordance with the Commission's guidelines for monitoring and reporting.

Each year emissions data must be verified, and the equivalent number of allowances surrendered. All transactions and surrendering of allowances take

EU Emissions Trading Scheme
Phase 2 monitoring plans

Phase 2 monitoring plans

Here you can see how after wide consultation, the European Commission have revised the Monitoring and Reporting Guidelines (MRG) for Phase II.

About the revisions

The revision to the MRG introduces a number of changes to monitoring and reporting requirements. As a consequence, all operators were required to submit a revised Monitoring Plan to the Environment Agency by 30 September 2007.

The ETS2.2 monitoring plan template and guidance can be downloaded from the following links:

- **ETS2.2 Monitoring Plan Template (Excel, 425KB)**
- **ETS2.2 Exemplar monitoring plan (Excel, 284KB)**
- **Guide to the Revised Monitoring and Reporting Guidelines (PDF, 30KB)**
- **Guidance on uncertainty assessment MRG2 (PDF, 20KB)**
- **Slides from the ETS2.2 Seminar (PDF, 41KB)**
- **Frequently Asked Questions (PDF, 71KB)**

The Commission adopted the Monitoring & Reporting Guidelines for Phase II on the 18th July 2007. The decision was published in the Official Journal of the European Union on the 31st August 2007 and can be downloaded from the following link:

- **Establishing guidelines for the monitoring and reporting of greenhouse gas emissions (PDF, 351KB)**

The Joint Environmental Programme (JEP) has produced guidance on the monitoring and reporting of CO2 emissions from Power Stations. Please note that this document does not represent the represent the Environment Agency's policy in relation to Phase II monitoring plans and is provided for reference only.

- **JEP Guidance on Monitoring & Reporting of CO2 emissions from Power Stations (PDF, 385KB)**

Questions about Monitoring & Reporting Guidelines for Phase II, completion of the ETS2.2 template and uncertainty assessments can be submitted to us via email.

EU Emissions Trading Scheme (ETS)

ETS operators

- Introductory Guide
- Directive & Regulations
- NAP Overview
- Phase III
- Phase II
- Phase I
- Research
- Compliance results
- Auctioning
- Monitoring, Reporting, Verification
- Emissions Trading Registry
- Aviation Operators

Monitoring, Reporting and Verification

Regulators are responsible for operational functions such as permitting, monitoring and reporting, registry administration, verification, enforcement and data management.

Regulators include: Environment Agency, Scottish Environmental Protection Agency; Department for Environment, Northern Ireland and the Department of Trade and Industry for offshore installations.

To improve operators' access to information, all documents and tables related to activities overseen by the regulators will be placed on the EA website. This site will be updated with information regarding this move in due course.

Guidance on annual verification for the EU Emissions Trading Scheme

This guidance document provides practical information and advice on the process and requirements for annual verification required by the EU ETS Directive, the Commission's Monitoring and Reporting Decision, and installation monitoring and reporting plans and Greenhouse Gas Permits. It aims to assist operators, verification bodies, and regulators to perform verifications consistently throughout the UK.

- Guidance on annual verification for the EU ETS (PDF 500 KB)
- The Quick Guide for Operators on Preparing for Annual Verification (PDF 60 KB)
- Frequently Asked Questions on Annual Verification (PDF 200 KB)

The Country-specific Factor List

This document contains tables of emission factors and calorific values for use in annual emissions reporting for the EU ETS. The national factors are Tier 2 and Tier 2a emission factors and net calorific values for specific fuels used by particular industries. The data have largely been extracted from the UK Greenhouse Gas Inventory (as presented in the 2008 National Inventory Report) that is presented on an annual basis to the United Nations Framework Convention on Climate Change. The Greenhouse Gas Inventory is developed independently to the EU Emissions Trading Scheme.

The factors in these spreadsheets should only be used in accordance with the requirements in the installation's Monitoring and Reporting Plan, which is part of the Greenhouse Gas Permit.

- Final version: Tables of emission factors and calorific values for use in annual emissions reporting for the EU ETS (Excel 160 KB)

Verification opinion statement template

DEPARTMENT OF ENERGY & CLIMATE CHANGE

This subject is now dealt with by the Department of Energy and Climate Change.

Internet

Environment Agency

Latest EU ETS Development: N_2O

- Nitrous oxide emissions from nitric acid plant
- By opt-in during EU ETS Phase 2 (2008 - 2012)
  - Applications currently approved from the Netherlands and Austria
- MRG amended (Commission Decision of 17 December 2008; OJ, L24/18, 28th January 2009)
  - Annex XIII: Activity-specific guidelines for determination of nitrous oxide (N_2O) from nitric acid, adipic acid, caprolactum, glyoxal, and glyoxylic acid production
- Mandatory inclusion from 1st January 2013 (the start of EU ETS Phase 3)

Environment Agency

Latest EU ETS Development: Aviation

- Directive 2008/101/EC amending Directive 2003/87/EC to include aviation
- Annex I activity from 2012, but:
  - Baseline t-km (payload x distance) requirement 2010 (to apply for free allowances)
  - Aircraft operators to report verified annual emissions for 2010 onwards (fuel consumption x emission factor)
- UK expecting ca. 1,500 monitoring plan submissions by 31st August for approval by 31st December 2009 (Europe ca. 6,800)
- Special geographical and scale of operator challenges
- Commission may adopt detailed provisions for verification (amended Article 15)
- MRG amended and common templates planned

Latest EU ETS Development: CCS

- MRG amendments to cover carbon capture and storage
  - Appropriate changes to the general guidelines of Annex I and to Annex XII (Guidelines for determination of emissions or amount of transfer of GHG by CEMS)
  - Annex XVI Capture
  - Annex XVII Transport
  - Annex XVIII Geological storage (MRV only in the event of leakage)
    - Uncertainty supplement approach
- Approved by the EC Climate Change Committee 16th March 2009

Revision of the EU ETS Directive

- For Phase 3 (from 1st January 2013)
- Extensions to proposed listed activities and gases
- Further revision awaiting outcome of COP15
- DECC planning 10 main work-streams, including on benchmarking, carbon leakage, auction design, and MRV
- Main issues MRV:
  - Article 14: Commission adoption of an M&R Regulation
  - Article 15: Commission adoption of a Regulation for verification of emission reports, and for accreditation and supervision of verifiers

  (Both by 31st December 2011)

Environment Agency

Compliance and Enforcement Issues 1

In general, require:

- A level playing field:
  - "A tonne is a tonne"; a common currency; for
  - Credibility
  - Linking
- Complete coverage of central requirements in domestic/regional legislation and permits/monitoring plans
- Common understanding and efficiencies: Template forms and reports; succinct guidance; electronic systems including helpdesks
- Reasonable flexibility
  - Different routes to the same outcome
  - Sound control system and quality assurance provisions

Compliance and Enforcement Issues 2

Regulatory Concerns:

- Approval of permits/monitoring plans
- Duty to enforce compliance with M&R conditions
- Enforcement Notices (to rectify contravention of M&R conditions)
- Checking of annual emission reports/verifier reports
- Power to determine reportable emissions
- Inspections - sufficient/proportionate; risk based
- Provisions for ‘entry’; and variation, surrender, revocation of permits/plans
- Improvement mechanism/account of verifier recommendations

Compliance and Enforcement Issues 3

- Meaningful sanctions/penalties (compared to the cost of carbon)
- Efficient system for imposing sanctions and penalties, and encouraging resumed compliance
- Civil penalties (better regulation)
- Costs
  - Need for robust data and affordable implementation/enforcement
  - Some problems with disproportionate costs for ‘small’ operators; proportionate approaches
  - Risk based approaches

Environment Agency

EC Forums and Technical Working Groups

- Further European Commission initiative **to improve the efficiency and consistency** of EU ETS implementation
- WG 3 Emissions Trading Group (CCC)
- Compliance Conference/Compliance Forum
- Verification Forum
- M&R Technical Working Group
- Verification, Accreditation and Accreditation Control Project Group
- Auctioning Technical Working Group
- Benchmarking Technical Working Group
- Aviation Technical Working Group – standard templates
- Etc.

EU ETS Compliance Forum

Objectives to:

- Strengthen, harmonise and raise the profile of the EU ETS Compliance Chain
- Improve communications between CAs to share experiences and best practice
- Raise the importance of consistent implementation to ensure common outcomes and integrity of the scheme
- Identify issues to be resolved/capacity build
- Bring together relevant stakeholders

EU ETS Compliance Forum: Tasks

- Aviation Implementation: 1. FAQ; 2. Exemplars and Guidance; 3. Approval of MPs, Enforcement and Sanctions
- E-reporting and use of IT in emissions trading
- Capacity building, compliance training, and inspections
- Communications (web-site, newsletter, digital forum)
- Interface with verification and accreditation
- Carbon capture and storage
- Auctioning
- Preparing for Phase 3 (the revised Directive)

- Compliance Conference: 3rd & 4th September 2009

IMPEL

- European Network for Implementation and Enforcement of Environmental Law

- Three EU ETS Projects to date:
  - I. Identifying Good Regulatory Practice In The EU Emissions Trading Scheme
  - II. Options and Proposals for Consistency in the Implementation of the EU Emissions Trading Scheme
    - Small installations;
    - Verification;
    - Compliance and enforcement; and
    - Monitoring and reporting.
  - III. Proposals for future development of the EU Emissions Trading Scheme – Phase II & beyond (Annex 5: technical guidance notes)

- See: http://ec.europa.eu/environment/impel/eu_ets.htm

Environment Agency

Concluding Comments

- An ETS puts emphasis on what rather than how
- It establishes maximum allowable emission level (compressed cap)
- It enforces the cap with increased emphasis on robust MRVCE and allowance surrender obligations
- It avoids dictating how each source is to comply (no elvs), and provides an incentive to go beyond allocations
- It puts a price on the emission
- Harmonised implementation important for equity and confidence - need a common currency
- Global linking should be the goal (common outputs likely to be more important than completely common structures)

Ontario Proposed Cap-and-Trade Legislation

Documents Planned for Release in July

Upcoming Events

July 6: Presentation to the WCI Markets Committeee

Jackie Huggins, Manager of Verification Services at The Climate Registry will discuss compliance, verification, and enforcement issues on Monday, July 6 from 8:30 - 10:00 a.m. Pacific Time. Details are posted on the WCI website.

July 21: WCI Partners Meeting

Stakeholders are invited to attend the next WCI Partners meeting either in-person or via teleconference, starting at 1:00 p.m. on Tuesday, July 21. The meeting will be held at The Nines Hotel in Portland, Oregon. To join the teleconference, dial 1-800-868-1837 toll free in the U.S. and Canada (1-404-920-6440 for outside the U.S. and Canada), and enter participant code 659537#. Follow this link to access the webinar portion of the meeting. Additional details will be posted to the WCI website as they become available.

WCI and Other Regional Initiatives Share Lessons and Discuss Roles

On Tuesday, June 23, 2009, representatives of the three U.S. and Canadian initiatives pursuing regional greenhouse gas reduction programs, including regional cap-and-trade programs, held their first joint meeting in Washington, DC.

Together, the Regional Greenhouse Gas Initiative, the Midwest Greenhouse Gas Reduction Accord, and the Western Climate Initiative involve 23 U.S. states and 4 Canadian provinces as members. Additional U.S. states, Mexican states, and Canadian provinces participate as official observers to these initiatives.

U.S. states participating in the three regional initiatives encompass about half of the U.S. population and GDP and ⅓ of all U.S. GHG emissions. Canadian provinces participating in the three regional initiatives account for more than ¾ of the Canadian population and GDP and nearly ½ of Canadian GHG emissions.

The purpose of the meeting was to:

- Share information on the status and future plans of each regional initiative.
- Identify and discuss issues on which inter-regional collaboration and information sharing may be beneficial to the ongoing program development activities of each regional group.

- Discuss the current status of US federal legislation, focusing on issues that have the most relevance to states and the regional initiatives.
- Explore the role of states and the regional initiatives under emerging federal programs (legislative and regulatory).

State and Provincial representatives participating in the meeting emphasized the importance of federal action and the critical role of states and provinces in the development and implementation of national programs. They also identified several areas of commonality and committed to continue to work together.

Complementary Policies Work Plan Available

The WCI Partners have approved the work plan for the WCI Complementary Policies Committee, which is available on the WCI website. This document will guide the deliberations of the Committee, which has been formed to evaluate and recommend to the WCI Partner jurisdictions complementary policies that will aid in achieving regional emissions reduction goals across all sectors of the economy, if these policies are adopted by some or all of the WCI Partner jurisdictions. The Complementary Policies Committee work plan was announced and summarized at the WCI public meeting on May 27. While the WCI Partners are not seeking formal comment on this document, the WCI Partners value feedback and will consider any comments that are submitted.

WCI Submits Comments To The U.S. EPA On Its Proposed Rule For Mandatory Reporting Of Greenhouse Gases

The WCI comments were submitted on June 9, 2009, and can be viewed on the WCI website.

WCI Submits Comments To The U.S. EPA On Its Proposed Endangerment Finding

The WCI comments were submitted on June 23, 2009, and can be viewed on the WCI website.

Quebec Passes Cap-and-Trade Legislation

On June 18, 2009, legislationwas adopted in Quebec which authorizes the government to implement a cap-and-trade system for greenhouse gases in North America, per its commitment to the WCI.

Ontario Proposes Cap-and-Trade Legislation

On May 27, 2009, the Ontario government introduced enabling legislation that if passed, would allow the implementation of a cap-and-trade system through future regulations that can link to the WCI and other emerging North American systems. To complement the proposed legislation, the Ontario government is seeking stakeholder comments on a discussion paper to inform the development of potential future regulations. The paper and proposed legislation are available at Ontario's Environmental Registry under number 010-6740.

Documents Planned for Release in July

The following documents are planned for release in July. Announcements will be sent through the WCI listserv as they become available, including information on how to submit comments.

- Final Essential Requirements for Mandatory GHG Reporting
- Offsets System Essential Elements White Paper
- Regional Emissions Database Reporting Options White Paper
- Implementation Update on the First Jurisdictional Deliverer Approach to Regulating Electricity Imports
- Draft Statement of Principles for Addressing Competitiveness Issues
- Phase III Economic Modeling Results and Revised Assumptions Book

The Climate Registry's Accreditation Program

The Climate Registry

Presented to WCI Markets Task 2 Compliance Verification and Enforcement (CVE) Group

July 6, 2009

Overview

- The Climate Registry's Accreditation Process
- The Climate Registry's Role and Responsibilities
- The Accreditation Body's Role and Responsibilities
- Dispute Resolution
- Enforcement
- Considerations/Next Steps for the WCI

The Process of Accreditation

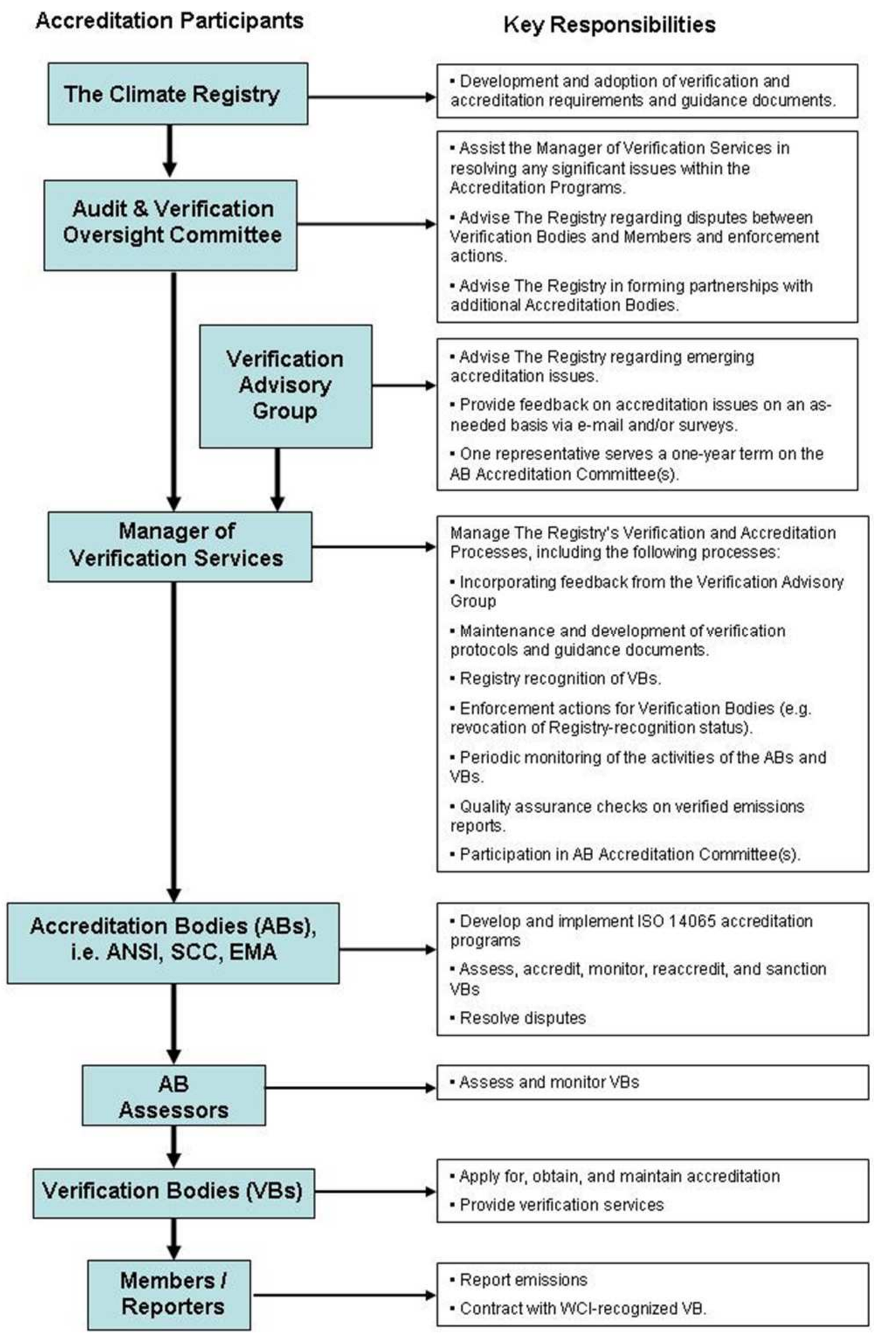
- Consistent with approach to accreditation for other schemes
  - Management systems or product certification
- Consistent with international approaches
  - ISO 14065
  - International Accreditation Forum (IAF) Mandatory Document for the Application of ISO 14065
- 3 stages :
  - Initial accreditation
  - Surveillance for maintenance of accreditation
  - Re-accreditation at the end of the cycle

ISO 14065 Requirements - Summary

- Verification Process Management System
- Impartiality
- Competency
- Personnel deployment & management
- Communications
- Records maintenance
- Verification processes must demonstrate:
  - VB applies ISO14064-3 & Registry's GVP requirements

Organizational Structure

The Climate Registry's Accreditation Organization Chart



Guidance on Accreditation (GoA)

for Verification Bodies

Provides overview of processes and requirements that Verification Bodies seeking recognition by The Climate Registry must meet:

http://www.theclimateregistry.org/downloads/GoA.pdf

The Climate Registry

Structure of the GoA

- Background
  - Relationships and responsibilities
- The Accreditation Processes
- Accreditation Requirements
  - ISO 14065
  - Registry-specific additional requirements
- Frequently Asked Questions
- Appendices: Including Accreditation Body-Specific Processes

Witness Assessments

- Three options for Verification Bodies to complete witness assessments:
  - TCR Members
  - CCAR Members
  - An entity that has produced an emissions inventory of at least 6 months of data consistent with the requirements of TCR's GRP.

Key Registry-Specific Criteria

- Knowledge of The Climate Registry's program requirements
- Consent to observation of verification by Verification Oversight Panel
- Compliance with COI process as described in GVP
- Liability insurance of at least $1,000,000
- Personnel competence expectations
- Requirement for 2 Lead Verifiers
- Provisions for use of subcontractors
- Reporting of engagement activity
- Record retention (5 years)

The Climate Registry

ANSI's Responsibilities

- Review VB applications
- Assess the professional credibility of the VBs
- Ensure that VBs possess the requisite knowledge, competence and impartiality
- Issue certificates of accreditation to VBs
- Monitor VBs
- Implement investigations and/or sanctions against accredited VBs, when necessary
- Manage the Accreditation Committee (through which the Registry will participate in key accreditation decisions)
- Prepare an annual report for the Registry
- Re-accredit

The Climate Registry

Registry's Oversight Role

- Develop Verification Program criteria
- Develop Registry-specific accreditation criteria
- Assist Accreditation Bodies (ABs) with accreditation decisions
- Monitoring/oversight of ABs and Verification Bodies (VBs)
- Contribute to appeals/dispute/conflict investigation and resolution process
- Participate in sanctioning
- Assess and improve program
- Audit and Verification Oversight Committee is responsible for high level oversight of accreditation and verification programs

Dispute Resolution

- Order of appeals:
  - Verification Body's internal dispute resolution process (in consultation with The Registry as necessary to resolve questions)
  - Request resolution from Accreditation Body
    - Either party may appeal
    - AB decisions is binding on Reporter and VB
    - VB is not required to agree or issue new statement

The Climate Registry

ISO 14065 Requirements for Appeals, and Complaints

- Documented process
- Publicly available upon request
- Persons engaged in resolution are different from those who carried out the validation or verification and prepared statements on the GHG assertion
- Provide complainant/appellant with reports and formal notice of the outcome
- Ensure that decisions on appeals do not result in any discriminatory actions against the complainant/ appellant.

The Climate Registry

ANSI Enforcement

ANSI may suspend, reduce or withdraw its accreditation of a Verification Body if any of the following occur:

a) Filing of any voluntary or involuntary petition of bankruptcy;

b) Making of any arrangement with creditors or holding of "composition of creditors" action in regard to financial difficulties or bankruptcy proceedings;

c) Appointment of a receiver for the business;

d) Voluntary or involuntary liquidation of the business or the organization;

e) Discontinuance of the accredited V/V Body program;

ANSI Enforcement

a) Failure by the V/V Body to take appropriate and timely corrective action on deficiencies in its program that have been requested by ANSI;

b) Persistent failure by a V/V Body to conform with the accreditation criteria, ANSI procedures or other program requirements, including sector- or GHG program-specific requirements

c) Inability or unwillingness of the V/V Body to ensure conformity of its clients with applicable verification/validation requirements

d) Improper use of the certificate of accreditation or ANSI accreditation mark

e) Failure to meet the requirements of accreditation or to abide by the rules for accreditation;

f) Failure to meet financial obligations to ANSI

g) Falsification of any nature

The Climate Registry

The Climate Registry Enforcement

The Climate Registry can:

- Issue warnings,
- Suspend or revoke Registry recognition, and/or
- Annul verification statements

In response to issues such as:

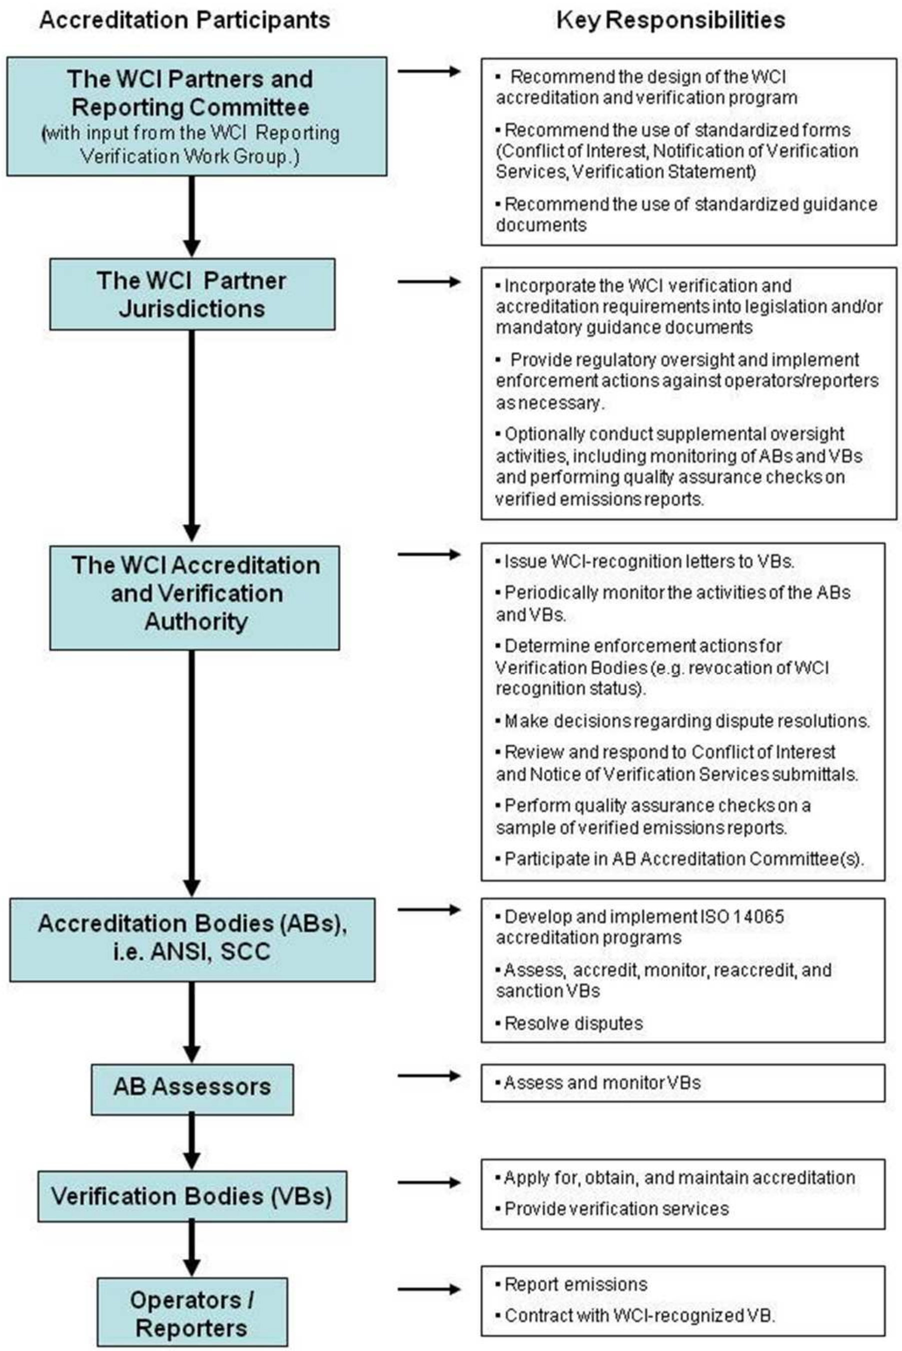
- Nonconformance with accreditation criteria
- ANSI and/or other GHG program enforcement action
- Submittal of incorrect/false COI assessments
- Significant concerns identified through oversight/surveillance activities

WCI Accreditation Program Goals

- Standardized, consistent accreditation process for the WCI region to ensure that qualified VBs conduct verification services according to WCI's requirements.
- Administrative simplicity for reporters and VBs.
- Efficient, cost-effective centralized program to reduce redundancy in resources allocated by jurisdictions.
- Flexible program to ensure jurisdictions can conduct additional oversight activities.
- Coordinated enforcement action (e.g. revocation of a VB's WCI-recognition status).

The Climate Registry

A Model for WCI Accreditation



Accreditation Considerations

- Partnership with ANSI and SCC
- WCI must define accreditation requirements for Verification Bodies
  - Demonstration of knowledge of the WCI program requirements
  - Appropriate level of professional indemnity insurance for VBs
  - WCI rules for VB use of subcontractors
  - Records retention requirements for VBs
  - Dispute resolution process (and how relates to AB process)
  - Etc.

Management Considerations

- WCI program management consideration
  - How much oversight does WCI want to have over the accreditation process and verification process?
  - How involved does WCI want to be with respect to COI?
  - How involved does WCI want to be with respect to monitoring VBs (surveillance audits, etc.)
- TCR is interested in providing services to promote a common, centralized, and streamlined accreditation administrative process.

Summary

The following documents are great resources to learn more about our program:

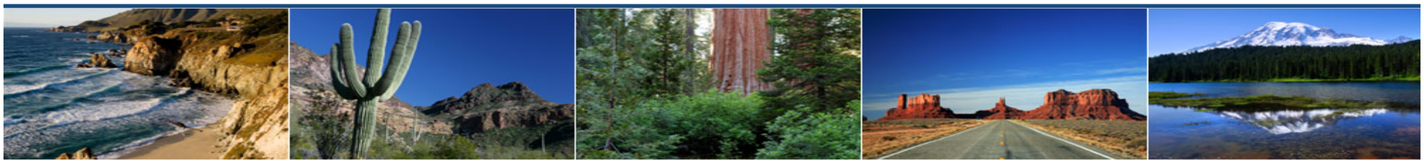
The Climate Registry

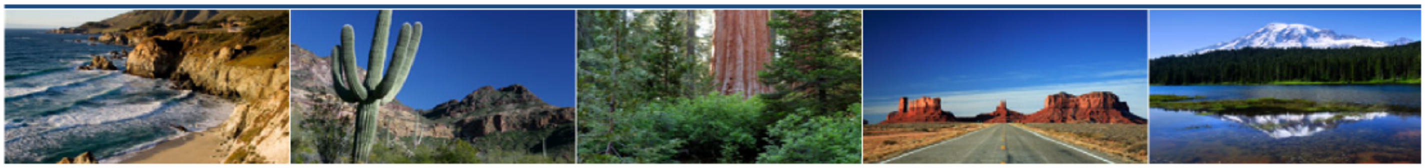
Western Climate Initiative



Final Essential Requirements of Mandatory Reporting

July 15, 2009

Western Climate Initiative



§ WCI.0	PURPOSE	2
§ WCI.1	APPLICABILITY	2
§ WCI.2	GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE	5
§ WCI.3	CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT	7
§ WCI.4	DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS	8
§ WCI.5	COMPLIANCE AND ENFORCEMENT	10
§ WCI.6	INCORPORATION BY REFERENCE	10
§ WCI.7	DESIGNATED REPRESENTATIVE (ONLY APPLICABLE TO WCI JURISDICTIONS IN THE UNITED STATES)	14
§ WCI.8	REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS	15
§ WCI.9	DEFINITIONS	15
§ WCI.10	GLOBAL WARMING POTENTIALS	15

EMISSIONS QUANTIFICATION, AND SAMPLING, ANALYSIS AND MEASUREMENT

§ WCI.20 through § WCI.xx

[These Essential Requirements for Reporting include placeholder references to requirements for reporting GHG emissions from the combustion of residential, commercial and industrial fuels and electricity imports that have not yet been completed by the WCI and will not go into effect for the 2010 reporting year. WCI Partner Jurisdictions may omit these references until they amend their rules to include reporting requirements for these sectors.]

§ WCI.0 PURPOSE

This rule requires mandatory reporting and verification of greenhouse gas (GHG) emissions data by certain facilities that directly emit GHG, by importers of electricity, and by suppliers of fossil fuels. The GHGs that must be reported under this rule are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), and sulfur hexafluoride (SF_6).

§ WCI.1 APPLICABILITY

(a) The GHG emissions reporting requirements, and related monitoring, recordkeeping, and verification requirements of this rule apply to the owners and operators *[Each jurisdiction will select the specific terminology for the regulated persons in accordance with its customary rule-writing practices]* of any facility that meets the requirements of paragraph (a)(1) of this section; and any fuel suppliers and electricity importers that meet the requirements of paragraph (a)(2), (a)(3), or (a)(4) of this section:

(1) Any facility that emits 10,000 metric tons CO_2e or more per year in combined emissions from one or more of the source categories listed in this paragraph in any calendar year starting in 2010.

[Please note that the quantification and monitoring methods for many of these source categories are currently being assessed. Only source categories for which adequate quantification methods exist will be included in the final WCI Essential Requirements for mandatory reporting.]

Adipic acid manufacturing
Aluminum manufacturing
Ammonia manufacturing [*still being assessed*]
Carbon dioxide transfer recipients [*still being assessed*]
Cement manufacturing
Coal mine fugitive emissions (active and abandoned)
Coal storage
Cogeneration
Electricity generation
Electronics Manufacturing [*still being assessed*]
Ferroalloy production [*still being assessed*]
General stationary fuel combustion
Glass Production and other uses of carbonates [*still being assessed*]
HCFC-22 production [*still being assessed*]
Hydrogen production
Industrial wastewater [still being assessed for some industries]
Iron and steel manufacturing
Lead production

Lime manufacturing
Magnesium production [still being assessed]
Natural gas transmission and distribution systems *[still being assessed]*
Nitric acid manufacturing *[still being assessed]*
Nonroad equipment at facilities *[still being assessed]*
Oil and gas production & gas processing *[still being assessed]*
Petrochemical production
Petroleum refineries
Phosphoric acid production *[still being assessed]*
Pulp and paper manufacturing
Refinery fuel gas
SF_6 from electrical equipment *[still being assessed]*
Soda ash manufacturing
Zinc production

(2) All importers of electricity. Importers of electricity include both retail providers and marketers that import electricity into the WCI region. *[This is preliminary language, pending definition of electricity importers by another WCI Committee.]*

(3) Any supplier that within the WCI region distributes transportation fuels in quantities that when combusted would emit 10,000 metric tons CO_2e per year or more in any calendar year starting in 2010. *[This is preliminary language, pending future determination of point of regulation for transportation fuels.]*

(4) Any supplier that distributes within the WCI region residential, commercial, and industrial fuels in quantities that when combusted would emit 10,000 metric tons CO_2e per year or more in any calendar year starting in 2010. *[This is preliminary language, pending future determination of points of regulation for these fuels.]*

(b) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold in paragraph (a)(1) of this section, the owner or operator shall calculate annual CO_2e emissions, as described in paragraphs (b)(1) through (b)(4) of this section.

(1) Estimate the annual emissions of CO_2, CH_4, N_2O, HFC, PFC, and SF_6 in metric tons for each unit, process, activity, or operation for which emission calculation methodologies are provided in sections WCI.20 through WCI.XX. The GHG emissions shall be calculated using methodologies specified in each applicable section.

(2) For stationary combustion units, carbon dioxide emissions from the combustion of biomass fuels shall be included in the calculations, with the following exceptions:

(A) Until such time as [jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, a maximum of 15,000 metric tons of carbon dioxide emissions from the combustion of pure solid biomass fuel may be excluded from calculation of GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold in paragraph (a)(1) of this section, provided that total GHG emissions including emissions from solid biomass fuel are less than 25,000 metric tons CO_2e.

(B) After such time as [jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, the carbon dioxide emissions from the combustion of those fuels may be excluded from calculation of GHG emissions for determining whether the 10,000 metric tons CO_2e per year emission threshold in paragraph (a)(1) of this section has been met.

[A WCI Partner jurisdiction may, in its discretion, choose to require carbon dioxide emissions from the combustion of biomass fuel to be included in the determination of stationary combustion units that are required to report and may require that those emissions be reported separately from emissions from fossil fuels.]

(3) Sum the total facility emissions for each GHG and calculate the metric tons of CO_2e using equation 1-1 below.

$$CO_2e = \sum_{i=1}^{n} GHG_i \times \mathrm{GWP}_i$$ **Equation 1-1**

Where:

CO_2e = Carbon dioxide equivalent, metric tons/year.
GHG_i = Mass emissions of each greenhouse gas emitted, metric tons/year.
GWP_i = Global warming potential for each greenhouse gas from Table WCI.10-1 of this regulation.
n = The number of greenhouse gases emitted.

(4) For purpose of determining if an emission threshold has been exceeded, any CO_2 that is captured for on-site use, on-site storage, or transfer off-site must be included in the emissions total.

(c) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of transportation fuels in paragraphs (a)(3) of this section, the owner or operator shall follow the procedures of paragraphs (c)(1) through (c)(2) below:

(1) Calculate the total mass in metric tons per year of CO_2, CH_4, and N_2O that would result from the complete combustion or oxidation of all transportation fuels that are distributed within the WCI region. The mass of each GHG shall be calculated using any of the applicable methodologies specified in section WCI.XX [Transportation Fuels Combustion] of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO_2e using Equation 1-1 of this rule.

(d) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of residential, commercial, and industrial fuels in paragraph (a)(4) of this section, the owner or operator shall follow the procedures of paragraphs (d)(1) and (d)(2) below:

(1) Calculate the total mass in metric tons per year of CO_2, CH_4, and N_2O that would result from the complete combustion or oxidation of all residential, commercial, and industrial fuels that are distributed within the WCI region. The calculation shall exclude any fuels that are supplied to facilities that are required to report GHG emissions under section WCI.1(a)(1). *[These accounting issues will be dealt with later in 2009 or in 2010.]* The mass of each GHG shall be calculated using any of the applicable methodologies

specified in section WCI.XX [Residential, Commercial and Industrial Fuels Combustion] of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO_2e using Equation 1-1 of this rule.

(e) If the operations of a facility or fuel supplier that is subject to this rule change such that emissions fall below 10,000 metric tons CO_2e per year, then the following reporting requirements shall apply:

(1) If, prior to such emission reduction, the emissions report was subject to the verification requirements of this rule; then the owner or operator shall continue to submit emission reports until reported emissions are below 10,000 metric tons CO_2e per year for a minimum of 3 consecutive years. If reported emission are less than 10,000 metric tons CO_2 per year during 3 consecutive years, then the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(2) If, prior to such emission reduction, the emissions report was not subject to the verification requirements of this rule; then the owner or operator shall submit to the *[jurisdiction]* a signed statement certifying that emissions are less than 10,000 metric tons CO_2e during the prior year. After certifying that emissions are below 10,000 metric tons CO_2e per year for 3 consecutive years, the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(3) Notwithstanding the requirements of paragraphs (e)(1) and (2) of this section, a facility or fuel supplier that is a covered entity under the WCI cap-and-trade program must continue to submit annual emissions reports.

(f) Upon request by the [*jurisdiction*], owner or operator of any facility or fuel supply operation must submit a demonstration that emissions have not exceeded one or more of the applicability criteria specified in this section in any year since 2010. Such demonstration shall be provided to the [*jurisdiction*] within 20 working days of receipt of a written request.

§ WCI.2 GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE

[Specific requirements of this section may change based on the future final design of the market trading program.]

(a) General. Owners or operators that are subject to this rule must submit an annual GHG emissions report. Owners and operators must collect data; calculate GHG emissions; and follow the procedures for quality assurance, missing data, recordkeeping, and reporting as specified in these General Provisions and in each relevant section WCI.20 through WCI.XX of this rule.

[WCI jurisdictions have the flexibility during the first year of reporting, 2010, to allow the application of Best available data and methods (as defined in WCI.9) in circumstances in which owners and operators demonstrate that they require additional time, for example, to install equipment and institute procedures that are required for reporting.]

(1) A facility, fuel supplier, or electricity importer that commenced operation before January 1, 2010, must report emissions beginning in 2011 for GHGs emitted in calendar year 2010.

(2) A new facility, fuel supplier, or electricity importer that commences operation on or after January 1, 2010, must report emissions for the first calendar year in which the facility operates, beginning with the first operating month and ending on December 31 of that year. Each subsequent annual report must cover emissions for the calendar year, beginning on January 1 and ending on December 31.

(b) Reporting and Verification Schedule.

(1) Annual GHG emissions reports must be submitted to [*the jurisdiction*] by April 1 of each year for emissions in the previous calendar year.

(2) Reporters subject to the verification requirements of WCI.8, must complete their verification process, including submittal of a verification statement to [*the jurisdiction*], according to the following schedule:

(A) For reporting years 2010 through 2011, September 1 of the year following the reporting year.

(B) For reporting years 2012 and later, *[date to be determined]*.

(c) Submission of GHG Emissions Report. The annual GHG emissions report must be submitted to [*the jurisdiction*] in a format [*to be specified by each jurisdiction*].

(d) Simplified Emission Calculation Methods for De Minimis Sources. The owner or operator may elect to designate as de minimis one or more sources or pollutants that collectively emit no more than 3 percent of the facility's total CO_2e emissions, but not to exceed 20,000 metric tons CO_2e. The owner or operator may estimate emissions for these de minimis sources using alternative methods to those required to be used by this rule. If verification of the emissions report is required by this rule, then the selection of any alternative GHG calculation method is subject to the concurrence of the verification team that the use of such methods provides reasonable assurance that the emissions so designated do not exceed the applicable de minimis limits. The operator shall separately identify and include in the emissions data report the emissions from designated de minimis sources.

(e) To ensure accuracy of reported data and the ability to conduct audits and/or verifications of each emissions data report, the owner or operator shall establish and maintain data acquisition and handling activities that provide for the transparency and verifiability of emissions calculations and supporting information consistent with section WCI.4.

[As a means of assuring a smooth verification process and a positive verification opinion WCI jurisdictions may also require or advise in guidance materials that facilities have a full GHG inventory management plan.]

(f) GHG Emissions Report Revisions.

(1) The owner or operator shall maintain documentation to support any revisions made to a previously submitted annual GHG emissions report. Documentation for all revisions shall be retained by the operator for 7 years.

(2) If, after the verification deadline, a report subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report within 60 days of the finding. To the extent possible, the revised report must correct all identified errors. A revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*]. [The jurisdiction] will send notification of approval or disapproval and an explanation of the reasons for any disapproval within 60 days of receipt of the revised report.

(3) If, after the report submittal deadline, a report not subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report within 30 days of the finding. To the extent possible, the revised report must correct all identified errors. A revised report will be accepted only if approved by [*the jurisdiction*]. [The jurisdiction] will send notification of approval or disapproval and an explanation of the reasons for any disapproval within 60 days of receipt of the revised report.

(4) An owner or operator that voluntarily chooses to correct errors of 5 percent or less in total CO_2e emissions reported may do so according to the following requirements:

(A) For reports subject to verification, a revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*].

(B) For reports not subject to verification, a revised report will be accepted if approved by [*the jurisdiction*].

(g) Where this rule specifies a choice between use of a fuel-based or mass balance-based calculation or use of a continuous emissions monitoring system (CEMS) to calculate CO_2 emissions, the operator shall make this choice and continue to use the method chosen for all future emissions data reports, unless the use of the alternative calculation method is approved in advance by *[the jurisdiction]*.

§ WCI.3 CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT

Each annual GHG emissions report shall contain the following information:

(a) Facility name, identification number, physical address, mailing address, and NAICS code.

(b) Reporting year.

(c) Date of report submittal.

(d) Total facility emissions aggregated from all applicable source categories in subparts WCI.20 through WCI.XX expressed in metric tons of CO_2e calculated using Equation 1-1 of section WCI.1, excluding emissions from CO_2 that is captured and CO_2 emissions from the combustion of biomass and biomass-derived fuels, which are reported separately.

(e) Total facility emissions of CO_2 from the combustion of biomass and biomass-derived fuels.

(f) Total annual mass of CO_2 captured for on-site use, on-site storage, or transfer off site, in metric tons.

(g) For applicable fuel supplier categories in subparts WCI.XX [Transportation Fuels Combustion] and WCI.XX [Residential, Commercial and Industrial Fuels Combustion], total CO_2e emissions aggregated from all specified fuels.

(h) Emissions from each applicable source category or fuel supplier category in subparts WCI.20 through WCI.XX, expressed in metric tons per year of CO_2, CH_4, N_2O, HFC, PFC, and SF_6. CO_2 emissions from the combustion of biomass and biomass-derived fuels shall be reported separately.

(i) For electricity importers, the information required by WCI.XX [Electricity Imports].

(j) Emissions and other data for individual units, processes, activities, and operations as specified for each source category in sections WCI.20 through WCI.XX of this rule.

(k) Emission factors developed or measured by the operator using approved source testing as provided under sections WCI.20 through WCI.XX. Emission factors shall be provided in units of emissions per amount of fuel consumed, where fuel is reported in the units specified in this regulation.

(l) Mass emissions from each designated de minimis source or pollutant, reported in metric tons per year of each GHG for which an alternative emission calculation method is used.

(m) Name and contact information including e-mail address and telephone number of the person primarily responsible for preparing and submitting the emissions report.

(n) [only applicable in United States jurisdictions] A signed and dated statement provided by the owner or operator, or their designated representative, certifying that the report has been prepared in accordance with this rule and that, subject to verification, the statements and information contained in the emissions data report are true, accurate, and complete to the best of their knowledge.

(o) [only applicable in Canadian jurisdictions] A statement signed and dated by the operator's representative, certifying that:

  (1) The operator's representative has examined the emissions report and ensured that it is complete and accurate; and

  (2) The emissions report has been prepared in accordance with this rule and that the statements and information contained in the emissions report are true and fair to the best of the knowledge of the operator's representative.

§ WCI.4 DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS

(a) The operator shall establish and maintain procedures for document retention and record keeping. The operator shall retain all documents regarding the design, development and maintenance of the GHG inventory in paper, electronic or other usable format for a period of not less than 7 years following submission of each emissions data report. The retained documents, including GHG emissions data, shall be sufficient to allow for the verification of each emissions data report.

(b) Upon request by *[jurisdiction]*, the operator shall provide within 10 working days all documents and data used to develop an emissions data report.

(c) In addition to information submitted as part of the emissions data report, each operator shall retain, at a minimum, the following information, if applicable, for at least 7 years after the submission of the report:

(1) A list of all GHG sources (i.e., units, operations, processes, and activities) included in the emission estimates.

(2) All records and documents used to calculate emissions for each source, categorized by process and fuel or material type.

(3) Documentation of the process for collecting emissions data.

(4) Any GHG emissions calculations and methods used;

(5) All emission factors used for emission estimates, including documentation for any factors not provided in the rule.

(6) All input data used for emission estimates.

(7) Documentation of biomass fractions for specific fuels.

(8) All other data submitted to the [*jurisdiction*] under this rule, including the GHG emissions report.

(9) All computations made to gap-fill missing data.

(10) Names and documentation of key facility personnel involved in emissions calculating and reporting;

(11) Any other information that is required for the verification of the GHG emissions report.

(12) A log to be prepared for each reporting year, beginning January 1, documenting all procedural changes made in GHG accounting methods and changes to instrumentation for GHG emissions estimation.

(13) Documentation of the data acquisition and handling activities required by WCI.2(e).

(d) For measurement based methodologies, the following information, if applicable, also must be retained for at least 7 years after the submission of the emissions data report:

(1) List of all emission points monitored.

(2) Collected monitoring data.

(3) Any quality assurance and quality control information collected in accordance with the data acquisition and handling activities required by WCI.2(e).

(4) A detailed technical description of the continuous measurement system, including documentation of any findings and approvals by federal, State or local agencies.

(5) Raw and aggregated data from the continuous measurement system.

(6) A log book of all system down-times, calibrations, servicing, and maintenance of the continuous measurement system.

(7) Documentation of any changes in the continuous measurement system over time.

§ WCI.5 COMPLIANCE AND ENFORCEMENT

(a) Submission of false or misleading information to the *[jurisdiction]* or a verification body shall constitute a single, separate violation of the requirements of this article for each day after the information has been received by the Executive Officer or verification body. *[Partners must be able to enforce this provision in the absence of evidence of intent, e.g., strict or absolute liability, depending on the jurisdiction.]*

(b) Each violation of this rule shall constitute a single, separate violation for each day the violation continues.

§ WCI.6 INCORPORATION BY REFERENCE

The following documents are incorporated by reference into this rule. These materials are incorporated as they exist on the date this article is adopted.

(a) The following materials are available for purchase from the following addresses: American Society for Testing and Material (ASTM), 100 Barr Harbor Drive, P.O. Box CB700, West Conshohocken, Pennsylvania 19428-B2959; and the University Microfilms International, 300 North Zeeb Road, Ann Arbor, Michigan 48106:

(1) ASTM D240-02, (Reapproved 2007), Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter.

(2) ASTM D388-05, Standard Classification of Coals by Rank.

(3) ASTM D396-08, Standard Specification for Fuel Oils.

(4) ASTM D975-08, Standard Specification for Diesel Fuel Oils.

(5) ASTM D1250-07, Standard Guide for Use of the Petroleum Measurement Tables.

(6) ASTM D1826-94 (Reapproved 2003), Standard Test Method for Calorific (Heating) Value of Gases in Natural Gas Range by Continuous Recording Calorimeter.

(7) ASTM Specification D1835-05 (2005).

(8) ASTM D1945-03 (Reapproved 2006), Standard Test Method for Analysis of Natural Gas by Gas Chromatography.

(9) ASTM D1946-90 (Reapproved 2006), Standard Practice for Analysis of Reformed Gas by Gas Chromatography.

(10) ASTM D2013-07, Standard Practice of Preparing Coal Samples for Analysis.

(11) ASTM D2234/D2234M-07, Standard Practice for Collection of a Gross Sample of Coal.

(12) ASTM D2502-04 (Reapproved 2002), Standard Test Method for Estimation of Molecular Weight (Relative Molecular Mass) of Petroleum Oils from Viscosity Measurements.

(13) ASTM D2503-92 (Reapproved 2007), Standard Test Method for Relative Molecular Mass (Relative Molecular Weight) of Hydrocarbons by Thermoelectric Measurement of Vapor Pressure.

(14) ASTM D2880-03, Standard Specification for Gas Turbine Fuel Oils.

(15) ASTM D3176-89 (Reapproved 2002), Standard Practice for Ultimate Analysis of Coal and Coke.

(16) ASTM D3238-95 (Reapproved 2005), Standard Test Method for Calculation of Carbon Distribution and Structural Group Analysis of Petroleum Oils by the n-d-M Method.

(17) ASTM D3588-98 (Reapproved 2003), Standard Practice for Calculating Heat Value, Compressibility Factor, and Relative Density of Gaseous Fuels.

(18) ASTM Specification D3699-07, Standard Specification for Kerosene.

(19) ASTM D4057-06, Standard Practice for Manual Sampling of Petroleum and Petroleum Products.

(20) ASTM D4809-06, Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter (Precision Method).

(21) ASTM Specification D4814-08a, Standard Specification for Automotive Spark-Ignition Engine Fuel.

(22) ASTM D4891-89 (Reapproved 2006), Standard Test Method for Heating Value of Gases in Natural Gas Range by Stoichiometric Combustion.

(23) ASTM D5291-02 (Reapproved 2007), Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants.

(24) ASTM D5373-08, Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Laboratory Samples of Coal and Coke.

(25) ASTM D5865-07a, Standard Test Method for Gross Calorific Value of Coal and Coke.

(26) ASTM D6316-04, Standard Test Method for the Determination of Total, Combustible and Carbonate Carbon in Solid Residues from Coal and Coke.

(27) ASTM D6866-06a, Standard Test Methods for Determining the Biobased Content of Natural Range Materials Using Radiocarbon and Isotope Ratio Mass Spectrometry Analysis.

(28) ASTM E1019-03, Standard Test Methods for Determination of Carbon, Sulfur, Nitrogen, and Oxygen in Steel and in Iron, Nickel, and Cobalt Alloys.

(29) ASTM E1915-07a, Standard Test Methods for Analysis of Metal Bearing Ores and Related Materials by Combustion Infrared-Absorption Spectrometry.

(30) ASTM D7459-08, Standard Practice for Collection of Integrated Samples for the Speciation of Biomass (Biogenic) and Fossil-Derived Carbon Dioxide Emitted from Stationary Emissions Sources.

(31) ASTM D6060-96(2001) Standard Practice for Sampling of Process Vents With a Portable Gas Chromatograph.

(32) ASTM D 2502-88(2004)e1 Standard Test Method for Ethylene, Other Hydrocarbons, and Carbon Dioxide in High-Purity Ethylene by Gas Chromatography.

(33) ASTM C25-06 Standard Test Method for Chemical Analysis of Limestone, quicklime, and Hydrated Lime.

(34) C1271-99(2006) Standard Test Method for X-ray Spectrometric Analysis of Lime and Limestone.

(35) C1301-95(2001) Standard Test Method for Major and Trace Elements in Limestone and Lime by Inductively Coupled Plasma-Atomic Emission Spectroscopy (ICP) and Atomic Absorption (AA).

(36) UOP539-97 Refinery Gas Analysis by Gas Chromatography.

(37) ASTM D5468-02 (Reapproved 2007).

(b) The following materials are available for purchase from the American Society of Mechanical Engineers (ASME), 22 Law Drive, P.O.Box 2900, Fairfield, NJ 07007-2900:

(1) ASME MFC-3M-2004, Measurement of Fluid Flow in Pipes Using Orifice, Nozzle, and Venturi.

(2) ASME MFC-4M-1986 (Reaffirmed 1997), Measurement of Gas Flow by Turbine Meters.

(3) ASME-MFC-5M-1985, (Reaffirmed 1994), Measurement of Liquid Flow in Closed Conduits Using Transit-Time Ultrasonic Flowmeters.

(4) ASME MFC-6M-1998, Measurement of Fluid Flow in Pipes Using Vortex Flowmeters.

(5) ASME MFC-7M-1987 (Reaffirmed 1992), Measurement of Gas Flow by Means of Critical Flow Venturi Nozzles.

§ WCI.7 DESIGNATED REPRESENTATIVE (ONLY APPLICABLE TO WCI JURISDICTIONS IN THE UNITED STATES)

(a) General. Each fuel supplier, electricity importer, and owner or operator of a facility that is subject to this rule, shall select a designated representative that is responsible for certifying and submitting GHG emissions reports under this reporting rule.

(b) Authorization of a Designated Representative. The designated representative of the facility shall be selected by a certificate of representation agreement that is signed by the designated representative and owners or operators of the facility. The designated representative must be an individual having responsibility for the overall operation of the facility or activity such as the position of the plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company.

(c) Responsibility of the Designated Representative.

(1) The designated representative of the facility shall represent and by any representations, actions, inactions, or submissions, legally bind each owner and operator in all matters pertaining to this rule.

(2) Each GHG emission report submitted under this rule must be signed by the designated representative and must contain the following certification statement: "I have been authorized to make this submission on behalf of the owners and operators of the facility (or supply operation, as appropriate). I certify under penalty of law that I have personally examined the information submitted in this document. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

(d) Changing a Designated Representative. The designated representative may be changed at any time upon submission of a superseding certificate of representation. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous designated representative before time of the superseding certificate of representation shall be binding on the new designated representative and the owners and operators.

(e) Changes in Owners and Operators. In the event of any change in ownership of the facility, any new owner or operator shall be deemed to be bound by the representations, actions, inactions, and submissions of the designated representative of the facility until such time as the designated representative is changed.

(f) Certificate of Representation. A certificate of representation must be submitted to *[the jurisdiction]* and kept on location by the facility, fuel supplier, or electricity importer. The certificate shall include the following information:

(1) Identification of the facility, fuel supplier, or electricity importer for which the certificate of representation is submitted.

(2) The name, address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the designated representative.

(3) A list of the owners and operators.

(4) Certification statements that the actions of the designated representative with respect to this rule are binding on the owners and operators, and that the designated representative has the necessary authority to carry out duties and responsibilities on behalf of the owners and operators.

(5) The signature of the designated representative and owner(s) and operator(s), and the dates signed.

§ WCI.8 REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS

[See separate document.]

§ WCI.9 DEFINITIONS

[See separate document.]

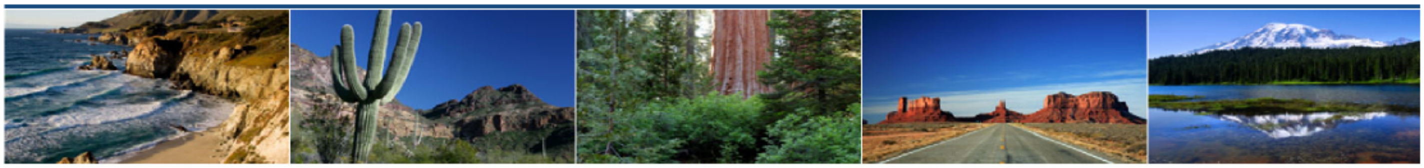
§ WCI.10 GLOBAL WARMING POTENTIALS

Owners and operators must use the global warming potential (GWP) values given in Table WCI.10-1 when converting emissions of greenhouse gases to metric tons of carbon dioxide equivalent (CO_2e), using Equation 1-1.

Table WCI.10-1. Global Warming Potential Factors for Greenhouse Gases

Common Name	Formula	Chemical Name	GWP
Carbon dioxide	CO_2		1
Methane	CH_4		21
Nitrous oxide	N_2O		310
Sulfur hexafluoride	SF_6		23,900
Hydrofluorocarbons (HFCs)			
HFC-23	CHF_3	trifluoromethane	11,700
HFC-32	CH_2F_2	difluoromethane	650
HFC-41	CH_3F	fluoromethane	150
HFC-43-10mee	$C_5H_2F_{10}$	1,1,1,2,3,4,4,5,5,5- decafluoropentane	1,300
HFC-125	C_2HF_5	pentafluoroethane	2,800
HFC-134	$C_2H_2F_4$	1,1,2,2-tetrafluoroethane	1,000
HFC-134a	$C_2H_2F_4$	1,1,1,2-tetrafluoroethane	1,300
HFC-143	$C_2H_3F_3$	1,1,2-trifluoroethane	300
HFC-143a	$C_2H_3F_3$	1,1,1-trifluoroethane	3,800
HFC-152	$C_2H_4F_2$	1,2-difluoroethane	43
HFC-152a	$C_2H_4F_2$	1,1-difluoroethane	140
HFC-161	C_2H_5F	fluoroethane	12
HFC-227ea	C_3HF_7	1,1,1,2,3,3,3- heptafluoropropane	2,900
HFC-236cb	$C_3H_2F_6$	1,1,1,2,2,3-hexafluoropropane	1,300
HFC-236ea	$C_3H_2F_6$	1,1,1,2,3,3-hexafluoropropane	1,200
HFC-236fa	$C_3H_2F_6$	1,1,1,3,3,3-hexafluoropropane	6,300
HFC-245ca	$C_3H_3F_5$	1,1,2,2,3-pentafluoropropane	560

HFC-245fa	$C_3H_3F_5$	1,1,1,3,3-pentafluoropropane	950
HFC-365mfc	$C_4H_5F_5$	1,1,1,3,3-pentafluorobutane	890
Perfluorocarbons (PFCs)			
Perfluoromethane	CF_4	tetrafluoromethane	6,500
Perfluoroethane	C_2F_6	hexafluoroethane	9,200
Perfluoropropane	C_3F_8	octafluoropropane	7,000
Perfluorobutane	C_4F_{10}	decafluorobutane	7,000
Perfluorocyclobutane	c-C_4F_8	octafluorocyclobutane	8,700
Perfluoropentane	C_5F_{12}	dodecafluoropentane	7,500
Perfluorohexane	C_6F_{14}	tetradecafluorohexane	7,400



§WCI.8 REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS

Note: The verification requirements laid out in this section strive for consistency with ISO 14064-3[1] *requirements and set forth a high standard for verification that will ultimately support a WCI cap and trade program. Due to differences in rulemaking procedures between jurisdictions, Supplement 1 provides supplemental text that jurisdictions must incorporate into either the jurisdiction's prescriptive rule language, replacing more general procedural language in Section WCI.8, or into enforceable guidance documents. There are notes in WCI.8 that direct readers to appropriate text in Verification Supplement 1 when applicable.*

It would be ideal for all jurisdictions to enforce the same requirements and have the same implementation processes for accreditation and verification to ensure that consistent accurate data exists throughout the WCI regional program. Reporters and verifiers with operations throughout the WCI region will benefit from a consistent approach and such an approach would facilitate administration of the verification requirements by a central body or designee.

(a) Applicability and Scope.

(1) Except as provided in WCI.8(a)(2) through (4) owners or operators [Each jurisdiction will select the specific terminology for the regulated persons in accordance with their customary rule-writing practices] are required to obtain annual verification for a facility that emits 25,000 metric tons CO_2e or more per year in combined emissions from one or more of the source categories listed in WCI.1 in any calendar year starting on or after 2010.

(2) When the operation of a facility, fuel supplier, or electricity importer subject to the requirements of this section is changed such that the operator has reported less than 25,000 metric tons of CO_2e emissions for a calendar year, the operator shall obtain verification of annual emissions reports for the lesser of three subsequent calendar years or for those years remaining in the current compliance period. If CO_2e emissions of a facility, fuel supplier, or electricity importer subject to the requirements of this section again exceed 25,000 metric tons in any calendar year the provisions of WCI.8(a)(1) apply.

[1] ISO (2006) ISO 14064-3: Greenhouse Gases-Part 3: Specification with guidance for the validation and verification of greenhouse gas assertions, March, 2006, International Organization for Standardization, Switzerland.

(3) Carbon dioxide emissions from the combustion of biomass fuels shall be included in the determination regarding verification applicability, with the following exceptions:

(A) Until such time as [the jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, a maximum of 15,000 metric tons of carbon dioxide emissions from the combustion of pure solid biomass fuel may be excluded from calculation of GHG emissions for comparison to the 25,000 metric ton CO_2e per year verification threshold in paragraph (a) of this section.

(B) After such time as [the jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, the carbon dioxide emissions from the combustion of those fuels may be excluded from calculation of GHG emissions for determining whether the 25,000 metric tons CO_2e per year verification threshold in paragraph (a)(1) of this section has been met.

[Under Design Recommendation 1.3, carbon neutral biomass will be excluded from the cap-and-trade program. A WCI Partner jurisdiction, however, may, in its discretion, choose to require carbon dioxide emissions from the combustion of biomass fuel to be included in the determination of the verification threshold in order to obtain a complete inventory of the fuels being combusted in the jurisdiction.]

(4) Owners or operators may exclude carbon dioxide emissions from the combustion of biomass fuels that [jurisdiction] has deemed carbon neutral from the scope of verification.

[A WCI Partner jurisdiction may, in its discretion, choose to require carbon dioxide emissions from the combustion of biomass fuel to be included in the scope of verification.]

(5) Notwithstanding WCI.8(a)(2) and (3), any facility, fuel supplier or electricity importer subject to a cap-and-trade program for CO_2e emissions established by [the jurisdiction] shall obtain verification of reported annual emissions.

(b) Requirements for Annual Verification of Emissions Data Reports.

(1) Verification bodies shall conduct verification processes and design verification procedures to determine whether there is a reasonable level of assurance for each separate emissions data report every year of the verification cycle. The verification team shall find that there is a reasonable level of assurance for an emissions data report if the report

(A) contains no material misstatement; and

(B) conforms to the requirements of this article.

(2) The verification body must provide verification services in compliance with WCI.8.

(3) Facility owners or operators, fuel suppliers, and electricity importers required to obtain annual verification shall be subject to full verification requirements in the first year that verification is required for an emissions data report. Upon completion of a positive verification statement under full verification requirements, the facility owner or operator, fuel supplier, or electricity importer may be eligible for two years of less intensive verification services as described in section WCI.9. This cycle may be

repeated in subsequent three-year cycles; however, full verification requirements shall apply at least once every three years.

(4) Facility owners or operators, fuel suppliers, and electricity importers required to obtain annual verification will be required to obtain full verification services if any of the following apply:

(A) There has been a change in the verification body from the previous year; or

(B) A verification body issued an adverse verification statement for that facility's previous year's emissions data report.

(c) Accreditation Requirements for Verification Bodies.

(1) The accreditation requirements specified in this subsection shall apply to all verification bodies that wish to provide verification services under this rule.

(2) A verification body is qualified to conduct verification services for the WCI if

(A) it has demonstrated knowledge of the WCI reporting requirements; and

(B) it is accredited to ISO 14065 through a program developed under ISO 17011 by an accreditation body that is a member of the International Accreditation Forum.

[Note the details of the WCI's specific accreditation process for verification bodies (which has yet to be developed) will be consistent with ISO 14065 through an accreditation program that will developed under ISO 17011 and will include demonstrated knowledge of the WCI reporting requirements. The WCI will explore additional accreditation requirements and/or other criteria for individual lead verifiers, general verifiers, and/or sector specialists.]

(3) Prior to January 1, 2013, accreditation by the California Air Resources Board under Title 17, California Code of Regulation, section 95132, may be substituted for the accreditation required under WCI.8(c)(2)(B).

(d) Requirements for Verification Services. The following verification services must be provided for each emissions data report.

(1) As part of the verification services, the verification team shall review documents submitted, assess risks of a material misstatement, develop a verification plan (that includes a sampling plan), evaluate the emissions data report against the verification requirements, and assess the materiality of errors, omissions and misstatements identified.

(2) The verification team shall request any information and documents needed for verification services. Such information shall include, but is not limited to original records and supporting data for the emissions data report.

(e) A verification team must include the following:

(1) a Lead Verifier;

(2) an Independent Peer Reviewer;

(3) any subcontractor elected to provide verification services under WCI.8(f).

(f) Subcontracting. The following requirements shall apply to any verification body that elects to subcontract verification services.

(1) The primary verification body must assume full legal responsibility for verification services performed by subcontracted verifiers or verification bodies.

(2) A verification body or verifier acting as a subcontractor to the primary verification body will not further subcontract that same work to another firm or individual.

(3) A verification body or verifier acting as a subcontractor is subject to all Conflict of Interest requirements in Section WCI.8(g).

(4) A verification body or verifier acting as a subcontractor must be identified by the primary verification body as part of the verification team.

(g) Conflict of Interest Requirements for Verification Bodies. The conflict of interest provisions of this section shall apply to the verification body, entities related to the verification body, and the verification team accredited according to the requirements of the WCI to perform verification services for the WCI program. Member for purposes of this section means any employee or subcontractor of the verification body or entities related to the verification body. Member also includes any individual with a majority equity share in the verification body or entities related to the verification body.

(1) Prior to a jurisdiction accepting a verification statement, and prior to a jurisdiction accepting the associated emissions report for consideration for approval, the AVA must determine that the verification body has a low potential for conflict of interest as described under WCI.8(g)(6). To inform this determination by the AVA, a self-evaluation of the potential for any conflict of interest that the verification body, entities related to the verification body, and members of the verification team, including subcontractors, may have with the owner or operator or their related entities for which verification services will be or have been provided shall be submitted to the AVA. This self-evaluation must include an evaluation of any threats to the verification body's independence including: [*note: a standardized Conflict of Interest Assessment form will be developed for the WCI*]

[To facilitate timely determinations of conflict-of-interest potential, and to reduce the risk of finding medium or high conflict-of-interest potential after verification services have been initiated, it is recommended that jurisdictions require that the self evaluations be submitted and evaluated by the AVA prior to the initiation of verification services. A jurisdiction may elect to allow verification services to commence prior to the determination of the conflict-of-interest potential by the AVA.]

(A) Threats created by the reporting operation offering inducements to the verification body, subcontractors or verification team members for a positive opinion;

(B) Threats created by members of the verification body, verification team members, subcontractors, or family of subcontractors or team members having a financial interest in the reporting operation or its operator;

(C) Threats created by members of the verification body reviewing work of the verification body, subcontractors, members of the verification team, or related companies, including but not limited to any situation where the body, subcontractors, team members or companies have provided services related to greenhouse gases;

(D) Threats created by members of the verification body, verification team members, or subcontractors having a close relationship with the reporting operation, such that they might become too sympathetic to the interests of the reporting operation; and

(E) Threats created by members of the verification body, verification team members, or subcontractors being deterred from acting objectively or exercising professional skepticism by threats, actual or perceived, from the reporting operation.

(2) The verification body shall deem the potential for conflict of interest to be low if

(A) No threats as listed in WCI.8(g)(1) exist, and

(B) Any non-verification services provided by the verification body to the owner or operator within the last three years are valued at less than five percent of the verification body's annual revenue in each of those years.

(3) The verification body shall deem the potential for conflict of interest to be high if threats as listed in WCI.8(g)(1)(A) or (E) exist.

[A jurisdiction may expand the list of high threats (i.e. un-mitigatable conflicts) with the items included in paragraph 2 of the Conflict of Interest section of Supplement 1 below.]

(4) The verification body shall deem the potential for a conflict of interest to be medium if the potential for a conflict of interest is not deemed to be either low or high as specified in sections WCI.8(g)(2)-(3).

(5) If a verification body deems the potential for conflict of interest to be medium and wishes to provide verification services for the owner or operator, then the verification body shall submit, in addition to the self-evaluation, a plan to avoid, neutralize, or mitigate the potential conflict of interest situation.

(6) Conflict of Interest Determinations. The AVA shall review the self-evaluation submitted by the verification body and determine the verification body's potential conflict of interest in performing verification services for the owner or operator.

[In addition to the AVA determination, a jurisdiction may elect to conduct audits of conflict of interest submissions for compliance verification and enforcement purposes.]

(A) The AVA shall notify the verification body in writing when the conflict of interest evaluation information submitted under section WCI.8(g)(1) is deemed complete. Within 45 days after deeming the evaluation information complete, the AVA shall determine the conflict-of-interest potential and shall notify the verification body or owner or operator if the potential conflict of interest is determined to be medium or high.

(B) If the AVA determines the verification body or any member of the verification team has any threats specified in section WCI.8(g)(1), the AVA shall find a high potential conflict of interest and verification services may not proceed.

(C) If the AVA determines that there is a low potential conflict of interest prior to the verification services being provided, verification services may proceed.

(D) If the AVA determines that the verification body and verification team have a medium potential for a conflict of interest, the AVA shall evaluate the conflict of interest mitigation plan and may request additional information from the applicant to complete the determination. In determining potential conflict of interest, the AVA may consider factors including, but not limited to, the nature of previous work performed, the current and past relationships between the verification body and its subcontractors with the owner or operator, and the cost of the verification services to be performed. The AVA will determine whether these factors when considered in combination with the mitigation plan demonstrate a low level of potential conflict of interest or a high level. If the AVA determines that there is a low potential conflict of interest prior to the verification services being initiated, verification services may proceed. If a high potential is determined prior to verification services being initiated, verification services may not proceed. If a high potential is determined after verification services have been initiated, the verification statement shall not be accepted..

(7) Monitoring Conflict of Interest Situations.

(A) After commencement of verification services, the verification body shall monitor and immediately make full disclosure in writing to the AVA regarding any potential for a conflict of interest situation that arises. This disclosure shall include a description of actions that the verification body has taken or proposes to take to avoid, neutralize, or mitigate the potential for a conflict of interest.

(B) The verification body shall monitor arrangements or relationships that may be present for a period of one year after the completion of verification services. During that period, within 30 calendar days of any change in arrangements or relationships with the owner or operator for which the verification body has provided verification services that may create a medium or high threat of conflict of interest, the verification body shall notify the AVA of the change and provide a description of the nature of the change. The AVA will make a conflict of interest determination under WCI.8(g)(6).

(C) The verification body shall report to the AVA any changes in its organizational structure, including mergers, acquisitions, or divestitures that may have created a medium or high threat of conflict of interest for one year after completion of verification services within 30 days and submit an evaluation of how the change(s) impacts the potential for conflict of interest.

(D) The AVA may invalidate a verification finding if a medium or high threat of a conflict of interest has arisen for the verification body or any member of the verification team and, in the case of a medium threat, the threat has not been adequately mitigated. In such a case, the owner or operator shall be provided 180 calendar days to have their emissions report verified by a different verification body.

(E) If the verification body or its subcontractor(s) are found to have violated the conflict of interest requirements of this section, the AVA may rescind its accreditation for any appropriate period of time . Additionally, the AVA may separately revoke its recognition of an accredited Verification Body under WCI.8(w). *[The WCI intends to develop more detailed accreditation requirements in the future.]*

(h) Notice of Verification Services. Prior to commencing verification services for a facility owner or operator, fuel supplier, and electricity importer, the verification body shall submit a notice of verification services to the AVA. Verification activities shall not proceed for 15 business days or until the verification body receives written approval to proceed from the AVA, whichever is earlier. If the AVA does not respond to the verification body within 15 business days, the verification body may begin to conduct verification activities.

[The NOVS form will be standardized across WCI and developed later.]

(i) Verification Plan.

(1) Accounting for requirements set by WCI.8, the verification plan shall document:

(A) the scope of the verification;

(B) the level of assurance;

(C) the verification standard;

(D) the verification criteria;

(E) the objectives of the verification;

(F) the timing of the verification, including site visits;

(G) the nature of the communications required;

(H) the resources required to conduct the verification, including the role of verification team members; and

(I) the nature, timing and extent of the verification procedures, including the sampling plan.

(2) The verification body shall retain the verification plan in paper, electronic, or other format for a period of not less than seven years following the submission of each verification statement.

(j) Site visits. In years for which full verification services are required under WCI.8(b)(3), at least one member of the verification team shall at a minimum make one onsite site visit to each facility or fuel supply location *[Note that exact location of fuel supplier site visits remains TBD]* for which an emissions data report is submitted. The verification team member(s) shall also conduct an onsite visit of the headquarters or other location of central data management, if different from the facility or fuel supply location, when the owner or operator is an electricity importer.

(k) Owners or operators shall make available to the verification team all information and documentation used to calculate and report emissions, electricity transactions, and other information required under this rule, as applicable.

(l) As applicable for electricity importers, the verification team shall review electricity transaction records, including receipts of power attributed to the Northwest or Southwest region as verifiable via North American Electric Reliability Corporation (NERC) E-Tags, settlements data, or other information as confirmation of the region of origin. [*Note that this procedure is subject to change pending WCI Electricity Committee review.*]

(m) Data Checks. To determine the reliability of the submitted emissions data report, the verification team shall use data checks as defined in WCI.9. Verifiers will use their professional judgment in determining how many data checks are needed to provide a reasonable level of assurance.

(n) Emissions Data Report Modifications. If as a result of review by the verification team and prior to completion of a verification statement the owner or operator chooses to make improvements or corrections to the submitted emissions data report, a revised emissions data report must be submitted to [the jurisdiction] as specified by section WCI.8(q). The owner or operator shall maintain documentation to support any revisions made to the initial emissions data report. Documentation for all emissions data report submittals shall be retained by the operator for seven years pursuant to section WCI.4.

(o) Materiality and Conformance Assessment Criteria. The verifier shall determine if the annual emissions report is prepared in such a way that it satisfies WCI.8(b)(1).

(1) A verification team shall determine that an emission data report contains a material misstatement, if either of the following is true:

(A) Based on the verification team's own determination of the level of emissions subject to verification based on the sampling plan, the verification team concludes that total reported emissions are less than 95 percent accurate using the following equation:

$$PA = 100 - (SOU/TRE * 100)$$

Where:

PA	=	Percent accuracy
SOU	=	The net result of summing overstatements and understatements resulting from errors, omissions and misreporting
TRE	=	Total reported emissions

(B) The individual or aggregate effect of one or more errors, omissions or misstatements identified in the course of verification make it probable that the judgment of a reasonable person regarding the total reported emissions would have been changed or influenced by the error, omission or misrepresentation.

(2) To assess conformance with this rule the verification team shall review the methods and factors used to develop the emissions data report for adherence to the requirements of this rule.

(3) The verification team shall keep a log of any issues identified in the course of verification activities that may affect determinations of material misstatement and nonconformance, and how those issues were resolved.

(p) Completion of verification services shall include:

(1) Verification Statement. Upon completion of the verification services required by WCI.8, the verification body shall complete a verification statement for each emissions data report, and provide that statement to the owner or operator and [the jurisdiction or other body] according to the schedule specified in section WCI.2(b). Before that statement is completed, the verification body shall have the verification services and findings of the verification team independently reviewed and approved by an Independent Peer Reviewer.

(2) The verification body shall provide either a positive or adverse verification statement to the reporter and to the AVA *[alternatively, this could be the reporter's responsibility to submit the statement to the AVA]* based on its findings during the verification process.

(3) The lead verifier in the verification team shall attest on the verification statement that the verification team has carried out all verification services as required by this rule, and the Independent Peer Reviewer shall attest to his or her independent review on behalf of the verification body and his or her concurrence with the verification findings. If the Independent Peer Reviewer does not determine that the verification team has carried out all verification services as required by the rule or if the Independent Peer Reviewer rejects the verification team's findings, then the verification body cannot issue a positive verification statement.

(4) The verification body shall provide to the owner or operator a detailed verification report. The verification report shall at minimum include the detailed comparison of the data checks with the submitted emissions data report, errors, omissions and misstatements identified during the course of the verification, any corrections made to the original annual emissions report as a result of the verification, and observations about the data management systems that are connected to the errors, omissions and misstatements identified, as well as any qualifying comments on findings during verification services. The detailed verification report shall be made available to [the jurisdiction] upon request.

(q) Prior to the verification body providing an adverse verification statement pursuant to WCI.8(p)(2), the owner or operator shall be provided at least 14 working days to modify the emissions data report to correct any material misstatement or nonconformance found by the verification team. The modified report and verification statement must be submitted to [the jurisdiction] before the applicable verification deadline, unless the operator makes a request to [the jurisidiction*]* as follows:

(1) If the owner or operator and the verification body cannot reach agreement on modifications to the emissions data report that result in a positive verification statement, the operator may petition the AVA to make a final decision as to the verifiability of the submitted emissions data report.

(2) If the AVA determines that the emissions data report does not meet the standards and requirements specified in this article, the owner or operator shall have the opportunity to submit within 60 calendar days of the date of this decision *[Note that this time frame may need to be changed pending details of cap-and-trade system design and needs.]* any emissions data report revisions that address the AVA's determination, for re-

verification of the emissions data report. In re-verifying a revised emissions data report, the verification body and verification team shall be subject to the requirements in section WCI.8(q)-(s).

(3) Upon provision of the verification statement to [the jurisdiction], the emissions data report shall be considered final and no changes shall be made except as provided in section WCI.8(n) or (q). All verification requirements of this rule shall be considered complete upon provision of the verification statement.

(r) In addition to initiating WCI's dispute resolution process, the operator and verification body must inform the applicable accreditation body of the dispute.

(s) The AVA may make void the positive verification statement submitted by the verification body if:

(1) The AVA finds a high level of conflict of interest existed between a verification body and an owner or operator; or,

(2) An emissions data report that received a positive verification statement fails an audit by the AVA.

(t) Upon request by the AVA, the owner or operator shall provide the data used to generate an emissions data report, including all data available to a verification body. The AVA may also review the full verification report given by the verification body to the owner or operator. The full verification report shall be provided to the AVA upon request.

(u) Upon written notification by the AVA, the verification body shall make itself available for a verification services audit.

(v) Duration of verification services by one verification body. Facility owners or operators, fuel suppliers, or electricity importers subject to annual verification shall not use the same verification body for a period of more than six consecutive years. If a facility owner or operator, fuel supplier, or electricity importer is required or elects to contract with another verification body, they may contract verification services from the previous verification body only after not using the previous verification body for at least three years. If a verification body or verification team member has been providing verification services for an owner or operator in a greenhouse gas reporting or reductions program other than [the jurisdiction's] within the previous three years, those years of services will count towards the six consecutive year limit in this section.

(w) Revocation of Recognition. A jurisdiction may review, and for good cause, work to revoke or modify the accreditation status of a recognized verification body. If a recognized verification body is suspended in any other mandatory or voluntary GHG reporting or trading program, that verification body will not be allowed to provide any verification services until that suspension ends. If a recognized verification body has its accreditation revoked under any other mandatory or voluntary GHG reporting or trading program, that verification body will no longer be allowed to provide verification services under WCI.8 until it is reaccredited.

Verification Supplement 1

Note: the additional content in this Supplement must either be included in regulatory text in the appropriate subsections of WCI.8 or enforceable guidance documents by jurisdictions. The language in this section provides further explanation of items required in WCI.8 or alternative, more prescriptive language of those requirements.

Preliminary Activities and Verification Plan

The verification team shall discuss with the owner or operator the scope and objective of the verification services and obtain information from the owner or operator necessary to develop a verification plan. Such information shall include but is not limited to:

- Information to allow the verification team to develop a general understanding of facility or entity boundaries, operations, emissions sources, electricity transactions, as applicable;
- Information about the data management system used to track GHG emissions, electricity transactions, and other required measurement data as applicable;
- Information regarding the training or qualifications of personnel involved in developing the GHG emissions data report;
- Description of the specific methodologies used to quantify and report GHG emissions, electricity transactions, and other required data as applicable;
- Records of measured data related to emissions and operations for the prior and current period;
- Inventory of sources and their associated emissions for the reporting period, and
- Any prior verification reports, if applicable.

In developing the verification plan, the verifier shall:

- Gain an understanding of the organization and the process that emit greenhouse gases;
- Conduct a risk assessment to evaluate inherent, control and detection risk;
- Conduct preliminary analytical testing to identify anomalies in the data;
- Conduct a sensitivity analysis to assess the relative contribution of each source in the inventory to the reported annual emissions, and
- Consider any other relevant developments at the facility, in the regulations, or legal environment.

Sampling Plan

As part of the verification procedures, the verification team shall develop a sampling plan that, when combined with the other verification procedures, provides sufficient and appropriate evidence to allow the verifier to arrive at a conclusion. The sampling plan shall be designed to achieve the specified verification objective. The sample plan shall consider:

- Statistical versus non-statistical approaches
- Design of the sample, including the population characteristics
- Stratification (categorization of population into subgroups)
- Emission weighted selection
- Sample size

- Sample selection

As relevant information becomes available during the course of verification activities, the verification team must modify the sampling plan as necessary to address potential issues emerge of material misstatement or nonconformance with the requirements of this rule.

Data Checks

The verification team conducts data checks throughout the verification process and shall focus first on the largest and most uncertain estimates of emissions and electricity transactions.

- In establishing the verification plan, the verification team shall use professional judgment to determine the number of data checks required for the team to conclude with reasonable assurance whether the reported emissions and transactions are free of material misstatement and the emissions data report otherwise conforms to the requirements of this rule.
- The verification team shall choose emissions sources, and electricity transactions data as applicable, for data checks based on their relative sizes and risks of material misstatement as indicated in the verification plan;
- The verification team, through the conformance assessment, shall ensure that the appropriate methodologies and emission factors have been applied for the emissions sources and electricity transactions for sampled data covered under sections WCI.20 through WCI.XX;

Site Visits

During the site visit, the verification team member(s) shall conduct the following:

- Observe whether all sources at the site are represented in the emissions report as specified in sections WCI.20 to WCI.XX as applicable to the owner or operator.
- Assess whether the source inventory is identified, categorized, and reported appropriately. Collect evidence as to explanations for data anomalies identified in the verification plan.
- Understand the data trail used by the owner or operator to measure, quantify, and report greenhouse gas emissions and, when applicable, electricity transactions.
- Understand and evaluate the associated data controls used by the owner to ensure the completeness and accuracy of the data

Materiality Assessment

In assessing whether misstatements are material, the verification team shall determine whether the total reported emissions are at least 95 percent accurate using the following equation:

Percent accuracy = 100 **–** (sum of (errors, omissions, misreporting) * 100 / (total reported emissions))

To assess conformance with this rule the verification team shall review the methods and factors used to develop the emissions data report for adherence to the requirement of this rule. The verification team shall keep a record of any errors, omissions or misstatements identified in the course of verification activities that may affect determinations of material misstatement and nonconformance, and how those issues were resolved.

Conflict of Interest (*could replace more general procedural language in Section WCI.8*)

(1) Conflict of Interest Submittal Requirements for Accredited Verification Bodies.

(A) Before the start of any work related to providing verification services to an owner or operator, a verification body must first be authorized in writing by *the AVA* to provide verification services. To obtain authorization the verification body shall submit to *the AVA* a self-evaluation of the potential for any conflict of interest that the verification body, entities related to the verification body, and members of the verification team including, subcontractors may have with the owner or operator or their related entities for which it will perform verification services. For the purposes of this section, the term member refers to staff on the verification team, in the verification body and any subcontractors. The submittal shall include the following:

(i) Identification of whether the potential for conflict of interest is high, low, or medium based on factors specified in this section;

(ii) An organizational chart of the business structure of the verification body, including its related entities and brief description of the primary work done by the verification body and related entities;

(iii) iii. Identification of whether any member of the verification body, entities related to the verification body, or the verification team including subcontractors has previously provided verification services for the owner or operator or its related entities and, if so, the years in which such verification services were provided;

(iv) Identification of whether any member of the verification body, entities related to the verification body, or the verification team or including subcontractors has engaged in any non-verification services of any nature with the owner or operator or related entities either within or outside the WCI region during the previous three years. The verification body must also disclose any services listed under section (high COI list) it has provided to the owner or operator, regardless of when these services occurred. If non-verification services have previously been provided, the following information shall also be submitted:

(v) Identification of the nature and location of the work performed for the owner or operator and whether the work is similar to the type of work to be performed during verification, such as emissions inventory auditing, energy efficiency, renewable energy, or other work with implications for the operator's greenhouse gas emissions or the accounting of greenhouse gas emissions or electricity transactions;

(vi) The nature of past, present or future relationships the verification body, entities related to the verification body, and members of the verification team including subcontractors have with the owner or operator or related entity including:

- Instances when any member has performed or intends to perform work for the owner or operator;
- Identification of whether work is currently being performed for the owner or operator and, if so, the nature of the work;

- Whether any member has any contracts or other arrangements to perform work for the owner or operator or a related entity;
- Identify how much work was performed in each of the last three years, as a percentage of the verification body's total gross income for each of the last three years;
- Identify how much work related to greenhouse gases or electricity transactions was has performed for the owner or operator or related entities in each of the last three years, as a percentage of the verification body's income for each of the last three years;
- Identify how much work was performed by each subcontractor for the operator in each of the last three years, as a percentage of each subcontractor's total gross income for each of the last three years.

(vii) Explanation of how the amount and nature of work previously performed is such that any member of the verification team's credibility and lack of bias should not be under question.

(viii) A list of names of the verification team members that will perform verification services for the owner or operator and a description of any instances of personal or family relationships with management or employees of the owner or operator that potentially represent a conflict of interest; and,

(ix) Identification of any other circumstances or relevant information known to the verification body or owner or operator that could result in a conflict of interest, or any situation where the appearance of impartiality could undermine confidence in the verification body's ability to assess the reported emissions.

(2) The potential for a conflict of interest shall be deemed to be high where:

(A) The verification body and owner or operator share any management staff or board of directors membership, or any of the management staff of the owner or operator have been employed by the verification body, or vice versa, within the previous three years; or

(B) Within the previous three years, any member of the verification body, any entity related to the verification body, and the verification team has provided to the owner or operator any of the following non-verification services:

(i) Designing, developing, implementing, or maintaining an inventory or information or data management system for facility greenhouse gases, or, where applicable, electricity transactions;

(ii) Developing greenhouse gas emission factors or other greenhouse gas-related engineering analysis;

(iii) Designing energy efficiency, renewable power, or other projects which explicitly identify greenhouse gas reductions as a benefit;

(iv) Preparing or producing greenhouse gas-related manuals, handbooks, or procedures specifically for the reporting facility;

(v) Appraisal services of carbon or greenhouse gas liabilities or assets;

(vi) Brokering in, advising on, or assisting in any way in carbon or greenhouse gas-related markets;

(vii) Managing any health, environment or safety functions which explicitly identify greenhouse gas reductions as a benefit;

(viii) Bookkeeping or other services related to the accounting records or financial statements, unless those services limited to financial auditing;

(ix) Any service related to information systems, unless those systems will not be part of the verification process and excluding third-party auditor or registration services;

(x) Appraisal and valuation services, both tangible and intangible related to GHG emissions or reductions inventories;

(xi) Fairness opinions and contribution-in-kind reports in which the verification body has provided its opinion on the adequacy of consideration in a transaction, unless the resulting services shall not be part of the verification process;

(xii) Any actuarially oriented advisory service involving the determination of amounts recorded in financial statements and related accounts;

(xiii) Any internal audit service as provided under section (GHG plan) that has been outsourced by the operator that relates to the owner's or operator's internal accounting controls, financial systems or financial statements, unless no consulting or advice was provided as part of the audit;

(xiv) Acting as a broker-dealer (registered or unregistered), promoter or underwriter on behalf of the owner or operator;

(xv) Any legal services related to GHG emissions;

(xvi) Expert services to the owner or operator or his or her legal representative for the purpose of advocating his or her's interests in litigation or in a regulatory or administrative proceeding or investigation involving GHG emissions, unless providing factual testimony.

(C) The potential for a conflict of interest shall also be deemed to be high where any staff member of the verification body, entity related to the verification body, or the verification team has provided verification services for the owner or operator for six consecutive years or within three years of the termination of a previous GHG verification contract with the owner or operator. If a verification body or verification team member has been providing verification services for a [operator/owner] in a greenhouse gas reporting or reductions program other than WCI within the past three years, those years of services will count towards the six consecutive year limit in the WCI.

(D) The potential for a conflict of interest shall be deemed high where the Independent Peer Reviewer for the verification team has provided verification or non-verification services for the operator during the current reporting year.

(3) The potential for a conflict of interest shall be deemed to be low where no potential for a conflict of interest is found under section WCI.8(g) *[may need to be updated, depending upon final version of WCI.8)* and any non-verification services provided by all members of the verification body and the verification team to the owner or operator within the last three years are valued at less than five percent of the verification body's revenue.

****

WCI.8 OPTIONAL GUIDANCE

Note: This text is supporting material and not intended as part of the essential requirements.

Collection of Evidence

The verification body shall obtain sufficient and appropriate evidence to be able to draw reasonable conclusions on which to base the verification statement. The verification body obtains evidence by performing verification procedures. Verification procedures are classified as:

- **Computation (or Recalculation)** is the checking of mathematical accuracy of documents or records
- **Observation** of a process or procedure
- **Confirmation** is obtaining representations from a third party
- **Enquiry** is seeking information from a knowledgeable person
- **Inspection** of Records or Documents/Assets
- **Re-performance** is the verifiers independent execution of procedures or controls
- **Analysis** is the evaluation of information made by studying the plausible relationships among different types of data

Some or all of these techniques can be used to obtain sufficient and appropriate evidence. Site visits are used to obtain evidence that is readily available at that location.

§ WCI.9 DEFINITIONS

“Accuracy” means the closeness of the agreement between the result of the measurement and the true value of the particular quantity (or a reference value determined empirically using internationally accepted and traceable calibration materials and standard methods), taking into account both random and systematic factors.

“Acid gas” means a gas mixture that has been separated from natural gas and consists mostly ofhydrogen sulphide or carbon dioxide and that may contain trace amounts of hydrocarbons, water, or other contaminants.

“Accreditation and Verification Authority” or “AVA” means [the jurisdiction] or any entity or entities to which [the jurisdiction] assigns any of the responsibilities for oversight and execution of the accreditation and verification program established in WCI.8.

“Adverse verification statement” means a verification statement rendered by a verification body stating that the verification body cannot conclude that there is a reasonable level of assurance for an emissions data report.

[“Article” is a placeholder for a jurisdiction-specific cross reference to whatever subdivision of its administrative code contains the WCI’s Essential Requirements for Mandatory Reporting in their entirety.]

“Asphalt” means a highly viscous liquid or semi-solid consisting mostly of bitumen and which is a residue by-product of petroleum refining

“Asphalt blowing” means the process by which air is blown through liquid asphalt to remove contaminants such as volatile compounds and to increase viscosity.

“Associated gas” means a natural gas which is found in association with crude oil, either dissolved in crude oil or as a cap of free gas above the crude oil.

“Barrel” or “bbl” means a volume equal to 42 U.S. gallons.

"Best available data and methods" means [the jurisdiction’s] methods for emissions calculations set forth in this article; or [the jurisdiction’s] approved next best alternative from the WCI source category quantification methodologies or other generally accepted methods for calculating greenhouse gas emissions organized by the same source categories and GHG species, using [jurisdiction] provided emission factors and other data.

“Compliance period” means, until such time as [the jurisdiction] adopts a cap-and-trade program covering sources subject to this article, a period of three calendar years.

“Biomass” means non-fossilized plants or parts of plants, animal waste, micro-organisms or any product made of either of these, and includes wood and wood products, agricultural residues and wastes, biologically derived organic matter found in municipal and industrial wastes, landfill gas, bio-alcohols, spent pulping liquor (black liquor), pulp fibers, sludge gas, and animal- or plant-derived oils.

“Biomass fuels” or “biomass-derived fuels” means fuels whose entire heat generating capacity is derived entirely from biomass.

“Bottoming cycle plant” means a cogeneration plant in which the energy input to the system is first applied to a useful thermal energy application or process, and at least some of the reject heat emerging from the application or process is then used for electricity production.

“Calcination” means the thermal decomposition of carbonate-based minerals, into one or more oxides and carbon dioxide

“Calcine” means to heat a substance to a high temperature but below its melting or fusion point causing oxidation or reduction.

“Calcined byproduct/waste type” refers to lime kiln dust and other partially calcined materials and co-products generated during the production of one of the three types of quicklime.

“Calcined byproduct type sold” refers to lime kiln dust and other calcined materials and coproducts, such as off-spec lime, that enters commerce.

“Calcined co-product/waste not sold” refers to any partially calcined co-product or partially calcined material produced during the calcination of limestone or other highly calcareous material that does not enter commerce as its own product or as part of another lime product. Types of calcined co-products/partially calcined material not sold include, but are not limited to, lime kiln dust, scrubber sludge, waste cores, and off-spec lime.

“Carbon dioxide equivalent” or “CO_2 equivalent” or “CO_2e” means a measure for comparing the global warming potentials of different greenhouse gases. By definition, carbon dioxide has a carbon dioxide equivalent of one, with the global warming potentials of other greenhouse gases stated relative to carbon dioxide.

“Catalytic cracking” means the process of breaking down larger, heavier, and more complex hydrocarbon molecules into simpler and lighter molecules through the use of a catalyst.

“Catalytic reforming” means the process of using controlled heat and pressure with catalysts to rearrange certain hydrocarbon molecules.

“Cement” means a building material that is produced by heating mixtures of limestone and other minerals or additives at high temperatures in a rotary kiln to form clinker, followed by cooling and grinding with blended additives to produce a finished powder.

“Cement kiln dust” or “CKD” means the fine-grained, solid, highly alkaline waste removed from cement kiln exhaust gas by air pollution control devices, consisting of partly calcined kiln feed material, dust from cement kilns and bypass systems, including bottom ash and bypass dust.

“Cement plant” means an industrial structure, installation, plant, or building primarily engaged in manufacturing Portland, natural, masonry, pozzolanic, and other hydraulic cements, and typically identified by NAICS code 327310.

“Chemical oxygen demand” or “COD” means the measure of the amount of organic compounds in water, in units of mass per unit volume of water, used to determine water quality.

“Clinker” means the mass of fused material produced in a cement kiln from which finished cement is manufactured by milling and grinding.

“Coal” means a combustible sedimentary rock composed primarily of carbon and classified as anthracite, bituminous, sub-bituminous, or lignite by the American Society for Testing and Materials Designation ASTM D388–05 “Standard Classification of Coals by Rank”.

“Cogeneration unit” means a stationary fuel combustion device which simultaneously generates electrical and thermal energy that is (i) used by the operator of the facility where the cogeneration unit is located; or (ii) transferred to another facility for use by that facility.

“Cogeneration system” means individual cogeneration components including the prime mover (heat engine), generator, heat recovery, and electrical interconnection, configured into an integrated system that provides sequential generation of multiple forms of useful energy (usually electrical and thermal), at least one form of which the facility consumes on-site or makes available to other users for an end-use other than electricity generation.

“Coke ” means a solid residue consisting mainly of carbon which is derived either from the cracking of petroleum hydrocarbons in a refinery coker unit (petroleum coke) or from the destructive distillation of low-ash, low-sulfur bituminous coal (coal coke).

“Coke burn-off” means the removal of coke from the surface of a catalyst through combustion during catalyst regeneration.

“Combustion emissions” means greenhouse gas emissions occurring during the exothermic reaction of a fuel with oxygen.

“Conflict of interest” means a situation in which, because of financial or other activities or relationships with other persons or organizations, a person or body is unable or potentially unable to render an impartial verification opinion of a potential client’s greenhouse gas emissions, or the person or body's objectivity in performing verification services is or might be otherwise compromised.

"Continuous emissions monitoring system (CEMS)" means the total equipment required to obtain a continuous measurement of a gas concentration or emission rate from combustion or industrial processes.

"Crude oil" means a combustible, liquid mixture found in natural underground reservoirs consisting of hydrocarbons and other organic compounds, or derived from tar sands, shale and coal.

"Data check" means an independent calculation or checking of data conducted by a verifier to recreate the emissions for a discreet source included in an emissions data report.

"Electricity generating unit" or "EGU" means any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce electricity.

"Emissions" means the release of greenhouse gases into the atmosphere from sources and processes in a facility.

"Equipment leak" means releases of fugitive greenhouse gas emissions from equipment including valves, pump seals, flanges, compressors, sampling connections, and open-ended lines and excluding storage tank emissions.

"Exporter" means *[To be defined later for transportation and RCI fuels accounting.]*

"Facility" means all buildings, plants, structures, installations, and equipment that:
(a) Emit or may emit GHG(s);
(b) Are located on one or more contiguous or adjacent properties;
(c) Are under common control of the same owner(s) or operator(s); and
(d) Form a producing unit, function as a single integrated site, or have the same first two digits of the Standard Industrial Classification or same first three digits of the North American Industry Classification System.

[For this version of the Essential Requirements, the words "nonroad engine" have been deleted from the definition of "facility." WCI, however, is considering the inclusion of a protocol for calculating nonroad engine emissions from certain facilities in a future version of the Essential Requirements. If and when that occurs, it may be appropriate to amend this definition to include nonroad engines in the list of covered activities at a stationary source.]

"Feed" means the prepared and mixed materials, which include but are not limited to materials such as limestone, clay, shale, sand, iron ore, mill scale, cement kiln dust, green coke and fly ash, that are fed into a kiln, furnace, or other equipment type but which exclude fuels that are combusted.

“Feedstock” means any raw material that is used in or upgraded by an industrial process but not combusted.

“Flexigas” means a low BTU gaseous fuel produced through the gasification of coke.

“Fluid catalytic cracking unit” or “FCCU” means a process unit in a refinery in which crude oil or a crude oil-derived feedstock is charged and fractured into smaller molecules in the presence of a catalyst, or reacts with a contact material to improve feedstock quality for additional processing, and in which the catalyst or contact material is regenerated by burning off coke and other deposits. The unit includes, but is not limited to, the riser, reactor, regenerator, air blowers, spent catalyst, and all equipment for controlling air pollutant emissions and recovering heat.

“Fluid coking” means a thermal cracking process utilizing the fluidized-solids technique to remove carbon (coke) for continuous conversion of heavy, low-grade oils into lighter products.

“Fossil fuel” means a fuel consisting of the decomposed remains of ancient plants and animals.

“Fuel” means solid, liquid or gaseous combustible material consisting of hydrocarbons and other compounds that is combusted or oxidized for the purpose of producing energy.

“Fuel analytical data” means any data collected about the mass, volume, flow rate, heat content, or carbon content of a fuel.

“Fuel gas system” means a system of compressors, piping, knock-out pots, mix drums, sulfur removal units (if necessary) and flaring units (if necessary) that collects fuel gas from one or more sources for treatment(if necessary), and transports it to a stationary combustion unit.

“Fugitive emissions” means the unintended or incidental emissions of greenhouse gases from the transmission, processing, storage, use, or transportation of fossil fuels, greenhouse gases or other substances, including but not limited to HFC emissions from refrigeration leaks, SF_6 from electric power distribution equipment, methane from mined coal, and CO_2 emitted from geyser steam and/or fluid used in geothermal generating facilities.

“Full verification” means all verification services as provided in section WCI.8(b).

“Generating unit” means any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce electricity.

“Global warming potential” or “GWP factor” means the radiative forcing of a greenhouse gas, calculated over a time interval of 100 years

“Greenhouse gas”, or “GHG” means any of the following: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs).

“High heat value” or “HHV” means the amount of heat energy released by the combustion of a unit quantity of a fuel, including the latent heat of vaporization of water embedded in the fuel

“Hydrocarbons” means chemical compounds consisting entirely of carbon and hydrogen.

“Hydrofluorocarbons” or “HFCs” means a class of GHGs consisting of hydrogen, fluorine, and carbon and primarily used as refrigerants, specifically those listed in Table WCI.10-1.

“Hydrogen plant” means a plant that produces hydrogen with steam hydrocarbon reforming, partial oxidation of hydrocarbons, or other processes.

“Importer” means *[To be defined later with input from the Electricity Subcommittee.]*

“Impregnated saw dust” means saw dust containing resins, preservatives or other substances derived from fossil fuels.

“Independent Peer Reviewer” means a Lead Verifier within a Verification Body who has not participated in conducting verification services for the current reporting year who provides an independent review of verification services rendered as required in section WCI.8(f).

“Kiln” means thermally insulated chambers, or ovens, in which controlled temperature regimes are produced, used in the production of clinker, lime and other products, and which includes any associated preheater or precalciner devices.

“Less Intensive Verification” means the verification services provided in interim years between full verifications; less intensive verification only requires risk assessment and data checks on an owner or operator's emissions data report based on the most current sampling plan developed as part of the most current full verification services. This level of verification may only be used if the verifier can provide findings with a reasonable level of assurance.

“Lime kiln dust” or “LKD” means lime dust produced in the course of production of quick lime.

“Lime type” refers to three types of quicklime derived from limestone containing varying percentages of magnesium carbonate. The three lime types are:

(a) High calcium quicklime, which is derived from limestone containing 0 to 5 percent magnesium carbonate.

(b) Magnesian quicklime, which is derived from limestone containing 5 to 35 percent magnesium carbonate

(c) Dolomitic quicklime, which is derived from limestone containing 35 to 46 percent magnesium carbonate.

“Liquefied petroleum gas” or “LPG” means a group of gaseous hydrocarbons derived from crude oil refining or natural gas fractionation, and includes propane, propylene, normal butane, butane, butylene, isobutene and isobutylene.

"Low BTU gas" means gases recovered from casing vents, vapor recovery systems, storage tanks and other components within the production process of crude oil, natural gas and petroleum products.

"Low Heat Value" or "LHV" means the heat energy released through the combustion of a unit quantity of fuel, excluding the latent heat of vaporization of water embedded in the fuel.

"Material misstatement" means an error or omission, or a collection of errors or omissions, that results in a determination that a verification statement contains a material misstatement under WCI.8(o)(1)(A) or (B).

"Measurement-based" means any of the various emission quantification methodologies that involve the determination of emissions by means of direct measurement of the flue gas flow, as well as the concentration of the relevant GHG(s) in the flue gas.

"Measurement uncertainty" means the scientific uncertainty associated with measuring of GHG emissions due to limitations of monitoring equipment or quantification methodologies.

"Municipal solid waste" or "MSW" means waste products collected from households, commercial/retail units, or institutions.

"NAICS" means the North American Industry Classification System.

"Nameplate generating capacity" means the maximum rated electrical power output of a generator under specific conditions designated by the manufacturer, expressed in megawatts (MW) or kilowatts (kW).

"Net power generated" means the gross electricity generation minus station service or unit service electricity requirements, expressed in megawatt hours (MWh) per year. In the case of cogeneration, this value is intended to include internal consumption of electricity for the purposes of a production process, as well as power put on the grid.

"Nonroad equipment" means [WCI is addressing the definition for nonroad equipment as part of its development of a nonroad equipment rule].

["Owner or operator," as noted in WCI.1(a), is a placeholder. Each jurisdiction will select the specific terminology for the regulated persons in accordance with its customary rule-writing practices.]

"Operator's representative" means:

(a) If the operator of the facility is an individual, the operator.

(b) If the operator of the facility is a corporation, either

  (1) Any officer of the corporation, whether or not the officer is also a director of the corporation, who performs a policy making function in respect of the corporation and who has the capacity to influence the direction of the corporation; or

(2) The individual with primary responsibility for the operations and management of the facility.

(c) If the operator of the facility is not an individual or a corporation, the individual with primary responsibility for the operations and management of the facility.

"Perfluorocarbons" or "PFCs" means synthetic compounds derived from hydrocarbons through the replacement of hydrogen with fluorine atoms.

"Petroleum" means crude oil.

"Petroleum refinery" or "refinery" means any facility engaged in producing gasoline, aromatics, kerosene, distillate fuel oils, residual fuel oils, lubricants, asphalt, or other products through distillation of petroleum or through redistillation, cracking, rearrangement or reforming of unfinished petroleum derivatives.

"Positive verification statement" means a verification statement rendered by a verification body stating that the verification body can say with reasonable assurance that the submitted emissions data report is free of material misstatement and that the emissions data report conforms to the requirements of this article.

"Power" means electricity, except where the context makes clear that another meaning is intended.

"Pressure swing adsorption" or "PSA" means a gas purification process which selectively concentrates target gas molecules using porous, high surface area solid adsorbents and elevated pressure.

"PSA off-gas" or "tail-gas" means the impurity stream resulting from the sequential PSA pressurization/depressurization purification process.

"Prime mover" means the type of equipment such as an engine or water wheel that drives an electric generator. "Prime movers" include, but are not limited to, reciprocating engines, combustion or gas turbines, steam turbines, microturbines, and fuel cells.

"Process" means the intentional or unintentional reactions between substances or their transformation, including, but not limited to, the chemical or electrolytic reduction of metal ores, the thermal decomposition of substances, and the formation of substances for use as product or feedstock.

"Process emissions" means the emissions from industrial processes (e.g., cement production, ammonia production) involving chemical or physical transformations other than fuel combustion. For example, the calcination of carbonates in a kiln during cement production or the oxidation of methane in an ammonia process results in the release of process CO_2 emissions to the atmosphere. Emissions from fuel combustion to provide process heat are not part of process emissions, whether the combustion is internal or external to the process equipment.

"Process vent" means an opening where a gas stream is continuously or periodically discharged during normal operation.

"Pure" means consisting of at least 97 percent by mass of a specified substance.

"Purge gas" means nitrogen, carbon dioxide, liquefied petroleum gas, or natural gas used to maintain a non-explosive mixture of gases in a flare header or provide sufficient exit velocity to prevent regressive flame travel back into the flare header.

"Quick lime" means a substance that consists of oxides of calcium and magnesium resulting from the calcination of limestone.

"Reasonable level of assurance" for an emissions data report means the report satisfies WCI.8(b)(1).

"Recycled" means a material that is reused or reclaimed.

"Refinery fuel gas" or "still gas" means gas generated at a petroleum refinery or any gas generated by a refinery process unit, and that is combusted separately or in any combination with any type of gas or used as a chemical feedstock.

"Reporting year" means the calendar year for which emissions are being reported in the emissions data report.

"Retail provider" means an entity that provides electricity to retail end users.

"Senior officer" means:

(a) The chair of the board of directors, a vice-chair of the board of directors, the president, a vice-president, the secretary, the treasurer or the general manager of a corporation or any other individual who performs functions for a corporation similar to those normally performed by an individual occupying any such office, and

(b) Each of the five highest paid employees of a corporation, including any individual referred to in clause (a).

"Screening value" or "SV" means the instrument reading (ppmv) obtained when components, including but not limited to valves, pump seals, connectors, flanges, open-ended lines and other equipment components, are evaluated for leakage as described in United States Environmental Protection Agency (U.S. EPA) Method 21 – Determination of Volatile Organic Compound Leaks.

"Sinter production" means a process that produces a fused aggregate of fine iron-bearing materials suited for use in a blast furnace. The sinter machine is composed of a continuous traveling grate that conveys a bed of ore fines and other finely divided iron-bearing material and fuel (typically coke breeze), a burner at the feed end of the grate for ignition, and a series of downdraft windboxes along the length of the strand to support downdraft combustion and heat sufficient to produce a fused sinter product.

"SI units" means the Système international d'unités (International System of Units).

"Small refiner" means any petroleum refiner who owns or operates a refinery that has a crude oil throughput capacity equal to or less than 55,000 barrels per day.

"Solid biomass fuel" means plants or parts of plants, in their natural state that have been mechanically or chemically separated, but not chemically altered from the natural state.

"Standard conditions" or "Standard Temperature and Pressure" or "STP" means either a temperature of 20 degrees Celsius (68 degrees Fahrenheit) and a pressure of 101.325 kPa (14.696 PSI) according to IUPAC standards, or a temperature of 0 degrees Celsius (32 degrees Fahrenheit) and an absolute pressure of 100 kPa, according to NIST standards.

"Standard cubic foot" or "scf" means the amount of gas that would occupy a volume of one cubic foot if free of combined water at standard conditions.

"Stationary combustion unit" means any boiler, heater, furnace, kiln, turbine, internal combustion engine, incinerator or other non-mobile source device that combusts any solid, liquid, or gaseous fuel for purposes of producing useful heat or energy for industrial, commercial, or institutional use; or for purposes of reducing the volume of waste by removing combustible material.

"Stationary fuel combustion emissions" means greenhouse gas emissions from stationary combustion units, including cogeneration units.

"Steam reforming" means the process by which methane and other hydrocarbons in natural gas are converted into hydrogen and carbon monoxide by reaction with steam over a catalyst.

"Storage tank" means any tank, other container, or reservoir used for the storage of organic liquids, excluding tanks that are permanently affixed to mobile vehicles such as railroad tank cars, tanker trucks or ocean vessels.

"Sulfur hexafluoride" or "SF_6" means a greenhouse gas composed of a single sulfur atom and six fluorine atoms, commonly used as a dielectric medium.

"Sulfur recovery unit" or "SRU" means a process unit that recovers elemental sulfur from gases that contain reduced sulfur compounds and other pollutants, usually by a vapor-phase catalytic reaction of sulfur dioxide and hydrogen sulfide.

"Supplemental firing" means an energy input to the cogeneration facility used only in the thermal process of a topping cycle plant, or in the electricity generating or manufacturing process of a bottoming cycle plant.

"Supplier" means . . . [To be defined later for transportation and RCI fuels accounting.].

"Topping cycle plant" means a cogeneration plant in which the energy input to the plant is first used to produce electricity, and at least some of the reject heat from the electricity production process is then used to provide useful thermal output.

"Total organic carbon" or "TOC" means a measure of the amount of carbon in an organic compound and is used as a measure of water quality.

"Uncertainty" means the degree to which data or a data system is deemed to be indefinite or unreliable.

"Useful thermal output" means the thermal energy made available in a cogeneration system for use in any industrial or commercial process, heating or cooling application, or delivered to other end users, i.e., total thermal energy made available for processes and applications other than electrical generation.

"Verification" means a systematic, independent and documented process for the evaluation of an operator's emissions data report against the WCI's reporting procedures and methods for calculating and reporting GHG emissions.

"Verification body" means a firm accredited by the [Accreditation Body TBD] and recognized by the jurisdiction or its designee, that is able to render a verification statement and provide verification services for operators subject to reporting under this article.

"Verification cycle" means three years of verification activities. Each verification cycle must include at least one year of full verification, and may include two years of less intensive verification, if eligible.

"Verification statement" means the final written declaration rendered by a verification body attesting whether an operator's emissions data report is free of material misstatement and whether the emissions data report conforms to the requirements of this article.

"Verification services" means services provided during verification as specified in WCI.8, including but not limited to reviewing an operator's emissions data report, verifying its accuracy according to the standards specified in this article, assessing the operator's compliance with this rule, and submitting a verification opinion to the *[jurisdiction or its agent]*.

"Verification team" means all of those working for a verification body, including all subcontractors, to provide verification services for an operator.

"Verifier" means an individual employed or contracted by an accredited verification body who has been deemed competent by the verification body to carry out verification services as specified in section WCI.8.

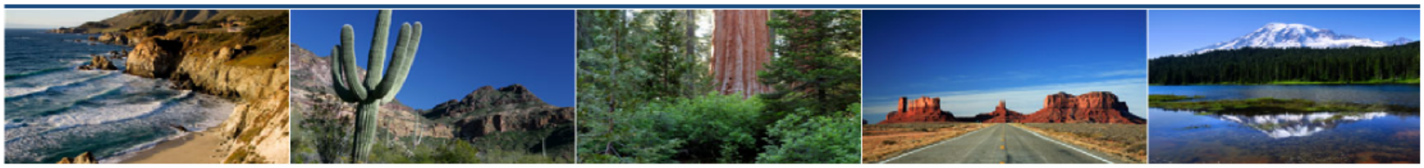
"Volatile Organic Compound" or "VOC" means an organic compound containing at least one carbon atom and which evaporates or vaporizes readily under normal conditions, participates in atmospheric photochemical reactions, and excludes carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate.

“Waste-derived fuel” means a fuel typically derived from waste(s) and generally used as a substitute for conventional fossil fuels. Waste-derived fuels can include substances derived from fossil fuels such as waste oil, plastics, or solvents. Waste-derived fuels can also include fuels containing fractions of both fossil fuels and biomass, such as municipal solid waste, tires, dried sewage or impregnated saw dust. Waste-derived fuel does not include fuels which are pure biomass.

“Wastewater” means any process water which contains oil, emulsified oil, or other organic compounds that are not recycled or otherwise used in a facility.

“Wastewater emissions” means releases of greenhouse gas emissions from wastewater and on-site wastewater treatment.

“Wastewater separator” means equipment used to separate oils and water from locations downstream of process drains.



§ WCI.20 GENERAL STATIONARY COMBUSTION

§ WCI.21 Source Category Definition

General stationary fuel combustion sources are devices that combust solid, liquid, or gaseous fuel for the purpose of generating steam (or providing useful heat or energy) for industrial, commercial, or institutional use; or reducing the volume of waste by removing combustible matter. General stationary combustion sources are boilers, combustion turbines, engines, incinerators, and process heaters, and any other stationary combustion device that is not specifically addressed under the provisions for another source category in this rule.

Note: The source category definition may need to be revised after the remaining ER sections are completed.

§ WCI.22 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

  (1) Total CO2 emissions for fossil and biomass fuels, reported by fuel type.

  (2) Total CH4 emissions, reported by fuel type.

  (3) Total N_2O emissions, reported by fuel type.

(b) Annual fuel consumption:

  (1) For gases, report in units of standard cubic feet.

  (2) For liquids, report in units of gallons.

  (3) For non-biomass solids, report in units of short tons.

  (4) For biomass solid fuels, report in units of bone dry short tons or bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average high heat value of each fuel, if used to compute CO_2 emissions.

(e) Annual steam generation in pounds or kilograms, for units that burn biomass fuels or municipal solid waste.

§ WCI.23 Calculation of CO_2 Emissions

For each fuel, calculate CO_2 mass emissions using one of the four calculation methodologies specified in this section, subject to the restrictions in §WCI.23(e).

(a) Calculation Methodology 1. Calculate the annual CO_2 mass emissions by substituting a fuel-specific default CO_2 emission factor, a default high heat value, and the annual fuel consumption into the Equation 20-1:

$$CO_2 = Fuel \times HHV \times EF \times CF \times 0.001$$ **Equation 20-1**

Where:

CO_2	=	Annual CO_2 mass emissions for the specific fuel type (metric tons).
Fuel	=	Mass or volume of fuel combusted per year (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).
HHV	=	Default high heat value of the fuel, from column 3 of Table 20-1 (mmBtu per mass or mmBtu per volume, as applicable).
EF	=	Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 (kg CO_2/mmBtu).
CF	=	Conversion factor of 0.024 (gallons to barrels) for petroleum products, only; 1.0 for all other fuels.
0.001	=	Conversion factor from kilograms to metric tons.

(b) Calculation Methodology 2. Calculate the annual CO_2 mass emissions using a default fuel-specific CO_2 emission factor, a high heat value provided by the supplier or measured by the operator, using Equation 20-2, except for emissions from the combustion of biomass fuels and municipal solid waste, for which the operator may instead elect to use the method shown in Equation 20-3.

(1) For any type of fuel for which an emission factor is provided in Tables 20-1 or 20-2, except biomass fuels and municipal solid waste when the operator elects to use the method in WCI.23(b)(2), use Equation 20-2:

$$CO_2 = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.001$$ **Equation 20-2**

Where:

CO_2	=	Annual CO_2 mass emissions for a specific fuel type (metric tons).
n	=	Number of required heat content measurements for the year as specified in WCI.25(a).
$Fuel_p$	=	Mass or volume of the fuel combusted during the measurement period “p” (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).
HHV_p	=	High heat value of the fuel for the measurement period (mmBtu per mass or volume).
EF	=	Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 or from Table 20-2 (kg CO_2/mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(2) For biomass solid fuels and municipal solid waste, use either Equation 20-2 above or Equation 20-3:

$$CO_2 = Steam \times B \times EF \times 0.001$$ **Equation 20-3**

Where:

CO_2	=	Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).
Steam	=	Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (mmBtu/lb steam).
EF	=	Default emission factor for biomass solid fuel or municipal solid waste, from column 5 of Table 20-1 (kg CO_2/mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(c) Calculation Methodology 3. Calculate the annual CO_2 mass emissions by using measurements of fuel carbon content or molar fraction (for gaseous fuels only), conducted by the operator or provided by the fuel supplier, and the quantity of fuel combusted, using Equation 20-4. For emissions from the combustion of biomass fuels and municipal solid waste, the operator may instead elect to use the method shown in Equation 20-5.

(1) For a solid fuel, use Equation 20-4 of this section:

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times 3.664 \times 0.907$$

Equation 20-4

Where:

CO_2	=	Annual CO_2 mass emissions from the combustion of the specific solid fuel (metric tons).
n	=	Number of carbon content determinations for the year as specified in WCI.25(a).
$Fuel_i$	=	Mass of the solid fuel combusted in measurement period "i" (short tons).
CC_i	=	Carbon content of the solid fuel, from the fuel analysis results for measurement period "i" (percent by weight, expressed as a decimal fraction, e.g., 95% = 0.95).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.907	=	Conversion factor from short tons to metric tons.

(2) For biomass fuels or municipal solid waste, use either Equation 20-4 above or Equation 20-5:

$$CO_2 = Steam \times B \times EF \times 0.001$$

Equation 20-5

Where:

CO_2	=	Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).
Steam	=	Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (mmBtu/lb steam).

EF	=	Default emission factor for biomass solid fuel or municipal solid waste, from column 5 of Table 20-1, (kg CO_2/mmBtu), adjusted no less often than every third year as provided in WCI.25(a)(5)(B).
0.001	=	Conversion factor from kilograms to metric tons.

(3) For a liquid fuel, use Equation 20-6 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times 0.001$$ **Equation 20-6**

Where:

CO_2	=	Annual CO_2 mass emissions from the combustion of the specific liquid fuel (metric tons).
n	=	Number of required carbon content determinations for the year, as specified in WCI.25(a).
$Fuel_i$	=	Volume of the liquid fuel combusted in measurement period "i" (gallons).
CC_i	=	Carbon content of the liquid fuel, from the fuel analysis results for measurement period "i" (kg C per gallon of fuel).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.001	=	Conversion factor from kg to metric tons.

(4) For a gaseous fuel, use Equation 20-7 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times \frac{MW}{MVC} \times 0.001$$ **Equation 20-7**

Where:

CO_2	=	Annual CO_2 mass emissions from combustion of the specific gaseous fuel (metric tons).
n	=	Number of required carbon content and molecular weight determinations for the year, as specified in WCI.25(a).
$Fuel_i$	=	Volume of the gaseous fuel combusted in period "i" (a day or month, as applicable) (scf).
CC_i	=	Average carbon content of the gaseous fuel, from the fuel analysis results for the period "i" (day or month, as applicable) (kg C per kg of fuel).
MW	=	Molecular weight of the gaseous fuel, from fuel analysis (kg/kg-mole).
MVC	=	Molar volume conversion factor (849.5 scf per kg-mole for STP of 20°C and 1 atmosphere or 836 scf per kg-mole for STP of 60°F, and 1 atmosphere).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.001	=	Conversion factor from kg to metric tons.

(d) Calculation Methodology 4. Calculate the annual CO_2 mass emissions from all fuels combusted in a unit, by using data from continuous emission monitoring systems (CEMS) as specified in (d)(1) through (d)(7).

(1) For a facility that combusts fossil fuels or biomass fuels and operates CEMS in response to federal, state, provincial, or local regulation, use CO_2 or O_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) The operator shall report CO_2 emissions for the reporting year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(B) If the operator of a facility that combusts biomass fuels uses O_2 concentrations to calculate CO_2 concentrations, annual source testing must demonstrate that calculated CO_2 concentrations when compared to measured CO_2 concentrations meet the Relative Accuracy Test Audit (RATA) requirements in 40 CFR Part 60, Appendix B, Performance Specification 3.

(2) For a facility that combusts waste-derived fuels (as defined in the General Provisions and listed in Table 20-2, including municipal solid waste), and operates a CEMS in response to federal, state, provincial, or local regulations use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) Annual CO_2 emissions shall be reported in metric tons based on the sum of hourly CO_2 mass emissions over the year.

(B) Emissions calculations shall not be based on O_2 concentrations.

(3) The operator of a facility that combusts waste-derived fuels and calculates CO_2 emissions using the methodology provided in WCI.23(d)(2) shall determine the portion of emissions associated with the combustion of biomass using the method provided in WCI.23(f).

(4) An operator who uses CEMS data to report CO_2 emissions from a facility that co-fires fossil fuels with biomass fuels or waste-derived fuels that are partly biomass shall determine the portion of total CO_2 emissions separately assigned to the fossil fuel and the biomass using the method provided in WCI.23(f), if applicable. The operator who co-fires pure biomass fuels with fossil fuels may elect to calculate CO_2 emissions for the fossil fuels using methods designated in WCI.23(a) or WCI.23(b)(1), as applicable, by fuel type and then calculate biomass fuel emissions by subtracting the fossil fuel related emissions from the total CO_2 emissions determined using the CEMS based methodology.

(5) For any units for which CO2 emissions are reported using CEMS data, the operator is relieved of the requirement to separately report process emissions from combustion emissions for that unit or to report emissions separately for different fossil fuels for that unit when only fossil fuels are co-fired. In this circumstance, operators shall still report fuel use by fuel type as otherwise required.

(6) If a facility is subject to requirements in 40 CFR Part 60 or 40 CFR Part 75 and the operator chooses to add devices to an existing CEMS for the purpose of measuring CO_2 concentrations or flue gas flow, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 60 or Part 75 that apply to the facility. If

the facility is subject to both 40 CFR Part 60 and 40 CFR Part 75, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 75.

(7) If a facility does not have a CEMS and the operator chooses to add one in order to measure CO_2 concentrations, the operator shall select and operate the CEMS pursuant to the requirements in 40 CFR Part 75 or equivalent requirements as applicable in Canada.

(A) The operator shall use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(B) The operator shall report CO_2 emissions for the report year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(C) Operators who add CEMS under this article are subject to specifications in WCI.23(d)(1)-(5), if applicable.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CO_2 emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) Calculation Methodology 1 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high heat value between 975 and 1,100 Btu per cubic foot. Otherwise, Calculation Methodology 1 may be used for any type of fuel for which a default CO2 emission factor and a default high heat value for the fuel is specified in Table 20-1.

(2) Calculation Methodology 2 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high heat value between 975 and 1,100 Btu per cubic foot. Otherwise, Calculation Methodology 2 may be used for any type of fuel combusted for which a default CO_2 emission factor for the fuel is specified in Table 20-1 or 20-2.

(3) Calculation Methodology 3 may be used for a unit of any size combusting any type of fuel, except when the use of Calculation Methodology 4 is required.

(4) Calculation Methodology 4 may be used for a unit of any size combusting any type of fuel, and must be used for: a combustion unit with a CEMS that is required by any federal, state, provincial, or local regulation and that includes both a stack gas volumetric flow rate monitor and a CO_2 concentration monitor.

(f) Mixtures of biomass or biomass fuel and fossil fuel.

(1) The owner or operator that combusts fuels or fuel mixtures for which the biomass fraction is known or can be documented shall use the applicable equations in WCI.23(a) through (c) to determine the fossil fuel fraction and shall determine the biomass fraction by subtracting the fossil fuel fraction from the total emissions.

(2) The owner or operator that combusts fuels or fuel mixtures for which the biomass fraction is unknown or cannot be documented (for example, municipal solid waste or tire-derived fuels) shall determine the biomass portion of CO_2 emissions using ASTM

D6866-06a, as specified in this paragraph. This procedure is not required for fuels that contain less than 5 percent biomass by weight or for waste-derived fuels that are less than 30 percent by weight of total fuels combusted in the year for which emissions are being reported, except where the operator wishes to report a biomass fuel fraction of CO_2 emissions.

(A) The operator shall conduct ASTM D6866-06a analysis on a representative fuel or exhaust gas sample at least every three months, and shall collect exhaust gas samples over at least 24 consecutive hours following the standard practice specified by ASTM D7459-08.

(B) The operator shall divide total CO_2 emissions between biomass emissions and non-biomass emissions using the average proportions of the samples analyzed for the year for which emissions are being reported.

(C) If there is a common fuel source to multiple units at the facility, the operator may elect to conduct ASTM D6866-06a testing for one of the units.

§ WCI.24 Calculation of CH_4 and N_2O Emissions

Calculate the annual CH_4 and N_2O mass emissions from stationary fuel combustion sources using the procedures in paragraph (a), (b), or (c), as appropriate.

(a) If the heat content of the fuel is not measured for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-8:

$$CH_4 \; or \; N_2O = Fuel \times HHV_D \times EF \times 0.001 \qquad \textbf{Equation 20-8}$$

Where:

CH_4 or N_2O	=	Combustion emissions from specific fuel type, metric tons CH_4 or N_2O per year.
Fuel	=	Mass or volume of fuel combusted specified by fuel type, unit of mass (short tons) or volume (scf, barrel) per year.
HHV_D	=	Default high heat value specified by fuel type provided in Table 20-1, MMBtu per unit of mass or volume.
EF	=	Default CH_4 or N_2O emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(b) If the heat content of the fuel is measured for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-9:

$$CH_4 \; or \; N_2O = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.001 \qquad \textbf{Equation 20-9}$$

Where:

CH_4 or N_2O	=	CH_4 or N_2O emissions from a specific fuel type, metric tons CH_4 or N_2O per year.
$Fuel_p$	=	Mass or volume of fuel combusted for the measurement period, p, specified by fuel type, unit of mass (short tons) or volume (scf, barrel) per year.

HHV_p	=	High heat value measured for the measurement period, p, specified by fuel type, MMBtu per unit mass or volume.
EF	=	Default emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(c) For biomass and municipal solid waste combustion, the operator may elect to use Equation 20-10 of this section to estimate CH_4 and N_2O emissions:

$$CH_4 \ or \ N_2O = Steam \times B \times EF \times 0.001 \qquad \textbf{Equation 20-10}$$

Where:

CH_4 or N_2O	=	Annual CH_4 or N_2O emissions from the combustion of a municipal solid waste (metric tons).
Steam	=	Total mass of steam generated by municipal solid waste combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output (mmBtu/lb steam).
EF	=	Fuel-specific emission factor for CH_4 or N_2O, from Table WCI.20-3 of this subpart (kg CH_4 or N_2O per mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(d) The operator may elect to calculate CH_4 or N_2O emissions using source-specific emission factors derived from source tests conducted at least annually under the supervision of (*jurisdiction*). Upon approval of a source test plan, the source test procedures in that plan shall be repeated in each future year to update the source specific emission factors annually.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CH_4 and N_2O emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) WCI.24(a) may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise, WCI.24(a) may be used for any type of fuel for which a default CH_4 or N_2O emission factor and a default higher heat value for the fuel is specified in Table 20-3.

(2) WCI.24(b) may be used for a unit of any size combusting any type of fuel.

(3) WCI.24(c) may only be used for biomass or municipal solid waste combustion.

(4) WCI.24(d) may be used for a unit of any size combusting any type of fuel.

§ WCI.25 Sampling, Analysis, and Measurement Requirements

(a) Fuel Sampling Requirements. Fuel sampling must be conducted or fuel sampling results must be received from the fuel supplier at the frequency specified in paragraphs (a)(1) through (a)(4) of this section.

(1) Once for each new fuel shipment or delivery or on a monthly basis for middle distillates (diesel, gasoline, fuel oil, kerosene), residual oil, liquid waste-derived fuels, and LPG (ethane, propane, isobutene, n-butane, unspecified LPG).

(2) Monthly for natural gas, associated gas, and mixtures of low Btu gas.

(3) Monthly for gases derived from biomass including landfill gas and biogas from wastewater treatment or agricultural processes.

(4) Monthly for solid fuels, as specified below:

(A) The monthly solid fuel sample shall be a composite sample of weekly samples.

(B) The solid fuel shall be sampled at a location after all fuel treatment operations but before fuel mixing and the samples shall be representative of the fuel chemical and physical characteristics immediately prior to combustion.

(C) Each weekly sub-sample shall be collected at a time (day and hour) of the week when the fuel consumption rate is representative and unbiased.

(D) Four weekly samples (or a sample collected during each week of operation during the month) of equal mass shall be combined to form the monthly composite sample.

(E) The monthly composite sample shall be homogenized and well mixed prior to withdrawal of a sample for analysis.

(F) One in twelve composite samples shall be randomly selected for additional analysis of its discrete constituent samples. This information will be used to monitor the homogeneity of the composite.

(5) For biomass fuels and waste-derived fuels, the following may apply in lieu of WCI.25(a)(4):

(A) If CO_2 emissions are calculated using WCI.23(c)(1), the source-specific carbon content is determined annually. Upon approval of a source test plan by [*jurisdiction*], the source test procedures in that plan shall be repeated in subsequent years to update the source specific emission factors annually.

(B) If CO_2 emissions are calculated using WCI.23(c)(2) (biomass fuels and municipal solid waste only), the operator shall adjust the emission factor, in kg CO2/MMBtu not less frequently than every third year, through a stack test measurement of CO2 and use of the applicable ASME Performance Test Code to determine heat input from all heat outputs, including the steam, flue gases, ash and losses.

(b) Fuel Consumption Monitoring Requirements.

(1) Facilities may determine fuel consumption on the basis of direct measurement or recorded fuel purchase or sales invoices measuring any stock change (measured in million Btu, gallons, million standard cubic feet, short tons or bone dry short, tons) using the following equation:

Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End

(2) Fuel consumption measured in Btu values shall be converted to the required metrics of mass or volume using heat content values that are either provided by the supplier, measured by the facility, or provided in Table 20-1.

(3) All oil and gas flow meters (except for gas billing meters) shall be calibrated prior to the first year for which GHG emissions are reported under this rule, using an applicable flow meter test method listed in section WCI.6 or the calibration procedures specified by the flow meter manufacturer. Fuel flow meters shall be recalibrated either annually or at the minimum frequency specified by the manufacturer.

(4) For fuel oil, tank drop measurements may also be used.

(5) Equipment used to measure solid fuel consumption at a facility shall be calibrated prior to the first year for which GHG emissions are reported under this rule, using a test method listed in section WCI.6 or the calibration procedures specified by the equipment manufacturer. Equipment shall be recalibrated either annually or at the minimum frequency specified by the manufacturer.

(c) Fuel Heat Content Monitoring Requirements. High heat values shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For gases, use ASTM D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), GPA Standard 2261-00 “Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography.” The operator may alternatively elect to use on-line instrumentation that determines heating value accurate to within ± 5.0 percent. Where existing on-line instrumentation provides only low heating value, the operator shall convert the value to high heat value as follows:

$$HHV = LHV \times CF$$

Equation 20-11

Where:

HHV = fuel or fuel mixture high heat value (Btu/scf).
LHV = fuel or fuel mixture low heat value (Btu/scf).
CF = conversion factor.

For natural gas, a CF of 1.11 shall be used. For refinery fuel gas and mixtures of refinery fuel gas, a weekly average fuel system-specific CF shall be derived as follows:

(A) by concurrent LHV instrumentation measurements and HHV determined by on-line instrumentation or laboratory analysis as part of the daily carbon content determination; or,

(B) by the HHV/LHV ratio obtained from the laboratory analysis of the daily samples.

(2) For middle distillates and oil, or liquid waste-derived fuels, use ASTM D240-02 (Reapproved 2007), or ASTM D4809-06 (Reapproved 2005).

(3) For solid biomass-derived fuels, use ASTM D5865-07a.

(4) For waste-derived fuels, use ASTM D5865-07a or ASTM D5468-02 (Reapproved 2007). Operators who combust waste-derived fuels that are not pure biomass fuels shall determine the biomass fuel portion of CO_2 emissions using the method specified in section WCI.23(f), if applicable

(d) Fuel Carbon Content Monitoring Requirements. Fuel carbon content and either molecular weight or molar fraction for gaseous fuels shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For coal and coke, solid biomass fuels, and waste-derived fuels; use ASTM 5373-08.

(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) “Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants”, ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2007).

(3) For gaseous fuels, use ASTM D1945-03 (Reapproved 2006) or ASTM D1946-90 (Reapproved 2006). The operator may alternatively elect to use on-line instrumentation that determines fuel carbon content accurate to ± 5 percent.

(e) Fuel Analytical Data Capture. When the applicable emissions estimation methodologies in sections WCI.20 through WCI.XXX require periodic collection of fuel analytical data for an emissions source, the operator shall demonstrate every reasonable effort to obtain a fuel analytical data capture rate of 100 percent for each report year.

(1) If the operator is unable to obtain fuel analytical data such that more than 20 percent of emissions from a source cannot be directly accounted for, the emissions from that source shall be considered unverifiable for the report year.

(2) If the fuel analytical data capture rate is at least 80 percent but less than 100 percent for any emissions source identified in sections WCI.20 through WCI.XXX, the operator shall use the mean of the fuel analytical data results captured to substitute for the missing values for the period of missing data.

(f) Procedure for Interim Fuel Analytical Data Collection.

(1) In the event of an unforeseen breakdown of fuel analytical data monitoring equipment required for the emissions estimation methodologies in sections WCI.20 through WCI.XXX, [jurisdiction] may authorize an operator to use an interim data collection procedure if [jurisdiction] determines that the operator has satisfactorily demonstrated that:

(A) The breakdown may result in a loss of more than 20 percent of the source’s fuel data for the reporting year, such that emissions for the affected source could not be verified under the provisions of section WCI.8;

(B) The fuel analytical data monitoring equipment cannot be promptly repaired or replaced without shutting down a process unit significantly affecting facility operations, or that the monitoring equipment must be replaced and replacement equipment is not immediately available;

(C) The interim procedure will not remain in effect longer than is reasonably necessary for repair or replacement of the malfunctioning data monitoring equipment; and

(D) The request was submitted within 30 calendar days of the breakdown of the fuel analytical data monitoring equipment.

(2) An operator seeking approval of an interim data collection procedure must, within 30 days of the monitoring equipment breakdown, submit a written request to [jurisdiction] that includes all of the following:

(A) The proposed start date and end date of the interim procedure;

(B) A detailed description of what data are affected by the breakdown;

(C) A discussion of the accuracy of data collected during the interim procedure compared with the data collected under the operator's usual equipment-based method;

(D) A demonstration that no feasible alternative procedure exists that would provide more accurate emissions data; and

(E) A demonstration that the proposed interim procedure meets the criteria specified in sectionWCI.25(f)(1).

(3) *[The jurisdiction]* may limit the duration of the interim data collection procedure or include other conditions of approval to ensure the criteria in section WCI.25(f)(1) are met.

(4) When approving an interim data collection procedure, [jurisdiction] shall determine whether the accuracy of data collected under the procedure is reasonably equivalent to data collected from properly functioning monitoring equipment, and if it is not, the relative accuracy to assign for purposes of assessing possible material misstatement under section WCI.8(o).

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type

Coal and Coke	kg C / MMBtu	MMBtu / Short Ton	kg CO_2 / Short Ton	kg CO_2 / MMBtu
Anthracite	28.26	25.09	2,597.94	103.54
Bituminous	25.49	24.93	2,328.35	93.40
Sub-bituminous	26.48	17.25	1,673.64	97.02

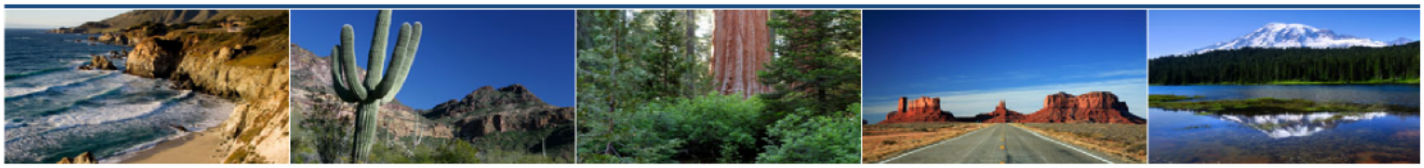
- Kraft Black Liquor emission factors, from International Council of Forest and Paper Associations, *Calculation Tools for Estimating Greenhouse Gas Emissions from Pulp and Paper Mills (2005),* Appendix F, Table 8.

The RC notes the significant difference in both the kraft black liquor and solid biomass (wood waste) emission factors published by the EPA and Environment Canada (as well as those submitted by industry associations). In lieu of recommending a single emission factor at this time (as there is no certainty as to which is most accurate) the RC is presenting both for information purposes. The RC will be working with experts in the two federal agencies and other organizations to ascertain the most accurate emission factor to use for both Metric and English unit versions of the Essential Requirements of Mandatory Reporting.



§ WCI.20 GENERAL STATIONARY COMBUSTION

§ WCI.21 Source Category Definition

General stationary fuel combustion sources are devices that combust solid, liquid, or gaseous fuel for the purpose of generating steam (or providing useful heat or energy) for industrial, commercial, or institutional use; or reducing the volume of waste by removing combustible matter. General stationary combustion sources are boilers, combustion turbines, engines, incinerators, and process heaters, and any other stationary combustion device that is not specifically addressed under the provisions for another source category in this rule.

Note: The source category definition may need to be revised after the remaining ER sections are completed.

§ WCI.22 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil and biomass fuels, reported by fuel type.
(2) Total CH_4 emissions, reported by fuel type.
(3) Total N_2O emissions, reported by fuel type.

(b) Annual fuel consumption:

(1) For gases, report in units of standard cubic meters.
(2) For liquids, report in units of kiloliters.
(3) For non-biomass solids, report in units of metric tons.
(4) For biomass solid fuels, report in units of bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average high heat value of each fuel, if used to compute CO_2 emissions.

(e) Annual steam generation in kilograms, for units that burn biomass fuels or municipal solid waste.

§ WCI.23 Calculation of CO_2 Emissions

For each fuel, calculate CO_2 mass emissions using one of the four calculation methodologies specified in this section, subject to the restrictions in §WCI.23(e).

(a) Calculation Methodology 1. Calculate the annual CO_2 mass emissions by substituting a fuel-specific default CO_2 emission factor, a default high heat value, and the annual fuel consumption into the Equation 20-1:

$$CO_2 = Fuel \times HHV \times EF \times 0.001$$ **Equation 20-1**

Where:

CO_2	=	Annual CO_2 mass emissions for the specific fuel type (metric tons).
Fuel	=	Mass or volume of fuel combusted per year (express mass in metric tons for solid fuel, volume in standard cubic meters for gaseous fuel, and volume in kiloliters for liquid fuel).
HHV	=	Default high heat value of the fuel, from Table 20-1 (GJ per metric ton for solid fuel, GJ per kiloliter for liquid fuel, or GJ per cubic meter for gaseous fuel).
EF	=	Fuel-specific default CO_2 emission factor, from Tables 20-2, 20-3, 20-5, or 20-7, as applicable (kg CO_2/GJ).
0.001	=	Conversion factor from kilograms to metric tons.

(b) Calculation Methodology 2. Calculate the annual CO_2 mass emissions using a default fuel-specific CO_2 emission factor, a high heat value provided by the supplier or measured by the operator, using Equation 20-2, except for emissions from the combustion of biomass fuels and municipal solid waste, for which the operator may instead elect to use the method shown in Equation 20-3.

(1) For any type of fuel for which an emission factor is provided in Tables 20-2, 20-3, 20-5, or 20-7, as applicable, except biomass fuels and municipal solid waste when the operator elects to use the method in WCI.23(b)(2), use Equation 20-2:

$$CO_2 = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.001$$ **Equation 20-2**

Where:

CO_2	=	Annual CO_2 mass emissions for a specific fuel type (metric tons).
n	=	Number of required heat content measurements for the year as specified in WCI.25.
$Fuel_p$	=	Mass or volume of the fuel combusted during the measurement period "p" (express mass in metric tons for solid fuel, volume in standard cubic meters for gaseous fuel, and volume in kiloliters for liquid fuel).
HHV_p	=	High heat value of the fuel for the measurement period (GJ per metric ton for solid fuel, GJ per kiloliter for liquid fuel, or GJ per cubic meter for gaseous fuel).
EF	=	Fuel-specific default CO_2 emission factor, from Tables 20-2, 20-3, 20-5, or 20-7, as applicable (kg CO_2/GJ).
0.001	=	Conversion factor from kilograms to metric tons.

(2) For biomass solid fuels and municipal solid waste, use either Equation 20-2 above or Equation 20-3:

$$CO_2 = Steam \times B \times EF \times 0.001$$ **Equation 20-3**

Where:

CO_2	=	Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).

Steam	=	Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (metric tons steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (GJ/metric ton steam).
EF	=	Default emission factor for biomass solid fuel or municipal solid waste, from Table 20-2 or Table 20-7, as applicable (kg CO_2/GJ).
0.001	=	Conversion factor from kilograms to metric tons.

(c) Calculation Methodology 3. Calculate the annual CO_2 mass emissions by using measurements of fuel carbon content or molar fraction (for gaseous fuels only), conducted by the operator or provided by the fuel supplier, and the quantity of fuel combusted, using Equation 20-4. For emissions from the combustion of biomass fuels and municipal solid waste, the operator may instead elect to use the method shown in Equation 20-5.

(1) For a solid fuel, use Equation 20-4 of this section:

Equation 20-4

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times 3.664$$

Where:

CO_2	=	Annual CO_2 mass emissions from the combustion of the specific solid fuel (metric tons).
n	=	Number of carbon content determinations for the year.
$Fuel_i$	=	Mass of the solid fuel combusted in measurement period "i" (metric tons).
CC_i	=	Carbon content of the solid fuel, from the fuel analysis results for measurement period "i" (percent by weight, expressed as a decimal fraction, e.g., 95% = 0.95).
3.664	=	Ratio of molecular weights, CO_2 to carbon.

(2) For biomass fuels or municipal solid waste, use either Equation 20-4 above or Equation 20-5:

$$CO_2 = Steam \times B \times EF \times 0.001$$

Equation 20-5

Where:

CO_2	=	Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).
Steam	=	Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (metric tons steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (GJ/metric ton steam).
EF	=	Default emission factor for biomass solid fuel or municipal solid waste, from Table 20-2 or 20-7, as applicable (kg CO_2/GJ), adjusted no less often than every third year as provided in WCI.25(a)(5)(B).
0.001	=	Conversion factor from kilograms to metric tons.

(3) For a liquid fuel, use Equation 20-6 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i$$ **Equation 20-6**

Where:

CO_2	=	Annual CO_2 mass emissions from the combustion of the specific liquid fuel (metric tons).
n	=	Number of required carbon content determinations for the year, as specified in WCI.25.
$Fuel_i$	=	Volume of the liquid fuel combusted in measurement period "i" (kiloliters).
CC_i	=	Carbon content of the liquid fuel, from the fuel analysis results for measurement period "i" (metric ton C per kiloliter of fuel).
3.664	=	Ratio of molecular weights, CO_2 to carbon.

(4) For a gaseous fuel, use Equation 20-7 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times \frac{MW}{MVC} \times 0.001$$ **Equation 20-7**

Where:

CO_2	=	Annual CO_2 mass emissions from combustion of the specific gaseous fuel (metric tons).
n	=	Number of required carbon content and molecular weight determinations for the year, as specified in WCI.25.
$Fuel_i$	=	Volume of the gaseous fuel combusted in period "i" (a day or month, as applicable) (scm).
CC_i	=	Average carbon content of the gaseous fuel, from the fuel analysis results for the period "i" (day or month, as applicable) (kg C per kg of fuel).
MW	=	Molecular weight of the gaseous fuel, from fuel analysis (kg/kg-mole).
MVC	=	Molar volume conversion factor (24.1 scm per kg-mole for STP of 20°C and 1 atmosphere or 23.7 scm per kg-mole for STP of 60°F, and 1 atmosphere).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.001	=	Conversion factor from kg to metric tons.

(d) Calculation Methodology 4. Calculate the annual CO_2 mass emissions from all fuels combusted in a unit, by using data from continuous emission monitoring systems (CEMS) as specified in (d)(1) through (d)(7).

(1) For a facility that combusts fossil fuels or biomass fuels and operates CEMS in response to federal, state, provincial, or local regulation, use CO_2 or O_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) The operator shall report CO_2 emissions for the reporting year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(B) If the operator of a facility that combusts biomass fuels uses O_2 concentrations to calculate CO_2 concentrations, annual source testing must demonstrate that calculated

CO_2 concentrations when compared to measured CO_2 concentrations meet the Relative Accuracy Test Audit (RATA) requirements in 40 CFR Part 60, Appendix B, Performance Specification 3.

(2) For a facility that combusts waste-derived fuels (as defined in the General Provisions and including municipal solid waste), and operates a CEMS in response to federal, state, provincial, or local regulations use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) Annual CO_2 emissions shall be reported in metric tons based on the sum of hourly CO_2 mass emissions over the year.

(B) Emissions calculations shall not be based on O_2 concentrations.

(3) The operator of a facility that combusts waste-derived fuels and calculates CO_2 emissions using the methodology provided in WCI.23(d)(2) shall determine the portion of emissions associated with the combustion of biomass using the method provided in WCI.23(f).

(4) An operator who uses CEMS data to report CO_2 emissions from a facility that co-fires fossil fuels with biomass fuels or waste-derived fuels that are partly biomass shall determine the portion of total CO_2 emissions separately assigned to the fossil fuel and the biomass using the method provided in WCI.23(f), if applicable. The operator who co-fires pure biomass fuels with fossil fuels may elect to calculate CO_2 emissions for the fossil fuels using methods designated in WCI.23(a) or WCI.23(b)(1), as applicable, by fuel type and then calculate biomass fuel emissions by subtracting the fossil fuel related emissions from the total CO_2 emissions determined using the CEMS based methodology.

(5) For any units for which CO2 emissions are reported using CEMS data, the operator is relieved of the requirement to separately report process emissions from combustion emissions for that unit or to report emissions separately for different fossil fuels for that unit when only fossil fuels are co-fired. In this circumstance, operators shall still report fuel use by fuel type as otherwise required.

(6) If a facility is subject to requirements in 40 CFR Part 60 or 40 CFR Part 75 and the operator chooses to add devices to an existing CEMS for the purpose of measuring CO2 concentrations or flue gas flow, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 60 or Part 75 that apply to the facility. If the facility is subject to both 40 CFR Part 60 and 40 CFR Part 75, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 75.

(7) If a facility does not have a CEMS and the operator chooses to add one in order to measure CO_2 concentrations, the operator shall select and operate the CEMS pursuant to the requirements in 40 CFR Part 75 or equivalent requirements as applicable in Canada.

(A) The operator shall use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(B) The operator shall report CO_2 emissions for the report year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(C) Operators who add CEMS under this article are subject to specifications in WCI.23(d)(1)-(5), if applicable.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CO_2 emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) Calculation Methodology 1 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high heat value between 36.3 and 40.98 MJ per cubic meter. Otherwise, Calculation Methodology 1 may be used for any type of fuel for which a default CO2 emission factor (Tables 20-2, 20-3, 20-5, or 20-7, as applicable) and a default high heat value for the fuel (Table 20-1) is specified.

(2) Calculation Methodology 2 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high heat value between 36.3 and 40.98 MJ per cubic meter. Otherwise, Calculation Methodology 2 may be used for any type of fuel combusted for which a default CO2 emission factor for the fuel is specified in Tables 20-2, 20-3, 20-5, or 20-7, as applicable.

(3) Calculation Methodology 3 may be used for a unit of any size combusting any type of fuel, except when the use of Calculation Methodology 4 is required.

(4) Calculation Methodology 4 may be used for a unit of any size combusting any type of fuel, and must be used for: a combustion unit with a CEMS that is required by any federal, state, provincial, or local regulation and that includes both a stack gas volumetric flow rate monitor and a CO_2 concentration monitor.

(f) Mixtures of biomass or biomass fuel and fossil fuel.

(1) The owner or operator that combusts fuels or fuel mixtures for which the biomass fraction is known or can be documented shall use the applicable equations in WCI.23(a) through (c) to determine the fossil fuel fraction and shall determine the biomass fraction by subtracting the fossil fuel fraction from the total emissions.

(2) The owner or operator that combusts fuels or fuel mixtures for which the biomass fraction is unknown or cannot be documented (for example, municipal solid waste or tire-derived fuels) shall determine the biomass portion of CO_2 emissions using ASTM D6866-06a, as specified in this paragraph. This procedure is not required for fuels that contain less than 5 percent biomass by weight or for waste-derived fuels that are less than 30 percent by weight of total fuels combusted in the year for which emissions are being reported, except where the operator wishes to report a biomass fuel fraction of CO_2 emissions.

(A) The operator shall conduct ASTM D6866-06a analysis on a representative fuel or exhaust gas sample at least every three months, and shall collect exhaust gas samples over at least 24 consecutive hours following the standard practice specified by ASTM D7459-08.

(B) The operator shall divide total CO_2 emissions between biomass fuel emissions and non-biomass fuel emissions using the average proportions of the samples analyzed for the year for which emissions are being reported.

(C) If there is a common fuel source to multiple units at the facility, the operator may elect to conduct ASTM D6866-06a testing for one of the units.

§ WCI.24 Calculation of CH_4 and N_2O Emissions

Calculate the annual CH_4 and N_2O mass emissions from stationary fuel combustion sources using the procedures in paragraph (a), (b), or (c), as appropriate.

(a) If the heat content of the fuel is not measured for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-8 for all fuels except coal. For coal, use Equation 20-9:

$$CH_4 \text{ or } N_2O = Fuel \times HHV_D \times EF \times 0.000001 \qquad \textbf{Equation 20-8}$$

$$CH_4 \text{ or } N_2O = Fuel \times EF_c \times 0.000001 \qquad \textbf{Equation 20-9}$$

Where:

CH_4 or N_2O = Combustion emissions from specific fuel type, metric tons CH_4 or N_2O per year.

Fuel = Mass or volume of fuel combusted per year (express mass in metric tons for solid fuel, volume in standard cubic meters for gaseous fuel, and volume in kiloliters for liquid fuel).

HHV_D = Default high heat value specified by fuel type provided in Table 20-1, (GJ per metric ton for solid fuel, GJ per kiloliter for liquid fuel, or GJ per cubic meter for gaseous fuel).

EF = Default CH_4 or N_2O emission factor provided in Tables 20-2 or 20-4, as applicable, grams CH_4 or N_2O per GJ.

EF_c = Default CH_4 or N_2O emission factor for coal provided in Table 20-6 (grams CH_4 or N_2O per metric ton of coal)

0.000001 = Factor to convert grams to metric tons.

(b) If the heat content of the fuel is measured or provided by the fuel supplier for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-10 for all fuels except coal. For coal, use Equation 20-11:

$$CH_4 \text{ or } N_2O = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.000001 \qquad \textbf{Equation 20-10}$$

$$CH_4 \text{ or } N_2O = \sum_{p=1}^{n} Fuel_p \times EF_c \times 0.000001 \qquad \textbf{Equation 20-11}$$

Where:

CH_4 or N_2O = CH_4 or N_2O emissions from a specific fuel type, metric tons CH_4 or N_2O per year.

$Fuel_p$ = Mass or volume of the fuel combusted during the measurement period “p” (express mass in metric tons for solid fuel, volume in standard cubic meters for gaseous fuel, and volume in kiloliters for liquid fuel)..

HHV_p	=	High heat value measured directly or provided by the fuel supplier for the measurement period, p, specified by fuel type (GJ per metric ton for solid fuel, GJ per kiloliter for liquid fuel, or GJ per cubic meter for gaseous fuel).
EF	=	Default CH_4 or N_2O emission factor provided in Tables 20-2 or 20-4, as applicable, grams CH_4 or N_2O per GJ.
EF_c	=	CH_4 or N_2O emission factor for coal, either measured directly or provided by the fuel supplier, grams CH_4 or N_2O per metric ton of coal
0.000001	=	Factor to convert grams to metric tons.

(c) For biomass and municipal solid waste combustion, the operator may elect to use Equation 20-10 of this section to estimate CH_4 and N_2O emissions:

$$CH_4 \ or \ N_2O = Steam \times B \times EF \times 0.000001$$ **Equation 20-10**

Where:

CH_4 or N_2O	=	Annual CH_4 or N_2O emissions from the combustion of a municipal solid waste (metric tons).
Steam	=	Total mass of steam generated by municipal solid waste combustion during the reporting year (metric tons steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output (GJ/metric ton steam).
EF	=	Fuel-specific emission factor for CH_4 or N_2O, from Tables 20-2, 20-4 or 20-6, as applicable (grams CH_4 or N_2O per GJ).
0.000001	=	Conversion factor from grams to metric tons.

(d) The operator may elect to calculate CH_4 or N_2O emissions using source-specific emission factors derived from source tests conducted at least annually under the supervision of (*jurisdiction*). Upon approval of a source test plan, the source test procedures in that plan shall be repeated in each future year to update the source specific emission factors annually.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CH_4 and N_2O emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) WCI.24(a) may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise, WCI.24(a) may be used for any type of fuel for which a default CH_4 or N_2O emission factor (Tables 20-2, 20-4 or 20-6) and a default higher heat value (Table 20-3) is specified.
(2) WCI.24(b) may be used for a unit of any size combusting any type of fuel.
(3) WCI.24(c) may only be used for biomass or municipal solid waste combustion.
(4) WCI.24(d) may be used for a unit of any size combusting any type of fuel.

§ WCI.25 Sampling, Analysis, and Measurement Requirements

(a) Fuel Sampling Requirements. Fuel sampling must be conducted or fuel sampling results must be received from the fuel supplier at the frequency specified in paragraphs (a)(1) through (a)(4) of this section.

(1) Once for each new fuel shipment or delivery or on a monthly basis for middle distillates (diesel, gasoline, fuel oil, kerosene), residual oil, liquid waste-derived fuels, and LPG (ethane, propane, isobutene, n-butane, unspecified LPG).
(2) Monthly for natural gas, associated gas, and mixtures of low MJ gas.
(3) Monthly for gases derived from biomass including landfill gas and biogas from wastewater treatment or agricultural processes.
(4) Monthly for solid fuels, as specified below:

(A) The monthly solid fuel sample shall be a composite sample of weekly samples.
(B) The solid fuel shall be sampled at a location after all fuel treatment operations but before fuel mixing and the samples shall be representative of the fuel chemical and physical characteristics immediately prior to combustion.
(C) Each weekly sub-sample shall be collected at a time (day and hour) of the week when the fuel consumption rate is representative and unbiased.
(D) Four weekly samples (or a sample collected during each week of operation during the month) of equal mass shall be combined to form the monthly composite sample.
(E) The monthly composite sample shall be homogenized and well mixed prior to withdrawal of a sample for analysis.
(F) One in twelve composite samples shall be randomly selected for additional analysis of its discrete constituent samples. This information will be used to monitor the homogeneity of the composite.

(5) For biomass fuels and waste-derived fuels, the following may apply in lieu of WCI.25(a)(4):

(A) If CO_2 emissions are calculated using WCI.23(c)(1), the source-specific carbon content is determined annually. Upon approval of a source test plan by [*jurisdiction*], the source test procedures in that plan shall be repeated in subsequent years to update the source specific emission factors annually.
(B) If CO_2 emissions are calculated using WCI.23(c)(2) (biomass fuels and municipal solid waste only), the operator shall adjust the emission factor, in kg CO_2/MJ not less frequently than every third year, through a stack test measurement of CO_2 and use of the applicable ASME Performance Test Code to determine heat input from all heat outputs, including the steam, flue gases, ash and losses.

(b) Fuel Consumption Monitoring Requirements.

(1) Facilities may determine fuel consumption on the basis of direct measurement or recorded fuel purchase or sales invoices measuring any stock change (measured in MJ, liters, million standard cubic meters, metric tons or bone dry metric tons) using the following equation:

Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End

(2) Fuel consumption measured in MJ values shall be converted to the required metrics of mass or volume using heat content values that are either provided by the supplier, measured by the facility, or provided in Table 20-1.

(3) All oil and gas flow meters (except for gas billing meters) shall be calibrated prior to the first year for which GHG emissions are reported under this rule, using an applicable flow meter test method listed in section WCI.6 or the calibration procedures specified by the flow meter manufacturer. Fuel flow meters shall be recalibrated either annually or at the minimum frequency specified by the manufacturer.

(4) For fuel oil, tank drop measurements may also be used.

(c) Fuel Heat Content Monitoring Requirements. High heat values shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For gases, use ASTM D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), GPA Standard 2261-00 "Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography." The operator may alternatively elect to use on-line instrumentation that determines heating value accurate to within ± 5.0 percent. Where existing on-line instrumentation provides only low heat value, the operator shall convert the value to high heat value as follows:

$$HHV = LHV \times CF$$

Equation 20-11

Where:

HHV = fuel or fuel mixture high heat value (MJ/scm).
LHV = fuel or fuel mixture low heat value (MJ/scm).
CF = conversion factor.

For natural gas, a CF of 1.11 shall be used. For refinery fuel gas and mixtures of refinery fuel gas, a weekly average fuel system-specific CF shall be derived as follows:

(A) by concurrent LHV instrumentation measurements and HHV determined by on-line instrumentation or laboratory analysis as part of the daily carbon content determination; or,

(B) by the HHV/LHV ratio obtained from the laboratory analysis of the daily samples.

(2) For middle distillates and oil, or liquid waste-derived fuels, use ASTM D240-02 (Reapproved 2007), or ASTM D4809-06 (Reapproved 2005).

(3) For solid biomass-derived fuels, use ASTM D5865-07a.

(4) For waste-derived fuels, use ASTM D5865-07a or ASTM D5468-02 (Reapproved 2007). Operators who combust waste-derived fuels that are not pure biomass fuels shall determine the biomass fuel portion of CO_2 emissions using the method specified in section WCI.23(f), if applicable

(d) Fuel Carbon Content Monitoring Requirements. Fuel carbon content and either molecular weight or molar fraction for gaseous fuels shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For coal and coke, solid biomass fuels, and waste-derived fuels; use ASTM 5373-08.
(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) "Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2007).
(3) For gaseous fuels, use ASTM D1945-03 (Reapproved 2006) or ASTM D1946-90 (Reapproved 2006). The operator may alternatively elect to use on-line instrumentation that determines fuel carbon content accurate to ± 5 percent.

(e) Fuel Analytical Data Capture. When the applicable emissions estimation methodologies in sections WCI.20 through WCI.XXX require periodic collection of fuel analytical data for an emissions source, the operator shall demonstrate every reasonable effort to obtain a fuel analytical data capture rate of 100 percent for each report year.

(1) If the operator is unable to obtain fuel analytical data such that more than 20 percent of emissions from a source cannot be directly accounted for, the emissions from that source shall be considered unverifiable for the report year.
(2) If the fuel analytical data capture rate is at least 80 percent but less than 100 percent for any emissions source identified in sections WCI.20 through WCI.XXX, the operator shall use the mean of the fuel analytical data results captured to substitute for the missing values for the period of missing data.

(f) Procedure for Interim Fuel Analytical Data Collection.

(1) In the event of an unforeseen breakdown of fuel analytical data monitoring equipment required for the emissions estimation methodologies in sections WCI.20 through WCI.XXX, [jurisdiction] may authorize an operator to use an interim data collection procedure if [jurisdiction] determines that the operator has satisfactorily demonstrated that:
    (A) The breakdown may result in a loss of more than 20 percent of the source's fuel data for the reporting year, such that emissions for the affected source could not be verified under the provisions of section WCI.8;
    (B) The fuel analytical data monitoring equipment cannot be promptly repaired or replaced without shutting down a process unit significantly affecting facility operations, or that the monitoring equipment must be replaced and replacement equipment is not immediately available;
    (C) The interim procedure will not remain in effect longer than is reasonably necessary for repair or replacement of the malfunctioning data monitoring equipment; and
    (D) The request was submitted within 30 calendar days of the breakdown of the fuel analytical data monitoring equipment.

(2) An operator seeking approval of an interim data collection procedure must, within 30 days of the monitoring equipment breakdown, submit a written request to [jurisdiction] that includes all of the following:

(A) The proposed start date and end date of the interim procedure;

(B) A detailed description of what data are affected by the breakdown;

(C) A discussion of the accuracy of data collected during the interim procedure compared with the data collected under the operator's usual equipment-based method;

(D) A demonstration that no feasible alternative procedure exists that would provide more accurate emissions data; and

(E) A demonstration that the proposed interim procedure meets the criteria specified in section WCI.25(f)(1).

(3) *[The jurisdiction]* may limit the duration of the interim data collection procedure or include other conditions of approval to ensure the criteria in section WCI.25(f)(1) are met.

(4) When approving an interim data collection procedure, *[jurisdiction]* shall determine whether the accuracy of data collected under the procedure is reasonably equivalent to data collected from properly functioning monitoring equipment, and if it is not, the relative accuracy to assign for purposes of assessing possible material misstatement under section WCI.8(o).

Table 20-1: Default Carbon Content and High Heat Value by Fuel Type

Liquid Fuels	**Carbon Content (kg C /GJ)**	**High Heat Value (GJ/kl)**
Asphalt & Road Oil	19.8	44.46

The ~~RC~~WCI notes the significant difference in both the black liquor and solid biomass emission factors published by the EPA and Environment Canada (as well as those submitted by industry associations). In lieu of recommending a single emission factor at this time (as there is no certainty as to which is most accurate) the RC is presenting both for information purposes. The RC will be working with experts in the two federal agencies and other organizations to ascertain the most accurate emission factor to use for both Metric and English unit versions of the Essential Requirements of Mandatory Reporting.

§ WCI.30 REFINERY FUEL GAS COMBUSTION

WCI.31 Source Category Definition

This source category consists of any combustion device that is located at a petroleum refinery and that combusts refinery fuel gas, still gas, flexigas, or associated gas.

WCI.32 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the emissions data report shall include the following information at the facility level:

(a) Annual CO_2, CH_4, and N_2O emissions from refinery fuel gas combustion in metric tons.

(b) Annual fuel consumption in units of million standard cubic feet or cubic meters.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average high heat value of each fuel, if used to compute CO_2 emissions.

WCI.33 Calculation of Greenhouse Gas Emissions

(a) Calculation of CO_2 Emissions. Owners and operators shall calculate daily CO_2 emissions for each fuel gas system using any of the methods specified in paragraphs (a)(1) through (a)(5) of this section. Calculate the total annual CO_2 emissions from combustion of all fuel gas by summing the CO_2 emissions from each fuel gas system.

(1) Use a CEMS that complies with the provisions in section WCI.23(d).

(2) Calculate CO_2 emissions from each refinery fuel gas system and flexigas system using measured carbon content and molecular weight of the gas and Equation 30-1.

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times \frac{MW}{MVC} \times 3.664 \times 0.001$$ **Equation 30-1 (English Units)**

Where:

CO_2	=	Carbon dioxide emissions, metric tons/year.
$Fuel_i$	=	Daily refinery fuel or flexigas combusted (scf).
CC_i	=	Daily sample of carbon content of the fuel (kg C/kg fuel).
MW	=	Daily sample of molecular weight of fuel.
MVC	=	Molar volume conversion factor (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere, or 836 scf/kg-mole for STP of 60°F and 1 atmosphere).
3.664	=	Conversion factor for carbon to carbon dioxide.
0.001	=	Conversion factor for kg to metric tons.
n	=	Number of days in a year.

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times \frac{MW}{MVC} \times 3.664 \times 0.001$$ **Equation 30-1 (Metric Units)**

Where:

CO_2 = Carbon dioxide emissions, metric tons/year.
$Fuel_i$ = Daily refinery fuel or flexigas combusted (scm).
CC_i = Daily sample of carbon content of the fuel (kg C/kg fuel).
MW = Daily sample of molecular weight of fuel.
MVC = Molar volume conversion factor (24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere).
3.664 = Conversion factor for carbon to carbon dioxide.
0.001 = Conversion factor for kg to metric tons.
n = Number of days in a year.

(A) For refinery fuel gas, the daily carbon content shall be determined a minimum of 3 times a day (once every 8 hours) using on-line instrumentation or discrete laboratory analysis using the methods specified in WCI.34.
(B) For flexigas, the daily carbon content shall be determined once per day using the methods specified in WCI.34.

(3) Calculate CO_2 emissions from each fuel gas system and flexigas system using Equation 30-2 and a daily average high heat value that is monitored using a continuous on-line instrument.

$$CO_2 = \sum_{i=1}^{n} HHV_i \times Fuel_i \times EF_{CO2,i} \times 0.000001$$ **Equation 30-2 (English Units)**

Where:

CO_2 = CO_2 emissions resulting from the combustion of fuel gas from an individual fuel gas system (metric tons/yr).
HHV_i = Daily average high heat value of fuel gas, derived from a continuous analyzer and integrated over a 24-hour period (Btu/scf).
$Fuel_i$ = Daily fuel consumption from all fuel combustion units burning gas from the system (scf/d).
$EF_{CO2,i}$ = Daily CO_2 emission factor for an individual fuel gas system, developed using Equation 30-3 (metric tons CO_2/MMBtu).
0.000001 = Conversion factor for Btu to MMBtu.
n = Number of days per year.

Equation 30-2 (Metric Units)

$$CO_2 = \sum_{i=1}^{n} HHV_i \times Fuel_i \times EF_{CO2,i}$$

Where:

CO_2 = CO_2 emissions resulting from the combustion of fuel gas from an individual fuel gas system (metric tons/yr).
HHV_i = Daily average high heat value of fuel gas, derived from a continuous analyzer and integrated over a 24-hour period (MJ/m^3).
$Fuel_i$ = Daily fuel consumption from all fuel combustion units burning gas from the system (m^3/d).
$EF_{CO2,i}$ = Daily CO_2 emission factor for an individual fuel gas system, developed using Equation 30-3 (metric tons CO_2/MJ).
n = Number of days per year.

$$EF_{CO2,i} = CC/HHV \times MW/MVC \times 3.664 \times 1{,}000$$ **Equation 30-3 (English Units)**

Where:

$EF_{CO2,i}$ = Daily CO_2 emission factor for an individual fuel gas system (metric tons CO_2/MMBtu).
CC = Daily sample of gas carbon content for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (kg carbon/kg fuel).
HHV = Daily sample of gas high heat value for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (Btu/scf).
MW = Refinery fuel A molecular weight (kg/kg-mole).
MVC = Molar volume conversion (849.5 scf/ kg-mole, for STP of 20°C and 1 atmosphere, or 836 scf/kg-mole for STP of 60°F and 1 atmosphere).
3.664 = Conversion factor for carbon to carbon dioxide.
1,000 = Conversion factor for kg/Btu to metric tons/MMBtu.

$$EF_{CO2,i} = CC/HHV \times MW/MVC \times 3.664 \times 0.001$$ **Equation 30-3 (Metric Units)**

Where:

$EF_{CO2,i}$ = Daily CO_2 emission factor for an individual fuel gas system (metric tons CO_2/MJ).
CC = Daily sample of gas carbon content for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (kg carbon/kg fuel).
HHV = Daily sample of gas high heat value for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (MJ/m^3).
MW = Refinery fuel A molecular weight (kg/kg-mole).
MVC = Molar volume conversion (24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere).
3.664 = Conversion factor for carbon to carbon dioxide.
0.001 = Conversion factor for kg/MJ to metric tons/MJ.

(A) For Equation 30-3, the carbon content shall be determined once per day by on-line instrumentation or by laboratory analysis of a representative sample using the methods specified in WCI.34. The HHV shall be determined from either the same sample used to conduct the carbon analysis or from on-line instrumentation using the hourly average value that coincides with the same hour in which the carbon content was determined.

(B) For facilities that meet the definition of a small refiner in WCI.10, the emissions measurements and calculations for Equation 30-2 and 30-3 may be conducted weekly.

(4) For associated gas, low heat content gas, or other fossil fuels; follow the requirements for general stationary source combustion sources in WCI .23(b) or (c), as appropriate for each fuel.

(5) Where individual fuels are mixed prior to combustion, the operator may choose to calculate CO_2 emissions for each fuel prior to mixing instead of using the methods in paragraphs (a)(1), (a)(2), or (a)(3) of this section. In this case, the operator must determine the fuel flow rate and appropriate fuel specific parameters (e.g. carbon content, HHV) of each fuel stream prior to mixing, calculate CO_2 emissions for each fuel stream, and sum the emissions of the individual fuel streams to determine total CO_2 emissions from the mixture. CO_2 emissions for each fuel stream must be estimated using the following methods:

(A) For natural gas and associated gas, use the appropriate methodology specified in section WCI.23(b) or (c).

(B) For refinery fuel gas and flexigas, use the methodology in either paragraph (a)(2) or (a)(3) of this section.

(C) For low heat content gas, use the methodology in paragraph (a)(2) of this section.

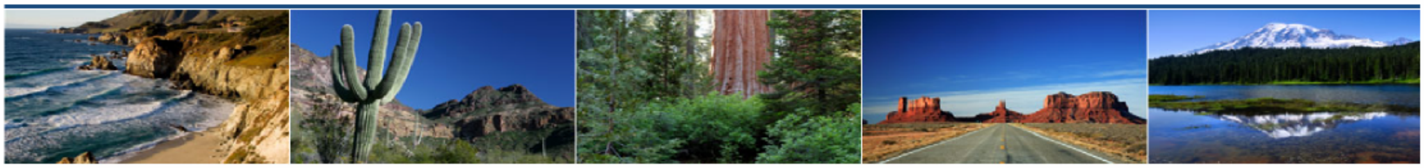
(b) Calculation of CH_4 and N_2O Emissions. Owners and operators shall use the methods specified in section WCI.24 to calculate the annual CH_4 and N_2O emissions.

WCI.34 Sampling, Analysis, and Measurement Requirements

(a) Measure the fuel consumption rate daily using methods specified in WCI.25(b).

(b) Measure the carbon content for fuel gas and flexigas using either ASTM D1945-03 (Reapproved 2006) or ASTM D1946-90 (Reapproved 2006). Where these methods do not adequately quantify all major hydrocarbons, then an owner or operator may request use of an alternative ASTM or other method to be approved by *[the jurisdiction]*.

(c) Measure high heat value using the monitoring requirements specified in WCI.25(c) for gaseous fuels.



§ WCI.40 ELECTRICITY GENERATION (ENGLISH UNITS)

§ WCI.41 Source Category Definition

An electricity generating unit is any combustion device that combusts solid, liquid, or gaseous fuel for the purpose of producing electricity either for sale or for use onsite. This source category includes cogeneration (combined heat and power) units.

§ WCI.42 Greenhouse Gas Reporting Requirements

For each electricity generating unit, the emissions data report shall include the following information:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil fuels, reported by fuel type.

(2) Total CO_2 emissions for all biomass fuels combined.

(3) Total CH_4 emissions for fuels combined.

(4) Total N_2O emissions for all fuels combined.

(b) Annual fuel consumption:

(1) For gases, report in units of million standard cubic feet.

(2) For liquids, report in units of gallons.

(3) For non-biomass solids, report in units of short tons.

(4) For biomass-derived solid fuels, report in units of bone dry short tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions as specified in WCI.43.

(d) Average high heating value of each fuel, if used to compute CO_2 emissions as specified WCI.43.

(e) The nameplate generating capacity in megawatts and net power generated in the reporting year in megawatt hours.

(f) For each cogeneration unit, indicate whether topping or bottoming cycle and provide useful thermal output as applicable, in mmBtu. Where steam or heat is acquired from another facility for the generation of electricity, report the provider and amount of acquired steam or heat in mmBtu. Where supplemental firing has been applied to support electricity generation or industrial output, report this purpose and fuel consumption by fuel type using the units in WCI.42(b).

(g) Process CO_2 emissions from acid gas scrubbers and acid gas reagent.

(h) Fugitive emissions of HFC from cooling units that support power generation.

(i) Fugitive CO_2 emissions from geothermal facilities.

(j) Fugitive CO_2 emissions from coal storage at coal-fired electricity generating facilities shall be reported as specified in section WCI.100.

§ WCI.43 Calculation of Greenhouse Gas Emissions

(a) Calculation of CO_2 Emissions. Operators shall use CEMS to measure CO_2 emissions if required to operate a CEMS by any other federal, state, provincial, or local regulation. Operators not required to operate a CEMS by another regulation may use either CEMS or the calculation methods specified in paragraphs (a)(1) through (a)(7). Operators using CEMS to determine CO_2 emissions shall comply with the provisions in section WCI.23(d).

(1) Natural Gas. For electric generating units combusting natural gas, use one of the following methods:

(A) If the high heat value is greater than or equal to 975 and less than or equal to 1,100 Btu/scf use either:

(i) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

(ii) The measured heat content of the fuel and the calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(B) If the high heat value is less than 975 or greater than 1,100 Btu/scf, use the measured carbon content of the fuel and the calculation methodology 3 in section WCI.23(c).

(2) Coal or Petroleum Coke. For electric generating units combusting coal or petroleum coke, use the measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c).

(3) Middle Distillates, Gasoline, Residual Oil, or Liquid Petroleum Gases. For electric generating units combusting middle distillates (such as diesel, fuel oil, or kerosene), gasoline, residual oil, or LPG (such as ethane, propane, isobutene, n-butane, or unspecified LPG), use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(4) Refinery Fuel Gas, Flexigas, or Associated Gas. For electric generating units combusting refinery fuel gas, flexigas, or associated gas, use the methods specified in section WCI.30.

(5) Landfill Gas, Biogas, or Biomass. For electric generating units combusting landfill gas, biogas, or biomass, use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(6) Municipal Solid Waste. Electric generating units combusting municipal solid waste, may use the measured steam generated, the default carbon content emission factor in Table 20-1, and the calculation methodology in section WCI.23(b)(2) provided the facility is not subject to the verification requirements of WCI.8. If the facility is subject to the verification requirements of WCI.8, the operator shall use CEMS to measure CO_2 emissions in accordance with WCI.23(d), or calculate emissions using steam flow and a CO_2 emission factor according to the provisions of WCI.23(c)(2).

(7) Start-up Fuels. The operators of generating facilities that primarily combust biomass-derived fuels but combust fossil fuels during start-up, shut-down, or malfunction operating periods only, shall calculate CO_2 emissions from fossil fuel combustion using one of the following methods:

(A) The default emission factors from Tables 20-1 and 20-2 and calculation methodology 1 provided in section WCI.23(a);

(B) The measured heat content of the fuel and calculation methodology 2 provided in section WCI.23(b);

(C) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or

(D) For combustion of refinery fuel gas, the measured heat content and carbon content of the fuel, and the calculation methodology provided in section WCI.30.

(8) Co-fired Electricity Generating Units. For electricity generating units that combust more than one type of fuel, the operator shall calculate CO_2 emissions as follows.

(A) For co-fired electricity generators that burn only fossil fuels, CO_2 emissions shall be determined using one of the following methods:

(i) A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method need not report emissions separately for each fossil fuel.

(ii) For units not equipped with a continuous emission system, calculate the CO2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(4) of this section.

(B) For co-fired electricity generators that burn biomass-derived fuel with a fossil fuel, CO_2 emissions shall be determined using one of the following methods:

(i) A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method shall determine the portion of the total CO_2 emissions attributable to the biomass-derived fuel and portion of the total CO_2 emissions attributable to the fossil fuel using the methods specified in section WCI.23(d)(4).

(ii) For units not equipped with a continuous emission system, calculate the CO_2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(7) of this section.

(b) Calculation of CH_4 and N_2O Emissions. Operators of electricity generating units shall use the methods specified in section WCI.24 to calculate the annual CH_4 and N_2O emissions. For coal combustion, use the default CH_4 emission factor in Table 20-3.

(c) Calculation of CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall calculate the annual CO_2 emissions from these processes using Equation 40-1 if these emissions are not already captured in CO_2 emissions determined using a continuous emissions monitoring system.

$$CO_2 = S \times R \times \left(CO_{2\,MW} / Sorbent_{MW}\right)$$ **Equation 40-1**

Where:

CO_2	=	CO_2 emitted from sorbent for the report year, metric tons;
S	=	Limestone or other sorbent used in the report year, metric tons;
R	=	Ratio of moles of CO_2 released upon capture of one mole of acid gas;
$CO_{2\ MW}$	=	Molecular weight of carbon dioxide (44);
$Sorbent_{\ MW}$	=	Molecular weight of sorbent (if calcium carbonate, 100).

(d) Calculating Fugitive HFC Emissions from Cooling Units. Operators of electricity generating facilities shall calculate fugitive HFC emissions for each HFC compound used in cooling units that support power generation or are used in heat transfers to cool stack gases using either the methodology in paragraph (d)(1) or (d)(2). The Operator is not required to report GHG emissions from air or water cooling systems or condensers that do not contain HFCs.

(1) Use Equation 40-2 to calculate annual HFC emissions:

$$HFC = HFC_{inventory} + HFC_{purchases/acquisitions} - HFC_{sales/disbursements} + HFC_{\Delta capacity}$$ **Equation 40-2**

Where:

HFC	=	Annual fugitive HFC emission, metric tons;
$HFC_{inventory}$	=	The difference between the quantity of HFC in storage at the beginning of the year and the quantity in storage at the end of the year. Stored HFC includes HFC contained in cylinders (such as 115-pound storage cylinders), gas carts, and other storage containers. It does not include HFC gas held in operating equipment. The change in inventory will be negative if the quantity of HFC in storage increases over the course of the year.
$HFC_{purchases/acquisitions}$	=	The sum of all HFC acquired from other entities during the year either in storage containers or in equipment.
$HFC_{sales/disbursements}$	=	The sum of all the HFC sold or otherwise transferred offsite to other entities during the year either in storage containers or in equipment.

$HFC_{\Delta capacity}$ = The net change in the total nameplate capacity (i.e. the full and proper charge) of the cooling equipment). The net change in capacity will be negative if the total nameplate capacity at the end of the year is less than the total nameplate capacity at the beginning of the year.

(2) Use service logs to document HFC usage and emissions from each cooling unit. Service logs should document all maintenance and service performed on the unit during the report year, including the quantity of HFCs added to or removed from the unit, and include a record at the beginning and end of each report year. The operator may use service log information along with the following simplified material balance equations to quantify fugitive HFCs from unit installation, servicing, and retirement, as applicable. The operator shall include the sum of HFC emissions from the applicable equations in the greenhouse gas emissions data report.

$$HFC_{Install} = R_{new} - C_{new}$$

$$HFC_{Service} = R_{recharge} - R_{Recover}$$

$$HFC_{Retire} = C_{retire} - R_{retire}$$

Where:

$HFC_{Install}$ = HFC emitted during initial charging/installation of the unit, kilograms;
$HFC_{Service}$ = HFC emitted during use and servicing of the unit for the report year, kilograms;
HFC_{Retire} = HFC emitted during the removal from service/retirement of the unit, kilograms;
R_{new} = HFC used to fill new unit (omit if unit was pre-charged by the manufacturer), kilograms;
C_{new} = Nameplate capacity of new unit (omit if unit was pre-charged by the manufacturer), kilograms;
$R_{recharge}$ = HFC used to recharge the unit during maintenance and service, kilograms;
$R_{recover}$ = HFC recovered from the unit during maintenance and service, kilograms;
C_{retire} = Nameplate capacity of the retired unit, kilograms; and
R_{retire} = HFC recovered from the retired unit, kilograms.

(e) Fugitive CO_2 Emissions from Geothermal Facilities. Operators of geothermal electricity generating facilities shall calculate the fugitive CO_2 emissions using one of the following methods:

(1) Calculate the fugitive CO_2 emissions using Equation 40-3:

$$CO_2 = 7.53 \times Heat \times 0.001$$ **Equation 40-3**

Where:

CO_2 = CO_2 emissions, metric tons per year;
7.53 = Default fugitive CO_2 emission factor for geothermal facilities, kg per mmBtu; and
Heat = Heat taken from geothermal steam and/or fluid, mmBtu/yr.

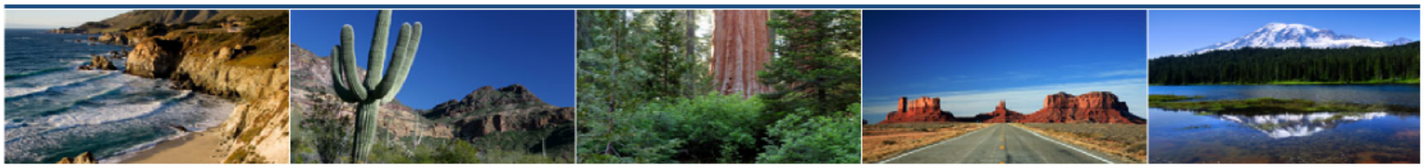
(2) Calculate CO_2 emissions using [*insert jurisdiction*] approved source specific emission factor.

§ WCI.44 Sampling, Analysis, and Measurement Requirements

(a) CO_2, CH_4 and N_2O Emissions from Fuel Combustion. Operators using CEMS to estimate CO_2 emissions from fuel combustion shall comply with the requirements in section WCI.23(d). Operators using methods other than CEMS shall comply with the applicable fuel sampling, fuel consumption monitoring, heat content monitoring, and carbon content monitoring specified in section WCI.25.

(b) CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall measure the amount of limestone or other sorbent used during the reporting year.

(c) CO_2 Emissions from Geothermal Facilities. Operators of geothermal facilities shall measure the heat recovered from geothermal steam. If using source specific emission factor instead of the default factor, the operator shall conduct an annual test of the CO_2 emission rate using a method approved by [*insert jurisdiction*]. The operator shall submit a test plan to the [*insert jurisdiction*] for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [*insert jurisdiction*].



§ WCI.40 ELECTRICITY GENERATION (METRIC UNITS)

§ WCI.41 Source Category Definition

An electricity generating unit is any combustion device that combusts solid, liquid, or gaseous fuel for the purpose of producing electricity either for sale or for use onsite. This source category includes cogeneration (combined heat and power) units.

§ WCI.42 Greenhouse Gas Reporting Requirements

For each electricity generating unit, the emissions data report shall include the following information:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

- (1) Total CO_2 emissions for fossil fuels, reported by fuel type.
- (2) Total CO_2 emissions for all biomass fuels combined.
- (3) Total CH_4 emissions for fuels combined.
- (4) Total N_2O emissions for all fuels combined.

(b) Annual fuel consumption:

- (1) For gases, report in units of standard cubic meters.
- (2) For liquids, report in units of kiloliters.
- (3) For non-biomass solids, report in units of metric tons.
- (4) For biomass-derived solid fuels, report in units of bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions as specified in WCI.43.

(d) Average high heating value of each fuel, if used to compute CO_2 emissions as specified WCI.43.

(e) The nameplate generating capacity in megawatts and net power generated in the reporting year in megawatt hours.

(f) For each cogeneration unit, indicate whether topping or bottoming cycle and provide useful thermal output as applicable, in MJ. Where steam or heat is acquired from another facility for the generation of electricity, report the provider and amount of acquired steam or heat in MJ. Where supplemental firing has been applied to support electricity generation or industrial output, report this purpose and fuel consumption by fuel type using the units in WCI.42(b).

(g) Process CO_2 emissions from acid gas scrubbers and acid gas reagent.

(h) Fugitive emissions of HFC from cooling units that support power generation.

(i) Fugitive CO_2 emissions from geothermal facilities.

(j) Fugitive CO_2 emissions from coal storage at coal-fired electricity generating facilities shall be reported as specified in section WCI.100.

§ WCI.43 Calculation of Greenhouse Gas Emissions

(a) Calculation of CO_2 Emissions. Operators shall use CEMS to measure CO_2 emissions if required to operate a CEMS by any other federal, state, provincial, or local regulation. Operators not required to operate a CEMS by another regulation may use either CEMS or the calculation methods specified in paragraphs (a)(1) through (a)(7). Operators using CEMS to determine CO_2 emissions shall comply with the provisions in section WCI.23(d).

(1) Natural Gas. For electric generating units combusting natural gas, use one of the following methods:

(A) If the high heat value is greater than or equal to 36.3 and less than or equal to 40.98 MJ/scm use either:

(i) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

(ii) The measured heat content of the fuel and the calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(B) If the high heat value is less than 36.3 or greater than 40.98 MJ/scm, use the measured carbon content of the fuel and the calculation methodology 3 in section WCI.23(c).

(2) Coal or Petroleum Coke. For electric generating units combusting coal or petroleum coke, use the measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c).

(3) Middle Distillates, Gasoline, Residual Oil, or Liquid Petroleum Gases. For electric generating units combusting middle distillates (such as diesel, fuel oil, or kerosene), gasoline, residual oil, or LPG (such as ethane, propane, isobutene, n-butane, or unspecified LPG), use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(4) Refinery Fuel Gas, Flexigas, or Associated Gas. For electric generating units combusting refinery fuel gas, flexigas, or associated gas, use the methods specified in section WCI.30.

(5) Landfill Gas, Biogas, or Biomass. For electric generating units combusting landfill gas, biogas, or biomass, use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(6) Municipal Solid Waste. Electric generating units combusting municipal solid waste, may use the measured steam generated, the default emission factor in WCI.20 Table 20-7, and the calculation methodology in section WCI.23(b)(2) provided the facility is not subject to the verification requirements of WCI.8. If the facility is subject to the verification requirements of WCI.8, the operator shall use CEMS to measure CO_2 emissions in accordance with WCI.23(d), or calculate emissions using steam flow and a CO_2 emission factor according to the provisions of WCI.23(c)(2).

(7) Start-up Fuels. The operators of generating facilities that primarily combust biomass-derived fuels but combust fossil fuels during start-up, shut-down, or malfunction operating periods only, shall calculate CO_2 emissions from fossil fuel combustion using one of the following methods:

(A) The default emission factors from Tables 20-2, 20-3, 20-5 or 20-7, as applicable, and calculation methodology 1 provided in section WCI.23(a);

(B) The measured heat content of the fuel and calculation methodology 2 provided in section WCI.23(b);

(C) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or

(D) For combustion of refinery fuel gas, the measured heat content and carbon content of the fuel, and the calculation methodology provided in section WCI.30.

(8) Co-fired Electricity Generating Units. For electricity generating units that combust more than one type of fuel, the operator shall calculate CO_2 emissions as follows.

(A) For co-fired electricity generators that burn only fossil fuels, CO_2 emissions shall be determined using one of the following methods:

(i) A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method need not report emissions separately for each fossil fuel.

(ii) For units not equipped with a continuous emission system, calculate the CO2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(4) of this section.

(B) For co-fired electricity generators that burn biomass-derived fuel with a fossil fuel, CO_2 emissions shall be determined using one of the following methods:

(i) A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method shall determine the portion of the total CO_2 emissions attributable to the biomass-derived fuel and portion of the total CO_2 emissions attributable to the fossil fuel using the methods specified in section WCI.23(d)(4).

(ii) For units not equipped with a continuous emission system, calculate the CO_2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(7) of this section.

(b) Calculation of CH_4 and N_2O Emissions. Operators of electricity generating units shall use the methods specified in section WCI.24 to calculate the annual CH_4 and N_2O emissions. For coal combustion, use the default CH_4 emission factor(s) in Table 20-6.

(c) Calculation of CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall calculate the annual CO_2 emissions from these processes using Equation 40-1 if these emissions are not already captured in CO_2 emissions determined using a continuous emissions monitoring system.

$$CO_2 = S \times R \times \left(CO_{2\,MW} / Sorbent_{MW} \right)$$ **Equation 40-1**

Where:

CO_2	=	CO_2 emitted from sorbent for the report year, metric tons;
S	=	Limestone or other sorbent used in the report year, metric tons;
R	=	Ratio of moles of CO_2 released upon capture of one mole of acid gas;
$CO_{2\ MW}$	=	Molecular weight of carbon dioxide (44);
$Sorbent_{\ MW}$	=	Molecular weight of sorbent (if calcium carbonate, 100).

(d) Calculating Fugitive HFC Emissions from Cooling Units. Operators of electricity generating facilities shall calculate fugitive HFC emissions for each HFC compound used in cooling units that support power generation or are used in heat transfers to cool stack gases using either the methodology in paragraph (d)(1) or (d)(2). The Operator is not required to report GHG emissions from air or water cooling systems or condensers that do not contain HFCs.

(1) Use Equation 40-2 to calculate annual HFC emissions:

$$HFC = HFC_{inventory} + HFC_{purchases/acquisitions} - HFC_{sales/disbursements} + HFC_{\Delta capacity}$$ **Equation 40-2**

Where:

HFC	=	Annual fugitive HFC emission, metric tons;
$HFC_{inventory}$	=	The difference between the quantity of HFC in storage at the beginning of the year and the quantity in storage at the end of the year. Stored HFC includes HFC contained in cylinders (such as 115-pound storage cylinders), gas carts, and other storage containers. It does not include HFC gas held in operating equipment. The change in inventory will be negative if the quantity of HFC in storage increases over the course of the year.
$HFC_{purchases/acquisitions}$	=	The sum of all HFC acquired from other entities during the year either in storage containers or in equipment.
$HFC_{sales/disbursements}$	=	The sum of all the HFC sold or otherwise transferred offsite to other entities during the year either in storage containers or in equipment.

$HFC_{\Delta capacity}$ = The net change in the total nameplate capacity (i.e. the full and proper charge) of the cooling equipment). The net change in capacity will be negative if the total nameplate capacity at the end of the year is less than the total nameplate capacity at the beginning of the year.

(2) Use service logs to document HFC usage and emissions from each cooling unit. Service logs should document all maintenance and service performed on the unit during the report year, including the quantity of HFCs added to or removed from the unit, and include a record at the beginning and end of each report year. The operator may use service log information along with the following simplified material balance equations to quantify fugitive HFCs from unit installation, servicing, and retirement, as applicable. The operator shall include the sum of HFC emissions from the applicable equations in the greenhouse gas emissions data report.

$$HFC_{Install} = R_{new} - C_{new}$$

$$HFC_{Service} = R_{recharge} - R_{Recover}$$

$$HFC_{Retire} = C_{retire} - R_{retire}$$

Where:

$HFC_{Install}$ = HFC emitted during initial charging/installation of the unit, kilograms;
$HFC_{Service}$ = HFC emitted during use and servicing of the unit for the report year, kilograms;
HFC_{Retire} = HFC emitted during the removal from service/retirement of the unit, kilograms;
R_{new} = HFC used to fill new unit (omit if unit was pre-charged by the manufacturer), kilograms;
C_{new} = Nameplate capacity of new unit (omit if unit was pre-charged by the manufacturer), kilograms;
$R_{recharge}$ = HFC used to recharge the unit during maintenance and service, kilograms;
$R_{recover}$ = HFC recovered from the unit during maintenance and service, kilograms;
C_{retire} = Nameplate capacity of the retired unit, kilograms; and
R_{retire} = HFC recovered from the retired unit, kilograms.

(e) Fugitive CO_2 Emissions from Geothermal Facilities. Operators of geothermal electricity generating facilities shall calculate the fugitive CO_2 emissions using one of the following methods:

(1) Calculate the fugitive CO_2 emissions using Equation 40-3:

$$CO_2 = 7.14 \times Heat \times 0.001$$ **Equation 40-3**

Where:

CO_2 = CO_2 emissions, metric tons per year;
7.14 = Default fugitive CO_2 emission factor for geothermal facilities, kg per GJ; and
Heat = Heat taken from geothermal steam and/or fluid, GJ/yr.

(2) Calculate CO_2 emissions using [*insert jurisdiction*] approved source specific emission factor.

§ WCI.44 Sampling, Analysis, and Measurement Requirements

(a) CO_2, CH_4 and N_2O Emissions from Fuel Combustion. Operators using CEMS to estimate CO_2 emissions from fuel combustion shall comply with the requirements in section WCI.23(d). Operators using methods other than CEMS shall comply with the applicable fuel sampling, fuel consumption monitoring, heat content monitoring, and carbon content monitoring specified in section WCI.25.

(b) CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall measure the amount of limestone or other sorbent used during the reporting year.

(c) CO_2 Emissions from Geothermal Facilities. Operators of geothermal facilities shall measure the heat recovered from geothermal steam. If using source specific emission factor instead of the default factor, the operator shall conduct an annual test of the CO_2 emission rate using a method approved by [*insert jurisdiction*]. The operator shall submit a test plan to the [*insert jurisdiction*] for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [*insert jurisdiction*].

§ WCI.60 IMPORTED ELECTRICITY

[*The requirements in this attachment do not include the default emissions factors necessary for reporting imported electricity from asset-controlling suppliers or imports from unspecified sources. Default factors for unspecified sources are under development by the Electricity Committee and asset-controlling suppliers will need to approach each jurisdiction for approval of a differentiated default factor*.]

§ WCI.61 Definitions

“Asset-controlling supplier” means any entity that owns or operates electricity generating facilities or serves as an exclusive marketer for certain generating facilities even though it does not own them, and is assigned a supplier-specific identification number for its fleet of generating facilities by [*the jurisdiction*].

“Balancing authority” means a responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports interconnection frequency in real time.

“Balancing authority area” means the collection of generation, transmission, and loads within the metered boundaries of a balancing authority. A balancing authority maintains load-resource balance within this area.

“Busbar” means a power conduit of an electricity generating facility that serves as the starting point for the electricity transmission system.

“Electricity generating facility” means a facility that generates electricity and includes one or more electricity generating units at the same location.

“Electricity importer” means [common boundary FJD] an owner of imported electricity [*or electricity wheeled through the WCI Region*] as it is delivered to the first point of delivery in the WCI Region or; [individual boundary FJD] an owner of imported electricity [*or electricity wheeled through the WCI Region*] as it is delivered to the first point of delivery in the WCI Partner jurisdiction of the final point of delivery. [The definition used may vary by jurisdiction.]

“Electricity transaction” means the purchase, sale, import, export or exchange of electric power.

“Electricity wheeled through the WCI Region” means electricity that is imported into the WCI Region but is simultaneously exported out of the WCI Region and has a final point of delivery in a location outside of the WCI Region.

“Entity” means a person, firm, association, organization, partnership, business trust, corporation, limited liability company, company, or government agency.

“Exchange agreement” means a commitment between electricity market participants to swap energy for energy. Exchange transactions do not involve transfers of payment or receipts of money for the full market value of the energy being exchanged, but may include payment for net differences due to market price differences between the two parts of the transaction or to settle minor imbalances.

"Final point of delivery" means the last point of delivery for a given electricity transaction.

"First Jurisdictional Deliverer" means the owner or operator of an electricity generating facility in a WCI Partner jurisdiction or an electricity importer that is jurisdictional to the regulatory authority of a WCI Partner jurisdiction or the immediate downstream purchaser or recipient of electricity from a non-jurisdictional electricity importer.

"Gross generation" means the total electrical output of the generating unit, expressed in megawatt hours (MWh) per year.

"Imported electricity" means electric power generated outside the WCI Region, delivered into the WCI Region and having a final point of delivery in the WCI Region.

"Megawatt hour" or "MWh" means the electrical energy unit of measure equal to one million watts of power supplied to, or taken from, an electric circuit steadily for one hour.

"Multi-jurisdictional retail provider" means a retail provider that provides electricity to consumers in [*the jurisdiction*] and in one or more other non-WCI jurisdictions in a contiguous service territory.

"Nameplate generating capacity" means the maximum rated output of a generator under specific conditions designated by the manufacturer, expressed in megawatts (MW) or kilowatts (kW).

"Net power generated" means the gross generation minus station service or unit service power requirements, expressed in megawatt hours (MWh) per year. In the case of cogeneration, this value is intended to include internal consumption of electricity for the purposes of a production process, as well as power put on the grid.

"NERC E-tag" means North American Electric Reliability Corporation (NERC) energy tag representing transactions on the North American bulk electricity market scheduled to flow between or across balancing authority areas.

"Point of delivery" means a point on an electricity transmission or distribution system where a power supplier delivers electricity to the receiver of that energy. This point can be an interconnection with another system or a substation where the transmission provider's transmission and distribution systems are connected to another system, or a distribution substation where electricity is imported into the WCI region over a multi-jurisdictional retail provider's distribution system.

"Power contract" means an arrangement for the purchase of electricity. Power contracts may be, but are not limited to, power purchase agreements and tariff provisions.

"Purchasing/selling entity" means an entity that purchases or sells energy or capacity and reserves transmission services between or among balancing authority areas.

"Renewable energy" means energy from sources that constantly renew themselves or that are regarded as practically inexhaustible. Renewable energy includes, but is not limited to, energy derived from solar, wind, geothermal, hydroelectric, wood, biomass, tidal power, sea currents, and ocean thermal gradients.

"Renewable energy certificate" or "renewable energy credit" means a certificate of proof issued by an approved generation information system or third-party verifier that one MWh of electricity was generated by a renewable energy source.

"Retail provider" means an entity that provides electricity to retail end users in [*the jurisdiction*].

"Specified source" means a specific electricity generating unit or electricity generating facility which can be matched to a reported electricity transaction due to full or partial ownership by the first jurisdictional deliverer or due to its identification in a power contract with the first jurisdictional deliverer.

"Unspecified source" means electricity generation that cannot be matched to a specific electricity generating facility or electricity generating unit. Unspecified sources of electricity may include electricity purchased from entities that own fleets of generating facilities such as independent power producers, retail providers, and federal power agencies and power purchased from electricity marketers, brokers, and markets.

"Western Climate Initiative" or "WCI" means a collaborative effort of the U.S. states and Canadian provinces that comprise the WCI Region to reduce greenhouse gas emissions in their respective jurisdictions.

"WCI Region" means the Canadian provinces of British Columbia, Manitoba, Ontario, and Quebec plus the U.S. states of Arizona, California, Montana, New Mexico, Oregon, Utah, and Washington, excluding lands that are not subject to state or provincial jurisdiction.

§ WCI.62 Greenhouse Gas Emissions Data Report: First Jurisdictional Deliverers of Imported Electricity

(a) General Requirements. First jurisdictional deliverers shall meet the following general requirements in preparing their greenhouse gas emissions data report for each report year. When reporting emissions and electricity transactions, first jurisdictional deliverers, excluding imported electricity that is imported at the distribution level by multi-jurisdictional retail providers, shall:

(1) Specify the amount of greenhouse gas emissions in metric tons CO_2e;

(2) Specify the amount of electricity in MWh;

(3) Aggregate imported electricity and emissions from specified sources by electricity generating facility or electricity generating unit, as applicable;

(4) For electricity from specified sources, specify the facility name, the facility ID, and, if applicable, the electricity generating unit ID for the unit generating the electricity;

(5) Report the amount of imported electricity from specified sources as measured at the busbar;

(6) For imported electricity transactions from specified sources where measurements at the busbar are not known, report the amount of imported electricity from the applicable specified sources as measured at the first point of delivery in [*the jurisdiction]* and report estimated transmission losses for each specified source;

(7) Report the amount of electricity from unspecified sources as measured at the first point of delivery in [*the jurisdiction*];

(8) For electricity from unspecified sources, disaggregate imported electricity by the balancing authority area or other geographic area as defined by [*the jurisdiction*] from which the electricity originated;

(9) Report the amount of electricity from asset-controlling suppliers as measured at the first point of delivery in [*the jurisdiction*];

(10) For electricity from asset-controlling suppliers, disaggregate imported electricity by the asset-controlling or asset-owning supplier from which the electricity was purchased;

(11) Report the number of renewable energy certificates from sources not in the WCI region that are retired, or whose greenhouse gas source specification fields are retired, as applicable, associated with imported electricity from an unspecified source or imported electricity from a specified source having an emission rate equal to or less than the default rate for the balancing authority where the specified generating facility is located;

(12) Specify electricity imported under exchange agreements as you would other import transactions;

(13) Report quantities of electricity wheeled through the WCI Region as measured at the first point of delivery inside [*the jurisdiction*];

(14) Retain for purposes of verification NERC E-tags, power contracts, settlements data, and all other information needed to confirm the transactions.

(b) Report Content. First Jurisdictional Deliverers shall include the following information in the greenhouse gas emissions data report for each report year.

(1) Specified Imported Electricity Transactions. Imported electricity and emissions from specified sources for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer.

(A) Electricity imported into the WCI Region from a specified hydroelectric generating facility with nameplate capacity of greater than 30 MW that was operational prior to January 1, 2008 or from a specified nuclear facility that was operational prior to January 1, 2008 shall be listed as one of the following:

(i) Electricity purchased with a contract in effect prior to January 1, 2008 that remains in effect or has been renegotiated for the same facility for the same share or quantity of net generation within one year of contract expiration;

(ii) Electricity purchased not meeting WCI.62(b)(1)(A)(i) and that is not associated with an increase in the facility's generating capacity;

(iii) Electricity purchased not meeting WCI.62(b)(1)(A)(i) that is associated with an increase in the facility's generating capacity due to increased efficiencies or other capacity increasing actions;

(iv) Electricity purchased from hydroelectric generating facilities during a "spill or sell" situation where power not purchased is lost;

(v) Electricity purchased that does not meet WCI.62(b)(1)(A)(i) due to federal power redistribution polices for federally owned resources and not related to price bidding.

(2) Unspecified Imported Electricity Transactions. Imported electricity and emissions from unspecified sources for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer.

(3) Imported Electricity from Asset-Controlling Suppliers. Imported electricity and emissions from asset-controlling suppliers for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer.

(4) Electricity Wheeled Through the WCI Region. Electricity wheeled through the WCI Region for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer.

§ WCI.63 Calculation of Emissions from Specified Sources

For each specified source, calculate CO_2 mass emissions using one of the two calculation methodologies specified in this section.

(a) Calculation Methodology 1: If the specified source reports emissions to [*the jurisdiction*], The Climate Registry, the U.S.EPA under 40 CFR Part 75 or to Environment Canada under Section 71 of the Canadian Environmental Protection Act calculate emissions using Equation 60-1:

$$CO_2 = CO_{2t} \times \frac{MWh_{imp}}{MWh_t}$$ **Equation 60-1**

Where:

CO_2 = Annual CO_2 mass emissions for imported electricity from the specified source (metric tons).

CO_{2t} = Total annual CO_2 mass emissions from the specified source (metric tons) reported, in order of preference, to [*the jurisdiction*], The Climate Registry, or to the U.S.EPA or Environment Canada.

MWh_{imp} = Megawatt-hours of electricity imported from the specified source, including estimated losses for transactions not measured at the busbar.

MWh_t = Total megawatt-hours of net power generated by the specified source.

(b) Calculation Methodology 2: If the specified source does not report emissions to [*the jurisdiction*], The Climate Registry, the U.S.EPA under 40 CFR Part 75 or to Environment Canada under Section 71 of the Canadian Environmental Protection Act, calculate emissions using Equation 60-2:

$$CO_2 = \sum HHV_f \times EF_f \times 0.001 \times \frac{MWh_{imp}}{MWh_t}$$ **Equation 60-2**

Where:

CO_2 = Annual CO_2 mass emissions for a specific fuel type (metric tons).
HHV_f = Higher heating value of the fuel *f* consumed for electricity production as reported in U.S. EIA Form 923, or its successor (mmBtu).
EF_f = Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 or from Table 20-2 (kg CO_2/mmBtu).
0.001 = Conversion factor from kilograms to metric tons.
MWh_{imp} = Megawatt-hours of electricity imported from the specified source.
MWh_t = Total megawatt-hours of net power generated by the specified source as reported in U.S. EIA Form 923, or its successor.

§ WCI.64 Calculation of Emissions from Asset-Controlling Suppliers and Unspecified Sources

For imported electricity from asset-controlling suppliers or unspecified sources, calculate emissions using the methodology specified in this section.

(a) Calculation Methodology: Calculate the annual CO_2 mass emissions by multiplying the reported quantities of imported electricity from each asset-controlling supplier, balancing authority area, or other geographic region defined by [*the jurisdiction*] by the appropriate default emission factor according to Equation 60-3:

$$CO_2 = MWh \times DEF$$ **Equation 60-3**

Where:
CO_2 = Annual CO_2 mass emissions for imported electricity from the specified source (metric tons).
MWh = Megawatt-hours of electricity imported from the asset-controlling supplier, balancing authority area, or other geographic region defined by [*the jurisdiction*].
DEF = The default emission factor corresponding to the asset-controlling supplier, balancing authority area, or other geographic region defined by [*the jurisdiction*].

§ WCI.65 Greenhouse Gas Emissions Data Report: Additional Requirements for Retail Providers Only

[*This section is optional. It is intended for any WCI jurisdiction that wishes to collect information about high-GHG generating facilities in other jurisdictions owned by retail providers serving its own jurisdiction.*]

Retail providers shall include the following information in the greenhouse gas emissions data report for each report year, in addition to the information identified in the sections above.

(a) If the retail provider holds a contract that entitles the retail provider to a specified percentage of the generation in the report year from an electricity generating facility not located in the WCI Region, the retail provider shall include electricity purchased or sold from that facility as being from a partially owned facility.

(b) For electricity generating facilities not located in the WCI Region that are fully or partially owned by the retail provider that have CO2 emissions greater than 500 kg of CO2 per MWh based on the most recent greenhouse gas emissions data report that received a positive verification opinion or on CO2 emissions reported to U.S.EPA under 40 CFR Part 75 or reported to Environment Canada under Section 71 of the Canadian Environmental Protection Act, the retail provider shall include:

(1) Facility name, state/province designated facility ID, state/province designated generating unit ID as applicable, percent ownership share at the facility level, ownership share at the generating unit level as applicable, and both net and gross power generated in the report year;

(2) Quantity of electricity sold by the retail provider or on behalf of the retail provider from the electricity generating facility or electricity generating unit having a final point of delivery outside the WCI Region, as measured at the busbar.

§ WCI.66 Greenhouse Gas Emissions Data Report: Additional Requirements for Multi-Jurisdictional Retail Providers Only.

[*This section applies only to jurisdictions with Multi-Jurisdictional Retail Providers, as defined.*]

Multi-jurisdictional retail providers that import electricity into the WCI Region at the distribution level shall include the following information in the greenhouse gas emissions data report for each report year in addition to the information identified in the sections above. Multi-jurisdictional retail providers meeting this condition shall provide:

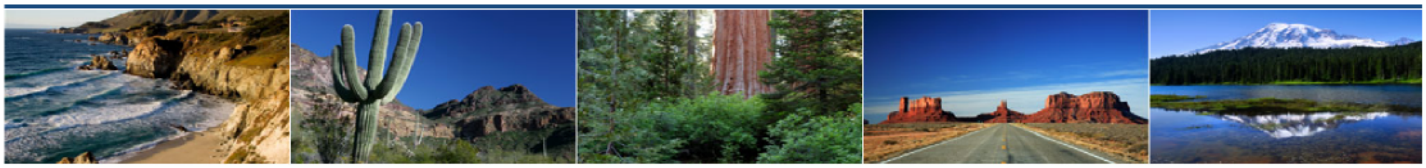
(a) A report of the greenhouse gas emissions associated with serving the load of the service territory that includes consumers in [*the jurisdiction*] following [*the jurisdiction's*] reporting protocol for retail providers or The Climate Registry's Electric Power Sector Protocol;

(b) The total retail load served by the multi-jurisdictional retail provider in the service territory that includes consumers in [*the jurisdiction*];

(c) The retail load of customers served in [*the jurisdiction's*] portion of the service territory;

(d) The greenhouse gas emissions associated with the imported electricity as the quantity of emissions reported in WCI.64(a) multiplied by the ratio of the quantity of electricity reported in WCI.64(b) to the quantity of electricity reported in WCI.64(c); and

(e) If the average emission rates differ among the various state or provincial portions of the service territory due to mandatory factors such as different Renewable Portfolio Standard requirements in [*the jurisdiction*] and the other jurisdictions, the multi-jurisdictional retail provider may report an adjusted quantity of greenhouse emissions and file a report that describes how the quantity reported in WCI.64(d) was adjusted.



§ WCI.70 PRIMARY ALUMINUM PRODUCTION

§ WCI.71 Source Category Definition

A primary aluminum production process converts alumina mineral to aluminum metal using electrolysis.

§ WCI.72 Greenhouse Gas Reporting Requirements

For each facility that includes a primary aluminum production process, the emissions data report must contain the following information:

(a) CO_2 emissions from anode consumption from prebaked and Søderberg electrolysis cells.

(b) CO_2 emissions from anode and cathode baking.

(c) CF_4 and C_2F_6 emissions for anode effects.

(d) CO_2 emissions from green coke calcination.

(e) SF_6 emissions from cover gas consumption.

(f) CO_2, N_2O, and CH_4 emissions from stationary combustion units as specified in WCI.20.

(g) Annual aluminum production.

§ WCI.73 Calculation of GHG Emissions

(a) Calculate CO_2 emissions from anode consumption using either Equation 70-1 or 70-2, as applicable.

(1) For Prebaked Anodes:

$$E_{CO_2} = \sum_{i=1}^{12}\left[NCC \times MP \times \frac{(100 - S_a - Ash_a - Imp_a)}{100} \times 3.664\right]_i$$

Equation 70-1

Where:

E_{CO2} = Annual CO_2 emissions (metric tons).

NCC = Net anode consumption per metric ton of aluminum for month i (metric ton/ metric ton aluminum).

MP = Aluminum production for month i (metric ton).

S_a = Sulfur content in baked anodes for month i (wt %).

Ash_a = Ash content in baked anodes for month i (wt %).

Imp_a = Content of fluorine and other impurities in baked anodes for month i (wt %).

3.664 = Conversion factor from carbon to CO_2.

(2) For Søderberg Anodes:

$$E_{CO_2} = \sum_{i=1}^{12} \left[\begin{array}{l} (PC \times MP) - \left(BSM \times \frac{MP}{1000} \right) - \left(\frac{BC}{100} \times PC \times MP \times \left(\frac{S_p + Ash_p + H_p}{100} \right) \right) \\ - \left(\frac{100 - BC}{100} \times PC \times MP \times \frac{S_c + Ash_c}{100} \right) \end{array} \right]_i \times 3.664$$

Equation 70-2

Where:

E_{CO2}	=	Annual CO_2 emissions (metric tons).
PC	=	Paste consumption for month i (metric tons paste/metric ton aluminum).
MP	=	Aluminum production for month i (metric tons).
BSM	=	Emissions of benzene-soluble matter (kilograms benzene-soluble matter/metric ton aluminum).
BC	=	Average binder (pitch) content in paste for month i (wt %).
S_p	=	Sulfur content in pitch for month i (wt %).
Ash_p	=	Ash content in pitch (wt %).
H_p	=	Hydrogen content in pitch (wt %).
S_c	=	Sulfur content in calcinated coke (wt %).
Ash_c	=	Ash content in calcinated coke (wt %).
3.664	=	Conversion factor from carbon to CO_2.

(b) If anode or cathode baking is performed onsite, calculate CO_2 emissions as specified in paragraphs (b)(1) or (2) as applicable. Total emissions as specified in paragraph (b)(3) if both (b)(1) and (2) are applicable.

(1) Calculate CO_2 emissions from packing coke using Equation 70-3.

$$EC_{CO_2} = \sum_{i=1}^{12} \left(PCC \times BAP \times \frac{100 - Ash_{pc} - S_{pc} - Imp}{100} \right)_i \times 3.664$$

Equation 70-3

Where:

EC_{CO2}	=	Annual CO_2 emissions (metric tons pre year).
PCC	=	Packing coke consumption per metric ton of baked anode for month i (metric tons coke/metric ton anodes).
BAP	=	Baked anode production for month i (metric tons).
Ash_{pc}	=	Ash content in packing coke for month i (wt %).
S_{pc}	=	Sulfur content in packing coke for month i (wt %).
Imp	=	Content of other impurities for month i (wt %).
3.664	=	Conversion factor from carbon to CO_2.

(2) Calculate CO_2 emissions from pitch coking using Equation 70-4.

$$EP_{CO_2} = \sum_{i=1}^{12} \left(GAW - BAP - \left(\frac{H_p}{100} \times \frac{PC}{100} \times GAW \right) - RT \right)_i \times 3.664$$ **Equation 70-4**

Where:
EP_{CO2} = CO_2 emissions (metric tons pre year).
GAW = Green anode consumption for month i (metric tons).
BAP = Baked anode production for month i (metric tons).
H_p = Hydrogen content in pitch for moth i (wt %).
PC = Pitch content in green anode for month i (wt %).
RT = Recovered tar for month i (metric tons).
3.664 = Conversion factor from carbon to CO_2.

(3) Calculate total CO_2 emissions for anode baking using Equation 70-5.

$$E_{anodebaking} = EC_{CO2} + EP_{CO2}$$ **Equation 70-5**

Where:

$E_{anodebaking}$ =Total annual CO_2 emissions from anode baking (metric tons).

EC_{CO2} = Annual CO_2 emissions from packing coke (metric tons).

EP_{CO2} = Annual CO_2 emissions from pitch coking (metric tons).

(c) Calculate CF_4 and C_2F_6 emissions from anode effects for each pot line using either the Slope Method in paragraph (c)(1) or the Pechiney Method in paragraph (c)(2).

(1) **Slope Method:** Calculate the CF_4 and C_2F_6 emissions using Equation 70-6.

$$E_{CF_4,C_2F_6} = \sum_{i=1}^{n} [slope_{CF_4,C_2F_6} \times AEF \times AED \times MP]_i$$ **Equation 70-6**

Where:
$E_{CF4, C2F6}$ = Annual emissions of CF_4 or C_2F_6 (metric tons/yr).

$slope_{CF4, C2F6}$ = Measured slope coefficient ([Metric tons of CF_4 or C_2F_6 /metric ton Aluminum]/[anode effect minutes/pot-days]).
AEF = Anode effect frequency (number of anode effects per pot per day).
AED = Anode effect duration (minutes per anode effect).
MP = Aluminum production per day (metric tons).
n = Number of operating days per year.

(2) **Pechiney Method:** Calculate the CF_4 and C_2F_6 emissions using Equation 70-7.

$$E_{CF_4,C_2F_6} = \sum_{i=1}^{n} [Over-voltage \quad coefficient_{CF_4,C_2F_6} \times \frac{AEO}{CE} \times MP]_i$$ **Equation 70-8**

Where:

$Emission_{CF4, C2F6}$	=	Emissions of CF_4 or C_2F_6 (metric tons/yr).
Over-voltage $coefficient_{CF4, C2F6}$	=	Experimentally measured ([Metric tons of CF_4 or C_2F_6 /metric ton Aluminum]/mV).
AEO	=	Anode effect over-voltage (millivolts per pot per day).
CE	=	Current efficiency of aluminum production process, expressed as a fraction.
MP	=	Aluminum production per day (metric tons).
n	=	Number of operating days per year.

(d) Calculate CO_2 emissions from onsite green coke calcination furnaces using Equation 70-9.

$$E_{CO_2} = \sum_{n=1}^{12} \left[\left[GC \times \frac{(100 - H_2O_{gc} - V_{gc} - S_{gc})}{100} - (CC + UCC + DE) \times \frac{(100 - S_{cc})}{100}\right] \times 3.664\right]_i + \left[GC \times 0.035 \times \frac{44}{16}\right]_i$$ **Equation 70-9**

Where:

E_{CO2}	=	CO_2 emissions (metric tons pre year).
GC	=	Green coke feed for month i (metric tons).
H_2O_{gc}	=	Humidity in green coke feed for month i (wt %).
V_{gc}	=	Volatiles in green coke feed for month i (wt %).
S_{gc}	=	Sulfur content in green coke feed in month i (wt %).
S_{cc}	=	Sulfur content in calcinated coke in month i (wt %).
CC	=	Calcinated coke produced in month i (metric tons).
UCC	=	Under-calcinated coke produced in month i (metric tons).
DE	=	Coke dust emissions for month i (metric tons).
3.664	=	Conversion factor from carbon to CO_2.
0.035	=	Assumed CH_4 and tar content in coke volatiles, contributing to CO_2 emissions.
44/16	=	Conversion factor from methane to CO_2.

(e) Calculate SF_6 emissions from cover gas consumption using one of the following methods:

(1) Calculate the annual SF_6 emissions using inventory records and Equation 70-10:

$$E_{SF6} = S_{Inv-Begin} - S_{Inv-End} + S_{Purchased} - S_{Shipped}$$ **Equation 70-10**

Where:

E_{SF6}	=	SF_6 emissions from cover gas (metric tons).

$S_{Purchased}$ = Quantity of SF_6 purchased (metric tons).
$S_{Shipped}$ = Quantity of SF_6 shipped offsite (metric tons).
$S_{Inv\text{-}Begin}$ = Quantity of SF_6 in storage at the beginning of the year, (metric tons).
$S_{Inv\text{-}End}$ = Quantity of SF_6 in storage at the end of the year (metric tons).

(2) Calculate the annual SF_6 emissions using Equation 70-11 and direct measurement of the SF6 input to electrolysis cells and the SF6 waste gases collected and transferred off-site:

$$E_{SF6} = \sum_{i=1}^{12} [(Q_{Input} \times C_{Input}) - (Q_{Output} \times C_{Output})]_i \qquad \textbf{Equation 70-11}$$

Where:
E_{SF6} = SF_6 emissions from cover gas (metric tons).
$Q_{in;put}$ = Quantity of SF_6 input to the electrolysis cell for month i (metric tons).
C_{Input} = Concentration of SF_6 input to the electrolysis cell for month i (metric tons).
Q_{Output} = Quantity of SF_6 gas collected during month i (if applicable) (metric tons).
C_{Output} = Concentration of SF_6 gas collected and sent off-site during month i (metric tons).

§ WCI.74 Monitoring Requirements

(a) Except as specified in paragraphs (b) through (c) of this section, all parameters must be measured monthly.

(b) Conduct performance tests once every 36 months to determine the slope or Pechiney coefficients for each pot line using the *Protocol for Measurement of Tetrafluoromethane and Hexafluoroethane Emissions from Primary Aluminum Production*, U.S. Environmental Protection Agency and International Aluminum Institute. April 2008. The test must be repeat whenever:

(1) Thirty-six months have passed since the last measurements;

(2) A change occurs in the control algorithm that affects the mix of types of anode effects or the nature of the anode effect termination routine; or

(3) Changes occur in the distribution or duration of anode effects (e.g. when the percentage of manual kills changes or if, over time, the number of anode effects decreases and results in a fewer number of longer anode effects) or, for Rio Tinto Alcan control technology, when the algorithm for bridge movements and anode effect overvoltage accounting changes.

(c) If using the direct measurement approach in WCI.73(e)(2) to calculate SF_6 emissions from cover gas consumption, you must measure the quantity of SF_6 gas input to the electrolysis cell month and the quantity and SF_6 concentration of any waste gas collected and sent off-site.

§ WCI.90 CEMENT MANUFACTURING

§ WCI.91 Source Category Definition

Cement manufacturing is comprised of all processes that are used to manufacture Portland, natural, masonry, pozzolanic, or other hydraulic cements.

§ WCI.92 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2, CH_4, and N_2O in metric tons.

(b) CO_2 process emissions from calcination (metric tons) and the following information:

- (1) Plant specific clinker emission factor (kg CO_2/metric ton clinker).
  - (A) Quantity of clinker produced (metric tons).
  - (B) Total lime (CaO) content of clinker (wt. fraction).
  - (C) Total magnesium Oxide (MgO) content of clinker (wt. fraction).
  - (D) Total carbonate (CO_2) content of clinker (wt. fraction).
- (2) Cement kiln dust (CKD) emission factor (kg CO_2/metric ton CKD discarded).
  - (A) Plant specific CKD calcination rate (unitless ratio).
  - (B) Quantity of CKD discarded (metric tons).

(c) CO_2 process emissions from organic carbon oxidation (metric tons) and the following information:

- (1) Amount of raw material consumed in the report year (metric tons).
- (2) Organic carbon content of raw material (wt. fraction).

(d) CO_2, CH_4, and N_2O emissions from fuel combustion in all kilns combined, following the calculation methods and reporting requirements specified in WCI.93(c) (metric tons).

(e) CO_2, CH_4, and N_2O emissions from all other fuel combustion units combined (kilns excluded), following the calculation methods and reporting requirements specified in WCI.20 (metric tons).

(f) If a continuous emissions monitor is used to measure CO_2 emissions from kilns, then the requirements of paragraphs (b), (c), and (d) of this section do not apply for CO_2. Cement plants that measure CO_2 emissions using CEMS shall report fuel usage by fuel type for kilns.

(g) Operators of cement plants shall also comply with the reporting requirements for any other applicable source category listed at WCI.1(a), including but not limited to the following:

- (1) Coal fuel storage as specified in WCI.100.

(2) Electricity generating as specified in WCI.40.

(3) Cogeneration systems as specified in WCI.50.

§ WCI.93 Calculation of Greenhouse Gas Emissions From Kilns

(a) Determine CO_2 emissions as specified under either paragraph (a)(1) or (a)(2) of this section.

(1) Use a continuous emissions monitoring system (CEMS) as specified in WCI.23(d).

(2) Calculate the sum of CO_2 process emissions from kilns and CO_2 fuel combustion emissions from kilns using the calculation methodologies specified in paragraph (b) and (c) of this section**.**

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions as the sum of emissions from calcination, using the method specified in paragraph (b)(1) of this section; and from organic carbon oxidation, using the method specified in paragraph (b)(2) of this section (Equation 90-0).

$$CO_2 \text{ process} = CO_2 \text{ calcination} + CO_2 \text{ raw material} \qquad \textbf{Equation 90-0}$$

(1) Calcination Emissions. Calculate CO_2 process emissions from calcination using Equation 90-1 and a plant-specific clinker emission factor and a plant-specific cement kiln dust (CKD) emission factor as specified in this section.

$$CO_{2-C} = \sum_{i=1}^{12} [(Cli) \times (EF_{Cli})] + [(Q_{CKD}) \times (EF_{CKD})] \qquad \textbf{Equation 90-1}$$

Where:

$CO_{2\text{-}C}$ = CO_2 emissions from calcination, metric tones.
Cli = Monthly quantity of clinker produced, metric tons.
EF_{Cli} = Monthly clinker emission factor, metric tons CO_2/metric ton clinker computed as specified in paragraph (b)(1)(A) of this section.
Q_{CKD} = Monthly quantity CKD discarded (i.e., not recycled to the kiln), metric tons.
EF_{CKD} = Monthly CKD emission factor, computed as specified in paragraph (b)(1)(B) of this section.

(A) Clinker Emission Factor. Calculate a plant-specific clinker emission factor (EF_{Cli}) for each report year based on monthly measurements of the weight fraction of CaO, MgO and CO_2 (carbonate) content in the clinker and using Equation 90-2, which assumes all carbonate remaining in the clinker is associated with the calcium.

$$EF_{Cli} = [(CaO\ content - \frac{CO2\ Content}{Molecular\ ratio\ CO2/CaO}) \times Molecular\ ratio\ of\ CO_2/CaO] + [(MgO\ Content) \times Molecular\ ratio\ of\ CO_2/MgO] \qquad \textbf{Equation 90-2}$$

Where:

CaO Content (by weight)	=	Total CaO content of Clinker (including calcined and uncalcined) (wt. fraction).
CO_2 Content (by weight)	=	Total CO_2 content of Clinker (wt. fraction).
Molecular ratio of CO_2/CaO	=	0.785.
MgO Content (by weight)	=	Total MgO content of Clinker (including calcined and uncalcined) (wt. fraction).
Molecular ratio of CO_2/MgO	=	1.092.

(B) CKD Emission Factor. If CKD is generated and not recycled back to the kiln, then calculate a plant-specific CKD emission factor based on monthly sampling. The CKD emission factor shall be calculated using Equation 90-3 and a plant-specific CKD calcination rate as specified in Equation 90-4.

$$EF_{CKD} = \frac{\frac{EF_{Cli}}{1 + EF_{Cli}} \times d}{1 - \left(\frac{EF_{Cli}}{1 + EF_{Cli}} \times d\right)} \qquad \textbf{Equation 90-3}$$

Where:

EF_{CKD}	=	Monthly CKD emission factor, kg CO_2/metric ton CKD discarded.
EF_{Cli}	=	Clinker emission factor, determined according to Equation 90-2.
d	=	CKD calcination rate, determined according to Equation 90-4.

$$d = 1 - \frac{fCO_{2CKD} \times (1 - fCO_{2RM})}{(1 - fCO_{2CKD}) \times fCO_{2RM}} \qquad \textbf{Equation 90-4}$$

Where:

d	=	CKD calcination rate (unitless ratio).
fCO_{2CKD}	=	Weight fraction of carbonate CO_2 in the CKD.
fCO_{2RM}	=	Weight fraction of carbonate CO_2 in the raw material.

(2) Organic Carbon Oxidation Emissions. Calculate CO_2 process emissions from the total organic content in raw materials by using Equation 90-5.

$$CO_{2-RM} = TOC_{RM} \times RM \times 3.664 \qquad \textbf{Equation 90-5}$$

Where:

$CO_{2\text{-}RM}$	=	CO_2 emissions from raw material oxidation, metric tons.
TOC_{RM}	=	Total organic carbon content in raw material (wt. fraction), measured using the method in WCI.94(c) or using a default of 0.002 (0.2%).
RM	=	Amount of raw material consumed (metric tons/yr).
3.664	=	The CO_2 to carbon molar ratio.

(c) Fuel Combustion Emissions in Kilns. Calculate CO_2, CH_4, and N_2O emissions from stationary fuel combustion following the calculation methods specified in WCI.20. Cement plants that combust pure biomass-derived fuels and combust fossil fuels only during periods of start-up, shut-down, or malfunction may report CO_2 emissions from fossil fuels using the emission factor methodology in WCI.23(a). "Pure" means that the biomass-derived fuels account for 97 percent of the total amount of carbon in the fuels burned.

§ WCI.94 Sampling, Analysis, and Measurement Requirements

(a) Determine the plant-specific weight fractions of total CaO, total MgO, total carbonate CO_2 in clinker using ASTM C114-07. Determine the weight fraction of carbonate CO_2 in the CKD and the weight fraction of carbonate CO_2 in the raw material using ASTM C114-07. The monitoring must be conducted monthly from clinker and CKD samples drawn from bulk storage.

(b) If not using the default value of 0.002 for TOC_{RM} in Equation 90-5, the total organic carbon contents of raw materials must be determined annually using ASTM Method C114-07. The analysis must be conducted on sample material drawn from bulk raw material storage for each category of raw material.

(c) The quantity of clinker produced must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(d) The quantity of CKD discarded must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(e) The quantity of raw materials consumed (i.e. limestone, sand, shale, iron oxide, and alumina) must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

§ WCI.100 COAL STORAGE

§ WCI.101 Source Category Definition

Coal storage piles are located at any facilities that combust coal. Coal storage piles release fugitive CH_4 emissions. Within natural coal deposits, CH_4 is either trapped under pressure within porous void spaces or adsorbed to the coal. Coal mining, post-mining activities, and coal-handling activities release pressurized CH_4 to the atmosphere; adsorbed CH_4 is also released until the CH_4 in the coal reaches equilibrium with the surrounding atmospheric conditions.

§ WCI.102 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CH_4 emissions.

(b) Annual coal purchases (tons for U.S.; metric tons for Canada).

(c) Source of coal purchases:

(1) Coal basin.

(2) State/province.

(3) Coal mine type (surface or underground).

§ WCI.103 Calculation of CH_4 Emissions

Note that this methodology for calculation of methane emissions uses emission factors for post-mining operations including all processes occurring after mining at the coal deposit and prior to combustion (e.g., preparation, handling, processing, transportation, storage, etc.) even though coal storage piles are only a subset of the overall post-mining operations. This follows the approach in the California Climate Action Registry, attributing all post-mining fugitive methane emissions to the facility combusting the coal, which is ultimately responsible for the coal having been processed and delivered to the facility.

Calculate fugitive CH_4 emissions from coal storage piles as specified under paragraph (a), (b), or (c) of this section.

(a) For coal purchased from U.S. sources, calculate fugitive CH_4 emissions using Equation 100-1 (English) and Table 100-1, or Equation 100-1 (Metric) and Table 100-2.

(b) For coal purchased from Canadian sources, calculate fugitive CH_4 emissions using Equation 100-1 (Metric) and Table 100-3.

(c) For coal purchased from non-U.S. and non-Canadian sources, owners or operators should use either WCI.103(a) or WCI.103(b), whichever is the most applicable. This chosen approach is subject to approval by [*the jurisdiction*].

$$CH_4 = \sum_i (PC_i \times EF_i) \times 0.04228 \,/\, 2{,}204.6$$ **Equation 100-1 (English Units)**

Where:

CH_4	=	Fugitive emissions from coal storage piles for each coal category *i* (metric tons CH_4 per year);
PC_i	=	Purchased coal for each coal category *i* (tons per year);
EF_i	=	Default CH_4 emission factor for each coal category *i* specified by location and mine type that coal originated from, provided in Table 100-1 (scf CH_4 per ton of coal);
0.04228	=	Methane conversion factor to convert scf to lbs;
2,204.6	=	Factor to convert lbs to metric tons.

$$CH_4 = \sum_i (PC_i \times EF_i) \times 0.6772 \,/\, 1{,}000$$ **Equation 100-1 (Metric Units)**

Where:

CH_4	=	Fugitive emissions from coal storage piles for each coal category *i*, (metric tons CH_4 per year);
PC_i	=	Purchased coal for each coal category *i* (metric tons per year);
EF_i	=	Default CH_4 emission factor for each coal category *i* specified by location and mine type that coal originated from, provided in Table 100-2 or Table 100-3 (m^3 CH_4 per metric ton of coal);
0.6772	=	Methane conversion factor to convert m^3 to kg;
1,000	=	Factor to convert kg to metric tons.

§ WCI.104 Sampling, Analysis, and Measurement Requirements

(a) Coal Purchase Monitoring Requirements.

Facilities may determine the quantity of coal purchased either using records provided by the coal supplier(s) or monitoring coal purchase quantities using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

Source: *Management of Methane Emissions from Coal Mines: Environmental, Engineering, Economic and Institutional Implications of Options*. Prepared by Brian G. King, Neill and Gunter (Nova Scotia) Limited, Darmouth, Nova Scotia for Environment Canada. Contract Number K2031-3-7062. March 1994. This document is cited by Environment Canada in the NIR 1990-2007 (Final Submission, April 2009), , but post-mining emission factors are not provided, so they were developed for WCI purposes by Province. Surface emission factors were derived from Table 3.1 (Coal production statistics [Column A] and post-mining emissions [Column F]). Underground emission factors were derived from Table 3.2 (Coal production statistics and post-mining emissions).

§ WCI.130 HYDROGEN PRODUCTION

§ WCI.131 Source Category Definition

A hydrogen production process produces hydrogen gas by steam hydrocarbon reforming, partial oxidation of hydrocarbons, or other transformation of hydrocarbon feedstock. The hydrogen produced may be either transferred offsite or used onsite at petrochemical, ammonia production, refineries, and other plants.

§ WCI.132 Greenhouse Gas Reporting Requirements

For each facility, the annual emissions report must contain the following information:

(a) Process CO_2 Emissions. The CO_2 process emissions from the hydrogen produced process.

(b) Feedstock Consumption (if estimating emissions using mass balance approach in WCI.133(b)). Annual feedstock consumption by feedstock type (including petroleum coke) reported in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

(c) Production. Annual hydrogen produced.

(d) Stationary Combustion Units. Report CO_2, N_2O, and CH_4 emissions as specified in WCI.20.

§ WCI.133 Calculation of Greenhouse Gas Emissions

The owner or operator shall calculate and report CO_2 process emissions using the methods in paragraphs (a) or (b) of this section.

(a) Continuous Emission Monitoring Systems. The owner or operator may calculate CO_2 process emissions using CEMS. The owner or operator must comply with the requirements in section WCI.20.

(b) Feedstock Material Balance. The owner or operator may calculate CO_2 process emissions using the following method. The factor S shall be used only for CO_2 and/or CH_4 emissions that are calculated and reported using applicable methods specified in this regulation. For example, carbon species in uncoverted feedstock contained in PSA off-gas and hydrogen plant product that is diverted to fuel gas systems, fed to downstream units, or diverted to flare may be included in the factor S provided the CO_2 and/or CH_4 emissions are reported using other methods in this regulation.

$$CO_2(Feedstock) = \sum_{i=1}^{n} \sum_{j=1}^{y} \left[\left(FS_j * CF_j \right) - S_j \right] * 3.664 * 0.001$$ **Equation 130-1 (English Units)**

Where:

CO_2 (Feedstock)	=	CO_2 emitted from feedstock (metric tons/year).
n	=	Days of operation per year.
FS_j	=	Feedstock b consumption rate (scf/day).
CF_j	=	Carbon content of feedstock j (kg C/scf feedstock).
y	=	Total number of feedstocks.
S_j	=	Carbon accounted for elsewhere (kg C/day).
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

$$CO_2(Feedstock) = \sum_{i=1}^{n} \sum_{j=1}^{y} \left[\left(FS_j * CF_j \right) - S_j \right] * 3.664 * 0.001$$ **Equation 130-1 (Metric Units)**

Where:

CO_2 (Feedstock)	=	CO_2 emitted from feedstock (metric tons/year).
n	=	Days of operation per year.
FS_j	=	Feedstock b consumption rate (m^3/day).
CF_j	=	Carbon content of feedstock j (kg C/m^3 feedstock).
y	=	Total number of feedstocks.
S_j	=	Carbon accounted for elsewhere (kg C/day).
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

WCI.134 Sampling, Analysis, and Measurement Requirements

(a) Owners or operators using CEMS to estimate CO_2 emissions shall comply with the monitoring requirements in section WCI.20.

(b) Owners or operators using the method in section WCI.133 (b) shall perform the following monitoring:

(1) The owner or operator shall measure the feedstock consumption rate daily.

(2) The owner or operator shall collect samples of each feedstock consumed and analyze each sample for carbon content using the methods specified in WCI.25(d). For natural gas feedstock not mixed with another feedstock prior to consumption, samples shall be collected and analyzed once per month. For all other feedstocks, samples shall be collected and analyzed daily. The samples shall be collected from a location in the

feedstock handling system that provides samples representative of the feedstock consumed in the hydrogen production process.

(3) Owners or operators shall measure the hydrogen produced daily.

(4) Owners or operators shall measure the CO_2 and CO collected daily.

§ WCI.150 IRON AND STEEL MANUFACTURING

§ WCI.151 Source Category Definition

Iron and steel manufacturing comprises four categories: primary facilities that produce both iron and steel, secondary steelmaking facilities, iron production facilities, and offsite production of metallurgical coke. These processes may occur together in an "integrated" facility or they may occur in separate offsite facilities.

§ WCI.152 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2 and CH_4 in metric tons at the facility level.

(b) CO_2 and CH_4 emissions from coke production (metric tons) and the following information:

(1) Quantity of coking coal consumed in coke production (metric tons)

(2) Quantity of other process materials (e.g., natural gas, fuel oil, etc.) consumed in coke production (metric tons)

(3) Quantity of blast furnace gas consumed in coke production (metric tons)

(4) Quantity of coke produced (metric tons)

(5) Quantity of coke oven gas transferred offsite (metric tons)

(6) Quantity of other coke oven by-products (e.g., coal tar, light oil, coke breeze, etc.) transferred offsite (metric tons)

(7) Carbon content of material inputs and outputs listed in (b)(1) through (b)(6) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(c) CO_2 and CH_4 emissions from iron and steel production (metric tons) and the following information:

(1) Quantity of coke consumed in iron and steel production (excluding sinter production) (metric tons)

(2) Quantity of on-site coke oven by-products (e.g., coal tar, light oil, coke breeze, etc.) consumed in blast furnace (metric tons)

(3) Quantity of coal directly injected into blast furnace (metric tons)

(4) Quantity of limestone directly injected into blast furnace (metric tons)

(5) Quantity of dolomite directly injected into blast furnace (metric tons)

(6) Quantity of carbon electrodes consumed in EAFs (metric tons)

(7) Quantity of direct reduced iron introduced to an EAF or BOF (metric tons)

(8) Quantity of other carbonaceous or process material (e.g., sinter, waste plastic, etc.) consumed in iron and steel production (metric tons)

(9) Quantity of coke oven gas consume in blast furnace (metric tons)

(10) Quantity of steel produced (metric tons)

(11) Quantity of iron production not converted to steel (metric tons)

(12) Quantity of blast furnace gas transferred offsite (metric tons)

(13) Carbon content of material inputs and outputs listed in (c)(1) through (c)(12) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(d) Process CO_2 and CH_4 emissions from sinter production (metric tons) and the following information:

(1) Quantity of coke breeze (purchased and produced on-site) used for sinter production (metric tons)

(2) Quantity of coke oven gas consumed in blast furnace in sinter production (metric tons)

(3) Quantity of blast furnace gas consumed in sinter production (metric tons)

(4) Quantity of other process materials (e.g., natural gas, fuel oil, etc.) consumed in sinter production (metric tons)

(5) Quantity of sinter off gas transferred offsite (metric tons)

(6) Carbon content of material inputs and outputs listed in (d)(1) through (d)(5) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(e) Process CO_2 and CH_4 emissions from direct reduced iron production (metric tons) and the following information:

(1) Energy from natural gas used in direct reduced iron production (gigajoules [GJ])

(2) Energy from coke breeze used in direct reduced iron production (GJ)

(3) Energy from metallurgical coke used in direct reduced iron production (GJ)

(4) Quantity of direct reduced iron produced (metric tons)

(5) Carbon content of material inputs listed in (e)(1) through (e)(3) (metric tons of C per GJ)

(6) Carbon content of direct reduced iron produced per e(4) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(f) CO_2, N_2O, and CH_4 emissions from stationary combustion units as specified in WCI.20.

§ WCI.153 Calculation of CO_2 Emissions

(a) Process CO_2 emissions. Determine process CO_2 emissions as specified under either paragraph (1) or (2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).

(2) Calculation methodologies specified in paragraph (b) of this section.

[CEMS and mass balance approach are based on IPCC Tier 3 methods.)

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions using the following mass balance approach:

(b) Calculate the coke production CO_2 (either within integrated facilities or at offsite facilities) emissions using Equation 150-1 (if applicable):

$$E_{coke} = \left[(CC \times C_{CC}) + \sum_a (PM_a \times C_a) + (BG \times C_{BG}) - (CO \times C_{CO}) - (COG \times C_{COG}) - \sum_b (COB_b \times C_b) \right] \times 3.664$$

Equation 150-1

Where:

E_{coke}	=	Emissions of CO_2 from coke production (metric tons);
CC	=	Quantity of coking coal (metric tons);
PM_a	=	Quantity of other process material *a* (not included as separate terms), such as natural gas or fuel oil (metric tons);
BG	=	Quantity of blast furnace gas consumed in coke ovens (metric tons);
CO	=	Quantity of coke produced (metric tons)
COG	=	Quantity of coke oven gas transferred offsite (metric tons);
COB_b	=	Quantity of coke oven by-product *b* transferred offsite (metric tons);
C_x	=	Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664	=	Conversion factor from metric tons of C to metric tons of CO_2.

(c) Calculate the iron and steel production CO_2 emissions using Equation 150-2:

$$E_{iron,steel} = \left[(CO \times C_{CO}) + \sum_a (COB_a \times C_a) + (CI \times C_{CI}) + (L \times C_L) + (D \times C_D) + (CE \times C_{CE}) + (DRI \times C_{DRI}) + \sum_b (O_b \times C_b) + (COG \times C_{COG}) - (S \times C_S) - (IP \times C_{IP}) - (BG \times C_{BG}) \right] \times 3.664$$

Equation 150-2

Where:

$E_{iron,steel}$	=	Emissions of CO_2 from iron and steel production (metric tons);
CO	=	Quantity of coke consumed (excluding sinter production) (metric tons);
COB_a	=	Quantity of coke oven by-product *a* consumed in blast furnace (metric tons);
CI	=	Quantity of coal directly injected into blast furnace (metric tons);
L	=	Quantity of limestone consumed (metric tons);
D	=	Quantity of dolomite consumed (metric tons);
CE	=	Quantity of carbon electrodes consumed in EAFs (metric tons);
DRI	=	Quantity of direct reduced iron introduced to an EAF or BOF (metric tons)
O_b	=	Quantity of other carbonaceous and process material *b*, such as sinter or waste plastic (metric tons);
COG	=	Quantity of coke oven gas consumed in blast furnace (metric tons);

S = Quantity of steel produced (metric tons);
IP = Quantity of iron production not converted to steel (metric tons);
BG = Quantity of blast furnace gas transferred offsite (metric tons);
C_x = Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664 = Conversion factor from metric tons of C to metric tons of CO_2.

(d) Calculate the sinter production CO_2 emissions using Equation 150-3 (if applicable):

$$E_{sinter} = \left[(CBR \times C_{CBR}) + (COG \times C_{COG}) + (BG \times C_{BG}) + \sum_a (PM_a \times C_a) - (SOG \times C_{SOG}) \right] \times 3.664$$

Equation 150-3

Where:

E_{sinter} = Emissions of CO_2 from sinter production (metric tons);
CBR = Quantity of purchased and onsite produced coke breeze used for sinter production (metric tons);
COG = Quantity of coke oven gas consumed in blast furnace for sinter production (metric tons);
BG = Quantity of blast furnace gas consumed for sinter production (metric tons);
PM_a = Quantity of other process material *a* consumed for sinter production (not included as separate terms), such as natural gas or fuel oil (metric tons);
SOG = Quantity of sinter off gas transferred offsite (metric tons);
C_x = Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664 = Conversion factor from metric tons of C to metric tons of CO_2.

(e) Calculate the direct reduced iron production CO_2 emissions using Equation 150-4 (if applicable):

$$E_{DRI} = [(DRI_{NG} \times C_{NG}) + (DRI_{BZ} \times C_{BZ}) + (DRI_{CK} \times C_{CK}) - (DRI \times C_{DRI})] \times 3.664$$

Equation 150-4

Where:

E_{DRI} = Emissions of CO_2 from direct reduced iron production (metric tons);
DRI_{NG} = Energy from natural gas used in direct reduced iron production (GJ);
DRI_{BZ} = Energy from coke breeze used in direct reduced iron production (GJ);
DRI_{CK} = Energy from metallurgical coke used in direct reduced iron production (GJ);
DRI = Quantity of direct reduced iron produced (metric tons)
C_{NG} = Carbon content of natural gas (metric ton C/GJ);
C_{BZ} = Carbon content of coke breeze (metric ton C/GJ);
C_{CK} = Carbon content of metallurgical coke (metric ton C/GJ);
C_{DRI} = Carbon content of direct reduced iron produced (metric tons of C per metric ton of direct reduced iron)

3.664 = Conversion factor from metric tons of C to metric tons of CO_2.

(f) Calculate the total CO_2 emissions using Equation 150-5:

$$E_{CO2} = E_{coke} + E_{iron,steel} + E_{sinter} + E_{DRI}$$ **Equation 150-5**

Where:

E_{CO2} = Total CO_2 emissions (metric tons);
E_{coke} = Emissions from coke production (metric tons);
$E_{iron,steel}$ = Emissions from iron and steel production (metric tons);
E_{sinter} = Emissions from sinter production (metric tons);
E_{DRI} = Emissions from direct reduced iron production (metric tons).

§ WCI.154 Calculation of CH_4 Emissions

(a) Process CH_4 emissions. Determine process CH_4 emissions as specified under either paragraph (1) or paragraph (2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).

(2) Site-specific emission factors.

§ WCI.155 Sampling, Analysis, and Measurement Requirements

Measurements of carbon contents of the material balance input, output, and by-product materials shall be conducted as described below.

(a) Fuel Carbon Content Requirements. Fuel carbon contents should be monitored in the following manner (from § WCI.25):

(1) For coal and coke, solid biomass-derived fuels, and waste-derived fuels; use ASTM 5373-02 (Reapproved 2007).

(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) “Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants”, ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2007).

(3) For gaseous fuels, use ASTM D1945-03 or ASTM D1946-90 (Reapproved 2006).

(b) By-Product Carbon Content Requirements. Carbon contents of by-products (e.g., blast furnace gas, coke oven gas, coal tar, light oil, coke breeze, sinter off gas, etc.) from all iron and steel production processes should be monitored in the following manner:

[Methodology to be determined.]

(c) Flux Carbon Content Requirements. Carbon contents of fluxes (i.e., limestone and dolomite) from all iron and steel production processes should be monitored in the following manner:

(1) For limestone and dolomite, use ASTM C25-06.

(d) Electrode Carbon Content Requirements. Carbon contents of carbon electrodes used in electric arc furnaces (EAFs) should be monitored in the following manner:

(1) Vendor specifications of carbon content in EAF carbon electrodes.

(e) Finished Product Carbon Content Requirements. Carbon contents of finished products (i.e., steel, iron not converted to steel, and direct reduced iron) from all iron and steel production processes should be monitored in the following manner:

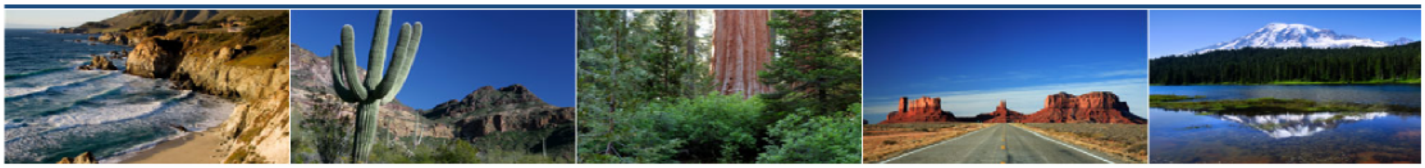
(1) For iron and steel, use ASTM E1019-08 or ASTM E351-93.

(f) Quantity Measurement Requirements. The quantities of process inputs, outputs, and by-products must be determined using the following methods:

(1) For solid process inputs, outputs, and by-products, quantities must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(2) For liquid process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes.

(3) For gaseous process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes.



§ WCI.170 LIME MANUFACTURING

§ WCI.171 Source Category Definition

Lime manufacturing is comprised of all processes that are used to manufacture quick lime (i.e. calcium oxide or calcium-magnesium oxide). Lime is produced via the calcination of limestone or other highly calcareous materials such as dolomite, aragonite, chalk, coral, marble, and shell.

§ WCI.172 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2, CH_4, and N_2O in metric tons.

(b) CO_2 process emissions from quick lime production (metric tons) and the following information:

(1) For lime production:

(A) The emission factor (kg CO_2/metric ton) for each lime type for each month.

(B) The quantity of lime produced (metric tons) each month.

(C) The calcium oxide (CaO) content (weight fraction) of each lime type for each month.

(D) The magnesium oxide (MgO) content (weight fraction) of each lime type for each month.

(2) For the production of calcined byproducts and wastes:

(A) The emission factor (kg CO_2/metric ton) for each calcined byproduct/waste type for each month.

(B) The quantity of each type of calcined byproduct/waste type produced each month.

(C) The calcium oxide (CaO) content (weight fraction) of each calcined byproduct/waste type for each month.

(D) The magnesium oxide (MgO) content (weight fraction) of each calcined byproduct/waste type for each month.

(c) CO_2, CH_4, and N_2O emissions from fuel combustion in all kilns combined, following the calculation methods and reporting requirements specified in WCI.173(c) (metric tons).

(d) CO_2, CH_4, and N_2O emissions from all other fuel combustion units combined (kilns excluded), following the calculation methods and reporting requirements specified in WCI.20 (metric tons).

(e) If a continuous emissions monitor is used to measure CO_2 emissions from kilns, then the requirements of paragraphs (b) and (c) of this section do not apply for CO_2.

(f) Operators of lime plants shall also comply with the reporting requirements for any other applicable source category listed at WCI.1(a), including but not limited to the following:

(1) Coal fuel storage as specified in WCI.100.

(2) Electricity generating as specified in WCI.40.

(3) Cogeneration systems as specified in WCI.42(f).

§ WCI.173 Calculation of greenhouse Gas Emissions from Kilns

(a) Determine process CO_2 emissions as specified under either paragraph (a)(1) or (a)(2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).

(2) Calculate the sum of CO_2 process emissions from kilns and CO_2 fuel combustion emissions from kilns using the calculation methodologies specified in paragraph (b) and (c) of this section.

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions as the sum of emissions from quick lime production, using the method specified in paragraph (b)(1) of this section.

(1) CO_2 Process Emissions. Calculate CO_2 emissions from quick lime production from each kiln using Equation 170-1 and a plant-specific quick lime emission factor and a plant-specific lime kiln dust (LKD) emission factor as specified in this section.

$$CO_2 = \sum_{i}^{12} \sum_{j}^{y} \left[QL_{ij} \times EF_{QL_{ij}} \right] + \sum_{k}^{4} \sum_{l}^{z} \left[LKD_{kl} \times EF_{LKD_{kl}} \right] \qquad \textbf{Equation 170-1}$$

Where:

CO_2	=	CO_2 emissions in metric tons/yr.
QL	=	Monthly Quantity of quick lime produced, metric tons.
EF_{QL}	=	Monthly Quick lime emission factor, metric tons CO_2/metric ton quick lime computed as specified in paragraph (b)(2) of this section.
LKD	=	Quarterly Quantity of calcined byproduct/waste, including LKD, scrubber sludge and other calcined wastes, produced annually, metric tons.
EF_{LKD}	=	Quarterly calcined byproduct/waste emission factor, computed as specified in paragraph (b)(3) of this section.
i	=	Month.
j	=	Lime type.
k	=	Quarter.
l	=	Calcined byproduct/waste type.
y	=	Total number of lime types.
z	=	Total number of calcined byproduct/waste types.

(2) Monthly Quick Lime Emission Factor. Calculate a plant-specific quick lime emission factor (EF$_{QL}$) for each kiln and month based on the percent of measured CaO and MgO content in quick lime and using Equation 170-2.

$$EF_{QL} = (CaO\ \ content \times Molecular\ \ ratio\ \ of\ \ CO_2 / CaO) + (MgO\ \ content \times Molecular\ \ ratio\ \ CO_2 / MgO) \quad \textbf{Equation 170-2}$$

Where:

CaO Content (by weight)	=	Total CaO content of Quick Lime.
Molecular ratio of CO_2/CaO	=	0.785.
MgO Content (by weight)	=	Total MgO content of Quick Lime.
Molecular ratio of CO_2/MgO	=	1.092.

(3) Monthly LKD Emission Factor. If LKD is generated and not recycled back to the kiln, then calculate a plant-specific LKD emission factor for each kiln and month. The LKD emission factor shall be calculated using Equation 170-3.

$$EF_{LKD} = [(CaO\ \ content - uncalcined\ \ CaO) \times Molecular\ \ ratio\ \ of\ \ CO_2 / CaO] + [(MgO\ \ Content - uncalcined\ \ MgO) \times Molecular\ \ ratio\ \ of\ \ CO_2 / MgO] \quad \textbf{Equation 170-3}$$

Where:

EF_{LKD}	=	LKD emission factor.
CaO Content (by weight)	=	Total CaO content of LKD, including calcined and uncalcined (weight fraction).
Uncalcined CaO (by weight)	=	Uncalcined CaO content of LKD (weight fraction).
Molecular ratio of CO_2/CaO	=	0.785.
MgO Content (by weight)	=	Total MgO content of LKD, including calcined and uncalcined (weight fraction).
Uncalcined MgO	=	Uncalcined MgO content of LKD (weight fraction).
Molecular ratio of CO_2/MgO	=	1.092.

(c) Fuel Combustion Emissions in Kilns. Calculate CO_2, CH_4, and N_2O emissions from stationary fuel combustion emissions following the calculation methods specified in WCI.20. Operators of lime manufacturing plants that primarily combust biomass-derived fuels and combust fossil fuels only during periods of start-up, shut-down, or malfunction may report CO_2 emissions from fossil fuels using the emission factor methodology in WCI.23(a).

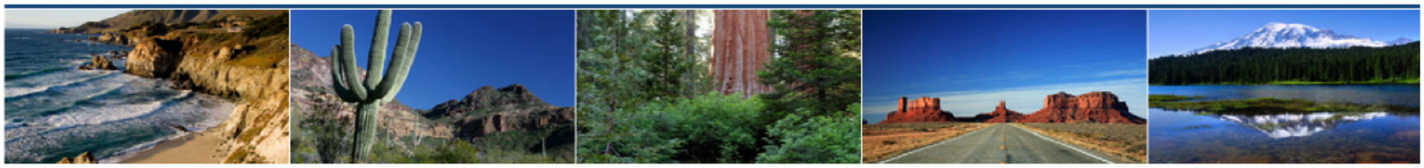
"Pure" means that the biomass-derived fuels account for 97 percent of the total amount of carbon in the fuels burned.

§ WCI.174 Sampling, Analysis, and Measurement Requirements

Determine the chemical composition (percent total CaO and percent total MgO) of each lime type and each calcined byproduct/waste type by laboratory analysis on a monthly basis for each lime type, and a quarterly basis for each calcined byproduct/waste type. This determination must be performed according to ASTM Methods C25, C1301 or C1271. Samples for analysis of the calcium oxide and magnesium oxide content of each lime type and each calcined byproduct/waste type should be collected during the same month or quarter as the production data. At least one sample must be collected monthly for each lime type produced during the month and quarterly for each calcined byproduct/waste type produced during the quarter.

(a) The quantity of lime produced and sold is to be estimated monthly using direct measurements (such as rail and truck scales) of lime sales for each lime type, and adjusted to take into account the difference in beginning- and end-of-period inventories of each lime type. The inventory period shall be annual at a minimum.

(b) The quantity of calcined byproduct/waste sold is to be estimated quarterly using direct measurements (such as rail and truck scales) of byproduct/waste sales for each byproduct/waste type, and adjusted to take into account the difference in beginning- and end-of-period inventories of each calcined byproduct/waste type. The inventory period shall be annual at a minimum. The quantity of calcined byproduct/waste not sold is to be determined no less often than quarterly for each calcined/byproduct waste type using direct measurements (such as rail and truck scales), or a calcined byproduct/waste generation rate (i.e. calcined byproduct produced as a factor of lime production).



§ WCI.200 PETROLEUM REFINERIES

§ WCI.201 Source Category Definition

A petroleum refinery consists of all processes used to produce gasoline, aromatics, kerosene, distillate fuel oils, residual fuel oils, lubricants, asphalt, or other products through distillation of petroleum or through redistillation, cracking, rearrangement or reforming of unfinished petroleum derivatives.

WCI.202 Greenhouse Gas Reporting Requirements

The annual emissions report must contain the following information reported at the facility level:

(a) Catalyst Regeneration. Report CO_2 emissions.

(b) Process Vents. Report CO_2, N_2O, and CH_4 emissions.

(c) Asphalt Production. Report CO_2 and CH_4 emissions.

(d) Sulfur Recovery. Report CO_2 emissions.

(e) Stationary Combustion Units Other than Flares and Control Devices. Report CO_2, N_2O, and CH_4 emissions as specified in WCI.23.

(f) Flares and Other Control Devices. Report CO_2, N_2O, and CH_4 emissions.

(g) Above-Ground Storage Tanks. Report CH_4 emissions.

(h) Wastewater Treatment. Report CH_4 and N_2O emissions.

(i) Oil-Water Separators. Report CH_4 emissions.

(j) Equipment Leaks. Report CH_4 emissions.

(k) Feedstock Consumption: Report feedstock consumption by type for all feedstocks which result in GHG emissions in the reporting year (including petroleum coke) in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

(l) Fuel Consumption: Report fuel consumption by fuel type consumed in the reporting year in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

WCI.203 Calculation of Greenhouse Gas Emissions

The operator shall calculate GHG emissions using the methods in paragraphs (a) through (i) of this section.

(a) Catalyst Regeneration. For units equipped with CEMS, operators shall calculate CO_2 process emissions resulting from catalyst regeneration using CEMS in accordance with WCI.20. In

the absence of CEMS data, the operator shall use the methods in paragraphs (a)(1) through (a)(3).

(1) The operator shall calculate process CO_2 emissions from the continuous regeneration of catalyst material in fluid catalytic cracking units (FCCU) and fluid cokers using Equations 200-1, 200-2, and 200-3.

$$CO_2 = \sum_{d=1}^{n} CR_d \times CF \times 3.664 \times 0.001$$ **Equation 200-1**

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
n	=	number of days of operation in the report year
CR_d	=	daily average coke burn rate (kg/day)
CF	=	carbon fraction in coke burned
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

$$CR_d = \left[\sum_{i=1}^{n} [K_1 Q_r \times (\%CO_2 + \%CO) + K_2 Q_a - K_3 Q_r \times [\%CO/2 + \%CO_2 + \%O_2] + K_3 Q_{oxy} \times (\%O_{oxy})]_i \right] / n$$

Equation 200-2

Where:

CR_d	=	daily average coke burn rate (kg/day or lb/day)
K_1, K_2, K_3	=	material balance and conversion factors (K_1, K_2, and K_3 from Table 200-1
n	=	number of hours per day
Q_r	=	volumetric flow rate of exhaust gas before entering the emission control system (dscm/min or dscf/min)
Q_a	=	volumetric flow rate of air to regenerator as determined from control room instrumentation (dscm/min or dscf/min)
$\%CO_2$	=	CO_2 concentration in regenerator exhaust, percent by volume – dry basis
%CO	=	CO concentration in regenerator exhaust, percent by volume – dry basis
$\%O_2$	=	O_2 concentration in regenerator exhaust, percent by volume – dry basis
Q_{oxy}	=	volumetric flow rate of O_2 enriched air to regenerator as determined from control room instrumentation (dscm/min or dscf/min)
$\%O_{xy}$	=	O_2 concentration in O_2 enriched air stream inlet to regenerator, percent by volume – dry basis

$$Q_r = (79 \times Q_a + (100 - \%Q_{xy}) \times Q_{oxy}) / (100 - \%CO_2 - \%CO - \%O_2)$$ **Equation 200-3**

Where:

Q_r	=	volumetric flow rate of exhaust gas from regenerator before entering the emission control system (dscm/min or dscf/min)
Q_a	=	volumetric flow rate of air to regenerator, as determined from control room instrumentation (dscm/min or dscf/min)
$\%Q_{xy}$	=	oxygen concentration in oxygen enriched air stream, percent by volume – dry basis
Q_{oxy}	=	volumetric flow rate of O_2 enriched air to regenerator as determined from catalytic cracking unit control room instrumentation (dscm/min or dscf/min)
$\%CO_2$	=	carbon dioxide concentration in regenerator exhaust, percent by volume – dry basis
%CO	=	CO concentration in regenerator exhaust, percent by volume – dry basis. When no auxiliary fuel is burned and a continuous CO monitor is not required, assume %CO to be zero
$\%O_2$	=	O_2 concentration in regenerator exhaust, percent by volume – dry basis

(2) The operator shall calculate process CO_2 emissions resulting from periodic catalyst regeneration using Equation 200-4.

$$CO_2 = \sum_{i=1}^{n} CRR \times \left(CF_{spent} - CF_{regen}\right)_i \times 3.664 \times 0.001 \qquad \textbf{Equation 200-4}$$

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
CRR	=	mass of catalyst regenerated (mass/regeneration cycle)
CF_{spent}	=	weight fraction carbon on spent catalyst
CF_{regen}	=	weight fraction carbon on regenerated catalyst (default = 0)
n	=	number of regeneration cycles
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

(3) The operator shall calculate process CO_2 emissions resulting from continuous catalyst regeneration in operations other than FCCUs and fluid cokers (e.g. catalytic reforming) using Equation 200-5.

$$CO_2 = CC_{irc} \times (CF_{spent} - CF_{regen}) \times H \times 3.664 \qquad \textbf{Equation 200-5}$$

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
CC_{irc}	=	average catalyst regeneration rate (metric tons/hr)
CF_{spent}	=	weight carbon fraction on spent catalyst
CF_{regen}	=	weight carbon fraction on regenerated catalyst (default = 0)
H	=	hours regenerator was operational (hr/yr)
3.664	=	ratio of molecular weights, CO_2 to carbon

(b) Process Vents. Except for process emissions reported under other requirements of this regulation, the operator shall calculate process emissions of CO_2, CH_4, and N_2O from process vents using Equation 200-6.

Equation 200-6

$$E_x = \sum_{i=1}^{n} VR_i \times F_{xi} \times (MW_x / MVC) \times VT_i \times 0.001$$

Where:

E_x	=	emissions of x (metric tons/yr), where x = CO_2, N_2O, or CH_4
VR_i	=	vent rate for venting event i (scf/unit time or m^3/unit time)
F_{xi}	=	molar fraction of x in vent gas stream during event i
MW_x	=	molecular weight of x (kg/kg-mole)
MVC	=	molar volume conversion (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole for STP of 60°F, and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
VT_i	=	time duration of venting event i
n	=	number of venting events
0.001	=	conversion factor – kg to metric tons

(c) Asphalt Production. The operator shall calculate CO_2 and CH_4 process emissions from asphalt blowing activities using Equations 200-7 and 200-8.

Equation 200-7

$$CH_4 = (M_A \times EF \times MW_{CH4} / MVC) \times (1 - DE) \times 0.001$$

Where:

CH_4	=	CH_4 emissions (metric tons/yr)
M_A	=	mass of asphalt blown (10^3 bbl/yr)
EF	=	emission factor (EF = 2,555 scf $CH_4/10^3$ bbl or 72.35 m^3 $CH_4/10^3$ bbl)
MW_{CH4}	=	CH_4 molecular weight (16.04 kg/kg-mole)
MVC	=	molar volume conversion factor (849.5 scf/kg- mole, for STP of 20°C and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
DE	=	control measure destruction efficiency (DE = 98% expressed as 0.98)
0.001	=	conversion factor – kg to metric tons

Equation 200-8

$$CO_2 = (M_A \times EF \times MW_{CH4} / MVC) \times DE \times 2.743 \times 0.001$$

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
M_A	=	mass of asphalt blown (10^3 bbl/yr)
EF	=	emission factor (EF = 2,555 scf $CH_4/10^3$ bbl or 72.35 m^3 $CH_4/10^3$ bbl)
MW_{CH4}	=	CH_4 molecular weight (16.04 kg/kg-mole)

MVC	=	molar volume conversion factor (849.5 scf/kg mole, for STP of 20°C and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
DE	=	control measure destruction efficiency (DE = 98% expressed as 0.98)
2.743	=	CH_4 to CO_2 conversion factor
0.001	=	conversion factor – kg to metric tons

(d) Sulfur Recovery. The operator shall calculate CO_2 process emissions from sulfur recovery units (SRUs) using Equation 200-9. For the molecular fraction (MF) of CO_2 in the sour gas, use either a default factor of 0.20 or a source specific molecular fraction value approved by [*insert jurisdiction*] and derived from source tests conducted at least once per calendar year under the supervision of [*insert jurisdiction*].

$$CO_2 = FR \times MW_{CO2} / MVC \times MF \times 0.001 \qquad \textbf{Equation 200-9}$$

Where:

CO_2	=	emissions of CO_2 (metric tons/yr)
FR	=	volumetric flow rate of acid gas to SRU (scf/year or m^3/year)
MW_{CO2}	=	molecular weight of CO_2 (44 kg/kg-mole)
MVC	=	molar volume conversion (849.5 scf/ kg-mole, for STP of 20°C and 1 atmosphere or 836 scf/kg-mole, for STP of 60°F, and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
MF	=	molecular fraction (%) of CO_2 in sour gas (default MF = 20% expressed as 0.20)
0.001	=	conversion factor – kg to metric tons

(e) Flares and Other Control Devices.

(1) The operator shall calculate and report CO_2, CH_4 and N_2O emissions resulting from the combustion of flare pilot and purge gas using the appropriate method(s) specified in sections WCI.20.

(2) The operator shall calculate and report CO_2 emissions resulting from the combustion of hydrocarbons routed to flares for destruction as follows:

(A) Use Equation 200-10 if the flare is equipped with a continuous flow and high heat value monitors:

$$CO_2 = Flare_N \times HHV \times (0.001 \times EmF) \qquad \textbf{Equation 200-10}$$

Where:

CO_2	=	CO_2 emissions (metric tons/year)
$Flare_N$	=	volume of flare gas (m^3/yr)
HHV	=	High heat value for refinery fuel or flare gas (MMBtu/MMscf or J/m^3)
0.001	=	conversion factor – kg to metric tons
EmF	=	default CO_2 emission factor (60 kg CO_2/MMBtu or 5.7 kg/kJ)

(B) Use Equation 200-11 if the flare is equipped with a continuous flow and carbon content monitors:

$$CO_2 = Flare_N \times CC_N \times (MW_n / MVC) \times 3.664 \times 0.001$$ **Equation 200-11**

Where:

CO_2	=	CO_2 emissions (metric tons/year)
$Flare_N$	=	volume of flare gas (m^3/yr)
CC_N	=	carbon content of flare gas (kg of carbon/kg of fuel)
MW_N	=	molecular weight of flare gas
MVC	=	molar volume conversion factor (849.5 scf/kg- mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole for STP of 60°F, and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

a. Use Equation 200-12 if the flare is not equipped with a continuous flow monitor and HHV or carbon content monitor:

$$CO_2 = RFT \times EF_{NMHC} \times CF_{NMHC} \times 3.664 \times 0.001$$ **Equation 200-12**

Where:

CO_2	=	CO_2 emissions (metric tons/year)
RFT	=	refinery feed input (m^3/yr)
EF_{NMHC}	=	non-methane hydrocarbon emission factor (EF_{NMHC} = 0.002 kg/m^3 throughput)
CF_{NMHC}	=	conversion factor – NMHC to carbon (CF_{NMHC}= 0.6)
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

(3) The operator who uses methods other than flares (e.g. incineration, combustion as a supplemental fuel in heaters or boilers) to destroy low Btu gases (e.g. coker flue gas, gases from vapor recovery systems, casing vents and product storage tanks) shall calculate CO_2 emissions using Equation 200-13. The operator shall determine CC_A and MW_A quarterly using methods specified in section WCI.20 and use the annual average values of CC_A and MW_A to calculate CO_2 emissions.

$$CO_2 = GV_A \times CC_A \times MW_A / MVC \times 3.664 \times 0.001$$ **Equation 200-13**

Where:

CO_2	=	CO_2 emissions (metric tons/year)
GV_A	=	volume of gas A destroyed annually (scf/year or m^3/year)
CC_A	=	carbon content of gas A (kg C/kg fuel)
MW_A	=	molecular weight of gas A
MVC	=	molar volume conversion factor (849.5 scf/kg- mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole for STP of 60°F, and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

(f) Storage Tanks. For above-ground storage tanks containing crude oil, asphalt, naphtha, and distillate oils that are not equipped with vapor recovery technology, the operator shall calculate CH_4 emissions using the U.S. EPA TANKS Model (Version 4.09D). For crude oil, naphtha, and distillate oils, use the default chemical databases for crude oil (RVP 5), distillate fuel oil No. 2, and jet naphtha (JP4), respectively. For asphalt, use the data in Table 200-4 to create an asphalt chemical database. The annual throughput for each storage tank must be distributed equally across the twelve months of the year and the single-component liquid option selected. The total VOC emission values generated by the model shall be converted to methane emissions using:

(1) A default conversion factor of 0.6 (CH_4 = 0.6 * VOC); or
(2) Species specific conversion factors determined by storage tank headspace vapor analysis using a sampling and analysis methodology approved by [*insert jurisdiction*].

(g) Wastewater Treatment.

(1) The operator shall calculate CH_4 emissions from wastewater treatment using Equation 200-14.

$$CH_4 = [(Q \times COD_{qave}) - S] \times B \times MCF \times 0.001$$ **Equation 200-14**

Where:

CH_4	=	emission of methane (tons/yr)
Q	=	volume of wastewater treated (m^3/yr)
COD_{qave}	=	average of quarterly determinations of chemical oxygen demand of the wastewater (kg/m^3)
S	=	organic component removed as sludge (kg COD/yr)
B	=	methane generation capacity (B = 0.25 kg CH_4/kg COD)
MCF	=	methane correction factor for anaerobic decay (0-1.0) from Table 200-2
0.001	=	conversion factor – kg to metric tons

(2) The operator shall calculate N_2O emissions from wastewater treatment using Equation 200-15.

$$N_2O = Q \times N_{qave} \times EF_{N2O} \times 1.571 \times 0.001$$ **Equation 200-15**

Where:

N_2O = emissions of N_2O (metric tons/yr)
Q = volume of wastewater treated (m^3/yr)
N_{qave} = average of quarterly determinations of N in effluent (kg N/m^3)
EF_{N2O} = emission factor for N_2O from discharged wastewater (0.005 kg N_2O-N/kg N)
1.571 = conversion factor – kg N_2O-N to kg N_2O
0.001 = conversion factor – kg to metric tons

(h) Oil-Water Separators. The operator shall calculate CH_4 emissions from oil-water separators using Equation 200-16. For the CF_{NMHC} conversion factor, operators shall use either a default factor of 0.6 or species specific conversion factors determined by analysis using a sampling and analysis methodology approved by [*jurisdiction*].

$$CH_4 = EF_{sep} \times V_{water} \times CF_{NMHC} \times 0.001$$ **Equation 200-16**

Where:

CH_4 = emission of methane (tons/yr)
EF_{sep} = NMHC (non methane hydrocarbon) emission factor (kg/m^3) from Table 200-3.
V_{water} = volume of waste water treated by the separator (m^3/yr)
CF_{NMHC} = NMHC to CH_4 conversion factor
0.001 = conversion factor – kg to metric tons

(i) Equipment leaks. The operator shall calculate CH_4 emissions for all components in natural gas, refinery fuel gas, and PSA off-gas systems as follows:

(1) Components shall be identified as one of the following classification types: valve, pump seal, connector, flange, open-ended line. Operators shall use the Component Identification and Counting Methodology and screening methods found in Method 3 in CAPCOA (1999) *[or the method in CCME EPC-73E for Canadian jurisdictions]*, which are incorporated by reference in WCI.6. Operators shall conduct screenings at the frequency interval required by *[insert jurisdiction]*. Operators shall measure and record emissions using instrumentation capable of detecting methane.
(2) The VOC emissions shall be calculated using the following methods:

(C) For components where the measured screening value (SV) is indistinguishable from zero when corrected for background, operators shall calculate VOC emissions using Equation 200-17:

$$E_{VOC-0} = \sum_{i=1}^{6} CC_i \times ZF_{i0} \times t$$ **Equation 200-17**

Where:

E_{VOC-0} = zero component VOC emission (kg/screening period)
i = component type (1 = valve, 2 = pump seal, 3 = other, 4 = connector, 5 = flange, 6 = open-ended line)

CC_i = number of i components where SV = 0
ZF_{i0} = zero VOC emission factor (kg/hr) for component i from Table 200-5
t = time (hours) since last screening

(D) For leaking components, operators shall calculate VOC emissions using the following methods:

(i) For screening values between background and 9,999 ppmv, the operator shall calculate the VOC emissions using Equation 200-18.

$$E_{VOCL-C} = \sum_{i=1}^{6}\sum_{n=1}^{n}\left(\sigma_i \times SV_n^{\beta i}\right)\times t$$ **Equation 200-18**

Where:

E_{VOCL-C} = leaking components VOC emissions (kg/screening period)
i = component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open ended-line)
n = number of i components
σ_i = correlation equation coefficient for component type i from Table 200-5
SV_n = screening value for component n
βi = correlation equation exponent for component type i from Table 200-5
t = time (hours) component has been leaking – default value is time from last screening

(ii) For screening values greater than 9,999 ppmv, the operator shall calculate the VOC emissions using Equation 200-19.

$$E_{VOCP} = \sum_{i=1}^{6} CC_i \times PF_{iP} \times t$$ **Equation 200-19**

Where:

E_{VOCP} = VOC emissions for components pegged over SV 9,999 ppmv (kg/screening period)
i = component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open-ended line)
CC_i = number of i components pegged over 9,999 ppmv
PF_{iP} = VOC emission factor (kg/hr) for component type i pegged over 9,999 ppmv from Table 200-5
t = time component has been leaking (hours) – default value is time since last screening

(E) The operator shall calculate CH_4 emissions using Equation 200-20. Operators shall use system specific determinations of gas composition and methane content (refinery fuel gas, natural gas, associated gas, flexigas, low Btu gas), where available, to determine a CF_{VOC} value. The sampling and analysis methodology must be approved by *[jurisdiction]*. When representative data is not available, operators shall use the default value of 0.6 for CF_{VOC}.

$$CH_4 = \sum_{1}^{n} \left(E_{VOC-0} + E_{VOC-LC} + E_{VOCP}\right)_n \times CF_{VOC} \times 0.001 \qquad \textbf{Equation 200-20}$$

Where:

CH_4	=	methane emissions (metric tons/year)
n	=	number of screenings/year
E_{VOC-0}	=	zero component VOC emissions (kg/screening period)
E_{VOC-LC}	=	leaking component VOC emissions (kg/screening period)
E_{VOCP}	=	VOC emissions for components pegged over 9,999 ppmv (kg/screening period)
CF_{VOC}	=	VOC to CH_4 conversion factor (default CF_{VOC}=0.6)
0.001	=	conversion factor – kg to metric tons

WCI.204 Sampling, Analysis, and Measurement Requirements

(a) Catalyst Regeneration.

(1) For FCCUs and fluid coking units, the operators shall measure the following parameters:

(A) The daily oxygen concentration in the oxygen enriched air stream inlet to the regenerator.
(B) Continuous measurements of the volumetric flow rate of air and oxygen enriched air entering the regenerator.
(C) Continuous or weekly periodic measurements of the CO_2, CO and O_2 concentrations in the regenerator exhaust gas, to be determined by individual jurisdictions.
(D) Daily determinations of the carbon content of the coke burned.
(E) The number of days of operation.

(2) For periodic catalyst regeneration, the operators shall measure the following parameters.

(A) The mass of catalyst regenerated in each regeneration cycle.
(B) The weight fraction of carbon on the catalyst prior to and after catalyst regeneration.

(3) For continuous catalyst regeneration in operations other than FCCUs and fluid cokers, the operators shall measure the following parameters.

(A) The hourly catalyst regeneration rate.
(B) The weight fraction of carbon on the catalyst prior to and after catalyst regeneration.
(C) The number of hours of operation.

(b) Process vents. Operators shall measure the following parameters for each process vent.

(1) The vent flow rate for each venting event.
(2) The molar fraction of CO_2, N_2O, and CH_4 in the vent gas stream during each venting event.
(3) The duration of each venting event.

(c) Asphalt Production. Operators shall measure the mass of asphalt blown.

(d) Sulfur Recovery. The operator shall measure the volumetric flow rate of acid gas to the SRU. If using source specific molecular faction value instead of the default factor, the operator shall conduct an annual test of the CO_2 content using methods approved by [insert jurisdiction]. The operator shall submit a test plan to the *[jurisdiction]* for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [*jurisdiction*].

(e) Flares and Other Control Devices. The operator shall measure the following:

(1) If using the method specified in WCI.203(e)(2)(a), monitor the flow rate and high heat value of the flare gas using continuous monitors.
(2) If using the method specified in WCI.203(e)(2)(b), monitor the flow rate and carbon content of the flare gas using continuous monitors.
(3) If using the method specified in WCI.203(e)(3), monitor the volume of gas destroyed annually (determined to accuracy of ± 7.5%) and the carbon content.

(f) Storage Tanks. The operator shall measure the annual throughput of crude oil, naphtha, distillate oil, asphalt, and gas oil for each storage tank using flow meters.

(g) Wastewater Treatment. Operators shall measure the following parameters.

(1) The daily volume of waste water treated.
(2) The quarterly chemical oxygen demand of the wastewater.
(3) The amount of sludge removed and the organic content of the sludge.
(4) The quarterly nitrogen content of the wastewater.

(h) Oil-Water Separators. Operators shall measure the daily volume of waste water treated by the oil-water separators using methods that comply with the measurement accuracy provisions in WCI.2(d).

(i) Equipment Leaks. Operators shall measure screening values for each valve, pump seal, connector, flange, and open-ended line used in natural gas, refinery fuel gas, and PSA off-gas systems using the methods specified in CAPCOA (1999) Method 3: Correlation Equation Method *[or the method in CCME EPC-73E for Canadian jurisdictions]* and an instrument capable of detecting methane. Operators shall conduct screenings at the frequency interval required by *[jurisdiction]*.

Table 200-1. Coke burn rate material balance and conversion factors

	(kg min)/(hr dscm %)	(lb min)/(hr dscf %)
K_1	0.2982	0.0186
K_2	2.0880	0.1303
K_3	0.0994	0.0062

Table 200-2. Default MCF Values for Industrial Wastewater			
Type of Treatment and Discharge Pathway or System	**Comments**	**MCF**	**Range**
Untreated			
Sea, river and lake discharge	Rivers with high organic loading may turn anaerobic, however this is not considered here	0.1	0 - 0.2
Treated			
Aerobic treatment plant	Well maintained, some CH_4 may be emitted from settling basins	0	0 – 0.1
Aerobic treatment plant	Not well maintained, overloaded	0.3	0.2 – 0.4
Anaerobic digester for sludge	CH_4 recovery not considered here	0.8	0.8 – 1.0
Anaerobic reactor	CH_4 recovery not considered here	0.8	0.8 – 1.0
Anaerobic shallow lagoon	Depth less than 2 meters	0.2	0 – 0.3
Anaerobic deep lagoon	Depth more than 2 meters	0.8	0.8 – 1.0

For CH_4 generation capacity (B) in kg CH_4/kg COD, use default factor of 0.25 kg CH_4/kg COD.

The emission factor for N_2O from discharged wastewater (EF_{N2O}) is 0.005 kg N_2O-N/kg-N.

MCF = methane conversion factor (the fraction of waste treated anaerobically).
COD = chemical oxygen demand (kg COD/m^3).

Table 200-3. Emission Factors for Oil/Water Separators	
Separator Type	**Emission factor (EF_{sep})[a] kg NMHC/m^3 wastewater treated**
Gravity type - uncovered	1.11e-01
Gravity type - covered	3.30e-03
Gravity type – covered and connected to destruction device	0
DAF[b] of IAF[c] - uncovered	4.00e-03[d]
DAF or IAF - covered	1.20e-04[d]
DAF or Iaf – covered and connected to a destruction device	0

[a] EFs do not include ethane
[b] DAF = dissolved air flotation type
[c] IAF = induced air flotation device
[d] EFs for these types of separators apply where they are installed as secondary treatment systems

Table 200-4. Data for Preparing the Asphalt Chemical Database	
Parameter	**Database Entry**
Liquid Molecular Weight	**1000**
Vapor Molecular Weight	**105**
Liquid Density (lb/gal. at 60 ^oF)	**8.0925**
Antoine's Equation Constants (using K)	**A = 75350.06**
	B = 9.00346

Table 200-5. Gas Service Components Fugitive Emissions			
Component Type / Service Type	**Default Zero Factor (kg/hr)**	**Correlation Equation (kg/hr)**	**Pegged Factor (kg/hr)**
			10,000 ppmv
	Zf_{i0}	**σ_i and β_i**	**(SV > 9,999) PF_{iP-10}**
Valves (1)	7.8×10^{-6}	$2.27 \times 10^{-6}(SV)^{0.747}$	0.064
Pump seals (2)	1.9×10^{-5}	$5.07 \times 10^{-5}(SV)^{0.622}$	0.089
Others (3)	4.0×10^{-6}	$8.69 \times 10^{-6}(SV)^{0.642}$	0.082
Connectors (4)	7.5×10^{-6}	$1.53 \times 10^{-6}(SV)^{0.736}$	0.030
Flanges (5)	3.1×10^{-7}	$4.53 \times 10^{-6}(SV)^{0.706}$	0.095
Open-ended lines (6)	2.0×10^{-6}	$1.90 \times 10^{-6}(SV)^{0.724}$	0.033

§ WCI.210 PULP AND PAPER MANUFACTURING

§ WCI.211 Source Category Definition

The pulp and paper manufacturing source category consists of facilities that produce pulp either at stand-alone pulp facilities or integrated pulp and paper mills.

§ WCI.212 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions report must contain the following information:

(a) Annual biogenic CO_2 process emissions from all recovery furnaces and kilns in metric tons, as specified in WCI.213.

(b) Annual fossil CO_2 process emissions from all recovery furnaces and kilns in metric tons, as specified in WCI.213

(c) CO_2, N_2O, and CH_4 emissions from stationary combustion units in metric tons, as specified in WCI.23.

(d) Annual consumption of carbonate in metric tons.

(e) Annual black liquor production in metric tons.

(f) Under consideration: Annual N_2O, and CH_4 emissions from onsite wastewater treatment plants in metric tons, as specified in WCI.200(g).

§ WCI.213 Calculation of GHG Emissions

(a) Calculate biogenic CO_2 process emissions from recovery furnaces and kilns using Equation 210-1:

$$CO_{2,biogenic} = \sum_{i=1}^{12} (BL_i \times CC_i \times 3.664) \qquad \textbf{Equation 210-1}$$

Where:

$CO_{2,\ biogenic}$	=	Biogenic CO_2 process emissions from recovery furnaces and kilns (metric tons/year).
BL_i	=	Black liquor produced in month i (metric tons/month).
CC_i	=	Carbon content of the black liquor (weight fraction)..
3.664	=	Ratio of molecular weights, CO_2 to carbon.

(b) Calculate fossil CO_2 process emissions from make-up carbonates used in the recovery furnace and kiln system using Equation 210-2:

$$CO_{2,\,fossil} = \sum_{i=1}^{12} \left(\sum_{j=1}^{n} RM_j \times EF_j\right)_i \qquad \textbf{Equation 210-2}$$

Where:

$CO_{2,\,fossil}$	=	Fossil CO_2 process emissions from recovery furnace and kiln systems (metric tons/year).
RM_j	=	Amount of make-up carbonate j consumed in month i (metric tons/month).
EF_j	=	Carbonate content of carbonate material j for month i (weight fraction as CO_2).
3.664	=	Ratio of molecular weights, CO_2 to carbon.

§ WCI.214 Monitoring Requirements

(a) Measure the quantity of black liquor produced each month.

(b) Collect monthly samples of black liquor and analyze each sample for carbon content using ASTM D5373-08 Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Laboratory Samples of Coal.

(c) For the amount of carbonate material consumed, either use records provided by the material supplier or monitor carbonate material consumption using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(d) For the carbonate content of each carbonate material consumed, either use carbonate content data provided by the supplier, the appropriate default factor from Table 1, or collect monthly samples of each carbonate material consumed and analyze each sample for carbonate content using ASTM Methods C25, C1301 or C1271.

Table 1: Formulae, Formula Weights, and Carbon Dioxide Emission Factors for Common Carbonate Species.

Carbonate	Mineral Name	Formula Weight	Emission Factor (metric tons CO_2/metric ton Carbonate)
$CaCO_3$	Calcite	100.1	0.4397
$CaMg(CO_3)_2$	Dolomite	184.4	0.4773
Na_2CO_3	Soda ash (sodium carbonate)	106.0	0.4149

§ WCI.230 SODA ASH PRODUCTION

§ WCI.231 Source Category Definition

The soda ash production source category consists of facilities that produce soda ash by calcining sodium carbonate bearing ore or brine.

§ WCI.232 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions report must contain the following information:

(a) Annual CO_2 process emissions from all soda ash calcining kilns combined, as specified in WCI.233 (metric tons).

(b) CO_2, N_2O, and CH_4 emissions from combustion of fuels in the calcining kilns, as specified in WCI.20 (metric tons).

(c) Annual consumption of trona ore or sodium carbonate-rich brine (metric tons).

(d) Annual soda ash production (metric tons).

(e) Annual mass of waste material output from calcining kilns (metric tons).

(f) For plants recycling the CO_2 generated from calcination for use in the carbonation towers, report annual CO_2 recycled within the process (metric tons).

§ WCI.233 Calculation of GHG Emissions

(a) You must calculate CO_2 emissions using the methods in either paragraphs (a)(1) or (a)(2) of this section.

(1) **Continuous Emission Monitoring Systems.** The owner or operator may measure CO_2 emissions using CEMS, as specified WCI.23(d).

(2) **Feedstock Material Balance.** The owner or operator may estimate CO_2 process emissions using Equation 230-1 and the measured carbon content and feedstock input of the trona ore or carbonate-rich brine.

$$CO_2 = \sum_{j=1}^{12} (3.664)[(Ci_j \times Ti_j) - (Cs_j \times Ts_j) - (Cw_j \times Tw_j)] \qquad \textbf{Equation 230-1}$$

Where:

CO_2 = CO_2 process emissions from soda ash production (metric tons/year).
Ci_j = Carbon content of feedstock (trona ore or carbonate-rich brine) input (percent by weight, expressed as a decimal fraction).
Ti_j = Weight of feedstock (trona ore or carbonate-rich brine) input (metric tons/month).
Cs_j = Carbon content of soda ash output (percent by weight, expressed as a decimal fraction).
Ts_j = Weight of soda ash output (metric tons/month).
Cw_j = Carbon content of waste material output from the kiln (i.e. kiln dust collected in control devices and not combined with the soda ash product) (percent by weight, expressed as a decimal fraction).
Tw_j = Weight of waste material output from the kiln (i.e. kiln dust collected in control devices and not combined with the soda ash product) (metric tons/month).
3.664 = Ratio of molecular weights, CO_2 to carbon.

(b) If you operate a soda ash production facility in which CO_2 generated in calcining kilns is recycled to carbonate towers for brine pre-treatment, you must calculate recycled CO_2 using Equation 230-2.

$$CO_2 = \sum_{j=1}^{12} (3.664)[(Ci_j \times Ti_j) - (Cb_j \times Tb_j)] \qquad \textbf{Equation 230-2}$$

Where:

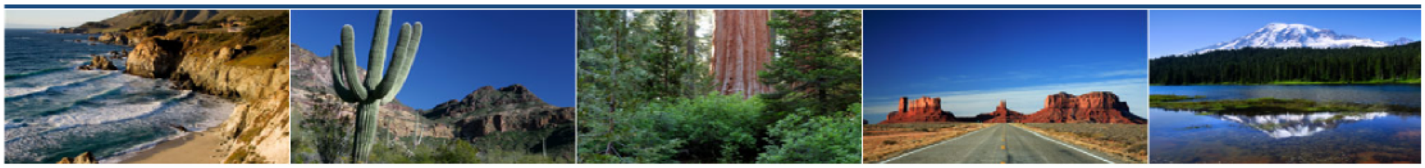
CO_2 = Recycled CO_2 from the ore calcining kiln (metric tons/year).
Ci_j = Carbon content of bicarbonate kiln input (percent by weight, expressed as a decimal fraction).
Ti_j = Weight of bicarbonate kiln input (metric tons/month).
Cb_j = Carbon content of sodium carbonate-rich brine input (percent by weight, expressed as a decimal fraction).
Tb_j = Weight of sodium carbonate-rich brine input (metric tons/month).
3.664 = Ratio of molecular weights, CO_2 to carbon.

§ WCI.234 Monitoring Requirements

Owners and operators using the mass balance method must comply with the following monitoring requirements:

(a) Measure the quantity of ore, soda ash, waste material, and carbonate-rich brine (as applicable) by direct measurement using the same instruments used for accounting purposes.

(b) Collect monthly samples of ore, soda ash, waste material, and carbonate-rich brine (as applicable) and analyze each sample for carbon content. For the carbon content of the brine ore and carbonate-rich brine, use a total organic carbon analyzer according to the ultraviolet light/chemical (sodium persulfate) oxidation method in ASTM D4839-03. Use method ASTM E359-00(2005) for the carbon content of trona ore, soda ash, and waste material.



§ WCI.300 PETROCHEMICAL MANUFACTURING

§ WCI.301 Source Category Definition

The petrochemical manufacturing source category consists of any facility that manufacturers petrochemicals, including acrylonitrile, propylene, ethylene, ethylene dichloride, ethylene oxide, or methanol, from feedstocks derived from petroleum, or petroleum and natural gas liquids.

§ WCI.302 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions report must contain the following information:

(a) CO_2, N_2O, and CH_4 emissions from combustion of fuels in the stationary combustion unit in metric tons, as specified in WCI.20.

(b) CO_2, N_2O, and CH_4 emissions from flares and other oxidizers in metric tons, as specified in WCI.303(a).

(c) CO_2, N_2O, and CH_4 emissions from process vents in metric tons, as specified in WCI.303(b).

(d) CH_4 emissions tons from equipment leaks in metric, as specified in WCI.303(c).

(e) Annual consumption of feedstock by type for all feedstocks that result in GHG emissions in million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

§ WCI.303 Calculation of GHG Emissions

(a) **Flares and Other Oxidizers.** You must calculate GHG emissions from flares and oxidation control devices as follows:

(1) Calculate CO_2, CH_4 and N_2O emissions resulting from the combustion of flare pilot and purge gas using the appropriate method(s) specified in WCI.20.

(2) Calculate CO_2 emissions for each gas destroyed in a flare or other oxidation control device using Equation 300-1.

Equation 300-1

$$CO_2 = \sum_{i=1}^{n} GV_i \times CC_i \times MW_i / MVC \times 3.664 \times 0.001$$

Where:

CO_2 = CO_2 emissions (metric tons/year).
GV_i = Volume of gas *i* destroyed annually (scf/year).
CC_i = Average annual carbon content of gas *i* (kg C/kg fuel).

MW_i	=	Average annual molecular weight of gas *i*.
MVC	=	Molar volume conversion factor (849.5 scf/kg- mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole, for STP of 60°F, and 1 atmosphere).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.001	=	Conversion factor, kg to metric tons.
n	=	Number of gases destroyed.

(b) **Process Vents.** Except for process emissions calculated pursuant to WCI.303(a) or (c), you must calculate process emissions of CO_2, CH_4, and N_2O from process vents using Equation 300-2.

$$E_x = \sum_{i=1}^{n} VR_i \times F_{xi} \times (MW_x / MVC) \times VT_i \times 0.001 \qquad \textbf{Equation 300-2}$$

Where:

E_x	=	Emissions of x (metric tons/yr), where x = CO_2, N_2O, or CH_4.
VR_i	=	Vent rate for venting event i (scf/unit time).
F_{xi}	=	Molar fraction of x in vent gas stream during event i.
MW_x	=	Molecular weight of x (kg/kg-mole).
MVC	=	Molar volume conversion (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole for STP of 60°F, and 1 atmosphere).
VT_i	=	Time duration of venting event i (same units of time used for VR_i).
n	=	Number of venting events.
0.001	=	Conversion factor, kg to metric tons.

(c) **Equipment Leaks.** You must calculate CH_4 emissions for each valve, pump seal, connector, flange, open-ended line, and other components in natural gas, fuel gas, and off-gas systems as follows:

(1) Identify and screen each valve, pump seal, connector, flange, open-ended line, and other components in natural gas, fuel gas, and off-gas systems using the monitoring method in WCI.304. Components identified as "other" components include instruments, loading arms, pressure relief valves, vents, compressors, dump lever arms, diaphragms, drains, hatches, meters, and polished rods stuffing boxes.

(2) Use the results of the component screening and the following equations to calculate VOC emissions:

(A) For components where the measured screening value is equal to zero when corrected for background, calculate VOC emissions using Equation 300-3 and the appropriate default emission factors from Table 300-1:

$$E_{VOC-0} = \sum_{i=1}^{6} CC_i \times ZF_{i0} \times t \qquad \textbf{Equation 300-3}$$

Where:

E_{VOC-0}	=	Emissions from components with a screening value equal to zero, when corrected for background (kg/screening period).
i	=	Component type (valve, pump seal, other, connector, flange, open-ended line).
CC_i	=	Number of i components where the screening value is 0.
ZF_{i0}	=	Default zero factor for component i from Table 300-1 (kg/hr).
t	=	Time since last screening (hours/screening period).

(B) For components where the measured screening value, corrected for background, is between 0 and 10,000 ppmv, calculate VOC emissions using Equation 300-4 and the appropriate default factors from Table 300-1:

$$E_{VOCL-C} = \sum_{i=1}^{6}\sum_{n=1}^{n} \left(\sigma_i \times SV_n^{\beta i}\right) \times t$$ **Equation 300-4**

Where:

E_{VOCL-C}	=	Emissions from components with screening values, corrected for background, between 0 and 10,000 (kg/screening period).
i	=	Component type (valve, pump seal, others, connector, flange, open ended-line).
n	=	Number of *i* components.
σ_i	=	Correlation equation coefficient for component type *i* from Table 300-1.
SV_n	=	Screening value for component *n.*
βi	=	Correlation equation exponent for component type *i* from Table 300-1.
t	=	Time component has been leaking (default value is time from last screening) (hours/screening period).

(C) For components where the screening value, corrected for background, is greater than or equal to 10,000 ppmv, calculate VOC emissions using Equation 300-5 and the appropriate default factors from Table 300-1:

$$E_{VOCP} = \sum_{i=1}^{6} CC_i \times PF_{iP} \times t$$ **Equation 300-5**

Where:

E_{VOCP}	=	Emissions from components with screening values, corrected for background, greater than or equal to 10,000 ppmv (kg/screening period).
i	=	Component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open-ended line).
CC_i	=	Number of *i* components with screening values greater than 9,999 ppmv.
PF_{iP}	=	VOC emission factor for component type *i* pegged over 9,999 ppmv from Table 300-1 (kg/hr).
t	=	Time component has been leaking (default value is time since last screening) (hours/screening period).

(3) Calculate CH_4 emissions using Equation 300-6 and either a default factor of 0.6 for CF_{VOC} or a site-specific conversion factor calculated from the composition and methane content of the gas.

$$CH_4 = \sum_{1}^{n} \left(E_{VOC-0} + E_{VOC-LC} + E_{VOCP}\right)_n \times CF_{VOC} \times 0.001 \qquad \textbf{Equation 300-6}$$

Where:

CH_4	=	CH_4 emissions (metric tons/year).
n	=	Number of screenings/year.
E_{VOC-0}	=	Emissions from components with a screening value equal to zero, when corrected for background (kg/screening period).
E_{VOC-LC}	=	Emissions from components with screening values, corrected for background, between 0 and 10,000 (kg/screening period).
E_{VOCP}	=	Emissions from components with screening values, corrected for background, greater than or equal to 10,000 ppmv (kg/screening period).
CF_{VOC}	=	VOC to CH_4 conversion factor (default CF_{VOC} = 0.6).
0.001	=	Conversion factor (kg to metric tons).

§ WCI.304 Monitoring Requirements

(a) Flares and Other Oxidizers. You must measure:

(1) The volume of each gas destroyed annually determined to an accuracy of ± 5 percent.

(2) The carbon content and molecular weight of each gas quarterly using the methods specified in WCI.25 and calculate the annual average values for carbon content and molecular weight for each gas destroyed.

(b) Process **Vents.** You must measure the following parameters for each process vent:

(1) The gas flow rate for each venting event.

(2) The molar fraction of CO2, N2O, and CH4 in the vent gas stream during each venting event.

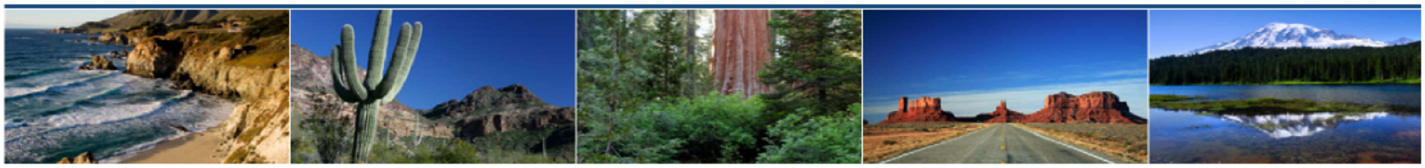
(3) The duration of each venting event.

(c) **Equipment Leaks.** You must screen each valve, pump seal, connector, flange, and open-ended line used in natural gas, fuel gas, and off-gas systems using the methods specified in CAPCOA (1999) Method 3: Correlation Equation Method and an instrument capable of detecting methane. Screenings must be performed at the frequency interval required by [*insert jurisdiction*]. The instrumentation used for screening must be capable of detecting methane.

(d) **Feedstock Consumption.** You must measure the feedstock consumption using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

Table 300-1. Fugitive Emissions from Gas Service Components			
Component Type / Service Type	**Default Zero Factor (kg/hr)**	**Correlation Equation (kg/hr)**	**Pegged Factor (kg/hr)**
	(SV = 0) Zf_{i0}	**(SV > 0 and < 10,000)** σ_i **and** β_i	**(SV ≥ 10,000)** PF_{iP-10}
Valves	7.8×10^{-6}	$2.27 \times 10^{-6}(SV)^{0.747}$	0.064
Pump seals	1.9×10^{-5}	$5.07 \times 10^{-5}(SV)^{0.622}$	0.089
Others[a]	4.0×10^{-6}	$8.69 \times 10^{-6}(SV)^{0.642}$	0.082
Connectors	7.5×10^{-6}	$1.53 \times 10^{-6}(SV)^{0.736}$	0.030
Flanges	3.1×10^{-7}	$4.53 \times 10^{-6}(SV)^{0.706}$	0.095
Open-ended lines	2.0×10^{-6}	$1.90 \times 10^{-6}(SV)^{0.724}$	0.033

[a] The "other" component type should be applied to any component type other than connectors, flanges, open-ended lines, pump seals, or valves. The "other" component type includes: instruments, loading arms, pressure relief valves, vents, compressors, dump lever arms, diaphragms, drains, hatches, meters, and polished rods stuffing boxes.



§ WCI.XX0 ADIPIC ACID MANUFACTURING

§ WCI.XX1 Source Category Definition

Adipic acid ($HOOC(CH_2)_4COOH$) is a dicarboxylic acid used in the production of a large number of products including synthetic fibers (primarily nylon 6,6), coatings, plastics, urethane foams, and synthetic lubricants. Adipic acid is produced by oxidizing a mixture of cyclohexanone ($(CH_2)_5CO$) and cyclohexanol ($(CH_2)_5CHOH$) with nitric acid in the presence of a catalyst; nitrous oxide (N_2O) is formed as an unwanted by-product.

§ WCI.XX2 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of N_2O at the facility level (metric tons)

(b) Total quantity of adipic acid production (metric tons)

(c) Facility-specific N_2O emission factor derived from periodic emissions monitoring or irregular emissions sampling (metric tons N_2O per metric ton of adipic acid)

(d) Destruction factor for facility-specific abatement technology (e.g., catalytic destruction, thermal destruction, nitric acid recycling, adipic acid recycling, etc.)

(e) Abatement system utilization factor for facility-specific abatement technology

(f) CO_2, N_2O, and CH_4 emissions from stationary combustion units as specified in WCI.20

§ WCI.XX3 Calculation of N_2O Emissions

(a) Process N_2O emissions. Determine process N_2O emissions as specified under either paragraph (1) or (2) of this section.

(1) Continuous emissions monitoring systems (CEMS).

(2) Calculation methodologies specified in paragraph (b) of this section.

(b) Process N_2O Emissions Calculation Methodology. Calculate total N_2O process emissions using the following equation:

$$E_{N2O} = EF \times AAP \times (1 - DF \times ASUF)$$

Equation XX0-1

Where:

E_{N2O}	=	Emissions of N_2O from adipic acid production (metric tons);
EF	=	N_2O emission factor (metric tons N_2O/metric ton of adipic acid produced) derived from periodic emissions monitoring or irregular emissions sampling;
AAP	=	Adipic acid production (metric tons);
DF	=	Destruction factor (dimensionless);
ASUF	=	Abatement system utilization factor (dimensionless).

§ WCI.XX4 Sampling, Analysis, and Measurement Requirements

The following measurement methods shall be used.

(a) Facility N_2O emissions tests. All facilities must conduct testing using:

(1) U.S. EPA Method 320 (40 CFR part 63, Appendix A) or ASTM D6348-03; or

(2) Continuous emissions monitor system (CEMS) to determine either the uncontrolled emissions to derive an emission factor (for use with the documented abator destruction efficiency), or the controlled emissions. The CEMS shall be operated in accordance with quality assurance and quality control program approved by the [jurisdiction].

(b) Adipic acid production rates. Production rates may be determined through sales records, or through direct measurement using flow meters or weigh scales.

1 Introduction

The WCI is today issuing the first version of the Final Essential Requirements of Mandatory Reporting (ERMR). The ERMR will serve as the basis for Partner jurisdictions to adopt initial rules implementing the WCI's reporting program. Future versions of the ERMR will include quantification methodologies for additional sources of greenhouse gas (GHG) emissions, such as electricity importers and residential, commercial and industrial fuel suppliers, as well as refinements to existing methodologies based on the Partner jurisdictions' experience in implementing the requirements.

The Final ERMR include numerous changes made in response to stakeholder comments on both the 3rd Draft ERMR issued on January 6, 2009, and the Final Draft ERMR issued on May 7, 2009. These comments are summarized below. Where the WCI declined to make the change suggested, the reasons for that decision follow the summary of the comment.

One overarching concern addressed in a number of comments received on both prior drafts is the potential for inconsistency with U.S. and Canadian national reporting requirements. WCI notes that the Reporting Committee has begun work on the planning of the Regional Emissions Database (RED) that will serve as the repository for data submitted under the ERMR. The Committee has identified alignment with the national reporting programs in order to minimize the burden on facilities subject to both WCI and federal reporting requirements as an important principle in the RED's development.

WCI wishes to thank commenters who supported changes made in the Final Draft ERMR. These comments are not included in the following summary.

Attached to this document are marked up versions of the Final ERMR showing changes from the Final Draft ERMR. A clean reference version of the Final ERMR is also being released with this document.

2 Comments on or Inconsistent with the WCI Design Recommendations

A number of comments reiterated objections to elements of the ERMR that are prescribed by the Design Recommendations. Because the Reporting Committee has previously addressed most of these comments and is in any case charged with implementing the Design Recommendations, these comments are summarized below for the benefit of the Partners without further response:

- The reporting deadline should be June 1 or July 1, rather than April 1.

- Suppliers of residential, commercial and industrial fuels should not be included in the reporting program. (Note that these entities are not yet addressed by the ERMR, but will be in future amendments in accordance with the Design Recommendations.)
- The WCI should not allow Partner jurisdictions to require reporting earlier, at lower thresholds or for entities and facilities not covered by the cap-and-trade program. There should be uniform reporting thresholds throughout the region.
- The applicability threshold should be 100,000, rather than 10,000 metric tons per year. If lower thresholds are retained, they should be phased in over time.
- Third-party verification should not be required.

Some commenters requested that WCI extend the deadline for submitting comments on the ERMR or re-circulate certain ERMR sections for another round of comment. Doing so, however, would make it difficult or impossible for jurisdictions to adopt implementing rules in time for the 2010 reporting year and therefore would be inconsistent with the Design Recommendations.

3 Comments on the General Provisions

3.1 Applicability

A commenter requested that WCI clarify "as soon as possible, preferably before the final version of the reporting requirements" how the definition of facility would apply to natural gas and other pipelines. The Final ERMR being issued today, however, do not apply to pipelines. The Reporting Committee's Work Plan contemplates that these requirements will not be finalized until the end of this year.

WCI believes the applicability provisions for pipeline facilities should be developed at the same time as the other essential requirements for these sources.

3.2 Administrative Requirements

3.2.1 Comments Previously Addressed

A number of commenters reiterated objections to ERMR administrative requirements raised in comments on previous drafts. WCI believes these comments were adequately addressed in the previous responses, which are identified below:

Objection to requirement to retain documents for seven years as being unduly onerous	RTC Third Draft* § 2.2.2, p. 18

Objection to requirement to provide within 10 working days all documents and data used to develop an emissions data report	RTC Third Draft § 2.2.2, p. 26
Recommendation to provide public with access only to aggregate emissions data	RTC Third Draft § 2.2.2, p. 13

*WCI, "Response to Stakeholder Comments and Final Draft Essential Requirements of Mandatory Reporting for the Western Climate Initiative" (May 7, 2009) (http://www.westernclimateinitiative.org/component/remository/Reporting-Committee-Documents/Response-to-Comments-on-Draft-Essential-Requirements-(5-7-09)/) ("RTC Third Draft").

3.2.2 Error Correction Reports

One commenter recommended that in the initial years of reporting, errors be corrected as part of the next reporting cycle, not within the 30 or 60 days as provided in WCI.2(g) (formerly WCI.2(f)). The commenter contended that in "the years when facilities are first developing their inventories to meet WCI requirements, a facility could conceivably be submitting error reports every month."

WCI acknowledges that the number of reporting errors can be expected to be higher in the initial years of reporting than in later years when reporters have gained experience with the reporting system. The requirement to submit error correction reports under WCI.2(g), however, applies only when cumulative errors exceed five percent of total CO_2e emissions. WCI believes it highly unlikely that even in the initial years of reporting, a facility will discover cumulative errors of this magnitude every month.

3.2.3 Designated Representative

A commenter reiterated the concern that WCI.7(e) could be interpreted to impose personal liability on a subsequent representative for the actions of the prior representatives. In response to the same comment submitted on the Third Draft ERMR, WCI stated that WCI.7(e) "does not create personal liability for the proposed new Designated Representative; it only prevents the new Designated Representative from repudiating the actions of the existing Designated Representative."

This commenter was nevertheless concerned that the language of WCI.7(e) itself was open to misinterpretation and suggested revisions that would clarify WCI's intent:

> (d) Changing a Designated Representative. The designated representative may be changed at any time upon submission of a superseding certificate of representation. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous designated

representative before time of the superseding certificate of representation shall continue to be binding on the ~~new designated representative and the~~ owners and operators.

WCI believes that the suggested revision correctly expresses the WCI's intent and therefore has made the suggested revision in the Final ERMR.

3.2.4 Compliance and Enforcement

Two comments reiterated arguments previously raised against the compliance and enforcement provisions in WCI.5. These comments also objected to revisions to WCI.5 adopted in the Final Draft ERMR that (1) impose strict liability for the submission of false or misleading data and (2) make it clear that each violation of the ERMR constitutes a separate violation.

In general these comments objected to the potential imposition of strict liability for any deviation from the reporting requirements and argued that this approach "poses an unacceptable compliance risk." One comment noted that "based on [California's] experience, 'almost all' entity reports could be subject to a compliance action, even if the 'issues' identified by a third party verifier amount to inconsequential errors." The comments argued that WCI.5 would impose a stricter enforcement regime than either California's GHG reporting rule or EPA's proposed Mandatory Reporting Rule (MRR).

These comments argued that "based on the complexity and newness of the program, enforcement should be relaxed or deferred in the early years of the program," that "trivial or inconsequential deviations from the requirements should not be considered violations subject to enforcement" and that the submission of false or misleading information should only constitute a violation if it was done knowingly and with the intent to deceive.

Ensuring compliance with the regulatory requirements is one of the WCI's core compliance verification and enforcement principles. This will be achieved through the use of a variety of compliance tools, giving consideration to using the most appropriate tool necessary to obtain compliance, and when required, to promote general deterrence. Civil enforcement is an essential compliance tool to be applied vigorously when necessary, but reserved for those situations where alternative compliance efforts are unable to achieve the desired outcomes or it has been otherwise determined that an enforcement response is appropriate. Due to the nature of the market system, WCI Partner jurisdictions will need to obtain an acceptable emissions total in a timely manner, so the first response may require an approach that differs from traditional environmental enforcement.

As noted in the response to comments on the Third Draft ERMR, strict or absolute civil liability for violations of environmental requirements is the norm among U.S. and Canadian jurisdictions. It is also common among these jurisdictions to impose a per day penalty for each violation of environmental requirements. Indeed most, if not all, WCI jurisdictions will be able to fulfill the essential requirement in WCI.5 on the basis of existing statutory enforcement authority once their reporting rules are in place. Both California and EPA, for example, have the authority to impose substantial per day penalties for each violation of their reporting requirements. CA Health & Safety Code § 42400, et seq.; 42 U.S.C. § 7413(b).

The federal, state and provincial governments have adopted this type of enforcement regime despite the fact that many environmental requirements are complex and were at one point new to the facilities obligated to comply with them. The complexity of environmental requirements may increase the risk of inadvertent violations compared to some other legal requirements, but that same complexity makes it impossible to prescribe in advance the types of violations that warrant the imposition of penalties. In addition, because compliance is typically in the hands of a number of corporate agents, proving that a violation was knowing or committed with intent to defraud is often infeasible.

Rather than placing limits on the types of violations subject to penalties or imposing a knowledge or intent requirement, U.S. and Canadian jurisdictions have typically chosen two other means to protect regulated facilities from overzealous enforcement and excessive penalties: (1) a right to a judicial hearing on any penalties imposed and (2) identification of the factors that should be taken into account in determining the level of the penalty (in the US) or the ability of the judicial process to weigh case-specific factors when assigning penalties (in Canada.) See, e.g., 42 U.S.C. § 7413(b), (d)(4), (e). The Reporting Committee has not attempted to prescribe particular procedures or penalty factors in these Essential Requirements but instead has concluded that the existing provisions of each jurisdiction's civil enforcement laws will be adequate for the initial years of the reporting program. The Markets Committee is currently evaluating to what degree WCI should seek to establish uniformity in these and other elements of the members' compliance and enforcement programs.

3.3 Verification

One commenter recommended that WCI require certification of individual GHG verifiers to a personnel certification program that is accredited to ISO 17024.

The WCI does not believe it advisable to require personnel certification under this program at this time. The 17024 process, however, could serve as one approach, or a component of an approach, toward meeting the ISO 14065 requirement to demonstrate that a verification body's staff is qualified.

One commenter argued that a projected shortage in verifiers could make it difficult to comply with the provision requiring reporting facilities to change verifiers every six years.

WCI addressed the shortage issue in a previous comment response. [RTC Third Draft § 2.2.3, p. 32.]

3.4 General Quantification and GHG Measurements

Two commenters repeated the suggestion that the de minimis level be increased from three percent to five percent. Another commenter supported the three percent level. In response to previous comments on this issue, WCI responded that the three percent de minimis threshold was based on the California reporting rule and that WCI was examining whether the three percent de minimis threshold and the five percent materiality threshold for verification needed to be harmonized. [See RTC Third Draft § 2.2.4, p. 39.]

WCI has concluded that because the de minimis and verification materiality thresholds serve entirely different purposes, they need not be reconciled.

The de minimis threshold is designed to provide reporters relief from the obligation to apply the ERMR quantification methodologies to activities with negligible impacts on GHG emissions. The materiality threshold serves as one of the tests for whether an emissions report provides a “reasonable level of assurance” and therefore qualifies for a positive verification statement. WCI has not been able to identify, nor have any commenters identified, how establishing different thresholds for these different purposes will introduce any inconsistencies to the reporting program. The existing California program has the same thresholds and there is no indication that they have caused any difficulties for reporters.

Another commenter recommended that WCI remove the 20,000 metric ton ceiling on de minimis emissions. WCI also agreed previously to give this request further consideration.

The Design Recommendation compliance threshold has been set at 25,000 metric tons. WCI has concluded that it would be inappropriate to treat emissions close to or exceeding this level as de minimis and is therefore retaining the 20,000 metric ton cap.

Finally, a commenter suggested that WCI abandon the use of a numeric threshold altogether and instead adopt a “principled” approach that would “roughly weigh the work or cost to estimate the emissions versus the potential size of the emissions being considered.” WCI does not believe such an approach would be administratively workable or provide regulated entities the certainty they need in determining their compliance obligations.

4 Source Category-Specific Comments

The following comments and responses pertain to specific source categories for which quantification and reporting requirements were proposed in the Third or Final Draft ERMR.

4.1 Cement

4.1.1 CEMS Requirement

A commenter objected to the requirement in WCI.93(a)(1) to use CEMS to determine CO_2 emissions as specified in WCI.23(d). The commenter argued that this requirement was duplicative, burdensome and expensive because "cement manufacturers ultimately must undertake all the detailed calculations implicit in WCI.23 Methodology 3, and WCI.90."

WCI disagrees with this comment. WCI.23(d)(5) expressly provides that:

> For any units for which CO2 emissions are reported using CEMS data, the operator is relieved of the requirement to separately report process emissions from combustion emissions for that unit or to report emissions separately for different fossil fuels for that unit when only fossil fuels are co-fired. In this circumstance, operators shall still report fuel use by fuel type as otherwise required.

In addition, WCI notes that the use of a CO_2 CEMS is only required when another federal, state, provincial, or local regulation already requires both a stack gas volumetric flow rate monitor and a CO2 concentration monitor.

4.1.2 CH_4 and N_2O Emissions

A commenter stated that if WCI reporting protocols continue to require reporting of de minimis, non-CO2 emissions from cement manufacturing operations, then WCI must include a separate table of default CH_4 and N_2O emissions factors for cement (and other) kilns, and these should be consistent with current IPCC guidance (see IPCC NGGI Table 2.8).

The Final ERMR have been modified to include national, industry specific emission factors where they exist and explicitly includes factors for natural gas used in cement kilns.

4.1.3 Monthly Sampling/Calculations

A commenter maintained that the requirement in WCI.93 to perform monthly calculations of key factors (e.g. clinker emission factor, CKD emission factor, and organic content of raw material) would be administratively inefficient. The commenter stated that data collection should be conducted on a monthly basis, but that calculations of key factors should only be undertaken annually.

It was WCI's intention to require only monthly sampling, not monthly calculation of emission factors. WCI has revised the language of WCI.93 to make this intent clear.

4.1.4 Mineral Component Reporting to Inform Allocation Decisions

A commenter noted that material substitution is a key means to reducing GHG emissions associated with cement manufacturing. The commenter argued that WCI.92(b) therefore should be revised to include a requirement to report information associated with the quantity and type of mineral components consumed in the production of cements and the quantity and type of mineral components produced for use as cement substitutes.

The focus of the ERMR is to gather data on GHG emissions as well as the underlying data used to calculate GHG emissions. It is not the function of the ERMR to collect all data that could conceivably be used in making allocation decisions. The WCI will be happy to accept any data the industry may want to present to assist in making those decisions in the future.

4.2 Coal Storage

Stakeholder comments on the previous draft ERMR (January 6, 2009) are summarized below along with our responses.

One commenter said that WCI should consider assigning responsibility for coal storage emissions further upstream (i.e, to the mining sector rather than the electricity sector). WCI points out that the requirements in WCI.100 are based on the California Climate Action Registry protocol which attributes all post-mining fugitive methane emissions to the facility combusting coal, since that facility is ultimately responsible for the coal having been processed and delivered to the facility. The California Air Resources Board has also adopted this requirement. The WCI believes it is an appropriate methodology for this program.

Another commenter suggested that the category method should be dropped altogether on the basis of "no accepted methodology for [quantification]" and goes on to say that if the section is retained then emission factors for coal from outside Canada and the U.S. should be provided. WCI modified the ERMR for coal storage to include emission factors for coals originating in Canada, as well as metric-unit emission factors for U.S. coal. Since coal storage emission factors (based on post-mining emissions) are not available for non-U.S. and non-Canadian coals, a provision has been added to WCI.100 that instructs the owner or operator to use the most appropriate emission factor from the tables provided, based on approval by the relevant jurisdiction.

Finally, a commenter pointed out that the method requests information on the annual coal consumption under sampling, analysis and measurement requirements, while the rest of the method uses information on annual quantity of coal purchased. WCI has corrected the requirement to monitor annual coal purchased, and has renumbered the relevant section to WCI.104 (was previously WCI.105).

4.3 General Stationary Combustion and Electric Generating Units

WCI received approximately 22 individual comments related to electric generating units (EGUs) and general stationary combustion (GSC) emissions quantification methodologies. These comments were divided into five summary topics: fuel sampling and monitoring, cogeneration, EGU reporting, EPA MRR, and fuel monitoring. The common theme with the comments is that WCI reporting requirements for EGUs and GSCs are not flexible enough.

WCI has made some revisions to the ERMR in response to the comments in order to improve flexibility.

4.3.1 Biomass and Waste-Derived Fuels

The cement industry commented that the use of the term “biomass fuel” (also referred to as “biomass-derived fuel”), which is defined as only those fuels derived entirely from biomass, creates confusion when used in rules, such as WCI.23(f), that provide for the separate reporting of CO_2 emissions from the combustion of the biomass fraction of waste-derived fuels. The comment argued that if biomass fuels must be derived entirely from biomass, then a waste-derived fuel cannot have a biomass fuel component.

WCI agrees that the definition of biomass fuel may create confusion when used in this context and therefore has revised WCI.23(d)(3), (d)(4) and (f) to add or substitute references to the defined term biomass.

The industry also argued that procedures for separately reporting and calculating the biomass fraction of mixed fuel emissions should be incorporated into the relevant methods in WCI.23. WCI has revised WCI.23(f) to specify how to calculate the biomass fraction of mixed fuel emissions when a mass balance approach is possible.

One commenter noted that sewage “contains an important amount of fossil carbon from sources such as detergents, shampoos, etc.” and therefore should not be treated as pure biomass. WCI agrees and has revised the definition of waste-derived fuels to make it clear that fuels derived from sewage and other wastes is not considered pure biomass.

4.3.2 Fuel Sampling

WCI received a comment supporting the amended approach that allows for use of vendor provided sampling results. As it relates to solid fuels sampling, the commenter does not agree with the protocol that requires weekly collection of samples composited into a monthly sample for testing of carbon content and heating value.

After considering these comments, WCI has determined that weekly sampling with monthly testing is not onerous and will improve the accuracy of the test results compared to monthly sampling. No amendments have been made to the language of the ERMR.

4.3.3 Fuel Monitoring

WCI received a comment regarding unnecessary costs to operations. The commenter feels that the requirements to install flow meters and high heating valve analyzers add to the material costs of operation and are not necessary in order to provide regulators with reliable data.

WCI agrees, and therefore amended the language of the Final Draft ERMR to eliminate these requirements. Reporters are now entitled to rely on fuel supplier data.

WCI received another comment requesting that the WCI remove the accuracy requirement for biomass and change the accuracy for solid fuel consumption to 25% for solid fuels other than biomass.

WCI has modified the measurement accuracy requirements to reflect the EPA proposal. However, WCI believes that this requirement is not stringent enough under a market context. In a market context, we must move toward more accuracy rather than less. WCI does not support the 25% accuracy level for solid fuels because this change is unnecessary given new calibration language.

4.3.4 Cogeneration

WCI received several comments regarding the importance of the appropriate treatment of industrial cogeneration facilities in order to avoid an unintended consequence of undermining the economic viability of existing cogeneration facilities. Other comments indicated that the significant environmental benefits over conventional power generation and the carbon benefits of biomass fired generation and cogeneration are substantial. Commenters have requested that this incremental benefit be recognized in the development of carbon emissions standards for electricity generation.

WCI has modified the Final ERMR to provide for reporting of certain additional information for cogeneration plants in addition to their emissions. WCI recognizes the interest in providing incentives for efficient cogeneration and will address this issue further when allocation is discussed.

4.3.5 EGU Reporting

WCI received several comments regarding the reporting protocols for EGUs. One commenter recommended that the WCI reporting guidelines be made identical to those of the EPA, so that there is no duplication of efforts or unnecessary use of resources for reporting purposes.

WCI requires sources already using CEMS in compliance with the Acid Rain Program (ARP) to report their emissions using CEMS. This is the same as the proposed EPA MRR. WCI requires sources that do not use CEMS to comply with a federal, state or other regulation to use methods in the GSC section (WCI.20), which are similar to those required by EPA. We see no conflict between the WCI requirements and the proposed MRR for estimating emissions for EGUs that already use CEMS under the ARP. However, some differences may exist in the actual data to be reported under the two programs, due to various reasons including the fact that WCI requires third party verification for sources emitting over 25,000 metric tons CO_2e, while EPA proposes not to require third party verification.

After considering these comments, WCI has determined that no change is required as a result of this comment. No amendments have been made to the language of the ERMR.

4.3.6 Other

Another commenter has requested that WCI.43(a)(6) be changed to reflect the changes to WCI.23 with respect to allowing those facilities that meet the requirements of WCI.23 (e) to use the appropriate sections of WCI.23 (a) through (d) to report CO_2 emissions, and not just require WCI.23 (d) for those facilities not required to measure CO_2 and stack gas flow, as under WCI.23.

WCI agrees that WCI.43 should be consistent with WCI.23 and has made this modification to the language of the ERMR.

WCI received a comment requesting integration of WCI requirements with utilities' other current and future reporting obligations.

WCI agrees and will address this concern and integration with MRR during the Regional Emissions Database (RED) development.

Another commenter stated that the current EGU reporting process provides the underlying data for an effective emissions market and argues that WCI provides no evidence that the existing reporting requirements for EGUs are insufficient.

WCI disagrees, and notes that the ERMR require sources that already report using CEMS (e.g., if subject to ARP) to report their GHG emissions using CEMS. No change is required as a result of this comment.

WCI received a comment suggesting that the following standardized units be used for fuels:

Gaseous: mmscf (or standard metric),

Liquid: 1000 gallons (or standard metric),

Solid: tons (or standard metric), and

Energy: MMBTU (or standard metric).

WCI has developed 2 versions of the GSC requirements (WCI.20), one in English and one in metric units. WCI requires reporting in the units suggested here within the English version requirements. The reason for two versions is that separate versions will be adopted by Partner jurisdictions in the U.S. and Canada. In the future, the RED will also address the two versions of units. How it will treat unit conversion has yet to be determined, but the recommendation is noted and will be referred to the WCI subcommittee responsible for RED development. No change is required as a result of these comments.

WCI received a comment indicating that there is no evidence to suggest that periodic fuel sampling, conducted by the final fuel consumer, would enhance GHG emission estimates. The commenter recommends that WCI allow either national average fuel-specific emission factors, those factors published by the IPCC, or site specific factors determined through experience or provided by vendors.

The Final ERMR does not require fuel sampling by consumer. Instead, the facility is allowed to use the information provided by the fuel supplier.

WCI received a comment recommending that established and recognized emissions factors be used in place of testing carbon content and heating values of well established fuels.

WCI had made changes in the previous Draft Final ERMR document to allow use of analysis results from fuel providers in lieu of fuel sampling procedures. Sampling frequencies were carefully considered and reflect fuel specific variation in carbon content. Note that the proposed MRR requires daily, weekly, or monthly fuel sampling, as well as annual and tri-annual source testing for biomass and municipal solid waste, depending upon fuel type and verification requirements. WCI disagrees that fuels like 'wood residue' would have consistent carbon content. WCI's emission factors in tables 20-1 through 20-3 represent industry standards. No change is required as a result of these comments.

WCI received a comment stating that even though WCI.23 outlines four acceptable calculation methodologies for CO_2 mass emissions, the Draft does not cite any sources for these methodologies or basis for the selection of these equations.

The calculation methodologies and equations in WCI.23 are in standard form. These require no additional reference.

WCI received a comment recommending that the document identify the appropriate source category for flares.

Flares are defined as a combustion source device and per WCI.20 they will be quantified as such. The definition of a facility for pipeline oil and gas processing will be defined in the future.

WCI received a comment requesting that we identify the source of the referenced default HHV value and consider allowing other default values in order to be consistent with existing reporting requirements.

There is a source given in Table 20-1. WCI has determined that we should be consistent with the national emissions inventory documents because they are more up-to-date than AP-42.

WCI received a comment requesting that we revise requirements to allow for different sampling frequencies to accommodate variations in sampling equipment.

WCI has determined that frequencies should be specific to fuel after consideration of potential carbon variability, rather than dependent on currently available monitoring equipment.

WCI received a comment recommending that we establish the burden of proof of life-cycle emissions on suppliers of unconventional fuels when the fuel supplier protocols are adopted by WCI.

WCI understands the comment and will consider this further at the appropriate time.

4.4 Hydrogen

Stakeholder comments on the previous draft ERMR (January 6, 2009) are summarized below along with our responses.

One stakeholder said that the fuel carbon content monitoring requirements in WCI.25(d)(3), which are referenced in the hydrogen production ERMR, should include a 5% accuracy requirement for continuous carbon analyzers. This change was made.

Two stakeholders cited WCI.132(c) that required the measurement of daily hydrogen production, and the fact that because this measurement is not used to calculate emissions it should not be subject to WCI.2(g) accuracy requirements. This requirement has been removed.

One stakeholder stated that measurement of feedstock adds monitoring costs to the system without yielding any benefits toward quantification of GHG emissions or GHG reduction activities. WCI has limited this requirement to the method using feedstock mass balance, for which accurate feedstock measurements would be imperative.

4.5 Iron and Steel

One set of comments was received from the sole producer of direct reducing iron (DRI) in North America. This stakeholder explained the DRI process. This stakeholder noted that the WCI.150 method (i.e., Equation 150.4) implies that ALL natural gas used at DRI is transformed into CO2, which is not the case as explained above. Furthermore, use of equation 150.2, where the iron and steel production CO_2 emissions are calculated, would result in double counting of CO2 for the DRI process.

In response to comments from this stakeholder, equations 150.2 and 150.4 of WCI.150 (Iron and Steel Mfg.) have been modified to include terms specifically relating to the production and use of the DRI product. At plants where DRI is produced and converted to steel on-site, the new terms effectively cancel out. However, DRI is bought and sold as an intermediate product and has a carbon content; the revised approach ensures that emissions resulting from release of this carbon are accounted for against the steel-making process, where they actually take place.

4.6 Lime

The WCI considered the following suggested changes to the method for calculating GHG emissions from lime kilns submitted by the industry in the form of comments and proposed rule language and determined that they could be made without sacrificing the accuracy of the ERMR:

- Eliminate the requirement for bulk storage sampling. Lime plants should have the option to sample lime immediately after manufacture, which reduces the potential for lime to re-carbonate during storage (thus understating emissions).

- Eliminate the requirement to determine the oxide content of lime kiln dust (“LKD”) that is “not recycled to the kiln.” The lime manufacturing process does NOT recycle LKD to the kiln.
- Eliminate the requirement that monthly emission factors (EF) for lime and LKD reflect the oxide content of “uncalcined CaO.” “Uncalcined” material is limestone (CaCO3) that has not been converted to calcium oxide and, therefore, no CO_2 is emitted.
- Expand the weigh feeder terminology, as WCI did for the requirements to validate fuel consumption estimates, to permit the use of regulated truck/rail scales and other devices, which are more precise than weigh belts or hoppers, to measure the amount of lime and LKD produced.
- Allow reporting of emissions by lime and calcined byproduct/waste type, rather than by kiln.

The industry also asked that the ERMR require annual, rather than quarterly, calibration of measurement devices to prevent additional CO_2 emissions that result each time a kiln is shut down to calibrate measurement devices.

This requirement in the general provisions (previously WCI.2(g)), has been removed.

The industry requested that the ERMR permit annual, not monthly, computation of lime and LKD emissions to accommodate the annual estimation of LKD produced.

WCI has revised the methodology to require quarterly computation to be consistent with the proposed MRR.

Finally, the industry requested that the requirement to report process data used to calculate GHG emissions be eliminated.

The WCI declines to make this change. The ERMR consistently require industries to report the data used to calculate GHG emissions in order to allow Partner jurisdictions to properly assess and perform quality assurance on a facility's emissions report.

4.7 Pulp and Paper Manufacturing, Biomass

4.7.1 Pulp and Paper Manufacturing

Comments received regarding WCI.210, Pulp and Paper Manufacturing, related to the calculation method chosen for CO_2 emissions from recovery boilers and lime kilns, quantification of emissions from carbonate material use, recommendations based on the content of other programs, and emission factor selection. WCI appreciates the technical information provided in the comments and the support expressed by several commenters for changes made to WCI.210 in response to comments received on the draft ERMRs (January 6, 2009).

One commenter recommended the use of default carbonate content values for the calculation of emissions from the use of make-up chemicals. This recommendation has been accepted. To calculate these emissions, WCI.210 now includes the option of using supplier data, default factors provided in the method or sampling and analysis of the carbonate materials consumed.

Two commenters also argued against requiring carbon analysis of black liquor for the purpose of calculating process CO_2 emissions from recovery boilers and lime kilns. Monthly sampling and analysis for carbon content using ASTM D5373-08 is not inconsistent with the approach taken in the EPA's proposed rule. The proposed EPA method requires monthly analysis of black liquor, for higher heating value at kraft mills and for carbon content at sulfite and semi-chemical facilities. WCI determined that the use of a default black liquor carbon content value would not provide the level of accuracy required to properly assess emission levels.

Comments received also recommended the use of information, tools and calculation methods provided by other sources such as the National Council for Air and Stream Improvement, Inc. (NCASI). Two commenters encouraged WCI to contact NCASI regarding measurement and data collection. WCI considered information and quantification methods from other programs and sources when designing the ERMR, incorporating elements from these sources as appropriate for the type of emissions reporting required for a cap-and-trade program. As part of the long-term refinement of the rule, WCI will review input from new rules (such as the EPA rule) and specific bodies (in this case NCASI). We specifically invite feedback from NCASI on areas for possible improvement.

One commenter provided information about methane emissions from pulp and paper mill landfills. Landfills are currently not within the scope of the Essential Requirements, however WCI appreciates the referral to the NCASI report cited in the comment, as it may be useful for the WCI Offsets Committee.

4.7.2 Biomass

Comments were received regarding definitions related to biomass in WCI.9, the carbon neutrality of emissions from biomass and emission factors for biomass combustion.

Multiple comments recommended modification of WCI.9 definitions related to biomass to better account for certain fuels including black liquor and pulp fibers. In response to these comments, changes have been made to the definitions in WCI.9 for “biomass”, “biomass fuels” or “biomass-derived fuels”, “solid biomass fuel” and “waste-derived fuel”, including adoption of a modified version of the Environment Canada definition for biomass. However, changes to the definition of “waste-derived fuel” do not include recommendations from one commenter concerned about references to co-products and by-products as waste. The use of the term ‘waste’ by WCI does not imply the conventional meaning of waste, but indicates that a fuel could be derived from a co- or by-product of other processes.

Several commenters reiterated positions voiced in response to the draft ERMRs (January 6, 2009), relating to the carbon-neutrality of biomass. The May 7, 2009, Response to Comments document[1] provides rationale for the biomass reporting requirements, referring to the relevant Design Recommendation. Because the most recent comments received provide substantive arguments against the Design Recommendation, the Reporting Committee forwarded these comments to the Partners for their consideration.

Referring to the WCI.9 definitions, commenters also expressed concern about whether emissions from black liquor would be included in the 15,000 metric ton applicability exemption for “pure solid biomass fuel” (WCI.1(b)(2)(A)). As black liquor is not a pure solid fuel, it is not included in the applicability exemption.

Commenters also recommended that biogenic emissions be reported separately from fossil fuel-derived emissions. The ERMR do provide for separate reporting of CO_2 emissions from biomass combustion. The 15,000 metric ton exclusion is designed to exclude certain facilities from having to report at all. It does not address how biomass emissions are reported, when a facility is subject to the rule.

Adjustments have been made to the tabulated emission factors in WCI.20 in response to comments received which recommended certain alternate or additional emission factors. As noted in WCI.20, there are significant differences between both the black liquor and solid biomass emission factors published by the EPA and Environment Canada (as well as those submitted by industry associations). In lieu of recommending a single emission factor at this time (as there is no certainty as to which is most accurate) both are presented for information purposes. WCI is working with experts in the two federal agencies and other organizations to ascertain the most accurate emission factor to use for both metric and imperial representations of the rule.

[1] WCI, “Response to Stakeholder Comments and Final Draft Essential Requirements of Mandatory Reporting for the Western Climate Initiative” (May 7, 2009). Available at http://www.westernclimateinitiative.org/component/remository/Reporting-Committee-Documents/Response-to-Comments-on-Draft-Essential-Requirements-(5-7-09)/.

4.8 Refineries

Many comments on the draft ERMR (January 6, 2009) were received pertaining to refineries (WCI.200) and refinery fuel gas combustion (WCI.30). Please refer to the May 7, 2009, Response to Comments document (O104F21560.pdf) for a summary of those comments.

Based on the comments received on the January draft ERMR and on-going work by the Reporting Committee to investigate comments, clarify definitions and language, correct typographical and other errors, etc., changes made to the final requirements for refineries and refinery fuel gas are listed below. In some cases, further investigation of a comment did not result in a change to the ERMR, and in these cases the reasons to not make the change are also explained below.

- Addition of standard conversion factors consistent with industry standard temperature and pressure conditions. Molar volume conversion factors have been added to the equations 200-6 (process vents), 200-7 and 200-8 (asphalt production), 200-9 (sulfur recovery), and 200-11 and 200-13 (flares and other control devices).
- Fugitive emission calculation methods. An alternative provision for Canadian sources to use the method in CCME EPC-73E for leak detection was added, however, WCI did not change the requirement to use the component identification and counting methods found in Method 3 of CAPCOA (1999). Leak detection and repair (LDAR) programs generate screening values for a number of different components. The CAPCOA method then applies either emissions factors or correlation equations (choice based on the magnitude of the screening value). Owners or operators should all screen the gas containing components and then use the CAPCOA (or similar Canadian) calculation method, thus assuring consistent data. State program requirements will use a mixture of methods which does not generate consistent data. Furthermore, the proposed U.S. EPA default approach for estimating fugitive emissions (based on number of distillation columns, FCCUs, etc.), would not generate data with acceptable quality and comparability as needed for the cap-and-trade program.
- Continuous measurement of volumetric flow rate of exhaust gas leaving the catalyst regenerator. This requirement was removed.
- Definition and clarification of terminology. Definitions for flexigas, refinery fuel gas, and other terms have been added to WCI.9.
- Methods for determination of flaring emissions. A method has been added to allow calculation of CO_2 emissions based on the proposed U.S. EPA MRR, using flow meters, HHV, and carbon content to determine flare emissions.

Also, several comments were received from stakeholders as part of the draft final ERMR (May 7, 2009), and these are summarized below along with WCI responses.

One stakeholder requested another opportunity to review the refinery ERMR prior to finalizing. The WCI acknowledges that the refinery protocol is an important component of the

ERMR. In order to provide jurisdictions the opportunity to adopt regulations implementing the ERMR by the end of 2009 to apply to the 2010 reporting year, a final WCI version must be available by the end of June. There is therefore insufficient time to re-circulate this protocol for additional stakeholder comment. However, this does not preclude future revisions to the reporting requirements based on new data, improved methods, additional stakeholder comments, and other factors.

One commenter implied that the American Petroleum Institute (API) compendium of GHG methods should be adopted for use by the WCI. WCI points out that the ERMR relied heavily upon API Compendium-based methodologies, however, we have included different and more rigorous methods where these are deemed necessary to support a cap-and-trade program.

On commenter strongly recommended that the sampling requirements for refinery fuel gas combustion be reduced to once-per-day (from three times daily) for those facilities doing manual sampling. WCI points out that refinery fuel gas combustion is a significant source of combustion emission for petroleum refiners. Until data are available indicating that a relaxed sampling frequency is appropriate, the magnitude of this GHG sources requires a stringent methodology.

4.9 Fuel Suppliers

A number of comments addressed specific issues raised by the Design Recommendation to require reporting by residential, commercial and industrial fuel suppliers, such as the appropriate quantification methodology. WCI will defer addressing these comments until a proposal relating to this sector is developed.

§ WCI.0	PURPOSE	2
§ WCI.1	APPLICABILITY	2
§ WCI.2	GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE	5
§ WCI.3	CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT	7
§ WCI.4	DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS	8
§ WCI.5	COMPLIANCE AND ENFORCEMENT	10
§ WCI.6	INCORPORATION BY REFERENCE	10
§ WCI.7	DESIGNATED REPRESENTATIVE (ONLY APPLICABLE TO WCI JURISDICTIONS IN THE UNITED STATES)	14
§ WCI.8	REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS	15
§ WCI.9	DEFINITIONS	15
§ WCI.10	GLOBAL WARMING POTENTIALS	15

EMISSIONS QUANTIFICATION, AND SAMPLING, ANALYSIS AND MEASUREMENT

§ WCI.20 through § WCI.xx

[These Essential Requirements for Reporting include placeholder references to requirements for reporting GHG emissions from the combustion of residential, commercial and industrial fuels and electricity imports that have not yet been completed by the WCI and will not go into effect for the 2010 reporting year. WCI Partner Jurisdictions may omit these references until they amend their rules to include reporting requirements for these sectors.]

§ WCI.0 PURPOSE

This rule requires mandatory reporting and verification of greenhouse gas (GHG) emissions data by certain facilities that directly emit GHG, by importers of electricity, and by suppliers of fossil fuels. The GHGs that must be reported under this rule are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFC), perfluorocarbons (PFC), and sulfur hexafluoride (SF_6).

§ WCI.1 APPLICABILITY

(a) The GHG emissions reporting requirements, and related monitoring, recordkeeping, and verification requirements of this rule apply to the owners and operators *[Each jurisdiction will select the specific terminology for the regulated persons in accordance with ~~their~~ its customary rule-writing practices]* of any facility that meets the requirements of paragraph (a)(1) of this section; and any fuel suppliers and electricity importers that meet the requirements of paragraph (a)(2), (a)(3), or (a)(4) of this section:

(1) Any facility that emits 10,000 metric tons CO_2e or more per year in combined emissions from one or more of the source categories listed in this paragraph in any calendar year starting in 2010.

[Please note that the quantification and monitoring methods for many of these source categories are currently being assessed. Only source categories for which adequate quantification methods exist will be included in the final WCI Essential Requirements for mandatory reporting.]

Adipic acid manufacturing
Aluminum manufacturing
Ammonia manufacturing [*still being assessed*]
Carbon dioxide transfer recipients [*still being assessed*]
Cement manufacturing
Coal mine fugitive emissions (active and abandoned)
Coal storage
Cogeneration ~~[still being assessed]~~
Electricity generation
Electronics Manufacturing [*still being assessed*]
Ferroalloy production [*still being assessed*]
General stationary fuel combustion
Glass Production and other uses of carbonates [*still being assessed*]
HCFC-22 production [*still being assessed*]
Hydrogen production
Industrial wastewater [still being assessed for some industries]
Iron and steel manufacturing
Lead production

Lime manufacturing
Magnesium production [still being assessed]
Natural gas transmission and distribution systems *[still being assessed]*
Nitric acid manufacturing *[still being assessed]*
Nonroad equipment at facilities *[still being assessed]*
Oil and gas production & gas processing *[still being assessed]*
Petrochemical production
Petroleum refineries
Phosphoric acid production *[still being assessed]*
Pulp and paper manufacturing
Refinery fuel gas
SF_6 from electrical equipment *[still being assessed]*
Soda ash manufacturing
Zinc production

(2) All importers of electricity. Importers of electricity include both retail providers and marketers that import electricity into the WCI region. *[This is preliminary language, pending definition of electricity importers by another WCI Committee.]*

(3) Any supplier that within the WCI region distributes transportation fuels in quantities that when combusted would emit 10,000 metric tons CO_2e per year or more in any calendar year starting in 2010. *[This is preliminary language, pending future determination of point of regulation for transportation fuels.]*

(4) Any supplier that distributes within the WCI region residential, commercial, and industrial fuels in quantities that when combusted would emit 10,000 metric tons CO_2e per year or more in any calendar year starting in 2010. *[This is preliminary language, pending future determination of points of regulation for these fuels.]*

(b) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold in paragraph (a)(1) of this section, the owner or operator shall calculate annual CO_2e emissions, as described in paragraphs (b)(1) through (b)(4) of this section.

(1) Estimate the annual emissions of CO_2, CH_4, N_2O, HFC, PFC, and SF_6 in metric tons for each unit, process, activity, or operation for which emission calculation methodologies are provided in sections WCI.20 through WCI.XX. The GHG emissions shall be calculated using methodologies specified in each applicable section.

(2) For stationary combustion units, carbon dioxide emissions from the combustion of biomass fuels shall be included in the calculations, with the following exceptions:

(A) Until such time as [jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, a maximum of 15,000 metric tons of carbon dioxide emissions from the combustion of pure solid biomass fuel may be excluded from calculation of GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold in paragraph (a)(1) of this section, provided that total GHG emissions including emissions from solid biomass fuel are less than 25,000 metric tons CO_2e.

(B) After such time as [jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, the carbon dioxide emissions from the combustion of those fuels may be excluded from calculation of GHG emissions for determining whether the 10,000 metric tons CO_2e per year emission threshold in paragraph (a)(1) of this section has been met.

[A WCI Partner jurisdiction may, in its discretion, choose to require carbon dioxide emissions from the combustion of biomass fuel to be included in the determination of stationary combustion units that are required to report and may require that those emissions be reported separately from emissions from fossil fuels.]

~~*[WCI is also considering a deduction of biomass fuel combustion emissions that have occurred within a jurisdiction that has deemed them to be carbon neutral from the determination of whether the verification threshold has been met and from the scope of the verification.]*~~

(3) Sum the total facility emissions for each GHG and calculate the metric tons of CO_2e using equation 1-1 below.

$$CO_2e = \sum_{i=1}^{n} GHG_i \times GWP_i$$

Equation 1-1

Where:

CO_2e = Carbon dioxide equivalent, metric tons/year.
GHG_i = Mass emissions of each greenhouse gas emitted, metric tons/year.
GWP_i = Global warming potential for each greenhouse gas from Table WCI.10-1 of this regulation.
n = The number of greenhouse gases emitted.

(4) For purpose of determining if an emission threshold has been exceeded, any CO_2 that is captured for on-site use, on-site storage, or transfer off-site must be included in the emissions total.

(c) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of transportation fuels in paragraphs (a)(3) of this section, the owner or operator shall follow the procedures of paragraphs (c)(1) through (c)(2) below:

(1) Calculate the total mass in metric tons per year of CO_2, CH_4, and N_2O that would result from the complete combustion or oxidation of all transportation fuels that are distributed within the WCI region. The mass of each GHG shall be calculated using any of the applicable methodologies specified in section WCI.XX [Transportation Fuels Combustion] of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO_2e using Equation 1-1 of this rule.

(d) To calculate GHG emissions for comparison to the 10,000 metric ton CO_2e per year emission threshold for suppliers of residential, commercial, and industrial fuels in paragraph (a)(4) of this section, the owner or operator shall follow the procedures of paragraphs (d)(1) and (d)(2) below:

(1) Calculate the total mass in metric tons per year of CO_2, CH_4, and N_2O that would result from the complete combustion or oxidation of all residential, commercial, and industrial fuels that are distributed within the WCI region. The calculation shall exclude any fuels that are supplied to facilities that are required to report GHG emissions under section WCI.1(a)(1). *[These accounting issues will be dealt with later in 2009 or in 2010.]* The mass of each GHG shall be calculated using any of the applicable methodologies specified in section WCI.XX [Residential, Commercial and Industrial Fuels Combustion] of this rule.

(2) Sum the emissions of each GHG and calculate total metric tons of CO_2e using Equation 1-1 of this rule.

(e) If the operations of a facility or fuel supplier that is subject to this rule change such that emissions fall below 10,000 metric tons CO_2e per year, then the following reporting requirements shall apply:

(1) If, prior to such emission reduction, the emissions report was subject to the verification requirements of this rule; then the owner or operator shall continue to submit emission reports until reported emissions are below 10,000 metric tons CO_2e per year for a minimum of 3 consecutive years. If reported emission are less than 10,000 metric tons CO_2 per year during 3 consecutive years, then the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(2) If, prior to such emission reduction, the emissions report was not subject to the verification requirements of this rule; then the owner or operator shall submit to the *[jurisdiction]* a signed statement certifying that emissions are less than 10,000 metric tons CO_2e during the prior year. After certifying that emissions are below 10,000 metric tons CO_2e per year for 3 consecutive years, the owner or operator shall be exempted from further reporting until CO_2e emissions again exceed 10,000 metric tons in any future calendar year.

(3) Notwithstanding the requirements of paragraphs (e)(1) and (2) of this section, a facility or fuel supplier that is a covered entity under the WCI cap-and-trade program must continue to submit annual emissions reports.

(f) Upon request by the [*jurisdiction*], owner or operator of any facility or fuel supply operation must submit a demonstration that emissions have not exceeded one or more of the applicability criteria specified in this section in any year since 2010. Such demonstration shall be provided to the [*jurisdiction*] within 20 working days of receipt of a written request.

~~*[WCI is considering whether this and other deadlines for responses provide sufficient time, and whether such deadlines should be standardized across requirements.]*~~

§ WCI.2 GENERAL GREENHOUSE GAS REPORTING REQUIREMENTS AND SCHEDULE

[Specific requirements of this section may change based on the future final design of the market~~ing~~ trading program.]

(a) General. Owners or operators that are subject to this rule must submit an annual GHG emissions report. Owners and operators must collect data; calculate GHG emissions; and follow the procedures for quality assurance, missing data, recordkeeping, and reporting as specified in these General Provisions and in each relevant section WCI.20 through WCI.XX of this rule.

[WCI jurisdictions have the flexibility during the first year of reporting, 2010, to allow the application of Best available data and methods (as defined in WCI.9) in circumstances in which owners and operators demonstrate that they require additional time, for example, to install equipment and institute procedures that are required for reporting.]

(1) A facility, fuel supplier, or electricity importer that commenced operation before January 1, 2010, must report emissions beginning in 2011 for GHGs emitted in calendar year 2010.

(2) A new facility, fuel supplier, or electricity importer that commences operation on or after January 1, 2010, must report emissions for the first calendar year in which the facility operates, beginning with the first operating month and ending on December 31 of that year. Each subsequent annual report must cover emissions for the calendar year, beginning on January 1 and ending on December 31.

(b) Reporting and Verification Schedule.

(1) Annual GHG emissions reports must be submitted to [*the jurisdiction*] by April 1 of each year for emissions in the previous calendar year.

(2) Reporters subject to the verification requirements of WCI.8, must complete their verification process, including submittal of a verification statement to [*the jurisdiction*], according to the following schedule:

(A) For reporting years 2010 through 2011, September 1 of the year following the reporting year.

(B) For reporting years 2012 and later, *[date to be determined]*.

(c) Submission of GHG Emissions Report. The annual GHG emissions report must be submitted to [*the jurisdiction*] in a format [*to be specified by each jurisdiction*].

(d) Simplified Emission Calculation Methods for De Minimis Sources. The owner or operator may elect to designate as de minimis one or more sources or pollutants that collectively emit no more than 3 percent of the facility's total CO_2e emissions, but not to exceed 20,000 metric tons CO_2e. The owner or operator may estimate emissions for these de minimis sources using alternative methods to those required to be used by this rule. If verification of the emissions report is required by this rule, then the selection of any alternative GHG calculation method is subject to the concurrence of the verification team that the use of such methods provides reasonable assurance that the emissions so designated do not exceed the applicable de minimis limits. The operator shall separately identify and include in the emissions data report the emissions from designated de minimis sources.

(e) To ensure accuracy of reported data and the ability to conduct audits and/or verifications of each emissions data report, the owner or operator shall establish and maintain data acquisition and handling activities that provide for the transparency and verifiability of emissions calculations and supporting information consistent with section WCI.4.

[As a means of assuring a smooth verification process and a positive verification opinion WCI jurisdictions may also require or advise in guidance materials that facilities have a full GHG inventory management plan.]

(f) GHG Emissions Report Revisions.

(1) The owner or operator shall maintain documentation to support any revisions made to a previously submitted annual GHG emissions report. Documentation for all revisions shall be retained by the operator for 7 years.

(2) If, after the verification deadline, a report subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report within 60 days of the finding. To the extent possible, the revised report must correct all identified errors. A revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*]. [The jurisdiction] will send notification of approval or disapproval and an explanation of the reasons for any disapproval within 60 days of receipt of the revised report.

(3) If, after the report submittal deadline, a report not subject to verification is found to contain an error, or accumulation of errors, greater than 5 percent of the total CO_2e emissions reported, the owner or operator shall revise and resubmit an annual GHG emissions report within 30 days of the finding. To the extent possible, the revised report must correct all identified errors. A revised report will be accepted only if approved by [*the jurisdiction*]. [The jurisdiction] will send notification of approval or disapproval and an explanation of the reasons for any disapproval within 60 days of receipt of the revised report.

(4) An owner or operator that voluntarily chooses to correct errors of 5 percent or less in total CO_2e emissions reported may do so according to the following requirements:

(A) For reports subject to verification, a revised report will be accepted only if verified according to WCI.8 and approved by [*the jurisdiction*].

(B) For reports not subject to verification, a revised report will be accepted if approved by [*the jurisdiction*].

(g) Where this rule specifies a choice between use of a fuel-based or mass balance-based calculation or use of a continuous emissions monitoring system (CEMS) to calculate CO_2 emissions, the operator shall make this choice and continue to use the method chosen for all future emissions data reports, unless the use of the alternative calculation method is approved in advance by *[the jurisdiction]*.

§ WCI.3 CONTENTS OF THE GREENHOUSE GAS EMISSIONS REPORT

Each annual GHG emissions report shall contain the following information:

(a) Facility name, identification number, physical address, mailing address, and NAICS code.

(b) Reporting year.

(c) Date of report submittal.

(d) Total facility emissions aggregated from all applicable source categories in subparts WCI.20 through WCI.XX expressed in metric tons of CO_2e calculated using Equation 1-1 of section WCI.1, excluding emissions from CO_2 that is captured and CO_2 emissions from the combustion of biomass and biomass-derived fuels, which are reported separately.

(e) Total facility emissions of CO_2 from the combustion of biomass and biomass-derived fuels.

(f) Total annual mass of CO_2 captured for on-site use, on-site storage, or transfer off site, in metric tons.

(g) For applicable fuel supplier categories in subparts WCI.XX [Transportation Fuels Combustion] and WCI.XX [Residential, Commercial and Industrial Fuels Combustion], total CO_2e emissions aggregated from all specified fuels.

(h) Emissions from each applicable source category or fuel supplier category in subparts WCI.20 through WCI.XX, expressed in metric tons per year of CO_2, CH_4, N_2O, HFC, PFC, and SF_6. CO_2 emissions from the combustion of biomass and biomass-derived fuels shall be reported separately.

(i) For electricity importers, the information required by WCI.XX [Electricity Imports].

(j) Emissions and other data for individual units, processes, activities, and operations as specified for each source category in sections WCI.20 through WCI.XX of this rule.

(k) Emission factors developed or measured by the operator using approved source testing as provided under sections WCI.20 through WCI.XX. Emission factors shall be provided in units of emissions per amount of fuel consumed, where fuel is reported in the units specified in this regulation.

(l) Mass emissions from each designated de minimis source or pollutant, reported in metric tons per year of each GHG for which an alternative emission calculation method is used.

(m) Name and contact information including e-mail address and telephone number of the person primarily responsible for preparing and submitting the emissions report.

(n) [only applicable in United States jurisdictions] A signed and dated statement provided by the owner or operator, or their designated representative, certifying that the report has been prepared in accordance with this rule and that, subject to verification, the statements and information contained in the emissions data report are true, accurate, and complete to the best of their knowledge.

(o) [only applicable in Canadian jurisdictions] A statement signed and dated by the operator's representative, certifying that:

    (1) The operator's representative has examined the emissions report and ensured that it is complete and accurate; and

    (2) The emissions report has been prepared in accordance with this rule and that the statements and information contained in the emissions report are true and fair to the best of the knowledge of the operator's representative.

§ WCI.4 DOCUMENT RETENTION AND RECORD KEEPING REQUIREMENTS

(a) The operator shall establish and maintain procedures for document retention and record keeping. The operator shall retain all documents regarding the design, development and maintenance of the GHG inventory in paper, electronic or other usable format for a period of not less than 7 years following submission of each emissions data report. The retained documents, including GHG emissions data, shall be sufficient to allow for the verification of each emissions data report.

(b) Upon request by *[jurisdiction]*, the operator shall provide within 10 working days all documents and data used to develop an emissions data report.

(c) In addition to information submitted as part of the emissions data report, each operator shall retain, at a minimum, the following information, if applicable, for at least 7 years after the submission of the report:

(1) A list of all GHG sources (i.e., units, operations, processes, and activities) included in the emission estimates.

(2) All records and documents used to calculate emissions for each source, categorized by process and fuel or material type.

(3) Documentation of the process for collecting emissions data.

(4) Any GHG emissions calculations and methods used;

(5) All emission factors used for emission estimates, including documentation for any factors not provided in the rule.

(6) All input data used for emission estimates.

(7) Documentation of biomass fractions for specific fuels.

(8) All other data submitted to the [*jurisdiction*] under this rule, including the GHG emissions report.

(9) All computations made to gap-fill missing data.

(10) Names and documentation of key facility personnel involved in emissions calculating and reporting;

(11) Any other information that is required for the verification of the GHG emissions report.

(12) A log to be prepared for each reporting year, beginning January 1, documenting all procedural changes made in GHG accounting methods and changes to instrumentation for GHG emissions estimation.

(13) ~~The GHG inventory data audit trail, data control policies and procedures, and supporting documentation.~~Documentation of the data acquisition and handling activities required by WCI.2(e).

(d) For measurement based methodologies, the following information, if applicable, also must be retained for at least 7 years after the submission of the emissions data report:

(1) List of all emission points monitored.

(2) Collected monitoring data.

(3) Any ~~Q~~quality assurance and quality control information collected in accordance with the data acquisition and handling activities required by ~~for the~~ WCI.2(e) ~~data audit trail and data controls section of this rule~~.

(4) A detailed technical description of the continuous measurement system, including documentation of any findings and approvals by federal, State or local agencies.

(5) Raw and aggregated data from the continuous measurement system.

(6) A log book of all system down-times, calibrations, servicing, and maintenance of the continuous measurement system.

(7) Documentation of any changes in the continuous measurement system over time.

§ WCI.5 COMPLIANCE AND ENFORCEMENT

(a) Submission of false or misleading information to the *[jurisdiction]* or a verification body shall constitute a single, separate violation of the requirements of this article for each day after the information has been received by the Executive Officer or verification body. *[Partners must be able to enforce this provision in the absence of evidence of intent, e.g., strict or absolute liability, depending on the jurisdiction.]*

(b) Each violation of this rule shall constitute a single, separate violation for each day the violation continues.

§ WCI.6 INCORPORATION BY REFERENCE

The following documents are incorporated by reference into this rule. These materials are incorporated as they exist on the date this article is adopted.

(a) The following materials are available for purchase from the following addresses: American Society for Testing and Material (ASTM), 100 Barr Harbor Drive, P.O. Box CB700, West Conshohocken, Pennsylvania 19428-B2959; and the University Microfilms International, 300 North Zeeb Road, Ann Arbor, Michigan 48106:

(1) ASTM D240-02, (Reapproved 2007), Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter.

(2) ASTM D388-05, Standard Classification of Coals by Rank.

(3) ASTM D396-08, Standard Specification for Fuel Oils.

(4) ASTM D975-08, Standard Specification for Diesel Fuel Oils.

(5) ASTM D1250-07, Standard Guide for Use of the Petroleum Measurement Tables.

(6) ASTM D1826-94 (Reapproved 2003), Standard Test Method for Calorific (Heating) Value of Gases in Natural Gas Range by Continuous Recording Calorimeter.

(7) ASTM Specification D1835-05 (2005).

(8) ASTM D1945-03 (Reapproved 2006), Standard Test Method for Analysis of Natural Gas by Gas Chromatography.

(9) ASTM D1946-90 (Reapproved 2006), Standard Practice for Analysis of Reformed Gas by Gas Chromatography.

(10) ASTM D2013-07, Standard Practice of Preparing Coal Samples for Analysis.

(11) ASTM D2234/D2234M-07, Standard Practice for Collection of a Gross Sample of Coal.

(12) ASTM D2502-04 (Reapproved 2002), Standard Test Method for Estimation of Molecular Weight (Relative Molecular Mass) of Petroleum Oils from Viscosity Measurements.

(13) ASTM D2503-92 (Reapproved 2007), Standard Test Method for Relative Molecular Mass (Relative Molecular Weight) of Hydrocarbons by Thermoelectric Measurement of Vapor Pressure.

(14) ASTM D2880-03, Standard Specification for Gas Turbine Fuel Oils.

(15) ASTM D3176-89 (Reapproved 2002), Standard Practice for Ultimate Analysis of Coal and Coke.

(16) ASTM D3238-95 (Reapproved 2005), Standard Test Method for Calculation of Carbon Distribution and Structural Group Analysis of Petroleum Oils by the n-d-M Method.

(17) ASTM D3588-98 (Reapproved 2003), Standard Practice for Calculating Heat Value, Compressibility Factor, and Relative Density of Gaseous Fuels.

(18) ASTM Specification D3699-07, Standard Specification for Kerosene.

(19) ASTM D4057-06, Standard Practice for Manual Sampling of Petroleum and Petroleum Products.

(20) ASTM D4809-06, Standard Test Method for Heat of Combustion of Liquid Hydrocarbon Fuels by Bomb Calorimeter (Precision Method).

(21) ASTM Specification D4814-08a, Standard Specification for Automotive Spark-Ignition Engine Fuel.

(22) ASTM D4891-89 (Reapproved 2006), Standard Test Method for Heating Value of Gases in Natural Gas Range by Stoichiometric Combustion.

(23) ASTM D5291-02 (Reapproved 2007), Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants.

(24) ASTM D5373-08, Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Laboratory Samples of Coal and Coke.

(25) ASTM D5865-07a, Standard Test Method for Gross Calorific Value of Coal and Coke.

(26) ASTM D6316-04, Standard Test Method for the Determination of Total, Combustible and Carbonate Carbon in Solid Residues from Coal and Coke.

(27) ASTM D6866-06a, Standard Test Methods for Determining the Biobased Content of Natural Range Materials Using Radiocarbon and Isotope Ratio Mass Spectrometry Analysis.

(28) ASTM E1019-03, Standard Test Methods for Determination of Carbon, Sulfur, Nitrogen, and Oxygen in Steel and in Iron, Nickel, and Cobalt Alloys.

(29) ASTM E1915-07a, Standard Test Methods for Analysis of Metal Bearing Ores and Related Materials by Combustion Infrared-Absorption Spectrometry.

~~(30)ASTM CS-104 (1985), Carbon Steel of Medium Carbon Content.~~

~~(31)~~(30) ASTM D~~-~~7459-08, Standard Practice for Collection of Integrated Samples for the Speciation of Biomass (Biogenic) and Fossil-Derived Carbon Dioxide Emitted from Stationary Emissions Sources.

~~(32)~~(31) ASTM D6060-96(2001) Standard Practice for Sampling of Process Vents With a Portable Gas Chromatograph.

~~(33)~~(32) ASTM D 2502-88(2004)e1 Standard Test Method for Ethylene, Other Hydrocarbons, and Carbon Dioxide in High-Purity Ethylene by Gas Chromatography.

~~(34)~~(33) ASTM C25-06 Standard Test Method for Chemical Analysis of Limestone, quicklime, and Hydrated Lime.

(34) C1271-99(2006) Standard Test Method for X-ray Spectrometric Analysis of Lime and Limestone.

(35) C1301-95(2001) Standard Test Method for Major and Trace Elements in Limestone and Lime by Inductively Coupled Plasma-Atomic Emission Spectroscopy (ICP) and Atomic Absorption (AA).

~~(35)~~(36) UOP539-97 Refinery Gas Analysis by Gas Chromatography.

~~(36)~~(37) ASTM D5468-02 (Reapproved 2007).

(b) The following materials are available for purchase from the American Society of Mechanical Engineers (ASME), 22 Law Drive, P.O.Box 2900, Fairfield, NJ 07007-2900:

(1) ASME MFC-3M-2004, Measurement of Fluid Flow in Pipes Using Orifice, Nozzle, and Venturi.

(2) ASME MFC-4M-1986 (Reaffirmed 1997), Measurement of Gas Flow by Turbine Meters.

(3) ASME-MFC-5M-1985, (Reaffirmed 1994), Measurement of Liquid Flow in Closed Conduits Using Transit-Time Ultrasonic Flowmeters.

(4) ASME MFC-6M-1998, Measurement of Fluid Flow in Pipes Using Vortex Flowmeters.

(5) ASME MFC-7M-1987 (Reaffirmed 1992), Measurement of Gas Flow by Means of Critical Flow Venturi Nozzles.

(6) ASME MFC-9M-1988 (Reaffirmed 2001), Measurement of Liquid Flow in Closed Conduits by Weighing Method.

(c) The following materials are available for purchase from the American National Standards Institute (ANSI), 25 West 43rd Street, Fourth Floor, New York, New York 10036:

(1) ISO 8316: 1987 Measurement of Liquid Flow in Closed Conduits- Method by Collection of the Liquid in a Volumetric Tank.

(2) ISO/TR 15349-1:1998, Unalloyed steel-Determination of low carbon content. Part 1: Infrared absorption method after combustion in an electric resistance furnace (by peak separation).

(3) ISO/TR 15349-3: 1998, Unalloyed steel-Determination of low carbon content. Part 3: Infrared absorption method after combustion in an electric resistance furnace (with preheating).

(d) The following materials are available for purchase from the following address: Gas Processors Association (GPA), 6526 East 60th Street, Tulsa, Oklahoma 74143:

(1) GPA Standard 2172-~~96~~09, Calculation of Gross Heating Value, Relative Density and Compressibility Factor for Natural Gas Mixtures from Compositional Analysis.

(2) GPA Standard 2261-00, Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography.

(e) The following American Gas Association materials are available for purchase from the following address: ILI Infodisk, 610 Winters Avenue, Paramus, New Jersey 07652:

(1) American Gas Association Report No. 3: Orifice Metering of Natural Gas, Part 1: General Equations and Uncertainty Guidelines (1990), Part 2: Specification and Installation Requirements (1990).

(2) American Gas Association Transmission Measurement Committee Report No. 7: Measurement of Gas by Turbine Meters (2006).

(f) The following materials are available for purchase from the following address: American Petroleum Institute, Publications Department, 1220 L Street, NW., Washington, DC 20005-4070:

(1) American Petroleum Institute (API) Manual of Petroleum Measurement Standards, Chapter 3- Tank Gauging:

(A) Section 1A, Standard Practice for the Manual Gauging of Petroleum and Petroleum Products, Second Edition, August 2005.

(B) Section 1B-Standard Practice for Level Measurement of Liquid Hydrocarbons in Stationary Tanks by Automatic Tank Gauging, Second Edition June 2001 (Reaffirmed, October 2006).

(C) Section 3-Standard Practice for Level Measurement of Liquid Hydrocarbons in Stationary Pressurized Storage Tanks by Automatic Tank Gauging, First Edition June 1996 (Reaffirmed, October 2006).

(2) Shop Testing of Automatic Liquid Level Gages, Bulletin 2509 B, December 1961 (Reaffirmed August 1987, October 1992).

(3) American Petroleum Institute (API) Manual of Petroleum Measurement Standards, Chapter 4- Proving Systems:

(B) Section 5-Master-Meter Provers, Second Edition, May 2000 (Reaffirmed, August 2005).

(4) American Petroleum Institute (API) Manual of Petroleum Measurement Standards, Chapter 22- Testing Protocol, Section 2-Differential Pressure Flow Measurement Devices, First Edition, August 2005.

(g) The following material is available for purchase from the following address: American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., 1791 Tullie Circle, NE., Atlanta, Georgia 30329: ASHRAE 41.8-1989: Standard Methods of Measurement of Flow of Liquids in Pipes Using Orifice Flowmeters.

(h) California Implementation Guidelines for Estimating Mass Emissions of Fugitive Hydrocarbon Leaks at Petroleum Facilities, California Air Pollution Control Officers Association (CAPCOA) and California Air Resources Board (ARB), February 1999.

(i) Control of Emissions from Refinery Flares, Rule 118, South Coast Air Quality Management District, Amended November 4, 2005.

(j) U.S. EPA TANKS Version 4.09D, US Environmental Protection Agency, October 2005.

(k) Gas Processors Association (GPA) Standard 2261-00, Revised 2000.

§ WCI.7 DESIGNATED REPRESENTATIVE (ONLY APPLICABLE TO WCI JURISDICTIONS IN THE UNITED STATES)

(a) General. Each fuel supplier, electricity importer, and owner or operator of a facility that is subject to this rule, shall select a designated representative that is responsible for certifying and submitting GHG emissions reports under this reporting rule.

(b) Authorization of a Designated Representative. The designated representative of the facility shall be selected by a certificate of representation agreement that is signed by the designated representative and owners or operators of the facility. The designated representative must be an individual having responsibility for the overall operation of the facility or activity such as the position of the plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company.

(c) Responsibility of the Designated Representative.

(1) The designated representative of the facility shall represent and by any representations, actions, inactions, or submissions, legally bind each owner and operator in all matters pertaining to this rule.

(2) Each GHG emission report submitted under this rule must be signed by the designated representative and must contain the following certification statement: “I have been authorized to make this submission on behalf of the owners and operators of the facility (or supply operation, as appropriate). I certify under penalty of law that I have personally examined the information submitted in this document. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

(d) Changing a Designated Representative. The designated representative may be changed at any time upon submission of a superseding certificate of representation. Notwithstanding any such change, all representations, actions, inactions, and submissions by the previous designated representative before time of the superseding certificate of representation shall be binding on the new designated representative and the owners and operators.

(e) Changes in Owners and Operators. In the event of any change in ownership of the facility, any new owner or operator shall be deemed to be bound by the representations, actions, inactions, and submissions of the designated representative of the facility until such time as the designated representative is changed.

(f) Certificate of Representation. A certificate of representation must be submitted to *[the jurisdiction]* and kept on location by the facility, fuel supplier, or electricity importer. The certificate shall include the following information:

(1) Identification of the facility, fuel supplier, or electricity importer for which the certificate of representation is submitted.

(2) The name, address, e-mail address (if any), telephone number, and facsimile transmission number (if any) of the designated representative.

(3) A list of the owners and operators.

(4) Certification statements that the actions of the designated representative with respect to this rule are binding on the owners and operators, and that the designated representative has the necessary authority to carry out duties and responsibilities on behalf of the owners and operators.

(5) The signature of the designated representative and owner(s) and operator(s), and the dates signed.

§ WCI.8 REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS

[See separate document.]

§ WCI.9 DEFINITIONS

[See separate document.]

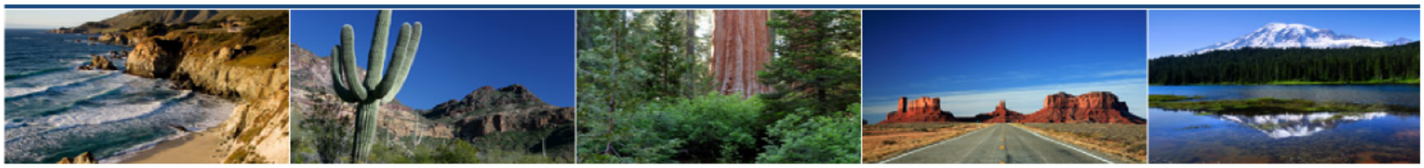
§ WCI.10 GLOBAL WARMING POTENTIALS

Owners and operators must use the global warming potential (GWP) values given in Table WCI.10-1 when converting emissions of greenhouse gases to metric tons of carbon dioxide equivalent (CO_2e), using Equation 1-1.

Table WCI.10-1. Global Warming Potential Factors for Greenhouse Gases

Common Name	Formula	Chemical Name	GWP
Carbon dioxide	CO_2		1
Methane	CH_4		21
Nitrous oxide	N_2O		310
Sulfur hexafluoride	SF_6		23,900
Hydrofluorocarbons (HFCs)			
HFC-23	CHF_3	trifluoromethane	11,700
HFC-32	CH_2F_2	difluoromethane	650
HFC-41	CH_3F	fluoromethane	150
HFC-43-10mee	$C_5H_2F_{10}$	1,1,1,2,3,4,4,5,5,5- decafluoropentane	1,300
HFC-125	C_2HF_5	pentafluoroethane	2,800
HFC-134	$C_2H_2F_4$	1,1,2,2-tetrafluoroethane	1,000
HFC-134a	$C_2H_2F_4$	1,1,1,2-tetrafluoroethane	1,300
HFC-143	$C_2H_3F_3$	1,1,2-trifluoroethane	300

HFC-143a	$C_2H_3F_3$	1,1,1-trifluoroethane	3,800
HFC-152	$C_2H_4F_2$	1,2-difluoroethane	43
HFC-152a	$C_2H_4F_2$	1,1-difluoroethane	140
HFC-161	C_2H_5F	fluoroethane	12
HFC-227ea	C_3HF_7	1,1,1,2,3,3,3- heptafluoropropane	2,900
HFC-236cb	$C_3H_2F_6$	1,1,1,2,2,3-hexafluoropropane	1,300
HFC-236ea	$C_3H_2F_6$	1,1,1,2,3,3-hexafluoropropane	1,200
HFC-236fa	$C_3H_2F_6$	1,1,1,3,3,3-hexafluoropropane	6,300
HFC-245ca	$C_3H_3F_5$	1,1,2,2,3-pentafluoropropane	560
HFC-245fa	$C_3H_3F_5$	1,1,1,3,3-pentafluoropropane	950
HFC-365mfc	$C_4H_5F_5$	1,1,1,3,3-pentafluorobutane	890
Perfluorocarbons (PFCs)			
Perfluoromethane	CF_4	tetrafluoromethane	6,500
Perfluoroethane	C_2F_6	hexafluoroethane	9,200
Perfluoropropane	C_3F_8	octafluoropropane	7,000
Perfluorobutane	C_4F_{10}	decafluorobutane	7,000
Perfluorocyclobutane	$c\text{-}C_4F_8$	octafluorocyclobutane	8,700
Perfluoropentane	C_5F_{12}	dodecafluoropentane	7,500
Perfluorohexane	C_6F_{14}	tetradecafluorohexane	7,400



§WCI.8 REQUIREMENTS FOR VERIFICATION OF GREENHOUSE GAS EMISSIONS DATA REPORTS AND REQUIREMENTS APPLICABLE TO EMISSIONS DATA VERIFIERS

Note: The verification requirements laid out in this section strive for consistency with ISO 14064-3[1] requirements and set forth a high standard for verification that will ultimately support a WCI cap and trade program. Due to differences in rulemaking procedures between jurisdictions, Supplement 1 provides supplemental text that jurisdictions must incorporate into either the jurisdiction's prescriptive rule language, replacing more general procedural language in Section WCI.8, or into enforceable guidance documents. There are notes in WCI.8 that direct readers to appropriate text in Verification Supplement 1 when applicable.

It ~~is imperative that~~would be ideal for all jurisdictions to enforce the same requirements and ~~have the same level of rigor and~~ have the same implementation processes for accreditation and verification to ensure that consistent accurate data exists throughout ~~to support a~~ the WCI regional program. Reporters and verifiers with operations throughout the WCI region will benefit from a consistent approach and such an approach would facilitate administration of the verification requirements by a central body or designee.

(a) Applicability and Scope.

(1) Except as provided in WCI.8(a)(2) through (4) ~~O~~owners or operators [Each jurisdiction will select the specific terminology for the regulated persons in accordance with their customary rule-writing practices] are required to obtain annual verification for a facility that emits 25,000 metric tons CO_2e or more per year in combined emissions from one or more of the source categories listed in WCI.1~~when the reported annual emissions of the operation subject to this rule are equal to or greater than 25,000 metric tons of CO_2e~~ in any calendar year starting ~~in~~ on or after 2010.

(2) When the operation of a facility, fuel supplier, or electricity importer subject to the requirements of this section is changed such that the operator has reported less than 25,000 metric tons of CO_2e emissions for a calendar year, the operator shall obtain verification of annual emissions reports for the lesser of three subsequent calendar years or for those years remaining in the current compliance period. If CO_2e emissions of a facility, fuel supplier, or electricity importer subject to the requirements of this section

[1] ISO (2006) ISO 14064-3: Greenhouse Gases-Part 3: Specification with guidance for the validation and verification of greenhouse gas assertions, March, 2006, International Organization for Standardization, Switzerland.

again exceed 25,000 metric tons in any calendar year the provisions of WCI.8(a)(1) apply.

(3) Carbon dioxide emissions from the combustion of biomass fuels shall be included in the determination regarding verification applicability, with the following exceptions:

(A) Until such time as [the jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, a maximum of 15,000 metric tons of carbon dioxide emissions from the combustion of pure solid biomass fuel may be excluded from calculation of GHG emissions for comparison to the 25,000 metric ton CO_2e per year verification threshold in paragraph (a) of this section.

(B) After such time as [the jurisdiction] has made a determination regarding the carbon neutrality of any biomass fuels, the carbon dioxide emissions from the combustion of those fuels may be excluded from calculation of GHG emissions for determining whether the 25,000 metric tons CO_2e per year verification threshold in paragraph (a)(1) of this section has been met.

[Under Design Recommendation 1.3, carbon neutral biomass will be excluded from the cap-and-trade program. A WCI Partner jurisdiction, however, may, in its discretion, choose to require carbon dioxide emissions from the combustion of biomass fuel to be included in the determination of the verification threshold in order to obtain a complete inventory of the fuels being combusted in the jurisdiction.]

(4) Owners or operators may exclude carbon dioxide emissions from the combustion of biomass fuels that [jurisdiction] has deemed carbon neutral from the scope of verification.

[A WCI Partner jurisdiction may, in its discretion, choose to require carbon dioxide emissions from the combustion of biomass fuel to be included in the scope of verification.]

~~(3)~~(5) Notwithstanding WCI.8(a)(~~1~~2) and (~~2~~3), any facility, fuel supplier or electricity importer ~~included as a covered entity under the WCI~~subject to a cap-and-trade program for CO_2e emissions established by [the jurisdiction] shall obtain verification of reported annual emissions.

~~*[WCI is considering a deduction of pure biomass fuel combustion emissions that have occurred within a jurisdiction that has deemed them to be carbon neutral from the determination of whether the verification threshold has been met and from the scope of the verification when one is required.]*~~

(b) Requirements for Annual Verification of Emissions Data Reports.

(1) Verification bodies shall conduct verification processes and design verification procedures to determine whether there is a reasonable level of assurance for each separate emissions data report every year of the verification cycle. The verification team shall find that there is a reasonable level of assurance for an emissions data report if the report

(A) contains no material misstatement; and

(B) conforms to the requirements of this article.

(2) The verification body must provide verification services in compliance with WCI.8.

~~(1)~~(3) Facility owners or operators, fuel suppliers, and electricity importers required to obtain annual verification shall be subject to full verification requirements in the first year that verification is required for an emissions data report. Upon completion of a positive verification statement under full verification requirements, the facility owner or operator, fuel supplier, or electricity importer may be eligible for two years of less intensive verification services as described in section WCI.9. This cycle may be repeated in subsequent three-year cycles; however, full verification requirements shall apply at least once every three years.

~~(2)~~(4) Facility owners or operators, fuel suppliers, and electricity importers required to obtain annual verification will be required to obtain full verification services if any of the following apply:

(A) ~~Change~~ There has been a change in the verification body from the previous year; or

(B) A verification body issued an adverse verification statement for that facility's previous year's emissions data report.~~;~~

(c) Accreditation Requirements for Verification Bodies.

(1) The accreditation requirements specified in this subsection shall apply to all verification bodies~~,~~ that wish to provide verification services under this rule.

(2) A verification body is qualified to conduct verification services for the WCI if

(A) it has demonstrated knowledge of the WCI reporting requirements; and ~~if it is:~~

~~(A)Accredited by the California Air Resources Board under Title 17, California Code of Regulation, section 95132, or~~

(B) it is ~~A~~accredited to ISO 14065 through a program developed under ISO 17011 by an accreditation body that is a member of the International Accreditation Forum.

[Note the details of the WCI's specific accreditation process for verification bodies (which has yet to be developed) will be consistent with ISO 14065 through an accreditation program that will developed under ISO 17011 and will include demonstrated knowledge of the WCI reporting requirements. The WCI will explore additional accreditation requirements and/or other criteria for individual lead verifiers, general verifiers, and/or sector specialists.]

~~(C)The WCI will only grandfather in existing verification bodies that meet the requirements of WCI.8(c)(2)(A)-(B) if they are accredited by December 31, 2012 to provide verification services for programs other than the WCI.~~

(3) Prior to January 1, 2013, accreditation by the California Air Resources Board under Title 17, California Code of Regulation, section 95132, may be substituted for the accreditation required under WCI.8(c)(2)(B).

(d) Requirements for Verification Services. ~~Verification services shall be subject to the following requirements.~~ The following verification services must be provided for each emissions data report.

(1) As part of the verification services, the verification team shall review documents submitted, assess risks of a material misstatement, develop a verification plan (that includes a sampling plan), evaluate the emissions data report against the verification

requirements, and assess the materiality of errors, omissions and misstatements identified.

(2) The verification team shall request any information and documents needed for verification services. Such information shall include, but is not limited to original records and supporting data for the emissions data report.

~~(e)Level of Assurance. Verification bodies shall conduct verification processes and design verification procedures to provide a reasonable level of assurance for each separate emissions data report every year of the verification cycle.~~

~~(f)~~(e) A verification team must include the following:

(1) a Lead Verifier;

(2) an Independent Peer Reviewer;

(3) any subcontractor elected to provide verification services under WCI.8(f).~~at least one sector specialist with demonstrated knowledge and specific skills, if required per WCI [TBD];~~

~~*[Note, the WCI will identify industrial sectors where a subject matter expert must be part of the verification team as part of development of its accreditation requirements.]*~~

~~(g)~~(f) Subcontracting. The following requirements shall apply to any verification body that elects to subcontract verification services.

(1) The primary verification body must assume full legal responsibility for verification services performed by subcontracted verifiers or verification bodies.

(2) A verification body or verifier acting as a subcontractor to the primary verification body will not further subcontract that same work to another firm or individual.

(3) A~~ny~~ verification body or verifier acting as a subcontractor is ~~bound~~ subject to all Conflict of Interest requirements in Section WCI.8(~~h~~g).

(4) A verification body or verifier acting as a subcontractor ~~M~~must be identified by the primary verification body as part of the verification team.

~~(h)~~(g) Conflict of Interest Requirements for Verification Bodies. The conflict of interest provisions of this section shall apply to the verification body, entities related to the verification body, and the verification team accredited according to the requirements of the WCI to perform verification services for the WCI program. Member for purposes of this section means any employee or subcontractor of the verification body or entities related to the verification body. Member also includes any individual with a majority equity share in the verification body or entities related to the verification body.

(1) Prior to a jurisdiction accepting a verification statement, and prior to a jurisdiction accepting the associated emissions report for consideration for approval, the AVA must determine that the verification body has a low potential for conflict of interest as described under WCI.8(g)(6). To inform this determination by the AVA, ~~commencing verification services for an owner or operator, a verification body must first be authorized in writing by [*(e.g. WCI regional administrative body or other organization to be determined) or jurisdiction in which the entity reports* (TBD)]~~the AVA ~~to provide~~

~~verification services. To obtain authorization the verification body shall submit to [TBD]~~a self-evaluation of the potential for any conflict of interest that the verification body, entities related to the verification body, and members of the verification team, including subcontractors, may have with the owner or operator or their related entities for which ~~it will perform~~ verification services will be or have been provided shall be submitted to the AVA. This self-evaluation must include an evaluation of any threats to the verification body's independence including: [*note: a standardized Conflict of Interest Assessment form will be developed for the WCI*]

[To facilitate timely determinations of conflict-of-interest potential, and to reduce the risk of finding medium or high conflict-of-interest potential after verification services have been initiated, it is recommended that jurisdictions require that the self evaluations be submitted and evaluated by the AVA prior to the initiation of verification services. A jurisdiction may elect to allow verification services to commence prior to the determination of the conflict-of-interest potential by the AVA.~~A jurisdiction may elect to require the reporting entity to submit the conflict-of-interest along with the verification statement required under WCI.2(b)(2), rather than requiring its submission before commencement of verification services, as provided in WCI.8(g)(1).~~]

(A) Threats created by the reporting operation offering inducements to the verification body, subcontractors or verification team members for a positive opinion~~,~~;

(B) Threats created by members of the verification body, verification team members, subcontractors, or family of subcontractors or team members having a financial interest in the reporting operation or its operator~~,~~;

(C) Threats created by members of the verification body reviewing work of the verification body, subcontractors, members of the verification team, or related companies, including but not limited to any situation where the body, subcontractors, team members or companies have provided services related to greenhouse gases~~,~~;~~:~~

(D) Threats created by members of the verification body, verification team members, or subcontractors having a close relationship with the reporting operation, such that they might become too sympathetic to the interests of the reporting operation~~,~~; ~~or~~and

(E) Threats created by members of the verification body, verification team members, or subcontractors being deterred from acting objectively or exercising professional skepticism by threats, actual or perceived, from the reporting operation.

(2) The verification body shall deem the potential for conflict of interest to be low if

(A) No threats as listed in WCI.8(~~h~~g)(1) exist, and

(B) Any non-verification services provided by ~~all members of~~ the verification body ~~the verification team~~ to the owner or operator within the last three years are valued at less than ~~[percent TBD]~~five percent of the verification body's annual revenue in each of those years.

(3) The verification body shall deem the potential for conflict of interest to be high if threats as listed in WCI.8(~~h~~g)(1)(A) or (E) exist~~, unless it is a potential for individual~~

~~conflict of interest as provided in section WCI.8((h)(5) and may be mitigated per section WCI.8(h)(3)(B)~~.

[A jurisdiction may expand the list of high threats (i.e. un-mitigatable conflicts) with the items included in paragraph 2 of the Conflict of Interest section of Supplement 1 below.]

(4) The verification body shall deem the potential for a conflict of interest to be medium if the potential for a conflict of interest is not deemed to be either ~~high or low~~low or high as specified in sections WCI.8~~(h)(1)-(2)~~(g)(2)-(3).

~~(5)~~If a verification body deems the potential for conflict of interest to be medium and wishes to provide verification services for the owner or operator, then

~~(A)~~(5) the verification body shall submit, in addition to the ~~Conflict of Interest Assessment~~ self-evaluation~~form~~, a plan to avoid, neutralize, or mitigate the potential conflict of interest situation.

~~(B)the verification body may submit a plan to neutralize a high individual conflict of interest assessed under WCI.8(h)(1)(B).~~

~~(C)the [TBD] shall evaluate the conflict of interest mitigation plan and determine whether verification services may proceed, as provided in section WCI.8(h)(4).~~

(6) Conflict of Interest Determinations. The ~~*[TBD]*~~ AVA shall review the self-evaluation submitted by the verification body and determine ~~whether~~ the verification body's potential conflict of interest in ~~is authorized to~~ performing verification services for the owner or operator.

[In addition to the AVA determination, a jurisdiction may elect to conduct audits of conflict of interest submissions for compliance verification and enforcement purposes.]

(A) The ~~*[TBD]*~~AVA shall notify the verification body in writing when the conflict of interest evaluation information submitted under section WCI.8(~~h~~g)(1) is deemed complete. Within ~~*[Number of days TBD]*~~ 45 days after ~~of~~ deeming the evaluation information complete, ~~*[TBD]*~~the AVA shall determine the conflict-of-interest potential ~~whether the verification body is authorized to proceed with verification~~ and shall ~~so~~ notify the verification body or owner or operator if the potential conflict of interest is determined to be medium or high.

(B) If ~~*[TBD]*~~the AVA determines the verification body or any member of the verification team has any threats specified in section WCI.8(~~h~~g)(1), ~~*[TBD]*~~the AVA shall find a high potential conflict of interest and verification services may not proceed.

(C) If ~~*[TBD]*~~the AVA determines that there is a low potential conflict of interest prior to the verification services being provided, verification services may proceed.

(D) If ~~*[TBD]*~~the AVA determines that the verification body and verification team have a medium potential for a conflict of interest, ~~*[TBD]*~~the AVA shall evaluate the conflict of interest mitigation plan and may request additional information from the applicant to complete the determination. In determining potential conflict of interest~~whether verification services may proceed~~, ~~*[TBD]*~~the AVA may consider factors including, but not limited to, the nature of previous work performed, the current and past relationships between the verification body and its subcontractors with the owner or operator, and the cost of the verification services to be performed. ~~If *[TBD]*t~~The AVA will determine~~s~~ ~~that~~ whether these factors when considered in combination with the mitigation plan demonstrate a low level of potential conflict of interest~~,~~ or a high level. If the AVA determines that there is a low potential conflict of interest prior to the verification services being initiated, verification services may proceed. If a high potential is determined prior to verification services being initiated, verification services may not proceed. If a high potential is determined after verification services have been initiated, the verification statement shall not be accepted.~~then *[TBD]*~~~~the AVA~~ ~~will authorize the verification body to provide verification services~~.

(7) Monitoring Conflict of Interest Situations.

(A) After commencement of verification services, the verification body shall monitor and ~~–~~immediately make full disclosure in writing to ~~*[TBD]*~~the AVA regarding any potential for a conflict of interest situation that arises. This disclosure shall include a description of actions that the verification body has taken or proposes to take to avoid, neutralize, or mitigate the potential for a conflict of interest.

(B) The verification body shall monitor arrangements or relationships that may be present for a period of one year after the completion of verification services. During that period, within 30 calendar days of any change in arrangements or relationships with the owner or operator for which the verification body has provided verification services that may create a medium or high threat of conflict of interest, the verification body shall notify ~~*[TBD]*~~the AVA of the change and provide a description of the nature of the change. The AVA will make a conflict of interest determination under WCI.8(g)(6).

(C) The verification body shall report to ~~*[WCI Regional Body or jurisdiction TBD]*~~the AVA any changes in its organizational structure, including mergers, acquisitions, or divestitures~~,~~ that may have created a medium or high threat of conflict of interest for one year after completion of verification services within 30 days and submit an evaluation of how the change(s) impacts the potential for conflict of interest.

(D) ~~*[TBD]*~~The AVA may invalidate a verification finding if a medium or high ~~potential~~ threat of a conflict of interest has arisen for the verification body or any member of the verification team and, in the case of a medium threat, the threat has not been adequately mitigated. In such a case, the owner or operator shall be provided 180 calendar days to have their emissions report verified by a different verification body.

(E) If the verification body or its subcontractor(s) are found to have violated the conflict of interest requirements of this section, ~~*[Accreditation Body TBD]*~~the AVA may rescind its accreditation for any appropriate period of time ~~as provided in section WCI.8(aaw)~~. Additionally, ~~(WCI Regional Body *[TBD]*~~the AVA may separately ~~rescind~~ revoke its recognition of an accredited Verification Body under WCI.8(w). *[~~TBD –~~The WCI intends to develop more detailed accreditation requirements in the future.]*~~.~~

~~(i)~~(h) Notice of Verification Services. Prior to commencing verification services for a facility owner or operator, fuel supplier, and electricity importer, the verification body shall submit a notice of verification services to the ~~*[TBD]*~~ AVA. Verification activities shall not proceed for 15 business days or until the verification body receives written approval to proceed from the ~~*[TBD]*~~AVA, whichever is earlier. If the ~~*[TBD]*~~AVA does not respond to the verification body within 15 business days, the verification body may begin to conduct verification activities.

[The NOVS form will be standardized across WCI and developed later~~, ~~. ~~Supplement will include some minimum information to be contained in NOVS~~]

~~(j)~~(i) Verification Plan.

(1) Accounting for requirements set by WCI.8, the verification plan shall document:

(A) the scope of the verification;

(B) the level of assurance;

(C) the verification standard;

(D) the verification criteria;

(E) the objectives of the verification;

(F) the timing of the verification, including site visits;

(G) the nature of the communications required;

(H) the resources required to conduct the verification, including the role of verification team members;~~,~~ and

(I) the nature, timing and extent of the verification procedures, including the sampling plan.

(2) The verification body shall retain the verification plan in paper, electronic, or other format for a period of not less than seven years following the submission of each verification statement.

~~(k)~~(j) Site visits. In years for which full verification services are required under WCI.8(b)(3), at least one member of the verification team shall at a minimum make one onsite site visit to each facility or fuel supply location *[Note that exact location of fuel supplier site visits remains TBD]* for which an emissions data report is submitted. ~~If the verification team requires a sector specialist as required (TBD through accreditation), that specialist must participate in the onsite visit(s).~~ The verification team member(s) shall also conduct an onsite visit of the headquarters or other location of central data management, if different from the facility or fuel supply location, when the owner or operator is an electricity importer.

~~(l)~~(k) Owners or operators shall make available to the verification team all information and documentation used to calculate and report emissions, electricity transactions, and other information required under this rule, as applicable.

~~(m)~~(l) As applicable for electricity importers, the verification team shall review electricity transaction records, including receipts of power attributed to the Northwest or Southwest region as verifiable via North American Electric Reliability Corporation (NERC) E-Tags, settlements data, or other information as confirmation of the region of origin. [*Note that this procedure is subject to change pending WCI Electricity Committee review.*]

~~(n)~~(m) Data Checks. To determine the reliability of the submitted emissions data report, the verification team shall use data checks as ~~described~~ defined in WCI.9~~, Definitions~~. Verifiers will use their professional judgment in determining how many data checks are needed to provide a reasonable level of assurance.

~~(o)~~(n) Emissions Data Report Modifications. If as a result of review by the verification team and prior to completion of a verification statement the owner or operator chooses to make improvements or corrections to the submitted emissions data report, a revised emissions data report must be submitted to [the jurisdiction] as specified by section WCI.~~2~~8(~~f~~q). The owner or operator shall maintain documentation to support any revisions made to the initial emissions data report. Documentation for all emissions data report submittals shall be retained by the operator for seven years pursuant to section WCI.4.

(o) Materiality and Conformance Assessment Criteria. The verifier shall determine if the annual emissions report is prepared in such a way that it ~~conforms to the verification criteria~~satisfies WCI.8(b)(1).

(1) ~~To verify that the emissions data report~~A verification team shall determine that an emission data report contains a ~~is free of~~ material misstatement, if either of the following is true:

(A) Based on the verification team's ~~shall make its~~ own determination of the level of emissions ~~checked~~ subject to verification based on the sampling plan, ~~and shall determine whether there is reasonable assurance if the individual or aggregate effect of any errors, omissions or misrepresentation could have resulted in an underestimation or overestimation of emissions by more than five percent of the facility's, fuel supplier's, or electricity importer's total reported CO2e emissions.~~the verification team concludes that total reported emissions are less than 95 percent accurate using the following equation:

$$PA = 100 - (SOU/TRE * 100)$$

Where:

PA	=	Percent accuracy
SOU	=	The net result of summing overstatements and understatements resulting from errors, omissions and misreporting
TRE	=	Total reported emissions

(B) The individual or aggregate effect of one or more errors, omissions or misstatements identified in the course of verification make it probable that the judgment of a reasonable person regarding the total reported emissions would have been changed or influenced by the error, omission or misrepresentation.

(2) To assess conformance with this rule the verification team shall review the methods and factors used to develop the emissions data report for adherence to the requirements of this rule.

(3) The verification team shall keep a log of any issues identified in the course of verification activities that may affect determinations of material misstatement and nonconformance, and how those issues were resolved.

~~(q)~~(p) Completion of verification services shall include:

(1) Verification Statement. Upon completion of the verification services ~~specified in~~ required by ~~sections~~ WCI.8~~(d)(j) (s)~~, the verification body shall complete a verification statement for each emissions data report, and provide that statement to the owner or operator and [the jurisdiction or other body] according to the schedule specified in section WCI.2(b). Before that statement is completed, the verification body shall have the verification services and findings of the verification team independently reviewed and approved by an Independent Peer Reviewer.

(2) The verification body shall provide either a positive or adverse verification statement to the reporter and to the AVA *[~~the jurisdiction or other central body (~~alternatively, this could be the reporter's responsibility to submit the statement to the ~~jurisdiction~~AVA~~)~~]* based on its findings during the verification process.

(3) The lead verifier in the verification team shall attest on the verification statement that the verification team has carried out all verification services as required by this rule, and the Independent Peer Reviewer shall attest to his or her independent review on behalf of the verification body and his or her concurrence with the verification findings. If the Independent Peer Reviewer does not determine that ~~that~~ the verification team has carried out all verification services as required by the rule or if the Independent Peer Reviewer rejects the verification team's findings, then the verification body cannot issue a positive verification statement.

(4) The verification body shall provide to the owner or operator a detailed verification report. The verification report shall at minimum include the detailed comparison of the data checks with the submitted emissions data report, errors, omissions and misstatements identified during the course of the verification, any corrections made to the original annual emissions report as a result of the verification, and observations about the data management systems that are connected to the errors, omissions and misstatements identified, as well as any qualifying comments on findings during verification services. The detailed verification report shall be made available to [the jurisdiction] upon request.

~~(r)~~(q) Prior to the verification body providing an adverse verification statement ~~to [the jurisdiction]~~pursuant to WCI.8(p)(2), the owner or operator shall be provided at least 14 working days to modify the emissions data report to correct any material misstatement or nonconformance found by the verification team. The modified report and verification statement must be submitted to [the jurisdiction] before the applicable verification deadline, unless the operator makes a request to [the jurisidiction*]* as follows:

~~(s)~~(1) If the owner or operator and the verification body cannot reach agreement on modifications to the emissions data report that result in a positive verification statement, the operator may petition *~~[TBD]~~*the AVA to make a final decision as to the verifiability of the submitted emissions data report.

~~(1)~~(2) If ~~*[TBD]*~~the AVA determines that the emissions data report does not meet the standards and requirements specified in this ~~rule~~ article, the owner or operator shall have the opportunity to submit within 60 calendar days of the date of this decision *[Note that this time frame may need to be changed pending details of cap-and-trade system design and needs.]* any emissions data report revisions that address ~~*[TBD's]*~~the AVA's determination, for re-verification of the emissions data report. In re-verifying a revised emissions data report, the verification body and verification team shall be subject to the requirements in section WCI.8(q)-(s).

~~(2)~~(3) Upon provision of the verification statement to [the jurisdiction], the emissions data report shall be considered final and no changes shall be made except as provided in section WCI.~~2~~8(~~(f~~n) or (q). All verification requirements of this rule shall be considered complete upon provision of the verification statement.

~~(t)~~(r) In addition to initiating WCI's dispute resolution process, the operator and verification body must inform the applicable accreditation body of the dispute.

~~(u)~~(s) The ~~*[TBD]*~~AVA may make void the positive verification statement submitted by the verification body if:

(1) The ~~[TBD]~~AVA finds a high level of conflict of interest existed between a verification body and an owner or operator; or,

(2) An emissions data report that received a positive verification statement fails an audit by ~~*[TBD*~~]the AVA.

~~(v)~~(t) Upon request by ~~*[TBD]*~~the AVA, the owner or operator shall provide the data used to generate an emissions data report, including all data available to a verification body~~verifier in the conduct of verification services~~. ~~*[TBD]*~~The AVA may also review the full verification report given by the verification body to the owner or operator. The full verification report shall be provided to the ~~*[TBD]*~~AVA upon request.

~~(w)~~(u) Upon written notification by the ~~*[TBD]*~~AVA, the verification body shall make itself available for a verification services audit.

~~(x)~~(v) Duration of verification services by one verification body. Facility owners or operators, fuel suppliers, or electricity importers subject to annual verification shall not use the same verification body for a period of more than six consecutive years. If a facility owner or operator, fuel supplier, or electricity importer is required or elects to contract with another verification body, they may contract verification services from the previous verification body only after not using the previous verification body for at least three years. If a verification body or verification team member has been providing verification services for ~~a [operator/owner]~~an owner or operator in a greenhouse gas reporting or reductions program other than ~~WCI~~ [the jurisdiction's] within the previous three years, those years of services will count towards the six consecutive year limit in ~~the WCI~~this section.

~~(y)~~(w) ~~Suspension of Verification Bodies~~Revocation of Recognition. A jurisdiction may review, and for good cause, work to revoke or modify the accreditation status of a ~~WCI~~ recognized verification body. If a ~~WCI~~ recognized verification body is suspended in any other mandatory or voluntary GHG reporting or trading program, that verification body will not be allowed to provide any verification services ~~under the WCI~~ until that suspension ends. If a ~~WCI~~ recognized verification body has ~~their~~ its ~~verification body~~ accreditation revoked under any other mandatory or voluntary GHG reporting or trading program, that verification body will no longer be allowed to provide verification services under WCI.8 until ~~they are~~it is reaccredited.

~~NEW OR REVISED DEFINITIONS OF TERMS USED IN WCI.8 ARE SHOWN IN ATTACHMENT 1, GENERAL PROVISIONS, SECTION WCI.9.~~

Verification Supplement 1

Note: the additional content in this Supplement must either be included in regulatory text in the appropriate subsections of WCI.8 or enforceable guidance documents by jurisdictions. The language in this section provides further explanation of items required in WCI.8 or alternative, more prescriptive language of those requirements.

Preliminary Activities and Verification Plan

The verification team shall discuss with the owner or operator the scope and objective of the verification services and obtain information from the owner or operator necessary to develop a verification plan. Such information shall include but is not limited to:

- Information to allow the verification team to develop a general understanding of facility or entity boundaries, operations, emissions sources, electricity transactions, as applicable;
- Information about the data management system used to track GHG emissions, electricity transactions, and other required measurement data as applicable;
- Information regarding the training or qualifications of personnel involved in developing the GHG emissions data report;
- Description of the specific methodologies used to quantify and report GHG emissions, electricity transactions, and other required data as applicable;
- Records of measured data related to emissions and operations for the prior and current period;
- Inventory of sources and their associated emissions for the reporting period, and
- Any prior verification reports, if applicable.

~~(A)~~
~~(B)~~In developing the verification plan, the verifier shall:

- Gain an understanding of the organization and the process that emit greenhouse gases;
- Conduct a risk assessment to evaluate inherent, control and detection risk;
- Conduct preliminary analytical testing to identify anomalies in the data;
- Conduct a sensitivity analysis to assess the relative contribution of each source in the inventory to the reported annual emissions, and
- Consider any other relevant developments at the facility, in the regulations, or legal environment.

Sampling Plan

As part of the verification procedures, the verification team shall develop a sampling plan that, when combined with the other verification procedures, provides sufficient and appropriate evidence to allow the verifier to arrive at a conclusion. The sampling plan shall be designed to achieve the specified verification objective. The sample plan shall consider:

- Statistical versus non-statistical approaches
- Design of the sample, including the population characteristics
- Stratification (categorization of population into subgroups)
- Emission weighted selection
- Sample size

- Sample selection

As relevant information becomes available during the course of verification activities, the verification team must modify the sampling plan as necessary to address potential issues emerge of material misstatement or nonconformance with the requirements of this rule.

Data Checks

The verification team conducts data checks throughout the verification process and shall focus first on the largest and most uncertain estimates of emissions and electricity transactions.

- In establishing the verification plan, the verification team shall use professional judgment to determine the number of data checks required for the team to conclude with reasonable assurance whether the reported emissions and transactions are free of material misstatement and the emissions data report otherwise conforms to the requirements of this rule.
- The verification team shall choose emissions sources, and electricity transactions data as applicable, for data checks based on their relative sizes and risks of material misstatement as indicated in the verification plan;
- The verification team, through the conformance assessment, shall ensure that the appropriate methodologies and emission factors have been applied for the emissions sources and electricity transactions for sampled data covered under sections WCI.20 through WCI.XX;

Site Visits

During the site visit, the verification team member(s) shall conduct the following:

- Observe whether all sources at the site are represented in the emissions report as specified in sections WCI.20 to WCI.XX as applicable to the owner or operator.
- Assess whether the source inventory is identified, categorized, and reported appropriately. Collect evidence as to explanations for data anomalies identified in the verification plan.
- Understand the data trail used by the owner or operator to measure, quantify, and report greenhouse gas emissions and, when applicable, electricity transactions.
- Understand and evaluate the associated data controls used by the owner to ensure the completeness and accuracy of the data

Materiality Assessment

In assessing whether misstatements are material, the verification team shall determine whether the total reported emissions are at least 95 percent accurate using the following equation:

Percent accuracy = 100 – (sum of (errors, omissions, misreporting) * 100 / (total reported emissions))

To assess conformance with this rule the verification team shall review the methods and factors used to develop the emissions data report for adherence to the requirement of this rule. The verification team shall keep a record of any errors, omissions or misstatements identified in the course of verification activities that may affect determinations of material misstatement and nonconformance, and how those issues were resolved.

Conflict of Interest (*could replace more general procedural language in Section WCI.8*)

(1) Conflict of Interest Submittal Requirements for Accredited Verification Bodies.

(A) Before the start of any work related to providing verification services to an owner or operator, a verification body must first be authorized in writing by ~~[TBD]~~*the AVA* to provide verification services. To obtain authorization the verification body shall submit to ~~[TBD]~~*the AVA* a self-evaluation of the potential for any conflict of interest that the verification body, entities related to the verification body, and members of the verification team including, subcontractors may have with the owner or operator or their related entities for which it will perform verification services. For the purposes of this section, the term member refers to staff on the verification team, in the verification body and any subcontractors. The submittal shall include the following:

(i) Identification of whether the potential for conflict of interest is high, low, or medium based on factors specified in this section;

(ii) An organizational chart of the business structure of the verification body, including its related entities and brief description of the primary work done by the verification body and related entities;

(iii) iii. Identification of whether any member of the verification body, entities related to the verification body, or the verification team including subcontractors has previously provided verification services for the owner or operator or its related entities and, if so, the years in which such verification services were provided;

(iv) Identification of whether any member of the verification body, entities related to the verification body, or the verification team or including subcontractors has engaged in any non-verification services of any nature with the owner or operator or related entities either within or outside the WCI region during the previous three years. The verification body must also disclose any services listed under section (high COI list) it has provided to the owner or operator, regardless of when these services occurred. If non-verification services have previously been provided, the following information shall also be submitted:

(v) Identification of the nature and location of the work performed for the owner or operator and whether the work is similar to the type of work to be performed during verification, such as emissions inventory auditing, energy efficiency, renewable energy, or other work with implications for the operator's greenhouse gas emissions or the accounting of greenhouse gas emissions or electricity transactions;

(vi) The nature of past, present or future relationships the verification body, entities related to the verification body, and members of the verification team including subcontractors have with the owner or operator or related entity including:

- Instances when any member has performed or intends to perform work for the owner or operator;
- Identification of whether work is currently being performed for the owner or operator and, if so, the nature of the work;

- Whether any member has any contracts or other arrangements to perform work for the owner or operator or a related entity;
- Identify how much work was performed in each of the last three years, as a percentage of the verification body's total gross income for each of the last three years;
- Identify how much work related to greenhouse gases or electricity transactions was has performed for the owner or operator or related entities in each of the last three years, as a percentage of the verification body's income for each of the last three years;
- Identify how much work was performed by each subcontractor for the operator in each of the last three years, as a percentage of each subcontractor's total gross income for each of the last three years.

~~—~~(vii) Explanation of how the amount and nature of work previously performed is such that any member of the verification team's credibility and lack of bias should not be under question.

~~(v)~~(viii) A list of names of the verification team members that will perform verification services for the owner or operator and a description of any instances of personal or family relationships with management or employees of the owner or operator that potentially represent a conflict of interest; and,

~~(vi)~~(ix) Identification of any other circumstances or relevant information known to the verification body or owner or operator that could result in a conflict of interest, or any situation where the appearance of impartiality could undermine confidence in the verification body's ability to assess the reported emissions.

(2) The potential for a conflict of interest shall be deemed to be high where:

(A) The verification body and owner or operator share any management staff or board of directors membership, or any of the management staff of the owner or operator have been employed by the verification body, or vice versa, within the previous three years; or

(B) Within the previous three years, any member of the verification body, any entity related to the verification body, and the verification team has provided to the owner or operator any of the following non-verification services:

(i) Designing, developing, implementing, or maintaining an inventory or information or data management system for facility greenhouse gases, or, where applicable, electricity transactions;

(ii) Developing greenhouse gas emission factors or other greenhouse gas-related engineering analysis;

(iii) Designing energy efficiency, renewable power, or other projects which explicitly identify greenhouse gas reductions as a benefit;

(iv) Preparing or producing greenhouse gas-related manuals, handbooks, or procedures specifically for the reporting facility;

(v) Appraisal services of carbon or greenhouse gas liabilities or assets;

(vi) Brokering in, advising on, or assisting in any way in carbon or greenhouse gas-related markets;

(vii) Managing any health, environment or safety functions which explicitly identify greenhouse gas reductions as a benefit;

(viii) Bookkeeping or other services related to the accounting records or financial statements, unless those services limited to financial auditing;

(ix) Any service related to information systems, unless those systems will not be part of the verification process and excluding third-party auditor or registration services;

(x) Appraisal and valuation services, both tangible and intangible related to GHG emissions or reductions inventories;

(xi) Fairness opinions and contribution-in-kind reports in which the verification body has provided its opinion on the adequacy of consideration in a transaction, unless the resulting services shall not be part of the verification process;

(xii) Any actuarially oriented advisory service involving the determination of amounts recorded in financial statements and related accounts;

(xiii) Any internal audit service as provided under section (GHG plan) that has been outsourced by the operator that relates to the owner's or operator's internal accounting controls, financial systems or financial statements, unless no consulting or advice was provided as part of the audit;

(xiv) Acting as a broker-dealer (registered or unregistered), promoter or underwriter on behalf of the owner or operator;

(xv) Any legal services related to GHG emissions;

(xvi) Expert services to the owner or operator or his or her legal representative for the purpose of advocating his or her's interests in litigation or in a regulatory or administrative proceeding or investigation involving GHG emissions, unless providing factual testimony.

(C) The potential for a conflict of interest shall also be deemed to be high where any staff member of the verification body, entity related to the verification body, or the verification team has provided verification services for the owner or operator for six consecutive years or within three years of the termination of a previous GHG verification contract with the owner or operator. If a verification body or verification team member has been providing verification services for a [operator/owner] in a greenhouse gas reporting or reductions program other than WCI within the past three years, those years of services will count towards the six consecutive year limit in the WCI.

(D) The potential for a conflict of interest shall be deemed high where the Independent Peer Reviewer for the verification team has provided verification or non-verification services for the operator during the current reporting year.

(3) The potential for a conflict of interest shall be deemed to be low where~~:~~ no potential for a conflict of interest is found under section WCI.8(g) *[may need to be updated, depending upon final version of WCI.8)* and any non-verification services provided by all members of the verification body and the verification team to the owner or operator within the last three years are valued at less than five percent of the verification body's revenue.

~~(A)No potential for a conflict of interest is found under section WCI.8(h) *(may need to be updated, depending upon final version of WCI.8)* and any non-verification services provided by all members of the verification body and the verification team to the owner or operator within the last three years are valued at less than *[Percent TBD*] of the verification body's revenue.~~

****

WCI.8 OPTIONAL GUIDANCE

Note: This text is supporting material and not intended as part of the essential requirements.

Collection of Evidence

The verification body shall obtain sufficient and appropriate evidence to be able to draw reasonable conclusions on which to base the verification statement. The verification body obtains evidence by performing verification procedures. Verification procedures are classified as:

- **Computation (or Recalculation)** is the checking of mathematical accuracy of documents or records
- **Observation** of a process or procedure
- **Confirmation** is obtaining representations from a third party
- **Enquiry** is seeking information from a knowledgeable person
- **Inspection** of Records or Documents/Assets
- **Re-performance** is the verifiers independent execution of procedures or controls
- **Analysis** is the evaluation of information made by studying the plausible relationships among different types of data

Some or all of these techniques can be used to obtain sufficient and appropriate evidence. Site visits are used to obtain evidence that is readily available at that location.

§ WCI.9 DEFINITIONS

"Accuracy" means the closeness of the agreement between the result of the measurement and the true value of the particular quantity (or a reference value determined empirically using internationally accepted and traceable calibration materials and standard methods), taking into account both random and systematic factors.

"Acid gas" means a gas mixture that has been separated from natural gas ~~that~~ and consists mostly of~~consists of~~ hydrogen sulphide or carbon dioxide and that may contain trace amounts of hydrocarbons, water, or other contaminants.

"Accreditation and Verification Authority" or "AVA" means [the jurisdiction] or any entity or entities to which [the jurisdiction] assigns any of the responsibilities for oversight and execution of the accreditation and verification program established in WCI.8.

"Adverse verification statement" means a verification statement rendered by a verification body stating that the verification body cannot ~~provide~~ conclude that there is a reasonable level of assurance ~~that the submitted~~for an emissions data report ~~is free of material misstatement, or that it cannot provide a positive statement that the emissions data report conforms to the requirements of this article~~.

["Article" is a placeholder for a jurisdiction-specific cross reference to whatever subdivision of its administrative code contains the WCI's Essential Requirements for Mandatory Reporting in their entirety.]

"Asphalt" means a highly viscous liquid or semi-solid consisting mostly of bitumen and which is a residue by-product of petroleum refining

~~"Asphalt blowing" means the process by which air is blown through asphalt flux to change the softening point and penetration rate.~~

"Asphalt blowing" means the process by which air is blown through liquid asphalt to remove contaminants such as volatile compounds and to increase viscosity.

~~"Associated gas" means a natural gas that is produced from gas wells or gas produced in association with the production of crude oil.~~
"Associated gas" means a natural gas which is found in association with crude oil, either dissolved in crude oil or as a cap of free gas above the crude oil.

"Barrel" or "bbl" means a volume equal to 42 U.S. gallons.

"Best available data and methods" means [the jurisdiction's] methods for emissions calculations set forth in this article; or [the jurisdiction's] approved next best alternative from the WCI source category quantification methodologies or other generally accepted methods for calculating greenhouse gas emissions organized by the same source categories and GHG species, using [jurisdiction] provided emission factors and other data.

"Compliance period" means, until such time as [the jurisdiction] adopts a cap-and-trade program covering sources subject to this article, a period of three calendar years.

"Biomass" means non-fossilized plants or parts of plants, animal waste, micro-organisms or any product made of either of these, and includes wood and wood products, agricultural residues and wastes, biologically derived organic matter found in municipal and industrial wastes, landfill gas, bio-alcohols, spent pulping liquor~~,~~ (black liquor),- pulp ~~fibres~~fibers, sludge gas, and animal- or plant-derived oils~~.~~ .~~(WCI – CEPA)~~

"Biomass fuels" or "biomass-derived fuels" means fuels whose entire heat generating capacity is derived entirely from biomass.

"Bottoming cycle plant" means a cogeneration ~~facility~~ plant in which the energy input to the system is first applied to a useful thermal energy application or process, and at least some of the reject heat emerging from the application or process is then used for ~~power~~ electricity production.

~~1. "British Thermal Unit" or "Btu" means the quantity of heat required to raise the temperature of one pound of water by one degree Fahrenheit at about 39.2 degrees Fahrenheit.~~

"Calcination" means the thermal decomposition of carbonate-based minerals, ~~such as calcium carbonate (the principal mineral in limestone)~~into ~~to form calcium~~ one or more oxides ~~in a cement kiln.~~and carbon dioxide

"Calcine" means to heat a substance to a high temperature but below its melting or fusion point causing oxidation or ~~reduction~~ reduction~~so that it oxidizes or reduces~~.

"Calcined byproduct/waste type" refers to lime kiln dust and other partially calcined materials and co-products generated during the production of one of the three types of quicklime.

"Calcined byproduct type sold" refers to lime kiln dust and other calcined materials and coproducts, such as off-spec lime, that enters commerce.

"Calcined co-product/waste not sold" refers to any partially calcined co-product or partially calcined material produced during the calcination of limestone or other highly calcareous material that does not enter commerce as its own product or as part of another lime product.

Types of calcined co-products/partially calcined material not sold include, but are not limited to, lime kiln dust, scrubber sludge, waste cores, and off-spec lime.

~~"Calendar year" means the period of twelve consecutive months commencing on January 1 through December 31.~~

"Carbon dioxide equivalent" or "CO_2 equivalent" or ~~"CO_2e"~~ "CO_2e" means a measure for comparing the global warming potentials of different greenhouse gases. By definition, carbon dioxide has a carbon dioxide equivalent of one, with the global warming potentials of other greenhouse gases stated relative to carbon dioxide. ~~other GHGs, based on the quantity of those gases multiplied by the appropriate global warming potential (GWP) factor and commonly expressed as metric tons of carbon dioxide equivalent.~~
~~"Catalyst" means a substance added to a chemical reaction, which facilitates or causes the reaction, and is not consumed by the reaction.~~

"Catalytic cracking" means ~~a refinery~~the process of breaking down larger, heavier, and more complex hydrocarbon molecules into simpler and lighter molecules~~. Catalytic cracking is accomplished by~~ through the use of a catalyst.

"Catalytic reforming" means ~~a refining~~the process of using controlled heat and pressure with catalysts to rearrange certain hydrocarbon molecules.

"Cement" means a building material that is produced by heating mixtures of limestone and other minerals or additives at high temperatures in a rotary kiln to form clinker, followed by cooling and grinding with blended additives to produce a finished powder ~~that is used with water, sand and gravel to make concrete and mortar~~.

"Cement kiln dust" or "CKD" means the fine-grained, solid, highly alkaline waste removed from cement kiln exhaust gas by air pollution control devices~~. CKD consists~~, consisting of partly calcined kiln feed material, ~~and includes all~~ dust from cement kilns and bypass systems, including bottom ash and bypass dust.

"Cement plant" means an industrial structure, installation, plant, or building primarily engaged in manufacturing Portland, natural, masonry, pozzolanic, and other hydraulic cements, and typically identified by NAICS code 327310.

"Chemical oxygen demand" or "COD" means the measure of the amount of organic compounds in water, in units of mass per unit volume of water, used to determine water quality. ~~chemical oxygen demand as determined using methods specified pursuant to 40 CFR 136.~~

"Clinker" means the mass of fused material produced in a cement kiln from which finished cement is manufactured by milling and grinding.

"Coal" means a combustible sedimentary rock composed primarily of carbon and~~all solid fuels~~ classified as anthracite, bituminous, sub-bituminous, or lignite by the American Society for Testing and Materials Designation ASTM D388–05 "Standard Classification of Coals by Rank".

2. ~~"Cogeneration emissions" means releases resulting from cogeneration units.~~

"Cogeneration unit" means a stationary fuel combustion device which simultaneously generates electrical and thermal energy that is (i) used by the operator of the facility where the cogeneration unit is located; or (ii) transferred to another facility for use by that facility.

"Cogeneration system" means individual cogeneration components including the prime mover (heat engine), generator, heat recovery, and electrical interconnection, configured into an integrated system that provides sequential generation of multiple forms of useful energy (usually ~~mechanical~~ electrical and thermal), at least one form of which the facility consumes on-site or makes available to other users for an end-use other than electricity generation.

"Coke ~~(petroleum)~~" means a solid residue consisting mainly of carbon which is derived either from~~results from~~ the cracking of petroleum hydrocarbons in ~~processes such as coking and fluid coking~~a refinery coker unit (petroleum coke) or from the destructive distillation of low-ash, low-sulfur bituminous coal (coal coke). ~~This includes catalyst coke deposited on a catalyst during the refining process which must be burned off in order to regenerate the catalyst.~~

"Coke burn-off" means the removal of coke ~~removal~~ from the surface of a catalyst ~~by~~ through combustion during catalyst regeneration.

3. ~~"Coke production" means the production of coke from coal in either a by-product coke oven battery or non-recovery coke oven battery.~~

"Combustion emissions" means greenhouse gas emissions occurring during the exothermic reaction of a fuel with oxygen.

4. ~~"Combustion source" means a source of combustion emissions.~~

"Conflict of interest" means a situation in which, because of financial or other activities or relationships with other persons or organizations, a person or body is unable or potentially unable to render an impartial verification opinion of a potential client's greenhouse gas emissions, or the person or body's objectivity in performing verification services is or might be otherwise compromised.

"Continuous emissions monitoring system (CEMS)" means the total equipment required to obtain a continuous measurement of a gas concentration or emission rate from combustion or industrial processes.

~~5. “Conveying system” means a device for transporting materials from one piece of equipment or location to another location within a facility. Conveying systems include but are not limited to the following: feeders, belt conveyors, bucket elevators and pneumatic systems.~~

~~6. “Cracking” means the process of breaking down larger molecules into smaller molecules, utilizing catalysts and/or elevated temperatures and pressures.~~

“Crude oil” means a combustible, liquid mixture ~~of hydrocarbons~~ found in natural underground reservoirs consisting of hydrocarbons and other organic compounds, or derived from tar sands, shale and coal. ~~that exists in the liquid phase and that is found in natural underground reservoirs.~~

“Data check” means an~~y~~ independent calculation or checking of data conducted by a verifier to recreate the emissions for a discreet source included in an emissions data report.

~~7. “De minimis” means those emissions reported for a source or sources that are calculated using alternative methods selected by the owner or operator in accordance with WCI.2(d).~~

~~8. “Diesel fuel” means a fuel composed of distillates obtained in petroleum refining operations.~~

~~9. “Direct emissions” means greenhouse gas emissions from sources that are under the operational control of the operator.~~

~~“Distillate fuel oil” of “distillate oil” means a general classification for a petroleum fraction produced in conventional distillation operations. It includes diesel fuels and fuel oils.~~

“Electricity generating unit” or “EGU” means any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce ~~electric power.~~electricity.

~~10. “Emission factor” means a unique value for determining an amount of a greenhouse gas emitted for a given quantity of activity (e.g., metric ton of carbon dioxide emitted per barrel of fossil fuel burned).~~

“Emissions” means the release of greenhouse gases into the atmosphere from sources and processes in a facility.

~~11. “Equipment” means any stationary article, machine, or other contrivance, or combination thereof, which may cause the issuance or control the issuance of air contaminants; equipment shall not mean portable equipment, tactical support equipment, or generating units designated as backup or emergency generators in a permit issued by an air pollution control district or air quality management district.~~

“Equipment leak” means releases of fugitive greenhouse gas emissions from equipment including valves, pump seals, flanges, compressors, sampling connections, and open-ended lines and excluding storage tank emissions.

“Exporter” means ~~…~~*[To be defined later for transportation and RCI fuels accounting.]*

“Facility” means all buildings, plants, structures, installations, and equipment that:

(a) Emit or may emit GHG(s);

(b) Are located on one or more contiguous or adjacent properties;

(c) Are under common control of the same owner(s) or operator(s); and

(d) Form a producing unit, function as a single integrated site, or have the same first two digits of the Standard Industrial Classification or same first three digits of the North American Industry Classification System.

[For this version of the Essential Requirements, the words “nonroad engine” have been deleted from the definition of “facility.” WCI, however, is considering the inclusion of a protocol for calculating nonroad engine emissions from certain facilities in a future version of the Essential Requirements. If and when that occurs, it may be appropriate to amend this definition to include nonroad engines in the list of covered activities at a stationary source.]

~~Facility” means any property, plant, building, structure, stationary source, stationary equipment or grouping of stationary equipment or stationary sources located on one or more contiguous or adjacent properties, in actual physical contact or separated solely by a public roadway or other public right-of-way, under common operational control, and having the same first two digits of the Standard Industrial Classification (SIC) or same first three digits of the North American Industry Classification System (NAICS) code.~~ ~~*[WCI is currently working to develop a definition that will harmonize common usages of the term in the U.S. and Canada. Some special facilities, such as oil and gas production fields will have separate definitions.]*~~

“Feed” means the prepared and mixed materials, which include but are not limited to materials such as limestone, clay, shale, sand, iron ore, mill scale, cement kiln dust, ~~and~~ green coke and fly ash, that are fed ~~to the kiln~~into a kiln, furnace, or other equipment type but which exclude ~~. Feed does not include the~~ fuels that are combusted.
~~used in the kiln to produce heat to form the clinker product.~~
“Feedstock” means any raw material that is used in or upgraded by an industrial process but not combusted.

~~“Flare” means a combustion device that uses an open flame to burn combustible gases with combustion air provided by uncontrolled ambient air around the flame and includes both ground-level and elevated flares.~~

~~12. “Flaring emissions” means controlled releases resulting from the combustion of a gas or liquid, the purpose for which is not producing energy.~~

“Flexigas” means a low BTU~~Btu~~ gaseous fuel produced through the gasification of coke ~~produced during flexicoking~~.

“Fluid catalytic cracking unit” or “FCCU” means a process unit in a refinery in which ~~petroleum derivative~~crude oil or a crude oil-derived feedstock is charged and fractured into smaller molecules in the presence of a catalyst, or reacts with a contact material to improve feedstock quality for additional processing, and in which the catalyst or contact material is regenerated by burning off coke and other deposits. The unit includes, but is not limited to, the riser, reactor, regenerator, air blowers, spent catalyst, and all equipment for controlling air pollutant emissions and recovering heat.

"Fluid coking" means a thermal cracking process utilizing the fluidized-solids technique to remove carbon (coke) for continuous conversion of heavy, low-grade oils into lighter products.

"Fossil fuel" means a fuel~~, such as coal, oil, and natural gas, produced by~~consisting of the decomposed remains of ~~the decomposition of~~ ancient ~~(fossilized)~~ plants and animals.

"Fuel" means solid, liquid or gaseous combustible material consisting of hydrocarbons and other compounds that is combusted or oxidized for the purpose of producing energy.

"Fuel analytical data" means any data collected about the mass, volume, flow rate, heat content, or carbon content of a fuel.

"Fuel gas system" means a system of compressors, piping, knock-out pots, mix drums, sulfur removal units (if necessary) and flaring units (if necessary) ~~and, if necessary, units used to remove sulfur contaminants from the fuel gas (e.g., amine scrubbers)~~ that collects fuel gas from one or more sources for treatment~~, as~~ (if necessary), and transports it to a stationary combustion unit. ~~A fuel gas system may have an overpressure vent to a flare but the primary purpose for the fuel gas system is to provide fuel to the various combustion units at the refinery.~~

"Fugitive emissions" means the unintended or incidental emissions of greenhouse gases from the transmission, processing, storage, use, or transportation of fossil fuels, greenhouse gases or other ~~materials~~substances, including but not limited to HFC~~s~~ emissions from refrigeration leaks, SF_6 from electric power distribution equipment, methane from mined coal, and CO_2 emitted from geyser steam and/or fluid used in geothermal generating facilities.

"Full verification" means all verification services as provided in section WCI.8(b).

"Generating unit" means any combination of physically connected generator(s), reactor(s), boiler(s), combustion turbine(s), or other prime mover(s) operated together to produce electricity ~~power~~.

"Global warming potential" or "GWP factor" means the ~~means the~~ radiative forcing of a greenhouse gas, calculated over a time interval of 100 years~~ratio of the time-integrated radiative forcing from the instantaneous release of one kilogram (kg) of a trace substance relative to that of one kg of a reference gas, i.e., CO_2.~~

"Greenhouse gas", ~~"greenhouse gases"~~ or "GHG" means any of the following: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbons (PFCs).

~~13. "Greenhouse gas source" means any physical unit, process, or other use or activity that releases a greenhouse gas into the atmosphere.~~

“High heat value” or “HHV” means the amount of heat energy released by the combustion of a unit quantity of a fuel, including the latent heat of vaporization of water embedded in the fuel

“Hydrocarbons” means chemical compounds ~~containing predominantly~~consisting entirely of carbon and hydrogen.

“Hydrofluorocarbons” or “HFCs” means a class of GHGs consisting of hydrogen, fluorine, and carbon and primarily used as refrigerants~~, consisting of hydrogen, fluorine, and carbon~~ specifically those listed in Table WCI.10-1.

“Hydrogen plant” means a ~~facility~~ plant that produces hydrogen with steam hydrocarbon reforming, partial oxidation of hydrocarbons, or other processes.

~~“High heat value” or “HHV” means the amount of heat produced by combustion of a unit quantity of a fuel where the water vapour resulting from the combustion is condensed and the heat is recovered.~~

“Importer” means *[To be defined later with input from the Electricity Subcommittee.]*

“Impregnated saw dust” means saw dust containing resins, preservatives or other substances derived from fossil fuels.

~~[WCI is developing a definition of impregnated saw dust, which generally refers to saw dust from wood treated or impregnated with resins, glues, or other substances derived from fossil fuels.]~~

“Independent Peer Reviewer” means a Lead Verifier within a Verification Body who has not participated in conducting verification services for the current reporting year who provides an independent review of verification services rendered as required in section WCI.8(f).

~~14. “Industrial process” means a process, a component of which involves (i) a chemical reaction other than stationary fuel combustion and not for the purpose of producing energy; or (ii) a physical action such as distillation, evaporation, friction, handling, impaction, or separation of a substance or feedstock that is subjected to the industrial process.~~

~~“Industrial process emissions” releases from an industrial process that involves chemical or physical reactions other than combustion, and the purpose of which is not to supply energy. (CEPA 46).~~

~~15. “ISO” means the International Organization for Standardization.~~

~~“Kerosene” means a light distillate fuel that includes No. 1-K and No. 2-K as well as other grades of range or stove oil that have properties similar to those of No. 1 fuel oil.~~

“Kiln” means thermally insulated chambers, or ovens, in which controlled temperature regimes are produced, used in the production of clinker, lime and other products, and which includes~~a~~

~~device, including~~ any associated preheater or precalciner devices.~~,~~ ~~that produce clinker by heating limestone and other materials for subsequent production of Portland or other cement.~~

~~"Lead verifier" means a person that has met all of the requirements in section WCI.8.~~

"Less Intensive Verification" means the verification services provided in interim years between full verifications; less intensive verification only requires risk assessment and data checks on an owner or operator's emissions data report based on the most current sampling plan developed as part of the most current full verification services. This level of verification may only be used if the verifier can provide findings with a reasonable level of assurance.

"Lime kiln dust" or "LKD" means lime dust produced in the course of production of quick lime.

"Lime type" refers to three types of quicklime derived from limestone containing varying percentages of magnesium carbonate. The three lime types are:

(a) High calcium quicklime, which is derived from limestone containing 0 to 5 percent magnesium carbonate.

(b) Magnesian quicklime, which is derived from limestone containing 5 to 35 percent magnesium carbonate

(c) Dolomitic quicklime, which is derived from limestone containing 35 to 46 percent magnesium carbonate.

"Liquefied petroleum gas" or "LPG" means a group of gaseous hydrocarbons ~~-based gases~~ derived from crude oil refining or natural gas fractionation~~.~~, and ~~They~~ includes propane, propylene, normal butane, butane, butylene, isobutene and isobutylene. ~~For convenience of transportation, these gases are liquefied through pressurization.~~

"Low ~~Btu~~ BTU gas" means gases recovered from casing vents, vapor recovery ~~-~~systems, ~~crude oil and petroleum product~~ storage tanks and other ~~parts~~ components within the production process of crude oil, natural gas and petroleum products.~~of petroleum refining and the crude oil and natural gas production process.~~

"Low Heat~~ing~~ Value" or "LHV" means the heat energy released through the combustion of a unit quantity of fuel, excluding the latent heat of vaporization of water embedded in the fuel.~~low or net heat content with the heat of vaporization excluded. The water is assumed to be in the gaseous state.~~

~~16. "Marketer" means a purchasing/selling entity that is not a retail provider, and that is the purchaser/seller at the first point of delivery in California for electric power imported into California, or the last point of receipt in California for power exported from California.~~

~~"Material misstatement" means (a) The individual or aggregate effect (overstatements and understatements offset each other) of one or more errors, omissions or misstatements identified in the course of verification that result in the total reported emissions being outside the 95~~

~~percent accuracy required to receive a positive verification statement. Material misstatement does not include any evaluation of acceptable measurement uncertainty of the monitoring equipment or quantification methodologies, or (b) The individual or aggregate effect of one or more errors, omissions or misstatements identified in the course of verification which make it probable that the judgment of a reasonable person judging the total reported emissions would have been changed or influenced by the error, omission or misrepresentation.~~“Material misstatement” means an error or omission, or a collection of errors or omissions, that results in a determination that a verification statement contains a material misstatement under WCI.8(o)(1)(A) or (B).

“Measurement-based” means any of the various emission quantification methodologies that involve the determination of emissions by means of direct measurement of the flue gas flow, as well as the concentration of the relevant GHG(s) in the flue gas.

“Measurement uncertainty” means the scientific uncertainty associated with measuring of GHG emissions due to limitations of monitoring equipment or quantification methodologies. ~~The WCI allows a measurement uncertainty of ±5 % for all measuring equipment which provides information underlying emissions reporting.~~

~~17. “MMBtu” means million British thermal units.~~

~~1. “Motor gasoline” means a complex mixture of relatively volatile hydrocarbons with or without small quantities of additives, blended to form a fuel suitable for use in spark-ignition engines. Motor gasoline is characterized as having a boiling range of 122 to 158 degrees Fahrenheit at the 10-percent recovery point to 365 to 374 degrees Fahrenheit at the 90-percent recovery point.~~

“Municipal solid waste” or “MSW” means waste products collected from ~~solid-phase~~ households, commercial/retail units, ~~and/~~or ~~institutional~~ institutions. ~~waste, such as, but not limited to, yard waste and refuse.~~

“NAICS” means the North American Industry Classification System.

“Nameplate generating capacity” means the maximum rated electrical power output of a generator under specific conditions designated by the manufacturer, expressed in megawatts (MW) or kilowatts (kW).

~~18. “Naphtha” means a generic term applied to a petroleum fraction with an approximate boiling range between 122 degrees Fahrenheit and 400 degrees Fahrenheit.~~

“Net power generated” means the gross electricity generation minus station service or unit service ~~power~~ electricity requirements, expressed in megawatt hours (MWh) per year. In the case of cogeneration, this value is intended to include internal consumption of electricity for the purposes of a production process, as well as power put on the grid.

“Nonroad equipment” means [WCI is addressing the definition for nonroad equipment as part of its development of a nonroad equipment rule].

~~"Owner or operator" means any person who owns, leases, operates, controls, or supervises a facility or fuel supply operation; or who imports electricity into the WCI region.~~ *["Owner or operator," as noted in WCI.1(a), is a placeholder. Each jurisdiction will select the specific terminology for the regulated persons in accordance with its customary rule-writing practices.]*

"Operator's representative" means:
(a) If the operator of the facility is an individual, the operator.
(b) If the operator of the facility is a corporation, either
  (1) Any officer of the corporation, whether or not the officer is also a director of the corporation, who performs a policy making function in respect of the corporation and who has the capacity to influence the direction of the corporation; or
  (2) The individual with primary responsibility for the operations and management of the facility.
(c) If the operator of the facility is not an individual or a corporation, the individual with primary responsibility for the operations and management of the facility.

"Perfluorocarbons" or "PFCs" means synthetic compounds derived from hydrocarbons through the replacement of hydrogen with fluorine atoms~~a class of greenhouse gases consisting on the molecular level of carbon and fluorine~~.

"Petroleum" means crude oil~~ removed from the earth and the oil derived from tar sands, shale and coal~~.

~~"Petroleum coke" means a solid residue consisting mainly of carbon which results from the cracking of petroleum hydrocarbons in processes such as coking and fluid coking. This includes catalyst coke deposited on a catalyst during the refining process which must be burned off in order to regenerate the catalyst.~~

"Petroleum refinery" or "refinery" means any facility engaged in producing gasoline, aromatics, kerosene, distillate fuel oils, residual fuel oils, lubricants, asphalt, or other products through distillation of petroleum or through redistillation, cracking, rearrangement or reforming of unfinished petroleum derivatives.

"Positive verification statement" means a verification statement rendered by a verification body stating that the verification body can say with reasonable assurance that the submitted emissions data report is free of material misstatement and that the emissions data report conforms to the requirements of this article.

"Power" means electricity, except where the context makes clear that another meaning is intended.

"Pressure swing adsorption" or "PSA" means a gas purification process which selectively concentrates target gas molecules using porous, high surface area solid adsorbents and elevated pressure.

“PSA off-gas” or “tail-gas” means the impurity stream resulting from the sequential PSA pressurization/depressurization purification process.

“Prime mover” means the type of equipment such as an engine or water wheel that drives an electric generator. “Prime movers” include, but are not limited to, reciprocating engines, combustion or gas turbines, steam turbines, microturbines, and fuel cells.

“Process” means the intentional or unintentional reactions between substances or their transformation, including, but not limited to, the chemical or electrolytic reduction of metal ores, the thermal decomposition of substances, and the formation of substances for use as product or feedstock.

“Process emissions” ~~means emissions~~ means the emissions from industrial processes (e.g., cement production, ammonia production) involving chemical or physical transformations other than fuel combustion. For example, the calcination of carbonates in a kiln during cement production or the oxidation of methane in an ammonia process results in the release of process CO2 emissions to the atmosphere. Emissions from fuel combustion to provide process heat are not part of process emissions, whether the combustion is internal or external to the process equipment. ~~(EPA – 98.6)~~
“Process vent” means an opening where a gas stream is continuously or periodically discharged during normal operation.

“Pure” means consisting of at least 97 percent by mass of a specified substance.
~~For facilities burning biomass fuels, this means the fraction of biomass carbon accounts for at least 97 percent of the total amount of carbon in the fuel burned at the facility.~~

“Purge gas” means nitrogen, carbon dioxide, liquefied petroleum gas, or natural gas used to maintain a non-explosive mixture of gases in a flare header or provide sufficient exit velocity to prevent regressive flame travel back into the flare header.

“Quick lime” means a substance that consists of oxides of calcium and magnesium resulting ~~, which results~~ from the calcination of limestone. ~~and is produced in a lime kiln.~~

~~“Raw material preparations” means, in respect of feedstock that is to be processed in the lime kiln, the preparation of the feedstock, which may include crushing, screening, washing, and sieving.~~

“Reasonable level of assurance” for an emissions data report means the report satisfies WCI.8(b)(1)~~means a high degree of confidence that submitted data and statements are valid and that the reported emissions are free from material misstatement (i.e. that the emissions report presents fairly, in all material respects, the annual emissions for the facility, fuel supplier, or electricity importer)~~.

“Recycled” means a material that is reused or reclaimed.

"Refinery fuel gas" or "still gas" means gas generated at a petroleum refinery or any gas generated by a refinery process unit, and that is combusted separately or in any combination with any type of gas or used as a chemical feedstock.

"Reporting year" means the calendar year for which emissions are being reported in the emissions data report.

19. ~~"Residual fuel oil" means a general classification for the heavier oils, known as No. 5 and No. 6 fuel oils, that remain after the distillate fuel oils and lighter hydrocarbons are distilled away in refinery operations.~~

"Retail provider" means an entity that provides electricity to retail end users.

"Senior officer" means:

(a) The chair of the board of directors, a vice-chair of the board of directors, the president, a vice-president, the secretary, the treasurer or the general manager of a corporation or any other individual who performs functions for a corporation similar to those normally performed by an individual occupying any such office, and

(b) Each of the five highest paid employees of a corporation, including any individual referred to in clause (a).

"Screening value ~~(SV)~~" or "SV" means the instrument reading (ppmv) obtained when components, including but not limited to valves, pump seals, connectors, flanges, open-ended lines and other equipment components, are evaluated for leakage as described in United States Environmental Protection Agency (U.S. EPA) Method 21 – Determination of Volatile Organic Compound Leaks.

"Sinter production" means a process that produces a fused aggregate of fine iron-bearing materials suited for use in a blast furnace. The sinter machine is composed of a continuous traveling grate that conveys a bed of ore fines and other finely divided iron-bearing material and fuel (typically coke breeze), a burner at the feed end of the grate for ignition, and a series of downdraft windboxes along the length of the strand to support downdraft combustion and heat sufficient to produce a fused sinter product.

"SI units" means the Système international d'unités (International System of Units).

"Small refiner" means any petroleum refiner who owns or operates a refinery that has a crude oil throughput ~~n oil~~ capacity ~~of~~ equal to or less than 55,000 barrels per day.
~~**[From Canadian EPA.]**~~

"Solid biomass fuel" means plants or parts of plants, in their natural state ~~or~~ that have been mechanically or chemically separated~~modified~~, but not chemically altered from the natural state.

20. ~~"Source" means greenhouse gas source, as defined in this section.~~

"Standard conditions" or "S<u>tandard Temperature and Pressure" or "S</u>TP" means <u>either </u>a temperature of 20 degrees Celsius (68 degrees Fahrenheit) and a~~n absolute~~ pressure of <u>101.325 kPa (14.696 PSI) according to IUPAC standards, or a temperature of 0 degrees Celsius (32 degrees Fahrenheit) and an absolute pressure of 100 kPa, according to NIST standards</u>~~760 mm (30 inches) of mercury or 60 degrees Fahrenheit and 1 atmosphere~~.

"Standard cubic foot" or "scf" means the amount of gas that would occupy a volume of one cubic foot if free of combined water at standard conditions.

~~"Stationary" means neither portable nor self propelled, and operated at a single facility.~~

"Stationary combustion unit" means any boiler, heater, furnace, kiln, turbine, internal combustion engine, incinerator or other non-mobile source device that combusts any solid, liquid, or gaseous fuel for purposes of producing useful heat or energy for industrial, commercial, or institutional use; or for purposes of reducing the volume of waste by removing combustible material.

"Stationary fuel combustion emissions" means ~~releases~~ <u>greenhouse gas emissions </u>from stationary combustion units, including cogeneration units.

"Steam reforming" means the process by which methane and other hydrocarbons in natural gas are converted into hydrogen and carbon monoxide by reaction with steam over a catalyst.

"Storage tank" means any tank, other container, or reservoir used for the storage of organic liquids, excluding tanks that are permanently affixed to mobile vehicles such as railroad tank cars, tanker trucks or ocean vessels.

"Sulfur hexafluoride" or "SF_6" means a ~~GHG~~ <u>greenhouse gas composed of a</u>~~consisting on the molecular level of a~~ single sulfur atom and six fluorine atoms<u>, commonly used as a dielectric medium.</u>

"Sulfur recovery unit" or "SRU" means a process unit that recovers elemental sulfur from gases that contain reduced sulfur compounds and other pollutants, usually by a vapor-phase catalytic reaction of sulfur dioxide and hydrogen sulfide.

<u>"Supplemental firing" means an energy input to the cogeneration facility used only in the thermal process of a topping cycle plant, or in the electricity generating or manufacturing process of a bottoming cycle plant.</u>

"Supplier" means . . . [To be defined later for transportation and RCI fuels accounting.].

"Topping cycle plant" means a cogeneration <u>plant</u>~~facility~~ in which the energy input to the ~~facility~~ <u>plant </u>is first used to produce ~~useful power output~~<u>electricity</u>, and at least some of the reject heat from the ~~power~~ <u>electricity </u>production process is then used to provide useful thermal output.

"Total organic carbon" or "TOC" means a measure of the amount of carbon in an ~~total~~ organic ~~carbon molecules present in a sample~~compound and is used as a measure of water quality.

"Uncertainty" means the degree to which data or a data system is deemed to be indefinite or unreliable.

"Useful thermal output" means the thermal energy made available in a cogeneration system for use in any industrial or commercial process, heating or cooling application, or delivered to other end users, i.e., total thermal energy made available for processes and applications other than electrical generation.

"Verification" means a systematic, independent and documented process for the evaluation of an operator's emissions data report against the WCI's reporting procedures and methods for calculating and reporting GHG emissions.

"Verification body" means a firm accredited by the [Accreditation Body TBD] and recognized by the jurisdiction or its designee, that is able to render a verification statement and provide verification services for operators subject to reporting under this article.

"Verification cycle" means three years of verification activities. Each verification cycle must include at least one year of full verification, and may include two years of less intensive verification, if eligible.

"Verification statement" means the final written declaration rendered by a verification body attesting whether an operator's emissions data report is free of material misstatement and whether the emissions data report conforms to the requirements of this article.

"Verification services" means services provided during verification as specified in WCI.8, including but not limited to reviewing an operator's emissions data report, verifying its accuracy according to the standards specified in this article, assessing the operator's compliance with this rule, and submitting a verification opinion to the *[jurisdiction or its agent]*.

"Verification team" means all of those working for a verification body, including all subcontractors, to provide verification services for an operator.

"Verifier" means an individual employed or contracted by an accredited verification body who has been deemed competent by the verification body to carry out verification services as specified in section WCI.8.

"Volatile Organic Compound" or "VOC" means an organic compound containing at least one carbon atom and which evaporates or vaporizes readily under normal conditions, participates in atmospheric photochemical reactions, and excludes ~~any volatile compound of carbon, excluding~~ carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate.~~, which participates in atmospheric photochemical reactions.~~

“Waste-derived fuel” means a fuel typically derived from waste(s) and generally used as a substitute for conventional fossil fuels. Waste-derived fuels can include substances derived from fossil fuels such as waste oil, plastics, or solvents. ~~;~~Waste-derived fuels can also include fuels containing ~~biomass such as dried sewage or impregnated saw dust; or~~ fractions of both fossil fuels and biomass, such as municipal solid waste, ~~or~~ tires, dried sewage or impregnated saw dust. Waste-derived fuel does not include fuels which are pure biomass.

“Wastewater” means any process water which contains oil, emulsified oil, or other organic compounds that are not recycled or otherwise used in a facility.

“Wastewater emissions” means releases of greenhouse gas emissions from wastewater and on-site wastewater treatment.

“Wastewater separator” means equipment used to separate oils and water from locations downstream of process drains.

§ WCI.20 GENERAL STATIONARY COMBUSTION

§ WCI.21 Source Category Definition

General stationary fuel combustion sources are devices that combust solid, liquid, or gaseous fuel for the purpose of generating steam (or providing useful heat or energy) for industrial, commercial, or institutional use; or reducing the volume of waste by removing combustible matter. General stationary combustion sources are boilers, combustion turbines, engines, incinerators, and process heaters, and any other stationary combustion device that is not specifically addressed under the provisions for another source category in this rule.

Note: The source category definition may need to be revised after the remaining ER sections are completed.

§ WCI.22 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO2 emissions for fossil and biomass fuels, reported by fuel type.

(2) Total CH4 emissions, reported by fuel type.

(3) Total N_2O emissions, reported by fuel type.

(b) Annual fuel consumption:

(1) For gases, report in units of standard cubic feet.

(2) For liquids, report in units of gallons.

(3) For non-biomass solids, report in units of short tons.

(4) For biomass solid fuels, report in units of bone dry short tons or bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average ~~higher~~high heat~~ing~~ value of each fuel, if used to compute CO_2 emissions.

(e) Annual steam generation in pounds or kilograms, for units that burn biomass fuels or municipal solid waste.

§ WCI.23 Calculation of CO_2 Emissions

For each fuel, calculate CO_2 mass emissions using one of the four calculation methodologies specified in this section, subject to the restrictions in §WCI.23(e).

(a) Calculation Methodology 1. Calculate the annual CO_2 mass emissions by substituting a fuel-specific default CO_2 emission factor, a default high~~er~~ heat~~ing~~ value, and the annual fuel consumption into the Equation 20-1:

$$CO_2 = Fuel \times HHV \times EF \times CF \times 0.001$$ **Equation 20-1**

Where:

CO_2	=	Annual CO_2 mass emissions for the specific fuel type (metric tons).
Fuel	=	Mass or volume of fuel combusted per year (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).
HHV	=	Default higher ~~er~~ heating ~~ing~~ value of the fuel, from column 3 of Table 20-1 (mmBtu per mass or mmBtu per volume, as applicable).
EF	=	Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 (kg CO_2/mmBtu).
CF	=	Conversion factor of 0.024 (gallons to barrels) for petroleum products, only; 1.0 for all other fuels.
0.001	=	Conversion factor from kilograms to metric tons.

(b) Calculation Methodology 2. Calculate the annual CO_2 mass emissions using a default fuel-specific CO_2 emission factor, a high~~er~~ heat~~ing~~ value provided by the supplier or measured by the operator, using Equation 20-2, except for emissions from the combustion of biomass fuels and municipal solid waste, for which the operator may instead elect to use the method shown in Equation 20-3.

(1) For any type of fuel for which an emission factor is provided in Tables 20-1 or 20-2, except biomass fuels and municipal solid waste when the operator elects to use the method in WCI.23(b)(2), use Equation 20-2:

$$CO_2 = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.001$$ **Equation 20-2**

Where:

CO_2	=	Annual CO_2 mass emissions for a specific fuel type (metric tons).
n	=	Number of required heat content measurements for the year as specified in WCI.25(a).
$Fuel_p$	=	Mass or volume of the fuel combusted during the measurement period "p" (express mass in short tons for solid fuel, volume in standard cubic feet for gaseous fuel, and volume in gallons for liquid fuel).
HHV_p	=	High~~er~~ heat~~ing~~ value of the fuel for the measurement period (mmBtu per mass or volume).
EF	=	Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 or from Table 20-2 (kg CO_2/mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(2) For biomass solid fuels and municipal solid waste, use either Equation 20-2 above or Equation 20-3:

$$CO_2 = Steam \times B \times EF \times 0.001$$ **Equation 20-3**

Where:

CO_2	=	Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).
Steam	=	Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (mmBtu/lb steam).
EF	=	Default emission factor for biomass solid fuel or municipal solid waste, from column 5 of Table 20-1 (kg CO_2/mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(c) Calculation Methodology 3. Calculate the annual CO_2 mass emissions by using measurements of fuel carbon content or molar fraction (for gaseous fuels only), conducted by the operator or provided by the fuel supplier, and the quantity of fuel combusted, using Equation 20-4. For emissions from the combustion of biomass fuels and municipal solid waste, the operator may instead elect to use the method shown in Equation 20-5.

(1) For a solid fuel, use Equation 20-4 of this section:

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times 3.664 \times 0.907$$

Equation 20-4

Where:

CO_2	=	Annual CO_2 mass emissions from the combustion of the specific solid fuel (metric tons).
n	=	Number of carbon content determinations for the year as specified in WCI.25(a).
$Fuel_i$	=	Mass of the solid fuel combusted in measurement period "i" (short tons).
CC_i	=	Carbon content of the solid fuel, from the fuel analysis results for measurement period "i" (percent by weight, expressed as a decimal fraction, e.g., 95% = 0.95).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.907	=	Conversion factor from short tons to metric tons.

(2) For biomass fuels or municipal solid waste, use either Equation 20-4 above or Equation 20-5:

$$CO_2 = Steam \times B \times EF \times 0.001$$

Equation 20-5

Where:

CO_2	=	Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).
Steam	=	Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (mmBtu/lb steam).

EF = Default emission factor for biomass solid fuel or municipal solid waste, from column 5 of Table 20-1, (kg CO_2/mmBtu), adjusted no less often than every third year as provided in WCI.25(a)(5)(B).
0.001 = Conversion factor from kilograms to metric tons.

(3) For a liquid fuel, use Equation 20-6 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times 0.001$$ **Equation 20-6**

Where:
CO_2 = Annual CO_2 mass emissions from the combustion of the specific liquid fuel (metric tons).
n = Number of required carbon content determinations for the year, as specified in WCI.25(a).
$Fuel_i$ = Volume of the liquid fuel combusted in measurement period "i" (gallons).
CC_i = Carbon content of the liquid fuel, from the fuel analysis results for measurement period "i" (kg C per gallon of fuel).
3.664 = Ratio of molecular weights, CO_2 to carbon.
0.001 = Conversion factor from kg to metric tons.

(4) For a gaseous fuel, use Equation 20-7 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times \frac{MW}{MVC} \times 0.001$$ **Equation 20-7**

Where:
CO_2 = Annual CO_2 mass emissions from combustion of the specific gaseous fuel (metric tons).
n = Number of required carbon content and molecular weight determinations for the year, as specified in WCI.25(a).
$Fuel_i$ = Volume of the gaseous fuel combusted in period "i" (a day or month, as applicable) (scf).
CC_i = Average carbon content of the gaseous fuel, from the fuel analysis results for the period "i" (day or month, as applicable) (kg C per kg of fuel).
MW = Molecular weight of the gaseous fuel, from fuel analysis (kg/kg-mole).
MVC = Molar volume conversion factor (849.5 scf per kg-mole for STP of 20°C and 1 atmosphere or 836 scf per kg-mole for STP of 60°F, and 1 atmosphere).
3.664 = Ratio of molecular weights, CO_2 to carbon.
0.001 = Conversion factor from kg to metric tons.

(d) Calculation Methodology 4. Calculate the annual CO_2 mass emissions from all fuels combusted in a unit, by using data from continuous emission monitoring systems (CEMS) as specified in (d)(1) through (d)(7).

(1) For a facility that combusts fossil fuels or biomass fuels and operates CEMS in response to federal, state, provincial, or local regulation, use CO_2 or O_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) The operator shall report CO_2 emissions for the reporting year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(B) If the operator of a facility that combusts biomass fuels uses O_2 concentrations to calculate CO_2 concentrations, annual source testing must demonstrate that calculated CO_2 concentrations when compared to measured CO_2 concentrations meet the Relative Accuracy Test Audit (RATA) requirements in 40 CFR Part 60, Appendix B, Performance Specification 3.

(2) For a facility that combusts waste-derived fuels (as defined in the General Provisions and listed in Table 20-2, including municipal solid waste), and operates a CEMS in response to federal, state, provincial, or local regulations use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) Annual CO_2 emissions shall be reported in metric tons based on the sum of hourly CO_2 mass emissions over the year.

(B) Emissions calculations shall not be based on O_2 concentrations.

(3) The operator of a facility that combusts waste-derived fuels and calculates CO_2 emissions using the methodology provided in WCI.23(d)(2) shall determine the portion of emissions associated with the combustion of biomass~~-derived fuels~~ using the method provided in WCI.23(f).

(4) An operator who uses CEMS data to report CO_2 emissions from a facility that co-fires fossil fuels with biomass fuels or waste-derived fuels that are partly biomass ~~fuels~~ shall determine the portion of total CO_2 emissions separately assigned to the fossil fuel and the biomass ~~fuels~~ using the method provided in WCI.23(f), if applicable. The operator who co-fires pure biomass fuels with fossil fuels may elect to calculate CO_2 emissions for the fossil fuels using methods designated in WCI.23(a) or WCI.23(b)(1), as applicable, by fuel type and then calculate biomass fuel emissions by subtracting the fossil fuel related emissions from the total CO_2 emissions determined using the CEMS based methodology.

(5) For any units for which CO2 emissions are reported using CEMS data, the operator is relieved of the requirement to separately report process emissions from combustion emissions for that unit or to report emissions separately for different fossil fuels for that unit when only fossil fuels are co-fired. In this circumstance, operators shall still report fuel use by fuel type as otherwise required.

(6) If a facility is subject to requirements in 40 CFR Part 60 or 40 CFR Part 75 and the operator chooses to add devices to an existing CEMS for the purpose of measuring CO_2 concentrations or flue gas flow, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 60 or Part 75 that apply to the facility. If

the facility is subject to both 40 CFR Part 60 and 40 CFR Part 75, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 75.

(7) If a facility does not have a CEMS and the operator chooses to add one in order to measure CO_2 concentrations, the operator shall select and operate the CEMS pursuant to the requirements in 40 CFR Part 75 or equivalent requirements as applicable in Canada.

(A) The operator shall use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(B) The operator shall report CO_2 emissions for the report year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(C) Operators who add CEMS under this article are subject to specifications in WCI.23(d)(1)-(5), if applicable.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CO_2 emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) Calculation Methodology 1 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high~~er~~ heat~~ing~~ value between 975 and 1,1~~5~~0 0 Btu per cubic foot. Otherwise, Calculation Methodology 1 may be used for any type of fuel for which a default CO2 emission factor and a default high~~er~~ heat~~ing~~ value for the fuel is specified in Table 20-1.

(2) Calculation Methodology 2 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a high~~er~~ heat~~ing~~ value between 975 and 1,1~~5~~0 0 Btu per cubic foot~~[CD1]~~. Otherwise, Calculation Methodology 2 may be used for any type of fuel combusted for which a default CO_2 emission factor for the fuel is specified in Table 20-1 or 20-2.

(3) Calculation Methodology 3 may be used for a unit of any size combusting any type of fuel, except when the use of Calculation Methodology 4 is required.

(4) Calculation Methodology 4 may be used for a unit of any size combusting any type of fuel, and must be used for: a combustion unit with a CEMS that is required by any federal, state, provincial, or local regulation and that includes both a stack gas volumetric flow rate monitor and a CO_2 concentration monitor.

(f) Mixtures of biomass or biomass fuel and fossil fuel.

(1) The owner or operator that combusts fuels or fuel mixtures for which the biomass fraction is known or can be documented shall use the applicable equations in WCI.23(a) through (c) to determine the fossil fuel fraction and shall determine the biomass fraction by subtracting the fossil fuel fraction from the total emissions.

(2) The owner or operator that combusts fuels or fuel mixtures for which the biomass ~~fuel~~ fraction is unknown or cannot be documented (for example, municipal solid waste or tire-derived fuels) shall determine the biomass ~~fuel~~ portion of CO_2 emissions using

ASTM D6866-06a, as specified in this paragraph. This procedure is not required for fuels that contain less than 5 percent biomass ~~fuel~~ by weight or for waste-derived fuels that are less than 30 percent by weight of total fuels combusted in the year for which emissions are being reported, except where the operator wishes to report a biomass fuel fraction of CO_2 emissions.

~~(1)~~(A) The operator shall conduct ASTM D6866-06a analysis on a representative fuel or exhaust gas sample at least every three months, and shall collect exhaust gas samples over at least 24 consecutive hours following the standard practice specified by ASTM D7459-08.

~~(2)~~(B) The operator shall divide total CO_2 emissions between biomass ~~fuel~~ emissions and non-biomass ~~fuel~~ emissions using the average proportions of the samples analyzed for the year for which emissions are being reported.

~~(3)~~(C) If there is a common fuel source to multiple units at the facility, the operator may elect to conduct ASTM D6866-06a testing for one of the units.

§ WCI.24 Calculation of CH_4 and N_2O Emissions

Calculate the annual CH_4 and N_2O mass emissions from stationary fuel combustion sources using the procedures in paragraph (a), (b), or (c), as appropriate.

(a) If the heat content of the fuel is not measured for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-8:

$$CH_4 \; or \; N_2O = Fuel \times HHV_D \times EF \times 0.001 \qquad \textbf{Equation 20-8}$$

Where:

CH_4 or N_2O	=	Combustion emissions from specific fuel type, metric tons CH_4 or N_2O per year.
Fuel	=	Mass or volume of fuel combusted ~~for the measurement period, p,~~ specified by fuel type, unit of mass (short tons) or volume (scf, barrel) per year~~units of mass or volume per unit time~~.
HHV_D	=	Default high~~er~~ heat~~ing~~ value specified by fuel type provided in Table 20-1, MMBtu per unit of mass or volume.
EF	=	Default CH_4 or N_2O emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(b) If the heat content of the fuel is measured for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-9:

$$CH_4 \; or \; N_2O = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.001 \qquad \textbf{Equation 20-9}$$

Where:

CH_4 or N_2O	=	CH_4 or N_2O emissions from a specific fuel type, metric tons CH_4 or N_2O per year.
$Fuel_p$	=	Mass or volume of fuel combusted for the measurement period, p, specified by fuel type, unit of mass (short tons) or volume (scf, barrel) per year.

HHV_p	=	Hi~~gh~~er heat~~ing~~ value measured for the measurement period, p, specified by fuel type, MMBtu per unit mass or volume.
EF	=	Default emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtu.
0.001	=	Factor to convert kg to metric tons.

(c) For biomass and municipal solid waste combustion, the operator may elect to use Equation 20-10 of this section to estimate CH_4 and N_2O emissions:

$$CH_4 \text{ or } N_2O = Steam \times B \times EF \times 0.001 \qquad \textbf{Equation 20-10}$$

Where:

CH_4 or N_2O	=	Annual CH_4 or N_2O emissions from the combustion of a municipal solid waste (metric tons).
Steam	=	Total mass of steam generated by municipal solid waste combustion during the reporting year (lb steam).
B	=	Ratio of the boiler's ~~maximum~~ design rated heat input capacity to its design rated steam output (mmBtu/lb steam).
EF	=	Fuel-specific emission factor for CH_4 or N_2O, from Table WCI.20-3 of this subpart (kg CH_4 or N_2O per mmBtu).
0.001	=	Conversion factor from kilograms to metric tons.

(d) The operator may elect to calculate CH_4 or N_2O emissions using source-specific emission factors derived from source tests conducted at least annually under the supervision of (*jurisdiction*). Upon approval of a source test plan, the source test procedures in that plan shall be repeated in each future year to update the source specific emission factors annually.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CH_4 and N_2O emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) WCI.24(a) may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise, WCI.24(a) may be used for any type of fuel for which a default CH_4 or N_2O emission factor and a default higher heat value for the fuel is specified in Table 20-3.

(2) WCI.24(b) may be used for a unit of any size combusting any type of fuel.

(3) WCI.24(c) may only be used for biomass or municipal solid waste combustion.

(4) WCI.24(d) may be used for a unit of any size combusting any type of fuel.

§ WCI.25 Sampling, Analysis, and Measurement Requirements

(a) Fuel Sampling Requirements. Fuel sampling must be conducted or fuel sampling results must be received from the fuel supplier at the frequency specified in paragraphs (a)(1) through (a)(4) of this section.

(1) Once for each new fuel shipment or delivery or on a monthly basis for middle distillates (diesel, gasoline, fuel oil, kerosene), residual oil, liquid waste-derived fuels, and LPG (ethane, propane, isobutene, n-butane, unspecified LPG).

(2) Monthly for natural gas, associated gas, and mixtures of low Btu gas.

(3) Monthly for gases derived from biomass including landfill gas and biogas from wastewater treatment or agricultural processes.

(4) Monthly for solid fuels, as specified below:

(A) The monthly solid fuel sample shall be a composite sample of weekly samples.

(B) The solid fuel shall be sampled at a location after all fuel treatment operations but before fuel mixing and the samples shall be representative of the fuel chemical and physical characteristics immediately prior to combustion.

(C) Each weekly sub-sample shall be collected at a time (day and hour) of the week when the fuel consumption rate is representative and unbiased.

(D) Four weekly samples (or a sample collected during each week of operation during the month) of equal mass shall be combined to form the monthly composite sample.

(E) The monthly composite sample shall be homogenized and well mixed prior to withdrawal of a sample for analysis.

(F) One in twelve composite samples shall be randomly selected for additional analysis of its discrete constituent samples. This information will be used to monitor the homogeneity of the composite.

(5) For biomass fuels and waste-derived fuels, the following may apply in lieu of WCI.25(a)(4):

(A) If CO_2 emissions are calculated using WCI.23(c)(1), the source-specific carbon content is determined annually. Upon approval of a source test plan by [*jurisdiction*], the source test procedures in that plan shall be repeated in subsequent years to update the source specific emission factors annually.

(B) If CO_2 emissions are calculated using WCI.23(c)(2) (biomass fuels and municipal solid waste only), the operator shall adjust the emission factor, in kg CO2/MMBtu not less frequently than every third year, through a stack test measurement of CO2 and use of the applicable ASME Performance Test Code to determine heat input from all heat outputs, including the steam, flue gases, ash and losses.

(b) Fuel Consumption Monitoring Requirements.

(1) Facilities may determine fuel consumption on the basis of direct measurement or recorded fuel purchase or sales invoices measuring any stock change (measured in million Btu, gallons, million standard cubic feet, short tons or bone dry short, tons) using the following equation:

Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End

(2) Fuel consumption measured in Btu values shall be converted to the required metrics of mass or volume using heat content values that are either provided by the supplier, measured by the facility, or provided in Table 20-1.

(3) All oil and gas flow meters (except for gas billing meters) shall be calibrated prior to the first year for which GHG emissions are reported under this rule, using an applicable flow meter test method listed in section WCI.6 or the calibration procedures specified by the flow meter manufacturer. Fuel flow meters shall be recalibrated either annually or at the minimum frequency specified by the manufacturer.

(4) For fuel oil, tank drop measurements may also be used.

~~(4)~~(5) Equipment used to measure solid fuel consumption at a facility shall be calibrated prior to the first year for which GHG emissions are reported under this rule, using a test method listed in section WCI.6 or the calibration procedures specified by the equipment manufacturer. Equipment shall be recalibrated either annually or at the minimum frequency specified by the manufacturer.

(c) Fuel Heat Content Monitoring Requirements. ~~Higher heating~~High heat values shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For gases, use ASTM D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), GPA Standard 2261-00 "Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography." The operator may alternatively elect to use on-line instrumentation that determines heating value accurate to within ± 5.0 percent. Where existing on-line instrumentation provides only low heating value, the operator shall convert the value to ~~higher heating~~high heat value as follows:

$$HHV = LHV \times CF$$

Equation 20-11

Where:

HHV = fuel or fuel mixture ~~higher heating~~high heat value (Btu/scf).
LHV = fuel or fuel mixture low~~er~~ heat~~ing~~ value (Btu/scf).
CF = conversion factor.

For natural gas, a CF of 1.11 shall be used. For refinery fuel gas and mixtures of refinery fuel gas, a weekly average fuel system-specific CF shall be derived as follows:

(A) by concurrent LHV instrumentation measurements and HHV determined by on-line instrumentation or laboratory analysis as part of the daily carbon content determination; or,

(B) by the HHV/LHV ratio obtained from the laboratory analysis of the daily samples.

(2) For middle distillates and oil, or liquid waste-derived fuels, use ASTM D240-02 (Reapproved 2007), or ASTM D4809-06 (Reapproved 2005).

(3) For solid biomass-derived fuels, use ASTM D5865-07a.

(4) For waste-derived fuels, use ASTM D5865-07a or ASTM D5468-02 (Reapproved 2007). Operators who combust waste-derived fuels that are not pure biomass fuels shall determine the biomass fuel portion of CO_2 emissions using the method specified in section WCI.23(f), if applicable

(d) Fuel Carbon Content Monitoring Requirements. Fuel carbon content and either molecular weight or molar fraction for gaseous fuels shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For coal and coke, solid biomass fuels, and waste-derived fuels; use ASTM 5373-08.

(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) “Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants”, ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2007).

(3) For gaseous fuels, use ASTM D1945-03 (Reapproved 2006) or ASTM D1946-90 (Reapproved 2006). The operator may alternatively elect to use on-line instrumentation that determines fuel carbon content accurate to ± 5 percent.

(e) Fuel Analytical Data Capture. When the applicable emissions estimation methodologies in sections WCI.20 through WCI.XXX require periodic collection of fuel analytical data for an emissions source, the operator shall demonstrate every reasonable effort to obtain a fuel analytical data capture rate of 100 percent for each report year.

(1) If the operator is unable to obtain fuel analytical data such that more than 20 percent of emissions from a source cannot be directly accounted for, the emissions from that source shall be considered unverifiable for the report year.

(2) If the fuel analytical data capture rate is at least 80 percent but less than 100 percent for any emissions source identified in sections WCI.20 through WCI.XXX, the operator shall use the mean of the fuel analytical data results captured to substitute for the missing values for the period of missing data.

(f) Procedure for Interim Fuel Analytical Data Collection.

(1) In the event of an unforeseen breakdown of fuel analytical data monitoring equipment required for the emissions estimation methodologies in sections WCI.20 through WCI.XXX, [jurisdiction] may authorize an operator to use an interim data collection procedure if [jurisdiction] determines that the operator has satisfactorily demonstrated that:

(A) The breakdown may result in a loss of more than 20 percent of the source’s fuel data for the reporting year, such that emissions for the affected source could not be verified under the provisions of section WCI.8;

(B) The fuel analytical data monitoring equipment cannot be promptly repaired or replaced without shutting down a process unit significantly affecting facility operations, or that the monitoring equipment must be replaced and replacement equipment is not immediately available;

(C) The interim procedure will not remain in effect longer than is reasonably necessary for repair or replacement of the malfunctioning data monitoring equipment; and

(D) The request was submitted within 30 calendar days of the breakdown of the fuel analytical data monitoring equipment.

(2) An operator seeking approval of an interim data collection procedure must, within 30 days of the monitoring equipment breakdown, submit a written request to [jurisdiction] that includes all of the following:

(A) The proposed start date and end date of the interim procedure;

(B) A detailed description of what data are affected by the breakdown;

(C) A discussion of the accuracy of data collected during the interim procedure compared with the data collected under the operator's usual equipment-based method;

(D) A demonstration that no feasible alternative procedure exists that would provide more accurate emissions data; and

(E) A demonstration that the proposed interim procedure meets the criteria specified in section ~~WCI.2(i)(1)~~WCI.25(f)(1).

(3) *[The jurisdiction]* may limit the duration of the interim data collection procedure or include other conditions of approval to ensure the criteria in section ~~WCI.2(i)(1)~~WCI.25(f)(1) are met.

(4) When approving an interim data collection procedure, [jurisdiction] shall determine whether the accuracy of data collected under the procedure is reasonably equivalent to data collected from properly functioning monitoring equipment, and if it is not, the relative accuracy to assign for purposes of assessing possible material misstatement under section WCI.8(o).

Table 20-1. Default Carbon Content, Heat Content, and Carbon Dioxide Emission Factors from Stationary Combustion by Fuel Type				
~~Fuel Type~~	~~Carbon Content~~	~~Higher Heat Value~~	~~CO_2 Emission Factor~~	~~CO_2 Emission Factor~~
Coal and Coke	**kg C / MMBtu**	**MMBtu / Short Ton**	**kg CO_2 / Short Ton**	**kg CO_2 / MMBtu**
Anthracite	28.26	25.09	2,597.94	103.54

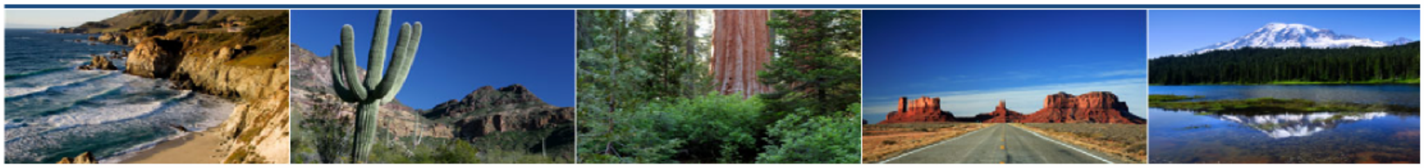
- Kraft Black Liquor emission factors, from International Council of Forest and Paper Associations, *Calculation Tools for Estimating Greenhouse Gas Emissions from Pulp and Paper Mills (2005)*, Appendix F, Table 8.

The RC notes the significant difference in both the kraft black liquor and solid biomass (wood waste) emission factors published by the EPA and Environment Canada (as well as those submitted by industry associations). In lieu of recommending a single emission factor at this time (as there is no certainty as to which is most accurate) the RC is presenting both for information purposes. The RC will be working with experts in the two federal agencies and other organizations to ascertain the most accurate emission factor to use for both ~~m~~Metric and English unit versions ~~imperial representations~~ of the Essential Requirements of Mandatory Reporting.~~rule.~~ ~~It is hoped that this can be completed in the two weeks prior to publication of the final Essential Requirements.~~



§ WCI.20 GENERAL STATIONARY COMBUSTION

§ WCI.21 Source Category Definition

General stationary fuel combustion sources are devices that combust solid, liquid, or gaseous fuel for the purpose of generating steam (or providing useful heat or energy) for industrial, commercial, or institutional use; or reducing the volume of waste by removing combustible matter. General stationary combustion sources are boilers, combustion turbines, engines, incinerators, and process heaters, and any other stationary combustion device that is not specifically addressed under the provisions for another source category in this rule.

Note: The source category definition may need to be revised after the remaining ER sections are completed.

§ WCI.22 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil and biomass fuels, reported by fuel type.
(2) Total CH_4 emissions, reported by fuel type.
(3) Total N_2O emissions, reported by fuel type.

(b) Annual fuel consumption:

(1) For gases, report in units of standard cubic ~~feet~~meters.
(2) For liquids, report in units of kilo~~gallons~~liters.
(3) For non-biomass solids, report in units of ~~short~~metric tons.
(4) For biomass solid fuels, report in units of ~~bone dry short tons or~~ bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average ~~higher heating~~high heat value of each fuel, if used to compute CO_2 emissions.

(e) Annual steam generation in ~~pounds or~~ kilograms, for units that burn biomass fuels or municipal solid waste.

~~*Please note that most of the calculation methodologies in this section currently accommodate inputs in English units, only, and not SI units. The section will be revised to allow inputs in SI units, as well as to provide applicable Canadian emission factors from "National Inventory Report 1990-2007: Greenhouse Gas Sources and Sinks in Canada – The Canadian Government's Submission to the UN Framework Convention on Climate Change, April 2009." (http://www.ec.gc.ca/pdb/ghg/inventory_e.cfm)]*~~

§ WCI.23 Calculation of CO_2 Emissions

For each fuel, calculate CO_2 mass emissions using one of the four calculation methodologies specified in this section, subject to the restrictions in §WCI.23(e).

(a) Calculation Methodology 1. Calculate the annual CO_2 mass emissions by substituting a fuel-specific default CO_2 emission factor, a default ~~higher heating~~high heat value, and the annual fuel consumption into the Equation 20-1:

$$CO_2 = Fuel \times HHV \times EF \times 0.001$$ **Equation 20-1**

Where:

CO_2	=	Annual CO_2 mass emissions for the specific fuel type (metric tons).
Fuel	=	Mass or volume of fuel combusted per year (express mass in ~~short~~metric tons for solid fuel, volume in standard cubic ~~feet~~meters for gaseous fuel, and volume in kilo~~gallons~~liters for liquid fuel).
HHV	=	Default ~~higher heating~~high heat value of the fuel, from ~~column 3 of~~ Table 20-1 (~~mmBtu~~~~M~~GJ per ~~mass~~ metric ton for solid fuel, ~~or mmBtu~~~~M~~GJ per kiloliter for liquid fuel, or GJ per cubic meter for gaseous fuel~~volume, as applicable~~).
EF	=	Fuel-specific default CO_2 emission factor, from ~~column 5 of~~ Tables 20-~~1~~ 2, 20-3, 20-5, or 20-7, as applicable (kg CO_2/~~mmBtu~~~~M~~GJ).
0.001	=	Conversion factor from kilograms to metric tons.

(b) Calculation Methodology 2. Calculate the annual CO_2 mass emissions using a default fuel-specific CO_2 emission factor, a ~~higher heating~~high heat value provided by the supplier or measured by the operator, using Equation 20-2, except for emissions from the combustion of biomass fuels and municipal solid waste, for which the operator may instead elect to use the method shown in Equation 20-3.

(1) For any type of fuel for which an emission factor is provided in Tables 20-2, 20-3, 20-5, or 20-7, as applicable~~Tables 20-1 or 20-2~~, except biomass fuels and municipal solid waste when the operator elects to use the method in WCI.23(b)(2), use Equation 20-2:

$$CO_2 = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.001$$ **Equation 20-2**

Where:

CO_2	=	Annual CO_2 mass emissions for a specific fuel type (metric tons).
n	=	Number of required heat content measurements for the year as specified in WCI.25.
$Fuel_p$	=	Mass or volume of the fuel combusted during the measurement period "p" (express mass in ~~short~~metric tons for solid fuel, volume in standard cubic ~~feet~~meters for gaseous fuel, and volume in kilo~~gallons~~liters for liquid fuel).
HHV_p	=	~~Higher heating~~High heat value of the fuel for the measurement period (~~mmBtu~~~~M~~GJ per metric ton for solid fuel, GJ per kiloliter for liquid fuel, or GJ per cubic meter for gaseous fuel~~J per mass or volume~~).

EF = Fuel-specific default CO_2 emission factor, from Tables 20-2, 20-3, 20-5, or 20-7, as applicable~~column 5 of Table 20-1 or from Table 20-2~~ (kg CO_2/~~mmBtu~~~~M~~GJ).

0.001 = Conversion factor from kilograms to metric tons.

(2) For biomass solid fuels and municipal solid waste, use either Equation 20-2 above or Equation 20-3:

$$CO_2 = Steam \times B \times EF \times 0.001$$ **Equation 20-3**

Where:

CO_2 = Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).

Steam = Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (~~lb~~~~kg~~metric tons steam).

B = Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (~~mmBtu~~~~M~~GJ/~~lb~~ ~~kg~~metric ton steam).

EF = Default emission factor for biomass solid fuel or municipal solid waste, from ~~column 5 of~~ Table 20-~~1~~2 or Table 20-7, as applicable (kg CO_2/~~mmBtu~~~~M~~GJ).

0.001 = Conversion factor from kilograms to metric tons.

(c) Calculation Methodology 3. Calculate the annual CO_2 mass emissions by using measurements of fuel carbon content or molar fraction (for gaseous fuels only), conducted by the operator or provided by the fuel supplier, and the quantity of fuel combusted, using Equation 20-4. For emissions from the combustion of biomass fuels and municipal solid waste, the operator may instead elect to use the method shown in Equation 20-5.

(1) For a solid fuel, use Equation 20-4 of this section:

~~Delete Incorrect Top Equation~~ $$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times 3.664 \times 0.907$$ **Equation 20-4**

~~Correct Equation on Bottom~~ $$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times 3.664$$

Where:

CO_2 = Annual CO_2 mass emissions from the combustion of the specific solid fuel (metric tons).

n = Number of carbon content determinations for the year.

$Fuel_i$ = Mass of the solid fuel combusted in measurement period "i" (~~short~~ metric tons).

CC_i = Carbon content of the solid fuel, from the fuel analysis results for measurement period "i" (percent by weight, expressed as a decimal fraction, e.g., 95% = 0.95).

3.664 = Ratio of molecular weights, CO_2 to carbon.

~~0.907 = Conversion factor from short tons to metric tons.~~

(2) For biomass fuels or municipal solid waste, use either Equation 20-4 above or Equation 20-5:

$$CO_2 = Steam \times B \times EF \times 0.001$$

Equation 20-5

Where:

CO_2	=	Annual CO_2 mass emissions from biomass solid fuel or municipal solid waste combustion (metric tons).
Steam	=	Total mass of steam generated by biomass solid fuel or municipal solid waste combustion during the reporting year (~~lb~~ ~~kg~~metric tons steam).
B	=	Ratio of the boiler's design rated heat input capacity to its design rated steam output capacity (~~mmBtu~~~~M~~GJ/~~lb~~ ~~kg~~metric ton steam).
EF	=	Default emission factor for biomass solid fuel or municipal solid waste, from ~~column 5 of~~ Table 20-~~1~~ 2 or 20-7, as applicable~~,~~ (kg CO_2/~~mmBtu~~~~M~~GJ), adjusted no less often than every third year as provided in WCI.25(a)(5)(B).
0.001	=	Conversion factor from kilograms to metric tons.

(3) For a liquid fuel, use Equation 20-6 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i$$

Equation 20-6

Where:

CO_2	=	Annual CO_2 mass emissions from the combustion of the specific liquid fuel (metric tons).
n	=	Number of required carbon content determinations for the year, as specified in WCI.25.
$Fuel_i$	=	Volume of the liquid fuel combusted in measurement period "i" (kilo~~gallons~~liters).
CC_i	=	Carbon content of the liquid fuel, from the fuel analysis results for measurement period "i" (~~kg~~ metric ton C per kilo~~gallon~~ liter of fuel).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
~~0.001~~	~~=~~	~~Conversion factor from kg to metric tons.~~

(4) For a gaseous fuel, use Equation 20-7 of this section:

$$CO_2 = \sum_{i=1}^{n} 3.664 \times Fuel_i \times CC_i \times \frac{MW}{MVC} \times 0.001$$

Equation 20-7

Where:

CO_2	=	Annual CO_2 mass emissions from combustion of the specific gaseous fuel (metric tons).
n	=	Number of required carbon content and molecular weight determinations for the year, as specified in WCI.25.
$Fuel_i$	=	Volume of the gaseous fuel combusted in period "i" (a day or month, as applicable) (~~scf~~scm).
CC_i	=	Average carbon content of the gaseous fuel, from the fuel analysis results for the period "i" (day or month, as applicable) (kg C per kg of fuel).
MW	=	Molecular weight of the gaseous fuel, from fuel analysis (kg/kg-mole).

MVC	=	Molar volume conversion factor (~~849.5 scf per kg-mole~~24.1 scm per kg-mole for STP of 20°C and 1 atmosphere or ~~836 scf per kg-mole~~23.7 scm per kg-mole for STP of 60°F, and 1 atmosphere).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.001	=	Conversion factor from kg to metric tons.

(d) Calculation Methodology 4. Calculate the annual CO_2 mass emissions from all fuels combusted in a unit, by using data from continuous emission monitoring systems (CEMS) as specified in (d)(1) through (d)(7).

(1) For a facility that combusts fossil fuels or biomass fuels and operates CEMS in response to federal, state, provincial, or local regulation, use CO_2 or O_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) The operator shall report CO_2 emissions for the reporting year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(B) If the operator of a facility that combusts biomass fuels uses O_2 concentrations to calculate CO_2 concentrations, annual source testing must demonstrate that calculated CO_2 concentrations when compared to measured CO_2 concentrations meet the Relative Accuracy Test Audit (RATA) requirements in 40 CFR Part 60, Appendix B, Performance Specification 3.

(2) For a facility that combusts waste-derived fuels (as defined in the General Provisions and ~~listed in Table 20-2,~~ including municipal solid waste), and operates a CEMS in response to federal, state, provincial, or local regulations use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(A) Annual CO_2 emissions shall be reported in metric tons based on the sum of hourly CO_2 mass emissions over the year.

(B) Emissions calculations shall not be based on O_2 concentrations.

(3) The operator of a facility that combusts waste-derived fuels and calculates CO_2 emissions using the methodology provided in WCI.23(d)(2) shall determine the portion of emissions associated with the combustion of biomass~~-derived fuels~~ using the method provided in WCI.23(f).

(4) An operator who uses CEMS data to report CO_2 emissions from a facility that co-fires fossil fuels with biomass fuels or waste-derived fuels that are partly biomass ~~fuels~~ shall determine the portion of total CO_2 emissions separately assigned to the fossil fuel and the biomass ~~fuels~~ using the method provided in WCI.23(f), if applicable. The operator who co-fires pure biomass fuels with fossil fuels may elect to calculate CO_2 emissions for the fossil fuels using methods designated in WCI.23(a) or WCI.23(b)(1), as applicable, by fuel type and then calculate biomass fuel emissions by subtracting the fossil fuel related emissions from the total CO_2 emissions determined using the CEMS based methodology.

(5) For any units for which CO2 emissions are reported using CEMS data, the operator is relieved of the requirement to separately report process emissions from combustion emissions for that unit or to report emissions separately for different fossil fuels for that

unit when only fossil fuels are co-fired. In this circumstance, operators shall still report fuel use by fuel type as otherwise required.

(6) If a facility is subject to requirements in 40 CFR Part 60 or 40 CFR Part 75 and the operator chooses to add devices to an existing CEMS for the purpose of measuring CO2 concentrations or flue gas flow, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 60 or Part 75 that apply to the facility. If the facility is subject to both 40 CFR Part 60 and 40 CFR Part 75, the operator shall select and operate the added devices pursuant to the requirements in 40 CFR Part 75.

(7) If a facility does not have a CEMS and the operator chooses to add one in order to measure CO_2 concentrations, the operator shall select and operate the CEMS pursuant to the requirements in 40 CFR Part 75 or equivalent requirements as applicable in Canada.

(A) The operator shall use CO_2 concentrations and flue gas flow measurements to determine hourly CO_2 mass emissions using methodologies provided in 40 CFR Part 75, Appendix F or equivalent requirements as applicable in Canada.

(B) The operator shall report CO_2 emissions for the report year in metric tons based on the sum of hourly CO_2 mass emissions over the year, converted to metric tons.

(C) Operators who add CEMS under this article are subject to specifications in WCI.23(d)(1)-(5), if applicable.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CO_2 emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) Calculation Methodology 1 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a ~~higher heating~~high heat value between ~~975 and 1,150 Btu per cubic foot~~36.3 and ~~42.8~~40.98 MJ per cubic meter. Otherwise, Calculation Methodology 1 may be used for any type of fuel for which a default CO2 emission factor (Tables 20-2, 20-3, 20-5, or 20-7, as applicable) and a default ~~higher heating~~high heat value for the fuel (Table 20-1) is specified~~ in Table 20-1~~.

(2) Calculation Methodology 2 may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a ~~higher heating~~high heat value between ~~975 and 1,150 Btu per cubic foot~~36.3 and ~~42.8~~40.98 MJ per cubic meter. Otherwise, Calculation Methodology 2 may be used for any type of fuel combusted for which a default CO2 emission factor for the fuel is specified in Tables 20-2, 20-3, 20-5, or 20-7, as applicable.~~Table 20-1 or 20-2.~~

(3) Calculation Methodology 3 may be used for a unit of any size combusting any type of fuel, except when the use of Calculation Methodology 4 is required.

(4) Calculation Methodology 4 may be used for a unit of any size combusting any type of fuel, and must be used for: a combustion unit with a CEMS that is required by any federal, state, provincial, or local regulation and that includes both a stack gas volumetric flow rate monitor and a CO_2 concentration monitor.

(f) Mixtures of biomass or biomass fuel and fossil fuel.

(1) The owner or operator that combusts fuels or fuel mixtures for which the biomass fraction is known or can be documented shall use the applicable equations in WCI.23(a)

through (c) to determine the fossil fuel fraction and shall determine the biomass fraction by subtracting the fossil fuel fraction from the total emissions.

(2) The owner or operator that combusts fuels or fuel mixtures for which the biomass fraction is unknown or cannot be documented (for example, municipal solid waste or tire-derived fuels) shall determine the biomass portion of CO_2 emissions using ASTM D6866-06a, as specified in this paragraph. This procedure is not required for fuels that contain less than 5 percent biomass by weight or for waste-derived fuels that are less than 30 percent by weight of total fuels combusted in the year for which emissions are being reported, except where the operator wishes to report a biomass fuel fraction of CO_2 emissions.

(A)~~(1)~~ The operator shall conduct ASTM D6866-06a analysis on a representative fuel or exhaust gas sample at least every three months, and shall collect exhaust gas samples over at least 24 consecutive hours following the standard practice specified by ASTM D7459-08.

(B) ~~(2)~~ The operator shall divide total CO_2 emissions between biomass fuel emissions and non-biomass fuel emissions using the average proportions of the samples analyzed for the year for which emissions are being reported.

(C) ~~(3)~~ If there is a common fuel source to multiple units at the facility, the operator may elect to conduct ASTM D6866-06a testing for one of the units.

§ WCI.24 Calculation of CH_4 and N_2O Emissions

Calculate the annual CH_4 and N_2O mass emissions from stationary fuel combustion sources using the procedures in paragraph (a), (b), or (c), as appropriate.

(a) If the heat content of the fuel is not measured for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-8 for all fuels except coal. For coal, use Equation 20-9:

$$CH_4 \; or \; N_2O = Fuel \times HHV_D \times EF \times 0.000001 \qquad \textbf{Equation 20-8}$$

$$CH_4 \; or \; N_2O = Fuel \times EF_c \times 0.000001 \qquad \textbf{Equation 20-9}$$

Where:

CH_4 or N_2O = Combustion emissions from specific fuel type, metric tons CH_4 or N_2O per year.

Fuel = Mass or volume of fuel combusted per year (express mass in metric tons for solid fuel, volume in standard cubic meters for gaseous fuel, and volume in kiloliters for liquid fuel).~~Mass or volume of fuel combusted for the measurement period, p, specified by fuel type, units of mass or volume per unit time.~~

HHV_D = Default ~~higher heating~~high heat value specified by fuel type provided in Table 20-1, ~~MMBtu~~ ~~M~~(GJ per metric ton for solid fuel, GJ per kiloliter for liquid fuel, or GJ per cubic meter for gaseous fuel)~~J per unit of mass or volume~~.

EF = Default CH_4 or N_2O emission factor provided in Tables 20-2 or 20-~~3~~4, as applicable, ~~k~~grams CH_4 or N_2O per ~~MMBtu~~~~M~~GJ.

EF_c = Default CH_4 or N_2O emission factor for coal provided in Table 20-6 (grams CH_4 or N_2O per metric ton of coal)

0.000001 = Factor to convert ~~k~~grams to metric tons.

(b) If the heat content of the fuel is measured or provided by the fuel supplier for CO_2 estimation, calculate CH_4 and N_2O emissions using Equation 20-~~9~~10 for all fuels except coal. For coal, use Equation 20-11:

$$CH_4 \ or \ N_2O = \sum_{p=1}^{n} Fuel_p \times HHV_p \times EF \times 0.000001 \qquad \textbf{Equation 20-10}$$

$$CH_4 \ or \ N_2O = \sum_{p=1}^{n} Fuel_p \times EF_c \times 0.000001 \qquad \textbf{Equation 20-11}$$

Where:

CH_4 or N_2O = CH_4 or N_2O emissions from a specific fuel type, metric tons CH_4 or N_2O per year.

$Fuel_p$ = Mass or volume of the fuel combusted during the measurement period "p" (express mass in metric tons for solid fuel, volume in standard cubic meters for gaseous fuel, and volume in kiloliters for liquid fuel).~~Mass or volume of fuel combusted specified by fuel type, unit of mass (short metric tons) or volume (scfscm, barrelliter) per year~~.

HHV_p = ~~Higher heating~~High heat value measured directly or provided by the fuel supplier for the measurement period, p, specified by fuel type ~~Default higher heating value of the fuel, from Table 20-1~~ (GJ per metric ton for solid fuel, GJ per kiloliter for liquid fuel, or GJ per cubic meter for gaseous fuel)~~Higher heating value measured for the measurement period, p, specified by fuel type, MMBtu MJ per unit mass or volume~~.

EF = Default CH_4 or N_2O emission factor provided in Tables 20-2 or 20-4, as applicable, ~~k~~grams CH_4 or N_2O per ~~M~~GJ.

EF_c = CH_4 or N_2O emission factor for coal, either measured directly or provided by the fuel supplier, grams CH_4 or N_2O per metric ton of coal

~~Default emission factor provided in Table 20-3, kg CH_4 or N_2O per MMBtuMJ.~~

0.000001 = Factor to convert ~~k~~grams to metric tons.

(c) For biomass and municipal solid waste combustion, the operator may elect to use Equation 20-10 of this section to estimate CH_4 and N_2O emissions:

$$CH_4 \ or \ N_2O = Steam \times B \times EF \times 0.000001 \qquad \textbf{Equation 20-10}$$

Where:

CH_4 or N_2O = Annual CH_4 or N_2O emissions from the combustion of a municipal solid waste (metric tons).

Steam = Total mass of steam generated by municipal solid waste combustion during the reporting year (~~lb~~ ~~kg~~metric tons steam).

B	=	Ratio of the boiler's ~~maximum~~ design rated heat input capacity to its design rated steam output (~~mmBtu/lbM~~GJ/metric ton~~kg~~ steam).
EF	=	Fuel-specific emission factor for CH_4 or N_2O, from Tables 20-2, 20-4 or 20-6, as applicable ~~WCI.20-3 of this subpart~~ (~~k~~grams CH_4 or N_2O per ~~mmBtu~~G~~M~~J).
0.000001	=	Conversion factor from ~~kilo~~grams to metric tons.

(d) The operator may elect to calculate CH_4 or N_2O emissions using source-specific emission factors derived from source tests conducted at least annually under the supervision of (*jurisdiction*). Upon approval of a source test plan, the source test procedures in that plan shall be repeated in each future year to update the source specific emission factors annually.

(e) Use of the Four CO_2 Calculation Methodologies. Use of the four CH_4 and N_2O emissions calculation methodologies described in paragraphs (a) through (d) of this section is subject to the following requirements and restrictions:

(1) WCI.24(a) may not be used by a facility that is subject to the verification requirements of WCI.8, except for stationary combustion units that combust natural gas with a higher heating value between 975 and 1,150 Btu per cubic foot. Otherwise, WCI.24(a) may be used for any type of fuel for which a default CH_4 or N_2O emission factor (Tables 20-2, 20-4 or 20-6) and a default higher heat value (Table 20-3)~~for the fuel i~~ is specified. ~~in Table 20-3.~~

(2) WCI.24(b) may be used for a unit of any size combusting any type of fuel.

(3) WCI.24(c) may only be used for biomass or municipal solid waste combustion.

(4) WCI.24(d) may be used for a unit of any size combusting any type of fuel.

§ WCI.25 Sampling, Analysis, and Measurement Requirements

(a) Fuel Sampling Requirements. Fuel sampling must be conducted or fuel sampling results must be received from the fuel supplier at the frequency specified in paragraphs (a)(1) through (a)(4) of this section.

(1) Once for each new fuel shipment or delivery or on a monthly basis for middle distillates (diesel, gasoline, fuel oil, kerosene), residual oil, liquid waste-derived fuels, and LPG (ethane, propane, isobutene, n-butane, unspecified LPG).

(2) Monthly for natural gas, associated gas, and mixtures of low ~~Btu~~ MJ gas.

(3) Monthly for gases derived from biomass including landfill gas and biogas from wastewater treatment or agricultural processes.

(4) Monthly for solid fuels, as specified below:

(A) The monthly solid fuel sample shall be a composite sample of weekly samples.

(B) The solid fuel shall be sampled at a location after all fuel treatment operations but before fuel mixing and the samples shall be representative of the fuel chemical and physical characteristics immediately prior to combustion.

(C) Each weekly sub-sample shall be collected at a time (day and hour) of the week when the fuel consumption rate is representative and unbiased.

(D) Four weekly samples (or a sample collected during each week of operation during the month) of equal mass shall be combined to form the monthly composite sample.

(E) The monthly composite sample shall be homogenized and well mixed prior to withdrawal of a sample for analysis.

(F) One in twelve composite samples shall be randomly selected for additional analysis of its discrete constituent samples. This information will be used to monitor the homogeneity of the composite.

(5) For biomass fuels and waste-derived fuels, the following may apply in lieu of WCI.25(a)(4):

(A) If CO_2 emissions are calculated using WCI.23(c)(1), the source-specific carbon content is determined annually. Upon approval of a source test plan by [*jurisdiction*], the source test procedures in that plan shall be repeated in subsequent years to update the source specific emission factors annually.

(B) If CO_2 emissions are calculated using WCI.23(c)(2) (biomass fuels and municipal solid waste only), the operator shall adjust the emission factor, in kg CO_2/~~MMBtu~~ MJ not less frequently than every third year, through a stack test measurement of CO_2 and use of the applicable ASME Performance Test Code to determine heat input from all heat outputs, including the steam, flue gases, ash and losses.

(b) Fuel Consumption Monitoring Requirements.

(1) Facilities may determine fuel consumption on the basis of direct measurement or recorded fuel purchase or sales invoices measuring any stock change (measured in ~~million Btu~~MJ, ~~gallons~~liters, million standard cubic ~~feet~~meters, ~~short~~ metric tons or bone dry ~~short,~~metric tons) using the following equation:

Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End

(2) Fuel consumption measured in ~~Btu~~ MJ values shall be converted to the required metrics of mass or volume using heat content values that are either provided by the supplier, measured by the facility, or provided in Table 20-1.

(3) All oil and gas flow meters (except for gas billing meters) shall be calibrated prior to the first year for which GHG emissions are reported under this rule, using an applicable flow meter test method listed in section WCI.6 or the calibration procedures specified by the flow meter manufacturer. Fuel flow meters shall be recalibrated either annually or at the minimum frequency specified by the manufacturer.

(4) For fuel oil, tank drop measurements may also be used.

(c) Fuel Heat Content Monitoring Requirements. ~~Higher heating~~High heat values shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For gases, use ASTM D1826-94 (Reapproved 2003), ASTM D3588-98 (Reapproved 2003), ASTM D4891-89 (Reapproved 2006), GPA Standard 2261-00 "Analysis for Natural Gas and Similar Gaseous Mixtures by Gas Chromatography." The operator may alternatively elect to use on-line instrumentation that determines heating value accurate to within ± 5.0 percent. Where existing on-line instrumentation provides only ~~low~~

~~heating~~low heat value, the operator shall convert the value to ~~higher heating~~high heat value as follows:

$$HHV = LHV \times CF$$

Equation 20-11

Where:

HHV	= fuel or fuel mixture ~~higher heating~~high heat value (~~Btu/scf~~MJ/scm).
LHV	= fuel or fuel mixture ~~lower heating~~low heat value (~~Btu/scf~~MJ/scm).
CF	= conversion factor.

For natural gas, a CF of 1.11 shall be used. For refinery fuel gas and mixtures of refinery fuel gas, a weekly average fuel system-specific CF shall be derived as follows:

(A) by concurrent LHV instrumentation measurements and HHV determined by on-line instrumentation or laboratory analysis as part of the daily carbon content determination; or,
(B) by the HHV/LHV ratio obtained from the laboratory analysis of the daily samples.

(2) For middle distillates and oil, or liquid waste-derived fuels, use ASTM D240-02 (Reapproved 2007), or ASTM D4809-06 (Reapproved 2005).
(3) For solid biomass-derived fuels, use ASTM D5865-07a.
(4) For waste-derived fuels, use ASTM D5865-07a or ASTM D5468-02 (Reapproved 2007). Operators who combust waste-derived fuels that are not pure biomass fuels shall determine the biomass fuel portion of CO_2 emissions using the method specified in section WCI.23(f), if applicable

(d) Fuel Carbon Content Monitoring Requirements. Fuel carbon content and either molecular weight or molar fraction for gaseous fuels shall be based on the results of fuel sampling and analysis received from the fuel supplier or determined by the operator, in either case using an applicable analytical method listed in section WCI.6.

(1) For coal and coke, solid biomass fuels, and waste-derived fuels; use ASTM 5373-08.
(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) "Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 2007).
(3) For gaseous fuels, use ASTM D1945-03 (Reapproved 2006) or ASTM D1946-90 (Reapproved 2006). The operator may alternatively elect to use on-line instrumentation that determines fuel carbon content accurate to ± 5 percent.

(e) Fuel Analytical Data Capture. When the applicable emissions estimation methodologies in sections WCI.20 through WCI.XXX require periodic collection of fuel analytical data for an emissions source, the operator shall demonstrate every reasonable effort to obtain a fuel analytical data capture rate of 100 percent for each report year.

(1) If the operator is unable to obtain fuel analytical data such that more than 20 percent of emissions from a source cannot be directly accounted for, the emissions from that source shall be considered unverifiable for the report year.

(2) If the fuel analytical data capture rate is at least 80 percent but less than 100 percent for any emissions source identified in sections WCI.20 through WCI.XXX, the operator shall use the mean of the fuel analytical data results captured to substitute for the missing values for the period of missing data.

(f) Procedure for Interim Fuel Analytical Data Collection.

(1) In the event of an unforeseen breakdown of fuel analytical data monitoring equipment required for the emissions estimation methodologies in sections WCI.20 through WCI.XXX, [jurisdiction] may authorize an operator to use an interim data collection procedure if [jurisdiction] determines that the operator has satisfactorily demonstrated that:

(A) The breakdown may result in a loss of more than 20 percent of the source's fuel data for the reporting year, such that emissions for the affected source could not be verified under the provisions of section WCI.8;

(B) The fuel analytical data monitoring equipment cannot be promptly repaired or replaced without shutting down a process unit significantly affecting facility operations, or that the monitoring equipment must be replaced and replacement equipment is not immediately available;

(C) The interim procedure will not remain in effect longer than is reasonably necessary for repair or replacement of the malfunctioning data monitoring equipment; and

(D) The request was submitted within 30 calendar days of the breakdown of the fuel analytical data monitoring equipment.

(2) An operator seeking approval of an interim data collection procedure must, within 30 days of the monitoring equipment breakdown, submit a written request to [jurisdiction] that includes all of the following:

(A) The proposed start date and end date of the interim procedure;

(B) A detailed description of what data are affected by the breakdown;

(C) A discussion of the accuracy of data collected during the interim procedure compared with the data collected under the operator's usual equipment-based method;

(D) A demonstration that no feasible alternative procedure exists that would provide more accurate emissions data; and

(E) A demonstration that the proposed interim procedure meets the criteria specified in section ~~WCI.2(i)(1)~~WCI.25(f)(1).

(3) *[The jurisdiction]* may limit the duration of the interim data collection procedure or include other conditions of approval to ensure the criteria in section ~~WCI.2(i)(1)~~WCI.25(f)(1) are met.

(4) ~~Data collected pursuant to an approved interim data collection procedure shall be considered captured data for purposes of compliance with the capture rate requirements in section WCI.2(g).~~ When approving an interim data collection procedure, *[jurisdiction]* shall determine whether the accuracy of data collected under the procedure is reasonably equivalent to data collected from properly functioning monitoring equipment, and if it is not, the relative accuracy to assign for purposes of assessing possible material misstatement under section WCI.8(~~q~~o).

~~The original Tables 20-1 through 20-3 have been replaced with the following tables from: "The National Inventory Report – Greenhouse Gas Sources and Sinks in Canada 1990-2007." The table numbers need to be assigned, and citations in the text need to be adjusted.~~

Table 20-1: Default Carbon Content and High~~er~~ Heat~~ing~~ Value by Fuel Type

Liquid Fuels	**Carbon Content (kg C /GJ)**	**High~~er~~ Heat~~ing~~ Value (~~MJ~~GJ/~~KL~~kl)**
Asphalt & Road Oil	19.8	44.46

The ~~RC~~WCI notes the significant difference in both the black liquor and solid biomass emission factors published by the EPA and Environment Canada (as well as those submitted by industry associations). In lieu of recommending a single emission factor at this time (as there is no certainty as to which is most accurate) the RC is presenting both for information purposes. The RC will be working with experts in the two federal agencies and other organizations to ascertain the most accurate emission factor to use for both ~~m~~Metric and ~~imperial representations~~English unit versions of the ~~rule~~Essential Requirements of Mandatory Reporting.

§ WCI.30 REFINERY FUEL GAS COMBUSTION

WCI.31 Source Category Definition

This source category consists of any combustion device that is located at a petroleum refinery and that combusts refinery fuel gas, still gas, flexigas, or associated gas.

WCI.32 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the emissions data report shall include the following information at the facility level:

(a) Annual CO_2, CH_4, and N_2O emissions from refinery fuel gas combustion in metric tons.

(b) Annual fuel consumption in units of million standard cubic feet or cubic meters.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions.

(d) Average ~~high heating~~high heat value of each fuel, if used to compute CO_2 emissions.

WCI.33 Calculation of Greenhouse Gas Emissions

(a) Calculation of CO_2 Emissions. Owners and operators shall calculate daily CO_2 emissions for each fuel gas system using any of the methods specified in paragraphs (a)(1) through (a)(5) of this section. Calculate the total annual CO_2 emissions from combustion of all fuel gas by summing the CO_2 emissions from each fuel gas system.

(1) Use a CEMS that complies with the provisions in section WCI.23(d).

(2) Calculate CO_2 emissions from each refinery fuel gas system and flexigas system using measured carbon content and molecular weight of the gas and Equation 30-1.

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times \frac{MW}{MVC} \times 3.664 \times 0.001$$

Equation 30-1 (English Units)

Where:

CO_2	=	Carbon dioxide emissions, metric tons/year.
$Fuel_i$	=	Daily refinery fuel or flexigas combusted (scf).
CC_i	=	Daily sample of carbon content of the fuel (kg C/kg fuel).
MW	=	Daily sample of molecular weight of fuel.
MVC	=	Molar volume conversion factor (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere, or 836 scf/kg-mole for STP of 60°F and 1 atmosphere).
3.664	=	Conversion factor for carbon to carbon dioxide.
0.001	=	Conversion factor for kg to metric tons.
n	=	Number of days in a year.

$$CO_2 = \sum_{i=1}^{n} Fuel_i \times CC_i \times \frac{MW}{MVC} \times 3.664 \times 0.001$$

Equation 30-1 (Metric Units)

Where:

CO_2 = Carbon dioxide emissions, metric tons/year.
$Fuel_i$ = Daily refinery fuel or flexigas combusted (scm~~3~~).
CC_i = Daily sample of carbon content of the fuel (kg C/kg fuel).
MW = Daily sample of molecular weight of fuel.
MVC = Molar volume conversion factor (24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere).
3.664 = Conversion factor for carbon to carbon dioxide.
0.001 = Conversion factor for kg to metric tons.
n = Number of days in a year.

(A) For refinery fuel gas, the daily carbon content shall be determined a minimum of 3 times a day (once every 8 hours) using on-line instrumentation or discrete laboratory analysis using the methods specified in WCI.34.

(B) For flexigas, the daily carbon content shall be determined once per day using the methods specified in WCI.34.

(3) Calculate CO_2 emissions from each fuel gas system and flexigas system using Equation 30-2 and a daily average ~~high heating~~high heat value that is monitored using a continuous on-line instrument.

$$CO_2 = \sum_{i=1}^{n} HHV_i \times Fuel_i \times EF_{CO2,i} \times 0.000001$$

Equation 30-2 (English Units)

Where:

CO_2 = CO_2 emissions resulting from the combustion of fuel gas from an individual fuel gas system (metric tons/yr).
HHV_i = Daily average ~~high heating~~high heat value of fuel gas, derived from a continuous analyzer and integrated over a 24-hour period (Btu/scf).
$Fuel_i$ = Daily fuel consumption from all fuel combustion units burning gas from the system (scf/d).
$EF_{CO2,i}$ = Daily CO_2 emission factor for an individual fuel gas system, developed using Equation 30-3 (metric tons CO_2/MM-Btu).
0.000001 = Conversion factor for Btu to MMBtu.
n = Number of days per year.

Equation 30-2 (Metric Units)

$$CO_2 = \sum_{i=1}^{n} HHV_i \times Fuel_i \times EF_{CO2,i}$$

Where:

CO_2 = CO_2 emissions resulting from the combustion of fuel gas from an individual fuel gas system (metric tons/yr).
HHV_i = Daily average ~~high heating~~high heat value of fuel gas, derived from a continuous analyzer and integrated over a 24-hour period (MJ/m^3).
$Fuel_i$ = Daily fuel consumption from all fuel combustion units burning gas from the system (m^3/d).
$EF_{CO2,i}$ = Daily CO_2 emission factor for an individual fuel gas system, developed using Equation 30-3 (metric tons CO_2/MJ).
n = Number of days per year.

$$EF_{CO2,i} = CC/HHV \times MW/MVC \times 3.664 \times 1,000$$ **Equation 30-3 (English Units)**

Where:

$EF_{CO2,i}$ = Daily CO_2 emission factor for an individual fuel gas system (metric tons CO_2/MMBtu).
CC = Daily sample of gas carbon content for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (kg carbon/kg fuel).
HHV = Daily sample of gas ~~high heating~~high heat value for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (Btu/scf).
MW = Refinery fuel A molecular weight (kg/kg-mole).
MVC = Molar volume conversion (849.5 scf/ kg-mole, for STP of 20°C and 1 atmosphere, or 836 scf/kg-mole for STP of 60°F and 1 atmosphere).
3.664 = Conversion factor for carbon to carbon dioxide.
1,000 = Conversion factor for kg/Btu to metric tons/MMBtu.

$$EF_{CO2,i} = CC/HHV \times MW/MVC \times 3.664 \times 0.001\cancel{1,000}$$ **Equation 30-3 (Metric Units)**

Where:

$EF_{CO2,i}$ = Daily CO_2 emission factor for an individual fuel gas system (metric tons CO_2/MJ).
CC = Daily sample of gas carbon content for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (kg carbon/kg fuel).
HHV = Daily sample of gas ~~high heating~~high heat value for a fuel gas system, collected according to paragraph (a)(3)(A) of this section (MJ/m^3).
MW = Refinery fuel A molecular weight (kg/kg-mole).
MVC = Molar volume conversion (24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere).
3.664 = Conversion factor for carbon to carbon dioxide.
0.001~~1,000~~ = Conversion factor for kg/MJ to metric tons/MJ.

(A) For Equation 30-3, the carbon content shall be determined once per day by on-line instrumentation or by laboratory analysis of a representative sample using the methods specified in WCI.34. The HHV shall be determined from either the same sample used to conduct the carbon analysis or from on-line instrumentation using the hourly average value that coincides with the same hour in which the carbon content was determined.

(B) For facilities that meet the definition of a small refiner in WCI.10, the emissions measurements and calculations for Equation 30-2 and 30-3 may be conducted weekly.

(4) For associated gas, low ~~Btu~~heat content gas, or other fossil fuels; follow the requirements for general stationary source combustion sources in WCI .23(b) or (c), as appropriate for each fuel.

(5) Where individual fuels are mixed prior to combustion, the operator may choose to calculate CO_2 emissions for each fuel prior to mixing instead of using the methods in paragraphs (a)(1), (a)(2), or (a)(3) of this section. In this case, the operator must determine the fuel flow rate and appropriate fuel specific parameters (e.g. carbon content, HHV) of each fuel stream prior to mixing, calculate CO_2 emissions for each fuel stream, and sum the emissions of the individual fuel streams to determine total CO_2 emissions from the mixture. CO_2 emissions for each fuel stream must be estimated using the following methods:

(A) For natural gas and associated gas, use the appropriate methodology specified in section WCI.23(b) or (c).

(B) For refinery fuel gas and flexigas, use the methodology in either paragraph (a)(2) or (a)(3) of this section.

(C) For low ~~Btu~~ heat content gas, use the methodology in paragraph (a)(2) of this section.

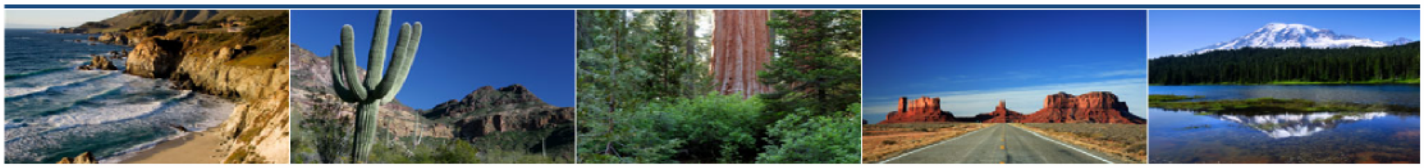
(b) Calculation of CH_4 and N_2O Emissions. Owners and operators shall use the methods specified in section WCI.24 to calculate the annual CH_4 and N_2O emissions.

WCI.34 Sampling, Analysis, and Measurement Requirements

(a) Measure the fuel consumption rate daily using methods specified in WCI.25(b).

(b) Measure the carbon content for fuel gas and flexigas using either ASTM D1945-03 (Reapproved 2006) or ASTM D1946-90 (Reapproved 2006). Where these methods do not adequately quantify all major –hydrocarbons, then an owner or operator may request use of an alternative ASTM or other method to be approved by *[the jurisdiction]*.

(c) Measure ~~high heating~~high heat value using the monitoring requirements specified in WCI.25(c) for gaseous fuels.



§ WCI.40 ELECTRICITY GENERATION (ENGLISH UNITS)

§ WCI.41 Source Category Definition

An electricity generating unit~~or~~ is any combustion device that combusts solid, liquid, or gaseous fuel for the purpose of producing electricity either for sale or for use onsite. This source category includes ~~excludes~~ cogeneration (combined heat and power) units~~ subject to WCI.50~~.

§ WCI.42 Greenhouse Gas Reporting Requirements

For each ~~facility~~electricity generating unit, the emissions data report shall include the following information:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil fuels, reported by fuel type.

(2) Total CO_2 emissions for all biomass fuels combined.

(3) Total CH_4 emissions for fuels combined.

(4) Total N_2O emissions for all fuels combined.

(b) Annual fuel consumption:

(1) For gases, report in units of million standard cubic feet~~ or cubic meters~~.

(2) For liquids, report in units of gallons~~ or liters~~.

(3) For non-biomass solids, report in units of short tons~~ or metric tons~~.

(4) For biomass-derived solid fuels, report in units of bone dry short tons~~ or bone dry metric tons~~.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions as specified in WCI.434.

(d) Average high heating value of each fuel, if used to compute CO_2 emissions as specified WCI.434.

(e) The nameplate generating capacity in megawatts and net power generated in the reporting year in megawatt hours.

(f) For each cogeneration unit, indicate whether topping or bottoming cycle and provide useful thermal output as applicable, in mmBtu~~mmBtu~~~~MJ~~. Where steam or heat is acquired from another facility for the generation of electricity, report the provider and amount of acquired steam or heat in mmBtu. Where supplemental firing has been applied to support electricity generation or industrial output, report this purpose and fuel consumption by fuel type using the units in WCI.42(b).

~~(f)~~(g) Process CO_2 emissions from acid gas scrubbers and acid gas reagent.

~~(g)~~(h) Fugitive emissions of HFC from cooling units that support power generation.

~~(h)~~(i) Fugitive CO_2 emissions from geothermal facilities.

~~(i)~~(j) Fugitive CO_2 emissions from coal storage at coal-fired electricity generating facilities shall be reported as specified in section WCI.100.

§ WCI.43 Calculation of Greenhouse Gas Emissions

(a) Calculation of CO_2 Emissions. Operators shall use CEMS to measure CO_2 emissions if required to operate a CEMS by any other federal, state, provincial, or local regulation. Operators not required to operate a CEMS by another regulation may use either CEMS or the calculation methods specified in paragraphs (a)(1) through (a)(7). Operators using CEMS to determine CO_2 emissions shall comply with the provisions in section WCI.23(d).

(1) Natural Gas. For electric generating units combusting natural gas, use one of the following methods:

(A) If the high heat value is greater than or equal to 975 ~~36.3~~ and less than or equal to 1,100 Btu/scf~~42.8 MJ/scm~~ use either:

(i) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

(ii) The measured heat content of the fuel and the calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8[BM1].

~~(D)~~(B) If the high heat value is less than 975 ~~36.3~~ or greater than 1,100 Btu/scf~~42.8 MJ/scm~~, use the measured carbon content of the fuel and the calculation methodology 3 in section WCI.23(c).

(2) Coal or Petroleum Coke. For electric generating units combusting coal or petroleum coke, use the measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c).

(3) Middle Distillates, Gasoline, Residual Oil, or Liquid Petroleum Gases. For electric generating units combusting middle distillates (such as diesel, fuel oil, or kerosene), gasoline, residual oil, or LPG (such as ethane, propane, isobutene, n-butane, or unspecified LPG), use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(4) Refinery Fuel Gas, Flexigas, or Associated Gas. For electric generating units combusting refinery fuel gas, flexigas, or associated gas, use the methods specified in section WCI.30.

(5) Landfill Gas, Biogas, or Biomass. For electric generating units combusting landfill gas, biogas, or biomass, use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(6) Municipal Solid Waste. Electric generating units combusting municipal solid waste, may use the measured steam generated, the default carbon content emission factor in Table 20-1, and the calculation methodology in section WCI.23(b)(2) provided the facility is not subject to the verification requirements of WCI.8. If the facility is subject to the verification requirements of WCI.8, the operator shall use CEMS to measure CO_2 emissions in accordance with WCI.23(d), or calculate emissions using steam flow and a CO_2 emission factor~~mmBtu~~~~mmBtu~~~~MJ~~ according to the provisions of WCI.23(c)(2).

(7) Start-up Fuels. The operators of generating facilities that primarily combust biomass-derived fuels but combust fossil fuels during start-up, shut-down, or malfunction operating periods only, shall calculate CO_2 emissions from fossil fuel combustion using one of the following methods:

(A) The default emission factors from Tables 20-1 and 20-2 and calculation methodology 1 provided in section WCI.23(a);

(B) The measured heat content of the fuel and calculation methodology 2 provided in section WCI.23(b);

(C) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or

(D) For combustion of refinery fuel gas, the measured heat content and carbon content of the fuel, and the calculation methodology provided in section WCI.30.

(8) Co-fired Electricity Generating Units. For electricity generating units that combust more than one type of fuel, the operator shall calculate CO_2 emissions as follows.

(A) For co-fired electricity generators that burn only fossil fuels, CO_2 emissions shall be determined using one of the following methods:

(i) A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method need not report emissions separately for each fossil fuel.

(ii) For units not equipped with a continuous emission system, calculate the CO2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(4) of this section.

(B) For co-fired electricity generators that burn biomass-derived fuel with a fossil fuel, CO_2 emissions shall be determined using one of the following methods:

(i) A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method shall determine the portion of the total CO_2 emissions attributable to the biomass-derived fuel and portion of the total CO_2 emissions attributable to the fossil fuel using the methods specified in section WCI.23(d)(4).

(ii) For units not equipped with a continuous emission system, calculate the CO_2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(7) of this section.

(b) Calculation of CH_4 and N_2O Emissions. Operators of electricity generating units shall use the methods specified in section WCI.24 to calculate the annual CH_4 and N_2O emissions. For coal combustion, use the default CH_4 emission factor in Table 20-3. ~~of 1g of CH_4/mmBtu [WCI will need to provide new factor in g of CH_4/MJ or other units].~~

(c) Calculation of CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall calculate the annual CO_2 emissions from these processes using Equation 40-1 if these emissions are not already captured in CO_2 emissions determined using a continuous emissions monitoring system.

$$CO_2 = S \times R \times \left(CO_{2\,MW} / Sorbent_{MW}\right)$$ **Equation 40-1**

Where:

CO_2	=	CO_2 emitted from sorbent for the report year, metric tons;
S	=	Limestone or other sorbent used in the report year, metric tons;
R	=	Ratio of moles of CO_2 released upon capture of one mole of acid gas;
$CO_{2\ MW}$	=	Molecular weight of carbon dioxide (44);
$Sorbent_{\ MW}$	=	Molecular weight of sorbent (if calcium carbonate, 100).

(d) Calculating Fugitive HFC Emissions from Cooling Units. Operators of electricity generating facilities shall calculate fugitive HFC emissions for each HFC compound used in cooling units that support power generation or are used in heat transfers to cool stack gases using either the methodology in paragraph (d)(1) or (d)(2). The Operator is not required to report GHG emissions from air or water cooling systems or condensers that do not contain HFCs.

(1) Use Equation 40-2 to calculate annual HFC emissions:

$$HFC = HFC_{inventory} + HFC_{purchases\,/\,acquisitions} - HFC_{sales\,/\,disbursements} + HFC_{\Delta capacity}$$ **Equation 40-2**

Where:

HFC	=	Annual fugitive HFC emission, metric tons;
$HFC_{inventory}$	=	The difference between the quantity of HFC in storage at the beginning of the year and the quantity in storage at the end of the year. Stored HFC includes HFC contained in cylinders (such as 115-pound storage cylinders), gas carts, and other storage containers. It does not include HFC gas held in operating equipment. The change in inventory will be negative if the quantity of HFC in storage increases over the course of the year.

$HFC_{purchases/acquisitions}$ = The sum of all HFC acquired from other entities during the year either in storage containers or in equipment.

$HFC_{sales/disbursements}$ = The sum of all the HFC sold or otherwise transferred offsite to other entities during the year either in storage containers or in equipment.

$HFC_{\Delta capacity}$ = The net change in the total nameplate capacity (i.e. the full and proper charge) of the cooling equipment). The net change in capacity will be negative if the total nameplate capacity at the end of the year is less than the total nameplate capacity at the beginning of the year.

(2) Use service logs to document HFC usage and emissions from each cooling unit. Service logs should document all maintenance and service performed on the unit during the report year, including the quantity of HFCs added to or removed from the unit, and include a record at the beginning and end of each report year. The operator may use service log information along with the following simplified material balance equations to quantify fugitive HFCs from unit installation, servicing, and retirement, as applicable. The operator shall include the sum of HFC emissions from the applicable equations in the greenhouse gas emissions data report.

$$HFC_{Install} = R_{new} - C_{new}$$

$$HFC_{Service} = R_{recharge} - R_{Recover}$$

$$HFC_{Retire} = C_{retire} - R_{retire}$$

Where:

$HFC_{Install}$ = HFC emitted during initial charging/installation of the unit, kilograms;
$HFC_{Service}$ = HFC emitted during use and servicing of the unit for the report year, kilograms;
HFC_{Retire} = HFC emitted during the removal from service/retirement of the unit, kilograms;
R_{new} = HFC used to fill new unit (omit if unit was pre-charged by the manufacturer), kilograms;
C_{new} = Nameplate capacity of new unit (omit if unit was pre-charged by the manufacturer), kilograms;
$R_{recharge}$ = HFC used to recharge the unit during maintenance and service, kilograms;
$R_{recover}$ = HFC recovered from the unit during maintenance and service, kilograms;
C_{retire} = Nameplate capacity of the retired unit, kilograms; and
R_{retire} = HFC recovered from the retired unit, kilograms.

(e) Fugitive CO_2 Emissions from Geothermal Facilities. Operators of geothermal electricity generating facilities shall calculate the fugitive CO_2 emissions using one of the following methods:

(1) Calculate the fugitive CO_2 emissions using Equation 40-3:

$$CO_2 = 7.53 \times Heat \times 0.001$$ **Equation 40-3**

Where:

CO_2 = CO_2 emissions, metric tons per year;
7.53 = Default fugitive CO_2 emission factor for geothermal facilities, kg per mmBtu~~MJ~~; and
Heat = Heat taken from geothermal steam and/or fluid, mmBtu~~MJ~~/yr.

(2) Calculate CO_2 emissions using [*insert jurisdiction*] approved source specific emission factor.

§ WCI.44 Sampling, Analysis, and Measurement Requirements

(a) CO_2, CH_4 and N_2O Emissions from Fuel Combustion. Operators using CEMS to estimate CO_2 emissions from fuel combustion shall comply with the requirements in section WCI.23(d). Operators using methods other than CEMS shall comply with the applicable fuel sampling, fuel consumption monitoring, heat content monitoring, and carbon content monitoring specified in section WCI.25.

(b) CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall measure the amount of limestone or other sorbent used during the reporting year.~~ using methods that comply with the measurement accuracy provisions in WCI.2(g).~~

(c) CO_2 Emissions from Geothermal Facilities. Operators of geothermal facilities shall measure the heat recovered from geothermal steam. If using source specific emission factor instead of the default factor, the operator shall conduct an annual test of the CO_2 emission rate using a method approved by [*insert jurisdiction*]. The operator shall submit a test plan to the [*insert jurisdiction*] for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [*insert jurisdiction*].

§ WCI.40 ELECTRICITY GENERATION (METRIC UNITS)

§ WCI.41 Source Category Definition

An electricity generating unit~~or~~ is any combustion device that combusts solid, liquid, or gaseous fuel for the purpose of producing electricity either for sale or for use onsite. This source category includes ~~excludes~~ cogeneration (combined heat and power) units~~ subject to WCI.50~~.

§ WCI.42 Greenhouse Gas Reporting Requirements

For each ~~facility~~electricity generating unit, the emissions data report shall include the following information:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CO_2 emissions for fossil fuels, reported by fuel type.

(2) Total CO_2 emissions for all biomass fuels combined.

(3) Total CH_4 emissions for fuels combined.

(4) Total N_2O emissions for all fuels combined.

(b) Annual fuel consumption:

(1) For gases, report in units of ~~million~~ standard ~~cubic feet or~~ cubic meters.

(2) For liquids, report in units of kilo~~gallons or~~ liters.

(3) For non-biomass solids, report in units of ~~short tons or~~ metric tons.

(4) For biomass-derived solid fuels, report in units of ~~bone dry short tons or~~ bone dry metric tons.

(c) Average carbon content of each fuel, if used to compute CO_2 emissions as specified in WCI.4~~4~~3.

(d) Average high heating value of each fuel, if used to compute CO_2 emissions as specified WCI.4~~4~~3.

(e) The nameplate generating capacity in megawatts and net power generated in the reporting year in megawatt hours.

(f) For each cogeneration unit, indicate whether topping or bottoming cycle and provide useful thermal output as applicable, in ~~mmBtu~~MJ. Where steam or heat is acquired from another facility for the generation of electricity, report the provider and amount of acquired steam or heat in MJ. Where supplemental firing has been applied to support electricity generation or industrial output, report this purpose and fuel consumption by fuel type using the units in WCI.42(b).

~~(f)~~(g) Process CO_2 emissions from acid gas scrubbers and acid gas reagent.

~~(g)~~(h) Fugitive emissions of HFC from cooling units that support power generation.

~~(h)~~(i) Fugitive CO_2 emissions from geothermal facilities.

~~(i)~~(j) Fugitive CO_2 emissions from coal storage at coal-fired electricity generating facilities shall be reported as specified in section WCI.100.

§ WCI.43 Calculation of Greenhouse Gas Emissions

(a) Calculation of CO_2 Emissions. Operators shall use CEMS to measure CO_2 emissions if required to operate a CEMS by any other federal, state, provincial, or local regulation. Operators not required to operate a CEMS by another regulation may use either CEMS or the calculation methods specified in paragraphs (a)(1) through (a)(7). Operators using CEMS to determine CO_2 emissions shall comply with the provisions in section WCI.23(d).

(1) Natural Gas. For electric generating units combusting natural gas, use one of the following methods:

(A) If the high heat value is greater than or equal to ~~975~~ 36.3 and less than or equal to ~~1,100 Btu/scf~~~~42.8~~40.98 MJ/scm use either:

~~(B)~~(i) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

~~(C)~~(ii) The measured heat content of the fuel and the calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

~~(D)~~(B) If the high heat value is less than ~~975~~ 36.3 or greater than ~~1,100 Btu/scf~~~~42.8~~40.98 MJ/scm, use the measured carbon content of the fuel and the calculation methodology 3 in section WCI.23(c).

(2) Coal or Petroleum Coke. For electric generating units combusting coal or petroleum coke, use the measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c).

(3) Middle Distillates, Gasoline, Residual Oil, or Liquid Petroleum Gases. For electric generating units combusting middle distillates (such as diesel, fuel oil, or kerosene), gasoline, residual oil, or LPG (such as ethane, propane, isobutene, n-butane, or unspecified LPG), use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(4) Refinery Fuel Gas, Flexigas, or Associated Gas. For electric generating units combusting refinery fuel gas, flexigas, or associated gas, use the methods specified in section WCI.30.

(5) Landfill Gas, Biogas, or Biomass. For electric generating units combusting landfill gas, biogas, or biomass, use one of the following methods:

(A) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or

(B) The measured heat content of the fuel and calculation methodology 2 in section WCI.23(b) provided the facility is not subject to the verification requirements of WCI.8.

(6) Municipal Solid Waste. Electric generating units combusting municipal solid waste, may use the measured steam generated, the default ~~carbon content~~ emission factor in WCI.20 Table 20-~~1~~7, and the calculation methodology in section WCI.23(b)(2) provided the facility is not subject to the verification requirements of WCI.8. If the facility is subject to the verification requirements of WCI.8, the operator shall use CEMS to measure CO_2 emissions in accordance with WCI.23(d), or calculate emissions using steam flow and a CO_2 emission factor ~~mmMJ~~according to the provisions of WCI.23(c)(2).

(7) Start-up Fuels. The operators of generating facilities that primarily combust biomass-derived fuels but combust fossil fuels during start-up, shut-down, or malfunction operating periods only, shall calculate CO_2 emissions from fossil fuel combustion using one of the following methods:

(A) The default emission factors from Tables ~~20-1 and 20-2~~20-2, 20-3, 20-5 or 20-7, as applicable, and calculation methodology 1 provided in section WCI.23(a);

(B) The measured heat content of the fuel and calculation methodology 2 provided in section WCI.23(b);

(C) The measured carbon content of the fuel and calculation methodology 3 provided in section WCI.23(c); or

(D) For combustion of refinery fuel gas, the measured heat content and carbon content of the fuel, and the calculation methodology provided in section WCI.30.

(8) Co-fired Electricity Generating Units. For electricity generating units that combust more than one type of fuel, the operator shall calculate CO_2 emissions as follows.

(A) For co-fired electricity generators that burn only fossil fuels, CO_2 emissions shall be determined using one of the following methods:

(i) A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method need not report emissions separately for each fossil fuel.

(ii) For units not equipped with a continuous emission system, calculate the CO2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(4) of this section.

(B) For co-fired electricity generators that burn biomass-derived fuel with a fossil fuel, CO_2 emissions shall be determined using one of the following methods:

(i) A continuous emission monitoring system in accordance with calculation methodology 4 in section WCI.23(d). Operators using this method shall determine the portion of the total CO_2 emissions attributable to the biomass-derived fuel and portion of the total CO_2 emissions attributable to the fossil fuel using the methods specified in section WCI.23(d)(4).

(ii) For units not equipped with a continuous emission system, calculate the CO_2 emissions separately for each fuel type using the methods specified in paragraphs (a)(1) through (a)(7) of this section.

(b) Calculation of CH_4 and N_2O Emissions. Operators of electricity generating units shall use the methods specified in section WCI.24 to calculate the annual CH_4 and N_2O emissions. For coal combustion, use the default CH_4 emission factor(s) in Table 20-6. ~~(TBD; update along with other text after metric tables are finalized).~~ ~~of 1g of CH_4/mmBtu [WCI will need to provide new factor in g of CH_4/MJ or other units].~~

(c) Calculation of CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall calculate the annual CO_2 emissions from these processes using Equation 40-1 if these emissions are not already captured in CO_2 emissions determined using a continuous emissions monitoring system.

$$CO_2 = S \times R \times \left(CO_{2\,MW} / Sorbent_{MW} \right)$$ **Equation 40-1**

Where:

CO_2	=	CO_2 emitted from sorbent for the report year, metric tons;
S	=	Limestone or other sorbent used in the report year, metric tons;
R	=	Ratio of moles of CO_2 released upon capture of one mole of acid gas;
$CO_{2\,MW}$	=	Molecular weight of carbon dioxide (44);
$Sorbent_{MW}$	=	Molecular weight of sorbent (if calcium carbonate, 100).

(d) Calculating Fugitive HFC Emissions from Cooling Units. Operators of electricity generating facilities shall calculate fugitive HFC emissions for each HFC compound used in cooling units that support power generation or are used in heat transfers to cool stack gases using either the methodology in paragraph (d)(1) or (d)(2). The Operator is not required to report GHG emissions from air or water cooling systems or condensers that do not contain HFCs.

(1) Use Equation 40-2 to calculate annual HFC emissions:

$$HFC = HFC_{inventory} + HFC_{purchases/acquisitions} - HFC_{sales/disbursements} + HFC_{\Delta capacity}$$ **Equation 40-2**

Where:

HFC	=	Annual fugitive HFC emission, metric tons;
$HFC_{inventory}$	=	The difference between the quantity of HFC in storage at the beginning of the year and the quantity in storage at the end of the year. Stored HFC includes HFC contained in cylinders (such as 115-pound storage cylinders), gas carts, and other storage containers. It does not include HFC gas held in operating equipment. The change in inventory will be negative if the quantity of HFC in storage increases over the course of the year.

$HFC_{purchases/acquisitions}$ = The sum of all HFC acquired from other entities during the year either in storage containers or in equipment.

$HFC_{sales/disbursements}$ = The sum of all the HFC sold or otherwise transferred offsite to other entities during the year either in storage containers or in equipment.

$HFC_{\Delta capacity}$ = The net change in the total nameplate capacity (i.e. the full and proper charge) of the cooling equipment). The net change in capacity will be negative if the total nameplate capacity at the end of the year is less than the total nameplate capacity at the beginning of the year.

(2) Use service logs to document HFC usage and emissions from each cooling unit. Service logs should document all maintenance and service performed on the unit during the report year, including the quantity of HFCs added to or removed from the unit, and include a record at the beginning and end of each report year. The operator may use service log information along with the following simplified material balance equations to quantify fugitive HFCs from unit installation, servicing, and retirement, as applicable. The operator shall include the sum of HFC emissions from the applicable equations in the greenhouse gas emissions data report.

$$HFC_{Install} = R_{new} - C_{new}$$

$$HFC_{Service} = R_{recharge} - R_{Recover}$$

$$HFC_{Retire} = C_{retire} - R_{retire}$$

Where:

$HFC_{Install}$ = HFC emitted during initial charging/installation of the unit, kilograms;
$HFC_{Service}$ = HFC emitted during use and servicing of the unit for the report year, kilograms;
HFC_{Retire} = HFC emitted during the removal from service/retirement of the unit, kilograms;
R_{new} = HFC used to fill new unit (omit if unit was pre-charged by the manufacturer), kilograms;
C_{new} = Nameplate capacity of new unit (omit if unit was pre-charged by the manufacturer), kilograms;
$R_{recharge}$ = HFC used to recharge the unit during maintenance and service, kilograms;
$R_{recover}$ = HFC recovered from the unit during maintenance and service, kilograms;
C_{retire} = Nameplate capacity of the retired unit, kilograms; and
R_{retire} = HFC recovered from the retired unit, kilograms.

(e) Fugitive CO_2 Emissions from Geothermal Facilities. Operators of geothermal electricity generating facilities shall calculate the fugitive CO_2 emissions using one of the following methods:

(1) Calculate the fugitive CO_2 emissions using Equation 40-3:

$$CO_2 = 7.14 \times Heat \times 0.001$$ **Equation 40-3**

Where:

CO_2 = CO_2 emissions, metric tons per year;
7.~~53~~14 = Default fugitive CO_2 emission factor for geothermal facilities, kg per ~~mmBtu~~G~~M~~J; and
Heat = Heat taken from geothermal steam and/or fluid, ~~mmBtu~~G~~M~~J/yr.

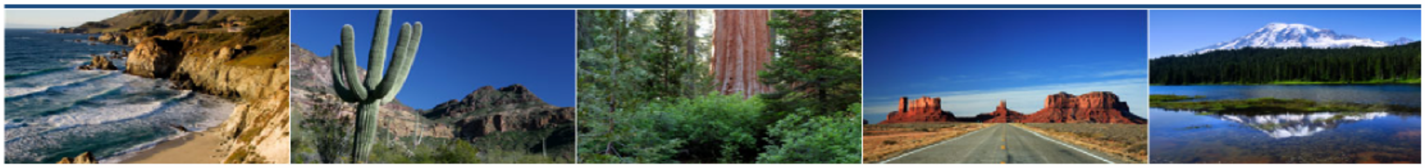
(2) Calculate CO_2 emissions using [*insert jurisdiction*] approved source specific emission factor.

§ WCI.44 Sampling, Analysis, and Measurement Requirements

(a) CO_2, CH_4 and N_2O Emissions from Fuel Combustion. Operators using CEMS to estimate CO_2 emissions from fuel combustion shall comply with the requirements in section WCI.23(d). Operators using methods other than CEMS shall comply with the applicable fuel sampling, fuel consumption monitoring, heat content monitoring, and carbon content monitoring specified in section WCI.25.

(b) CO_2 Emissions from Acid Gas Scrubbing. Operators of electricity generating units that use acid gas scrubbers or add an acid gas reagent to the combustion unit shall measure the amount of limestone or other sorbent used during the reporting year ~~using methods that comply with the measurement accuracy provisions in WCI.2(g)~~.

(c) CO_2 Emissions from Geothermal Facilities. Operators of geothermal facilities shall measure the heat recovered from geothermal steam. If using source specific emission factor instead of the default factor, the operator shall conduct an annual test of the CO_2 emission rate using a method approved by [*insert jurisdiction*]. The operator shall submit a test plan to the [*insert jurisdiction*] for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [*insert jurisdiction*].



~~Suggested Essential Requirements for Reporting of Imported~~

§ WCI.60 IMPORTED ELECTRICITY

[*The requirements in this attachment do not include the default emissions factors necessary for reporting imported electricity from asset-controlling suppliers or imports from unspecified sources. Default factors for unspecified sources are under development by the Electricity Committee and asset-controlling suppliers will need to approach each jurisdiction for approval of a differentiated default factor.*]

§ WCI.61 Definitions

"Asset-controlling supplier" means any entity that owns or operates electricity generating facilities or serves as an exclusive marketer for certain generating facilities even though it does not own them, and is assigned a supplier-specific identification number for its fleet of generating facilities by [*the jurisdiction*].

"Balancing authority" means a responsible entity that integrates resource plans ahead of time, maintains load-interchange-generation balance within a Balancing Authority Area, and supports interconnection frequency in real time.

"Balancing authority area" means the collection of generation, transmission, and loads within the metered boundaries of a balancing authority. A balancing authority maintains load-resource balance within this area.

"Busbar" means a power conduit of an electricity generating facility that serves as the starting point for the electricity transmission system.

"Electricity generating facility" means a facility that generates electricity and includes one or more electricity generating units at the same location.

"Electricity importer" means [common boundary FJD] an owner of imported electricity ~~generated outside the WCI region~~[*or electricity wheeled through the WCI Region*] as it is delivered to the first point of delivery in the WCI Region ~~for electricity having a final point of delivery in the WCI Region~~ or; [individual boundary FJD] an owner of imported electricity ~~generated outside the WCI region~~[*or electricity wheeled through the WCI Region*] as it is delivered to the first point of delivery in the WCI Partner jurisdiction of the final point of delivery ~~[Both definitions included until the Partners make a final decision on the boundary issue~~. [The definition used may vary by jurisdiction.]

"Electricity transaction" means the purchase, sale, import, export or exchange of electric power.

"Electricity wheeled through the WCI Region" means electricity that is imported into the WCI Region but is simultaneously exported out of the WCI Region and has a final point of delivery in a location outside of the WCI Region.

"Entity" means a person, firm, association, organization, partnership, business trust, corporation, limited liability company, company, or government agency.

"Exchange agreement" means a commitment between electricity market participants to swap energy for energy. Exchange transactions do not involve transfers of payment or receipts of money for the full market value of the energy being exchanged, but may include payment for net differences due to market price differences between the two parts of the transaction or to settle minor imbalances.

"Final point of delivery" means the last point of delivery for a given electricity transaction.

"First Jurisdictional Deliverer" means the owner or operator of an electricity generating facility in a WCI Partner jurisdiction or an electricity importer that is jurisdictional to the regulatory authority of a WCI Partner jurisdiction or the immediate downstream purchaser or recipient of electricity from a non-jurisdictional electricity importer.

"Gross generation" means the total electrical output of the generating unit, expressed in megawatt hours (MWh) per year.

"Imported ~~power~~electricity" means electric power generated ~~in a non-WCI location~~outside the WCI Region, delivered into the WCI Region and having a final point of delivery in the WCI Region.

"Megawatt hour" or "MWh" means the electrical energy unit of measure equal to one million watts of power supplied to, or taken from, an electric circuit steadily for one hour.

"Multi-jurisdictional retail provider" means a retail provider that provides electricity to consumers in ~~a WCI Partner~~[*the jurisdiction*] and in one or more other non-WCI ~~states and provinces~~jurisdictions in a contiguous service territory.

"Nameplate generating capacity" means the maximum rated output of a generator under specific conditions designated by the manufacturer, expressed in megawatts (MW) or kilowatts (kW).

"Net power generated" means the gross generation minus station service or unit service power requirements, expressed in megawatt hours (MWh) per year. In the case of cogeneration, this value is intended to include internal consumption of electricity for the purposes of a production process, as well as power put on the grid.

"NERC E-tag" means North American Electric Reliability Corporation (NERC) energy tag representing transactions on the North American bulk electricity market scheduled to flow between or across balancing authority areas.

"Point of delivery" means a point on an electricity transmission or distribution system where a power supplier delivers electricity to the receiver of that energy. This point can be an interconnection with another system or a substation where the transmission provider's transmission and distribution systems are connected to another system, or a distribution substation where electricity is imported into the WCI region over a multi-jurisdictional retail provider's distribution system.

"Power contract" means an arrangement for the purchase of electricity. Power contracts may be, but are not limited to, power purchase agreements and tariff provisions.

"Purchasing/selling entity" means an entity that purchases or sells energy or capacity and ~~reserve~~reserves transmission services between or among balancing authority areas.

"Renewable energy" means energy from sources that constantly renew themselves or that are regarded as practically inexhaustible. Renewable energy includes, but is not limited to, energy derived from solar, wind, geothermal, hydroelectric, wood, biomass, tidal power, sea currents, and ocean thermal gradients.

"Renewable energy certificate" or "renewable energy credit" means a certificate of proof issued by an approved generation information system or third-party verifier that one MWh of electricity was generated by a renewable energy source.

"Retail provider" means an entity that provides electricity to retail end users in [*the* ~~WCI Region~~*jurisdiction*].

"Specified source" means a specific electricity generating unit or electricity generating facility which can be matched to a reported electricity transaction due to full or partial ownership by the first jurisdictional deliverer or due to its identification in a power contract with the first jurisdictional deliverer.

~~"Stationary source" means any building, structure, facility, or installation that emits or may emit greenhouse gases.~~

"Unspecified source" means electricity generation that cannot be matched to a specific electricity generating facility or electricity generating unit. Unspecified sources of ~~power~~ electricity may include ~~power~~electricity purchased from entities that own fleets of generating facilities such as independent power producers, retail providers, and federal power agencies and power purchased from electricity marketers, brokers, and markets.

"Western Climate Initiative" or "WCI" means a collaborative effort of the U.S. states and Canadian provinces that comprise the WCI Region to reduce greenhouse gas emissions in their respective jurisdictions.

"WCI Region" means the Canadian provinces of British Columbia, Manitoba, Ontario, and Quebec plus the U.S. states of Arizona, California, Montana, New Mexico, Oregon, Utah, and Washington, excluding lands that are not subject to state or provincial jurisdiction.

§ WCI.62 Greenhouse Gas Emissions Data Report: First Jurisdictional Deliverers of Imported ~~Power~~Electricity

(a) General Requirements. First jurisdictional deliverers shall meet the following general requirements in preparing their greenhouse gas emissions data report for each report year. When reporting emissions and electricity transactions, first jurisdictional deliverers, excluding imported electricity that is imported at the distribution level by multi-jurisdictional retail providers, shall:

(1) Specify the amount of greenhouse gas emissions in metric tons CO_2e;

(2) Specify the amount of electricity in MWh;

~~(3)~~ Aggregate imported ~~power by point of delivery;~~

~~(4) Report the amount of~~ electricity ~~as measured at the first point of delivery in the WCI Region;~~

(3) ~~For electricity from unspecified sources, disaggregate imported power for each point of delivery by purchasing/seller entity from which the power was purchased, if~~ and emissions from specified sources by electricity generating facility or electricity generating unit, as applicable;

(4) For electricity from specified sources, specify the facility name, the facility ID, and, if applicable, the electricity generating unit ID for the unit generating the ~~power, if~~electricity;

(5) Report the amount of imported electricity from specified sources as measured at the busbar;

(6) For imported electricity transactions from specified sources where measurements at the busbar are not known, report the amount of imported electricity from the applicable~~;~~ specified sources as measured at the first point of delivery in [*the jurisdiction]* and report estimated transmission losses for each specified source;

(7) Report the amount of electricity from unspecified sources as measured at the first point of delivery in [*the jurisdiction*];

(8) For electricity from unspecified sources, disaggregate imported electricity by the balancing authority area or other geographic area as defined by [*the jurisdiction*] from which the electricity originated;

(9) Report the amount of electricity from asset-controlling suppliers as measured at the first point of delivery in [*the jurisdiction*];

(10) For electricity from asset-controlling suppliers, disaggregate imported electricity by the asset-controlling or asset-owning supplier from which the electricity was purchased;

(11) Report the number of renewable energy certificates from sources not in the WCI region that are retired, or whose greenhouse gas source specification fields are retired, as applicable, associated with imported electricity from an unspecified ~~imported power~~source or imported electricity from a specified ~~imported power~~source having an emission rate equal to or less than the default rate for the ~~region~~balancing authority where the specified generating facility is located;

(12) Specify electricity imported under exchange agreements as you would other import transactions;

(13) Report quantities of ~~imported~~ electricity wheeled through the WCI Region ~~to a final point of delivery outside the WCI Region~~ as measured at the first point of delivery inside ~~the WCI Region~~[*the jurisdiction*];

(14) Retain for purposes of verification NERC E-tags, power contracts, settlements data, and all other information needed to confirm the transactions.

(b) Report Content. First Jurisdictional Deliverers shall include the following information in the greenhouse gas emissions data report for each report year.

(1) Specified Imported ~~Power~~ Electricity Transactions. ~~Electricity~~ Imported electricity and emissions from specified sources for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer.

(A) ~~Power~~ Electricity imported into the WCI Region from a specified hydroelectric generating facility with nameplate capacity of greater than 30 MW that was operational prior to January 1, 2008 or from a specified nuclear facility that was operational prior to January 1, 2008 shall be listed as one of the following:

(i) ~~Power~~ Electricity purchased with a contract in effect prior to January 1, 2008 that remains in effect or has been renegotiated for the same facility for the same share or quantity of net generation within one year of contract expiration;

(ii) ~~Power~~Electricity purchased not meeting ~~(2~~WCI.62(b)(1)(A)~~1.a~~(i) and that is not associated with an increase in the facility's generating capacity;

(iii) ~~Power~~Electricity purchased not meeting ~~(2~~WCI.62(b)(1)(A)~~1.a~~(i) that is associated with an increase in the facility's generating capacity due to increased efficiencies or other capacity increasing actions;

(iv) ~~Power~~Electricity purchased from hydroelectric generating facilities during a "spill or sell" situation where power not purchased is lost;

(v) ~~Power~~Electricity purchased that does not meet ~~(2~~WCI.62(b)(1)(A)~~1.a~~(i) due to federal power redistribution polices for federally owned resources and not related to price bidding.

(2) Unspecified Imported ~~Power~~Electricity Transactions. ~~Electricity~~ Imported electricity and emissions from unspecified sources for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer~~ with final point of delivery in the WCI Region~~.

(3) ~~Electricity Wheeled Through the WCI Region. Power imported into the WCI Region~~Imported Electricity from Asset-Controlling Suppliers. Imported electricity and emissions from asset-controlling suppliers for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer~~ with a final point of delivery outside of the WCI Region, measured at the first point of delivery in the WCI Region~~.

(4) Electricity Wheeled Through the WCI Region. Electricity wheeled through the WCI Region for which the First Jurisdictional Deliverer is the electricity importer or that the First Jurisdictional Deliverer purchased or received immediately downstream from a non-jurisdictional electricity importer.

§ WCI.63 Calculation of Emissions from Specified Sources

For each specified source, calculate CO_2 mass emissions using one of the two calculation methodologies specified in this section.

(a) Calculation Methodology 1: If the specified source reports emissions to [*the jurisdiction*], The Climate Registry, the U.S.EPA under 40 CFR Part 75 or to Environment Canada under Section 71 of the Canadian Environmental Protection Act calculate emissions using Equation 60-1:

$$CO_2 = CO_{2t} \times \frac{MWh_{imp}}{MWh_t} \qquad \textbf{Equation 60-1}$$

Where:

CO_2 = Annual CO_2 mass emissions for imported electricity from the specified source (metric tons).

CO_{2t} = Total annual CO_2 mass emissions from the specified source (metric tons) reported, in order of preference, to [*the jurisdiction*], The Climate Registry, or to the U.S.EPA or Environment Canada.

MWh_{imp} = Megawatt-hours of electricity imported from the specified source, including estimated losses for transactions not measured at the busbar.

MWh_t = Total megawatt-hours of net power generated by the specified source.

(b) Calculation Methodology 2: If the specified source does not report emissions to [*the jurisdiction*], The Climate Registry, the U.S.EPA under 40 CFR Part 75 or to Environment Canada under Section 71 of the Canadian Environmental Protection Act, calculate emissions using Equation 60-2:

$$CO_2 = \sum HHV_f \times EF_f \times 0.001 \times \frac{MWh_{imp}}{MWh_t} \qquad \textbf{Equation 60-2}$$

Where:

CO_2 = Annual CO_2 mass emissions for a specific fuel type (metric tons).

HHV_f = Higher heating value of the fuel *f* consumed for electricity production as reported in U.S. EIA Form 923, or its successor (mmBtu).

EF_f = Fuel-specific default CO_2 emission factor, from column 5 of Table 20-1 or from Table 20-2 (kg CO_2/mmBtu).

0.001 = Conversion factor from kilograms to metric tons.

MWh_{imp} = Megawatt-hours of electricity imported from the specified source.

MWh_t = Total megawatt-hours of net power generated by the specified source as reported in U.S. EIA Form 923, or its successor.

§ WCI.64 Calculation of Emissions from Asset-Controlling Suppliers and Unspecified Sources

For imported electricity from asset-controlling suppliers or unspecified sources, calculate emissions using the methodology specified in this section.

(a) Calculation Methodology: Calculate the annual CO_2 mass emissions by multiplying the reported quantities of imported electricity from each asset-controlling supplier, balancing authority area, or other geographic region defined by [*the jurisdiction*] by the appropriate default emission factor according to Equation 60-3:

$$CO_2 = MWh \times DEF \qquad \text{Equation 60-3}$$

Where:

CO_2 = Annual CO_2 mass emissions for imported electricity from the specified source (metric tons).

MWh = Megawatt-hours of electricity imported from the asset-controlling supplier, balancing authority area, or other geographic region defined by [*the jurisdiction*].

DEF = The default emission factor corresponding to the asset-controlling supplier, balancing authority area, or other geographic region defined by [*the jurisdiction*].

§ WCI.65 Greenhouse Gas Emissions Data Report: Additional Requirements for Retail Providers Only

[*This section is optional. It is intended for any WCI jurisdiction that wishes to collect information about high-GHG generating facilities in other jurisdictions owned by retail providers serving its own jurisdiction.*]

Retail providers ~~that serve consumers in the WCI Region~~ shall include the following information in the greenhouse gas emissions data report for each report year, in addition to the information identified in the sections above.

~~(c)~~(a) If the retail provider holds a contract that entitles the retail provider to a specified percentage of the generation in the report year from an electricity generating facility not located in the WCI Region, the retail provider shall include ~~power~~ electricity purchased or sold from that facility as being from a partially owned facility.

(b) For electricity generating facilities not located in the WCI Region that are fully or partially owned by the retail provider that have CO2 emissions greater than 500 kg of CO2 per MWh based on the most recent greenhouse gas emissions data report that received a positive verification opinion or on CO2 emissions reported to U.S.EPA under 40 CFR Part 75 or reported to Environment Canada under Section 71 of the Canadian Environmental Protection Act, the retail provider shall include:

(1) Facility name, state/province designated facility ID, state/province designated generating unit ID as applicable, percent ownership share at the facility level, ownership share at the generating unit level as applicable, and both net and gross power generated in the report year;

~~(2)~~ Quantity of ~~power from the~~ electricity ~~generating facility or electricity generating unit measured at the busbar and imported into the WCI Region with a final point of delivery in the WCI Region;~~

(2) ~~Quantity of power~~ sold by the retail provider or on behalf of the retail provider from the electricity generating facility or electricity generating unit ~~measured at the busbar and with~~having a final point of delivery outside the WCI Region~~. These quantities shall be disaggregated by purchasing counterparty.~~, as measured at the busbar.

§ WCI.~~64~~66 Greenhouse Gas Emissions Data Report: Additional Requirements

for Multi-~~Jurisdiction~~Jurisdictional Retail Providers Only.

[*This section applies only to jurisdictions with Multi-Jurisdictional Retail Providers, as defined.*]

Multi-jurisdictional retail providers that import ~~power~~ electricity into the WCI Region at the distribution level shall include the following information in the greenhouse gas emissions data report for each report year~~,~~ in addition to the information identified in the sections above. Multi-jurisdictional retail providers meeting this condition shall provide:

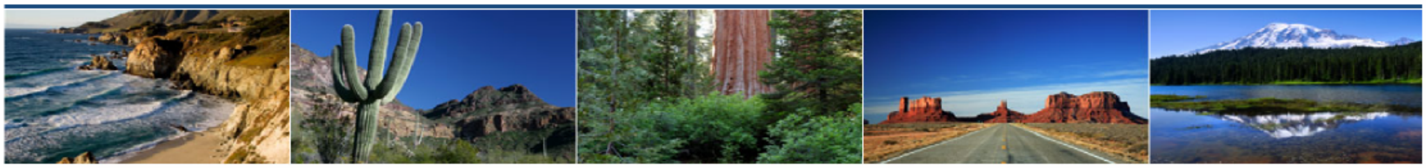
(a) A report of the greenhouse gas emissions associated with serving the load of the service territory that includes consumers in ~~the WCI Region~~[*the jurisdiction*] following [*the jurisdiction's*] reporting protocol for retail providers or The Climate Registry's Electric Power Sector Protocol ~~or the applicable state or provincial reporting protocol for retail providers~~;

(b) The total retail load served by the multi-jurisdictional retail provider in the service territory that includes consumers in ~~the WCI Region;~~[*the jurisdiction*];

(c) The retail load of customers served in ~~the WCI Region~~[*the jurisdiction's*] portion of the service territory; ~~and~~

(d) ~~A report on adjustments to~~The greenhouse gas emissions associated with the imported electricity as the quantity of emissions reported in WCI.64(a) multiplied by the ratio of the quantity of electricity reported in WCI.64(b) to the quantity of electricity reported in WCI.64(c); and

(e) If the ~~service territory's~~ average emission ~~rate that cause the average emission rate to~~ rates differ among the various state or provincial portions of the service territory due to mandatory factors such as different Renewable Portfolio Standard requirements in [*the jurisdiction*] and the ~~WCI state or province and~~other jurisdictions, the ~~non-WCI state(s) or province(s).~~multi-jurisdictional retail provider may report an adjusted quantity of greenhouse emissions and file a report that describes how the quantity reported in WCI.64(d) was adjusted.



§ WCI.70 PRIMARY ALUMINUM PRODUCTION

§ WCI.71 Source Category Definition

A primary aluminum production process converts alumina mineral to aluminum metal using electrolysis.

§ WCI.72 Greenhouse Gas Reporting Requirements

For each facility that includes a primary aluminum production process, the emissions data report must contain the following information:

(a) CO_2 emissions from anode consumption from prebaked and Søderberg electrolysis cells.

(b) CO_2 emissions from anode and cathode baking.

(c) CF_4 and C_2F_6 emissions for anode effects.

(d) CO_2 emissions from green coke calcination.

(e) SF_6 emissions from cover gas consumption.

(f) CO_2, N_2O, and CH_4 emissions from stationary combustion units as specified in WCI.20.

(g) Annual aluminum production.

§ WCI.73 Calculation of GHG Emissions

(a) Calculate CO_2 emissions from anode consumption using either Equation 70-1 or 70-2, as applicable.

(1) For Prebaked Anodes:

$$E_{CO_2} = \sum_{i=1}^{12} [NCC \times MP \times \frac{(100 - S_a - Ash_a - Imp_a)}{100} \times 3.664]_i$$ **Equation 70-1**

Where:

E_{CO2}	=	Annual CO_2 emissions (metric tons).
NCC	=	Net anode consumption per metric ton of aluminum for month i (metric ton/ metric ton aluminum).
MP	=	Aluminum production for month i (metric ton).
S_a	=	Sulfur content in baked anodes for month i (wt %).
Ash_a	=	Ash content in baked anodes for month i (wt %).
Imp_a	=	Content of fluorine and other impurities in baked anodes for month i (wt %).
3.664	=	Conversion factor from carbon to CO_2.

(2) For Søderberg Anodes:

$$E_{CO_2} = \sum_{i=1}^{12} \left[\begin{array}{l} (PC \times MP) - \left(BSM \times \frac{MP}{1000} \right) - \left(\frac{BC}{100} \times PC \times MP \times \left(\frac{S_p + Ash_p + H_p}{100} \right) \right) \\ - \left(\frac{100 - BC}{100} \times PC \times MP \times \frac{S_c + Ash_c}{100} \right) \end{array} \right]_i \times 3.664$$

Equation 70-2

Where:

E_{CO2}	=	Annual CO_2 emissions (metric tons).
PC	=	Paste consumption for month i (metric tons paste/metric ton aluminum).
MP	=	Aluminum production for month i (metric tons).
BSM	=	Emissions of benzene-soluble matter (kilograms benzene-soluble matter/metric ton aluminum).
BC	=	Average binder (pitch) content in paste for month i (wt %).
S_p	=	Sulfur content in pitch for month i (wt %).
Ash_p	=	Ash content in pitch (wt %).
H_p	=	Hydrogen content in pitch (wt %).
S_c	=	Sulfur content in calcinated coke (wt %).
Ash_c	=	Ash content in calcinated coke (wt %).
3.664	=	Conversion factor from carbon to CO_2.

(b) If anode or cathode baking is performed onsite, calculate CO_2 emissions as specified in paragraphs (b)(1) or (2) as applicable. Total emissions as specified in paragraph (b)(3) if both (b)(1) and (2) are applicable.

(1) Calculate CO_2 emissions from packing coke using Equation 70-3.

$$EC_{CO_2} = \sum_{i=1}^{12} \left(PCC \times BAP \times \frac{100 - Ash_{pc} - S_{pc} - Imp}{100} \right)_i \times 3.664$$

Equation 70-3

Where:

EC_{CO2}	=	Annual CO_2 emissions (metric tons pre year).
PCC	=	Packing coke consumption per metric ton of baked anode for month i (metric tons coke/metric ton anodes).
BAP	=	Baked anode production for month i (metric tons).
Ash_{pc}	=	Ash content in packing coke for month i (wt %).
S_{pc}	=	Sulfur content in packing coke for month i (wt %).
Imp	=	Content of other impurities for month i (wt %).
3.664	=	Conversion factor from carbon to CO_2.

(2) Calculate CO_2 emissions from pitch coking using Equation 70-4.

$$EP_{CO_2} = \sum_{i=1}^{12} \left(GAW - BAP - \left(\frac{H_p}{100} \times \frac{PC}{100} \times GAW \right) - RT \right)_i \times 3.664$$ **Equation 70-4**

Where:

EP_{CO2} = CO_2 emissions (metric tons pre year).
GAW = Green anode consumption for month i (metric tons).
BAP = Baked anode production for month i (metric tons).
H_p = Hydrogen content in pitch for moth i (wt %).
PC = Pitch content in green anode for month i (wt %).
RT = Recovered tar for month i (metric tons).
3.664 = Conversion factor from carbon to CO_2.

(3) Calculate total CO_2 emissions for anode baking using Equation 70-5.

$$E_{anodebaking} = EC_{CO2} + EP_{CO2}$$ **Equation 70-5**

Where:

$E_{anodebaking}$ = Total annual CO_2 emissions from anode baking (metric tons).

EC_{CO2} = Annual CO_2 emissions from packing coke (metric tons).

EP_{CO2} = Annual CO_2 emissions from pitch coking (metric tons).

(c) Calculate CF_4 and C_2F_6 emissions from anode effects for each pot line using either the Slope Method in paragraph (c)(1) or the Pechiney Method in paragraph (c)(2).

(1) **Slope Method:** Calculate the CF_4 and C_2F_6 emissions using Equation 70-6.

$$E_{CF_4, C_2F_6} = \sum_{i=1}^{n} [slope_{CF_4, C_2F_6} \times AEF \times AED \times MP]_i$$ **Equation 70-6**

Where:

$E_{CF4, C2F6}$ = Annual emissions of CF_4 or C_2F_6 (metric tons/yr).

$slope_{CF4, C2F6}$ = Measured slope coefficient ([Metric tons of CF_4 or C_2F_6 /metric ton Aluminum]/[anode effect minutes/pot-days]).
AEF = Anode effect frequency (number of anode effects per pot per day).
AED = Anode effect duration (minutes per anode effect).
MP = Aluminum production per day (metric tons).
n = Number of operating days per year.

(2) **Pechiney Method:** Calculate the CF_4 and C_2F_6 emissions using Equation 70-7.

$$E_{CF_4,C_2F_6} = \sum_{i=1}^{n}[Over-voltage\ \ coefficient_{CF_4,C_2F_6} \times \frac{AEO}{CE} \times MP]_i \qquad \textbf{Equation 70-8}$$

Where:

$Emission_{CF4, C2F6}$	=	Emissions of CF_4 or C_2F_6 (metric tons/yr).
Over-voltage $coefficient_{CF4, C2F6}$	=	Experimentally measured ([Metric tons of CF_4 or C_2F_6 /metric ton Aluminum]/mV).
AEO	=	Anode effect over-voltage (millivolts per pot per day).
CE	=	Current efficiency of aluminum production process, expressed as a fraction.
MP	=	Aluminum production per day (metric tons).
n	=	Number of operating days per year.

(d) Calculate CO_2 emissions from onsite green coke calcination furnaces using Equation 70-9.

$$E_{CO_2} = \sum_{n=1}^{12}\left[\left[GC \times \frac{\left(100 - H_2O_{gc} - V_{gc} - S_{gc}\right)}{100} - \left(CC + UCC + DE\right) \times \frac{\left(100 - S_{cc}\right)}{100}\right] \times 3.664\right]_i + \left[GC \times 0.035 \times \frac{44}{16}\right]_i \qquad \textbf{Equation 70-9}$$

Where:

E_{CO2}	=	CO_2 emissions (metric tons pre year).
GC	=	Green coke feed for month i (metric tons).
H_2O_{gc}	=	Humidity in green coke feed for month i (wt %).
V_{gc}	=	Volatiles in green coke feed for month i (wt %).
S_{gc}	=	Sulfur content in green coke feed in month i (wt %).
S_{cc}	=	Sulfur content in calcinated coke in month i (wt %).
CC	=	Calcinated coke produced in month i (metric tons).
UCC	=	Under-calcinated coke produced in month i (metric tons).
DE	=	Coke dust emissions for month i (metric tons).
3.664	=	Conversion factor from carbon to CO_2.
0.035	=	Assumed CH_4 and tar content in coke volatiles, contributing to CO_2 emissions.
44/16	=	Conversion factor from methane to CO_2.

(e) Calculate SF_6 emissions from cover gas consumption using one of the following methods:

(1) Calculate the annual SF_6 emissions using inventory records and Equation 70-10:

$$E_{SF6} = S_{Inv-Begin} - S_{Inv-End} + S_{Purchased} - S_{Shipped} \qquad \textbf{Equation 70-10}$$

Where:

E_{SF6}	=	SF_6 emissions from cover gas (metric tons).

$S_{Purchased}$ = Quantity of SF_6 purchased (metric tons).
$S_{Shipped}$ = Quantity of SF_6 shipped offsite (metric tons).
$S_{Inv\text{-}Begin}$ = Quantity of SF_6 in storage at the beginning of the year, (metric tons).
$S_{Inv\text{-}End}$ = Quantity of SF_6 in storage at the end of the year (metric tons).

(2) Calculate the annual SF_6 emissions using Equation 70-11 and direct measurement of the SF6 input to electrolysis cells and the SF6 waste gases collected and transferred off-site:

$$E_{SF6} = \sum_{i=1}^{12}[(Q_{Input} \times C_{Input}) - (Q_{Output} \times C_{Output})]_i \qquad \textbf{Equation 70-11}$$

Where:
E_{SF6} = SF_6 emissions from cover gas (metric tons).
$Q_{in;put}$ = Quantity of SF_6 input to the electrolysis cell for month i (metric tons).
C_{Input} = Concentration of SF_6 input to the electrolysis cell for month i (metric tons).
Q_{Output} = Quantity of SF_6 gas collected during month i (if applicable) (metric tons).
C_{Output} = Concentration of SF_6 gas collected and sent off-site during month i (metric tons).

§ WCI.74 Monitoring Requirements

(a) Except as specified in paragraphs (b) through (c) of this section, all parameters must be measured monthly. ~~using methods that comply with the measurement accuracy provisions in WCI.2(g).~~

(b) Conduct performance tests once every 36 months to determine the slope or Pechiney coefficients for each pot line using the *Protocol for Measurement of Tetrafluoromethane and Hexafluoroethane Emissions from Primary Aluminum Production*, U.S. Environmental Protection Agency and International Aluminum Institute. April 2008. The test must be repeat whenever:

(1) Thirty-six months have passed since the last measurements;

(2) A change occurs in the control algorithm that affects the mix of types of anode effects or the nature of the anode effect termination routine; or

(3) Changes occur in the distribution ~~of~~ or duration of anode effects (e.g. when the percentage of manual kills changes or if, over time, the number of anode effects decreases and results in a fewer number of longer anode effects) or, for Rio Tinto Alcan control technology, when the algorithm for bridge movements and anode effect overvoltage accounting changes.

~~(c)~~If using the direct measurement approach in WCI.73(e)(2) to calculate SF_6 emissions from cover gas consumption, you must measure the quantity of SF_6 gas input to the electrolysis cell month and the quantity and SF_6 concentration of any waste gas collected and sent off-site.

~~(d) Monitoring methods have not been specified in the available methodologies for the aluminum industry. There are several possible approaches to specifying monitoring methods:~~

~~(e)~~

~~**(f)**Specify the accuracy required for each datum and allow the source to select their own methodologies that meet the accuracy requirements, and require the verifiers to certify the accuracy requirements were achieved, [This approach is especially useful for monitoring that is currently being made with a wide variety of instruments and are likely being made with high accuracy, such as monitoring of raw material flows and product flows; however, much burden is placed on verifiers to ensure the accuracy of the methods used. This approach is used for monitoring fuel flow for combustion sources.]~~

~~**(g)**Specify the accuracy required for each datum and require the source to submit a monitoring plan that meets the accuracy requirements, and require the verifiers to certify the source followed the approved plan. [This approach places a lot of burden on WCI to approve individual monitoring plans.]~~

~~**(h)**Specify the methodologies that should be followed, selecting them from available ASTM, ISO, U.S. EPA, and EC methodologies; however, there are not established methods for all parameters. Listed below are examples of the available methodologies for monitoring the aluminum industry.~~

~~**(i)**~~

~~(j) ISO 9055:1988. Carbonaceous materials for the production of aluminum -- Pitch for electrodes -- Determination of sulfur content by the bomb method.~~

~~(k)~~

~~(l) ISO 10238:1999. Carbonaceous materials used in the production of aluminum -- Pitch for electrodes -- Determination of sulfur content by an instrumental method.~~

~~(m)~~

~~(n) ISO 8006:1985. Carbonaceous materials used in the production of aluminum -- Pitch for electrodes -- Determination of ash.~~

~~(o)~~

~~(p) ISO 8005-2005. Carbonaceous materials used in the production of aluminum -- Green and calcined coke -- Determination of ash content~~

~~(q)~~

~~(r) ISO 10237-1997. Carbonaceous materials for use in the production of aluminum -- Calcined coke -- Determination of residual hydrogen content.~~

~~(s)~~

~~(t) ISO 5931:2000. Carbonaceous materials used in the production of aluminum -- Calcined coke and calcined carbon products -- Determination of total sulfur by the Eschka method.~~

~~(u)~~

~~(v) Slope and Over-voltage Coefficient: Protocol for Measurement of Tetrafluoromethane and Hexafluoroethane Emissions from Primary Aluminum Production. U.S. Environmental Protection Agency and International Aluminum Institute. April 2008.~~

~~(w)~~

~~(x) ASTM D3173 Test Method for Moisture in the Analysis Sample of Coal and Coke~~

~~(y)~~

~~(z) The following parameters are not covered by a specific ASTM or ISO methodology. They are candidates for being addressed using one of the first two approaches listed above.~~

~~**(aa)**Mass flow rates or consumption of aluminum, paste, carbon, anodes, coke, recovered tar, and coke dust,~~

~~**(bb)**Emissions of benzene soluble matter,~~

~~**(cc)**Binder content in paste,~~

~~**(dd)**Pitch content in anodes,~~

~~**(ee)**Current efficiency,~~

~~**(ff)**Anode effect frequency,~~

~~**(gg)**Anode effect duration,~~

~~**(hh)**Anode effect over-voltage,~~

~~**(ii)**Current efficiency,~~

(c) ~~Volatile content in coke.~~

§ WCI.90 CEMENT MANUFACTURING

§ WCI.91 Source Category Definition

Cement manufacturing is comprised of all processes that are used to manufacture Portland, natural, masonry, pozzolanic, or other hydraulic cements.

§ WCI.92 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2, CH_4, and N_2O in metric tons.

(b) CO_2 process emissions from calcination (metric tons) and the following information:

(1) Plant specific c~~C~~linker emission factor (kg CO_2/metric ton clinker).

(A) Quantity of clinker produced (metric tons).

(B) Total lime (CaO) content of clinker (wt. fraction).

(C) Total magnesium Oxide (MgO) content of clinker (wt. fraction).

(D) Total carbonate ~~Uncalcined CaO~~(CO_2) content of clinker (wt. fraction).

~~(E) Uncalcined MgO (wt. fraction).~~

(2) Cement kiln dust (CKD) emission factor (kg CO_2/metric ton CKD discarded).

(A) Plant specific CKD calcination rate (unitless ratio).

(B) Quantity of CKD discarded (metric tons).

(c) CO_2 process emissions from organic carbon oxidation (metric tons) and the following information:

(1) Amount of raw material consumed in the report year (metric tons).
(2) Organic carbon content of raw material (wt. fraction).

(d) CO_2, CH_4, and N_2O emissions from fuel combustion in all kilns combined, following the calculation methods and reporting requirements specified in WCI.93(c) (metric tons).

(e) CO_2, CH_4, and N_2O emissions from all other fuel combustion units combined (kilns excluded), following the calculation methods and reporting requirements specified in WCI.20 (metric tons).

(f) If a continuous emissions monitor is used to measure CO_2 emissions from kilns, then the requirements of paragraphs (b), (c), and (d) of this section do not apply for CO_2. Cement plants that measure CO_2 emissions using CEMS shall report fuel usage by fuel type for kilns.

(g) Operators of cement plants shall also comply with the reporting requirements for any other applicable source category listed at WCI.1(a), including but not limited to the following:

(1) Coal fuel storage as specified in WCI.100.

(2) Electricity generating as specified in WCI.40.

(3) Cogeneration systems as specified in WCI.50.

§ WCI.93 Calculation of Greenhouse Gas Emissions From Kilns

(a) ~~(a)~~ Determine CO_2 emissions as specified under either paragraph (a)(1) or (a)(2) of this section.

(1) Use a continuous emissions monitoring system (CEMS) as specified in WCI.23(d).

(2) Calculate the sum of CO_2 process emissions from kilns and CO_2 fuel combustion emissions from kilns using the calculation methodologies specified in paragraph (b) and (c) of this section.

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions as the sum of emissions from calcination, using the method specified in paragraph (b)(1) of this section; and from organic carbon oxidation, using the method specified in paragraph (b)(2) of this section (Equation 90-0).

$$CO_2 \text{ process} = CO_2 \text{ calcination} + CO_2 \text{ raw material} \qquad \textbf{Equation 90-0}$$

(1) Calcination Emissions. Calculate CO_2 process emissions from calcination using Equation 90-1 and a plant-specific clinker emission factor and a plant-specific cement kiln dust (CKD) emission factor as specified in this section.

$$CO_{2-C} = \sum_{i=1}^{12} [(Cli) \times (EF_{Cli})] + [(Q_{CKD}) \times (EF_{CKD})] \qquad \textbf{Equation 90-1}$$

Where:

$CO_{2\text{-}C}$ = CO_2 emissions from calcination, metric tones.
Cli = Monthly quantity of clinker produced, metric tons.
EF_{Cli} = Monthly clinker emission factor, metric tons CO_2/metric ton clinker computed as specified in paragraph (b)(1)(A) of this section.
Q_{CKD} = Monthly quantity CKD discarded (i.e., not recycled to the kiln), metric tons.
EF_{CKD} = Monthly CKD emission factor, computed as specified in paragraph (b)(1)(B) of this section.

(A) ~~Monthly~~ Clinker Emission Factor. Calculate a ~~monthly~~ plant-specific clinker emission factor (EF_{Cli}) for each report year based on monthly measurements of the ~~percent~~ weight fraction of ~~measured~~ CaO~~, and~~ MgO and CO_2 (carbonate) content in the clinker and using Equation 90-2, which assumes all carbonate remaining in the clinker is associated with the calcium.

$$EF_{Cli} = [(CaO\ content - \frac{CO2\ Content}{Molecular\ ratio\ CO2/CaO}) \times Molecular\ ratio\ of\ CO_2/CaO] + [(MgO\ Content) \times Molecular\ ratio\ of\ CO_2/MgO] \qquad \textbf{Equation 90-2}$$

Where:

CaO Content (by weight)	=	Total CaO content of Clinker (including calcined and uncalcined) (wt. fraction).
~~Non-carbonate CaO~~ CO_2 Content (by weight)	=	Total CO_2 content ~~Uncalcined CaO~~ of Clinker (wt. fraction).
Molecular ratio of CO_2/CaO	=	0.785.
MgO Content (by weight)	=	Total MgO content of Clinker (including calcined and uncalcined) (wt. fraction).
~~Non-carbonate MgO~~	~~=~~	~~Uncalcined MgO of Clinker (wt. fraction).~~
Molecular ratio of CO_2/MgO	=	1.092.

(B) ~~Monthly~~ CKD Emission Factor. If CKD is generated and not recycled back to the kiln, then calculate a ~~monthly~~ plant-specific CKD emission factor based on monthly sampling. The CKD emission factor shall be calculated using Equation 90-3 and a plant-specific CKD calcination rate as specified in Equation 90-4.

$$EF_{CKD} = \frac{\frac{EF_{Cli}}{1 + EF_{Cli}} \times d}{1 - \left(\frac{EF_{Cli}}{1 + EF_{Cli}} \times d\right)}$$

Equation 90-3

Where:

EF_{CKD}	=	Monthly CKD emission factor, kg CO_2/metric ton CKD discarded.
EF_{Cli}	=	Clinker emission factor, determined according to Equation 90-2.
d	=	CKD calcination rate, determined according to Equation 90-4.

$$d = 1 - \frac{fCO_{2CKD} \times (1 - fCO_{2RM})}{(1 - fCO_{2CKD}) \times fCO_{2RM}}$$

Equation 90-4

Where:

d	=	CKD calcination rate (unitless ratio).
fCO_{2CKD}	=	Weight fraction of carbonate CO_2 in the CKD.
fCO_{2RM}	=	Weight fraction of carbonate CO_2 in the raw material.

(2) Organic Carbon Oxidation Emissions. Calculate CO_2 process emissions from the total organic content in raw materials by using Equation 90-5.

$$CO_{2-RM} = TOC_{RM} \times RM \times 3.664$$

Equation 90-5

Where:

$CO_{2\text{-}RM}$ = CO_2 emissions from raw material oxidation, metric tons.
TOC_{RM} = Total organic carbon content in raw material (wt. fraction), measured using the method in WCI.94(c) or using a default of 0.002 (0.2%).
RM = Amount of raw material consumed (metric tons/yr).
3.664 = The CO_2 to carbon molar ratio.

(c) Fuel Combustion Emissions in Kilns. Calculate CO_2, CH_4, and N_2O emissions from stationary fuel combustion following the calculation methods specified in WCI.20. Cement plants that combust pure biomass-derived fuels and combust fossil fuels only during periods of start-up, shut-down, or malfunction may report CO_2 emissions from fossil fuels using the emission factor methodology in WCI.23(a). "Pure" means that the biomass-derived fuels account for 97 percent of the total amount of carbon in the fuels burned.

§ WCI.94 Sampling, Analysis, and Measurement Requirements

~~*Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the cement industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.*~~

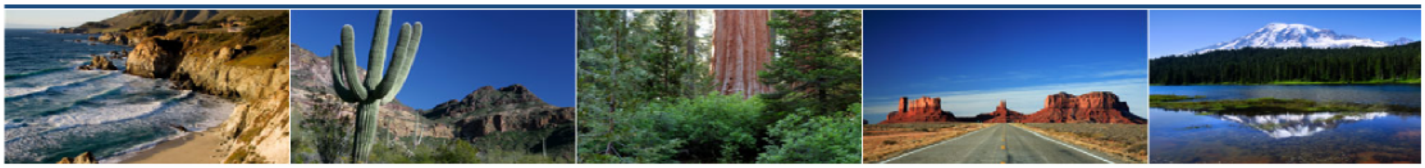
(a) Determine the plant-specific weight fractions of total CaO, total MgO, total carbonate CO_2~~uncalcined CaO, and uncalcined MgO~~ in clinker ~~from each kiln~~ using ASTM C114-07~~(method to be determined)~~. Determine the weight fraction of carbonate CO_2 in the CKD and the weight fraction of carbonate CO_2 in the raw material using ASTM C114-07. The monitoring must be conducted monthly ~~for each kiln~~ from~~ a~~ clinker and CKD samples drawn from bulk ~~clinker~~ storage.

(b) If not using the default value of 0.002 for TOC_{RM} in Equation 90-5, the total organic carbon contents of raw materials must be determined annually ~~*[monthly?]*~~ using ASTM Method C114-07. The analysis must be conducted on sample material drawn from bulk raw material storage for each category of raw material.

(c) The quantity of clinker produced must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(d) The quantity of CKD discarded must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(e) The quantity of raw materials consumed (i.e. limestone, sand, shale, iron oxide, and alumina) must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.



§ WCI.100 COAL STORAGE

§ WCI.101 Source Category Definition

Coal storage piles are located at any facilities that combust coal. Coal storage piles release fugitive CH_4 emissions. Within natural coal deposits, CH_4 is either trapped under pressure within porous void spaces or adsorbed to the coal. Coal mining, post-mining activities, and coal-handling activities release pressurized CH_4 to the atmosphere; adsorbed CH_4 is also released until the CH_4 in the coal reaches equilibrium with the surrounding atmospheric conditions.

§ WCI.102 Greenhouse Gas Reporting Requirements

The emissions data report shall include the following information at the facility level:

(a) Annual greenhouse gas emissions in metric tons, reported as follows:

(1) Total CH_4 emissions.

(b) Annual coal purchases ~~in~~ (tons for U.S.; metric tons for Canada).

(c) Source of coal purchases:

(1) Coal basin.

(2) State/province.

(3) Coal mine type (surface or underground).

§ WCI.103 Calculation of CH_4 Emissions

Note that this methodology for calculation of methane emissions uses emission factors for post-mining operations including all processes occurring after mining at the coal deposit and prior to combustion (e.g., preparation, handling, processing, transportation, storage, etc.) even though coal storage piles are only a subset of the overall post-mining operations. This follows the approach in the California Climate Action Registry, attributing all post-mining fugitive methane emissions to the facility combusting the coal, which is ultimately responsible for the coal having been processed and delivered to the facility. ~~*The Reporting Subcommittee is considering whether to require reporting of these emissions as indicated below, and whether to include these emissions in the total emissions of the coal-combusting facility. Stakeholder comment is requested.*~~

~~*Canadian-specific default fugitive methane emissions (i.e., a Canadian version of Table 100-1) will be developed.*~~

Calculate fugitive CH_4 emissions from coal storage piles as specified under paragraph (a), (b), or (c) of this section.

(a) For coal purchased from U.S. sources, ~~C~~calculate fugitive CH_4 emissions using Equation 100-1 (English) ~~and~~and Table 100-1, or Equation 100-1 (Metric) and Table 100-2.

(b) ~~C~~For coal purchased from Canadian sources, calculate fugitive CH_4 emissions using Equation 100-1 (M~~m~~etric) and ~~Table 100-2 and/or Table~~ Table 100-3.[BM1]

(c) For coal purchased from non-U.S. and non-Canadian sources, owners or ~~operations~~ operators should use either WCI.103(a) or WCI.103(b), whichever is the most applicable. This chosen approach is subject to approval by [*the jurisdiction*].

~~using the following equation:~~

$$CH_4 = \sum_i (PC_i \times EF_i) \times 0.04228 / 2{,}204.6$$ **Equation 100-1 (English Units)**

Where:

CH_4	=	Fugitive emissions from coal storage piles for each coal category *i* (~~,~~ metric tons CH_4 per year)~~.~~;
PC_i	=	Purchased coal for each coal category *i*~~,~~ (tons per year)~~.~~;
EF_i [BM2]	=	Default CH_4 emission factor for each coal category *i* specified by location and mine type that coal originated from, provided in Table 100-1~~,~~ (scf CH_4 per ton of coal)~~.~~;
0.04228	=	Methane conversion factor to convert scf to lbs~~.~~;
2,204.6	=	Factor to convert lbs to metric tons.

~~Calculate fugitive CH_4 emissions from coal storage piles using the following equation:~~

$$CH_4 = \sum_i (PC_i \times EF_i) \times 0.6772 / 1{,}000$$ **Equation 100-1 (~~m~~Metric Units)**

Where:

CH_4	=	Fugitive emissions from coal storage piles for each coal category *i*, (metric tons CH_4 per year);
PC_i	=	Purchased coal for each coal category *i* ~~-~~(metric tons per year);
EF_i	=	Default CH_4 emission factor for each coal category *i* specified by location and mine type that coal originated from, provided in Table 100-~~1~~2 or Table 100-3~~,~~ (m^3 CH_4 per metric ton of coal~~.~~);
0.6772	=	Methane conversion factor to convert m^3 to kg~~.~~;
1,000	=	Factor to convert kg to metric tons.

§ WCI.104 Sampling, Analysis, and Measurement Requirements

(a) Coal Purchase~~Fuel Consumption~~ Monitoring Requirements[BM3].

~~(1)~~Facilities may determine the quantity of coal purchased either using records provided by the coal supplier(s) or monitoring coal purchase quantities using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.~~consumption on the basis of recorded fuel purchase or sales invoices measuring any stock change (short tons) using the following equation:~~

~~*Fuel Consumption in the Report Year = Total Fuel Purchases – Total Fuel Sales + Amount Stored at Beginning of Year – Amount Stored at Year End*~~

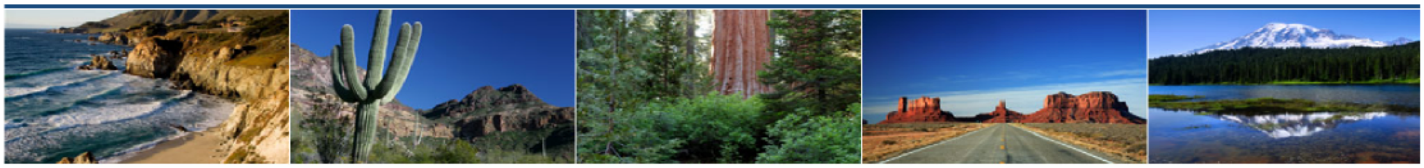
King, Neill and Gunter (Nova Scotia) Limited, Darmouth, Nova Scotia for Environment Canada. Contract Number K2031-3-7062. March 1994. This document is cited by Environment Canada in the NIR 1990-2007 (Final Submission, April 2009), ~~their greenhouse gas emission inventories~~, but post-mining emission factors are not provided, so they were developed for WCI purposes by Province.~~esented in those inventories.~~ Surface emission factors were derived from Table 3.1 (Coal production statistics [Column A] and post-mining emissions [Column F]). Underground emission factors were derived from Table 3.2 (Coal production statistics and post-mining emissions).			



§ WCI.130 HYDROGEN PRODUCTION

§ WCI.131 Source Category Definition

A hydrogen production process produces hydrogen gas by steam hydrocarbon reforming, partial oxidation of hydrocarbons, or other transformation of hydrocarbon feedstock. The hydrogen produced may be either transferred offsite or used onsite at petrochemical, ammonia production, refineries, and other plants.

§ WCI.132 Greenhouse Gas Reporting Requirements

For each facility, the annual emissions report must contain the following information:

(a) Process CO_2 Emissions. The CO_2 process emissions from the hydrogen produced process.

(b) Feedstock Consumption (if estimating emissions using mass balance approach in WCI.133(b)). Annual feedstock consumption by feedstock type (including petroleum coke) reported in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

(c) Production. Annual hydrogen produced.

(d) Stationary Combustion Units. Report CO_2, N_2O, and CH_4 emissions as specified in WCI.20.

§ WCI.133 Calculation of Greenhouse Gas Emissions

The owner or operator shall calculate and report CO_2 process emissions using the methods in paragraphs (a) or (b) of this section.

(a) Continuous Emission Monitoring Systems. The owner or operator may calculate CO_2 process emissions using CEMS. The owner or operator must comply with the requirements in section WCI.20.

(b) Feedstock Material Balance. The owner or operator may calculate CO_2 process emissions using the following method. The factor S shall be used only for CO_2 and/or CH_4 emissions that are calculated and reported using applicable methods specified in this regulation. For example, carbon species in uncoverted feedstock contained in PSA off-gas and hydrogen plant product that is diverted to fuel gas systems, fed to downstream units, or diverted to flare may be included in the factor S provided the CO_2 and/or CH_4 emissions are reported using other methods in this regulation.

$$CO_2(Feedstock) = \sum_{i=1}^{n} \sum_{j=1}^{y} \left[(FS_j * CF_j) - S_j \right] * 3.664 * 0.001$$

Equation 130-1 (English Units)

Where:

CO_2 (Feedstock)	=	CO_2 emitted from feedstock (metric tons/year).
n	=	Days of operation per year.
FS_j	=	Feedstock b consumption rate (scf/day).
CF_j	=	Carbon content of feedstock j (kg C/scf feedstock).
y	=	Total number of feedstocks.
S_j	=	Carbon accounted for elsewhere (kg C/day).
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

$$CO_2(Feedstock) = \sum_{i=1}^{n} \sum_{j=1}^{y} \left[(FS_j * CF_j) - S_j \right] * 3.664 * 0.001$$

Equation 130-1 (Metric Units)

Where:

CO_2 (Feedstock)	=	CO_2 emitted from feedstock (metric tons/year).
n	=	Days of operation per year.
FS_j	=	Feedstock b consumption rate (m^3/day).
CF_j	=	Carbon content of feedstock j (kg C/m^3 feedstock).
y	=	Total number of feedstocks.
S_j	=	Carbon accounted for elsewhere (kg C/day).
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

WCI.134 Sampling, Analysis, and Measurement Requirements

(a) Owners or operators using CEMS to estimate CO_2 emissions shall comply with the monitoring requirements in section WCI.20.

(b) Owners or operators using the method in section WCI.1~~0~~33 (b) shall perform the following monitoring:

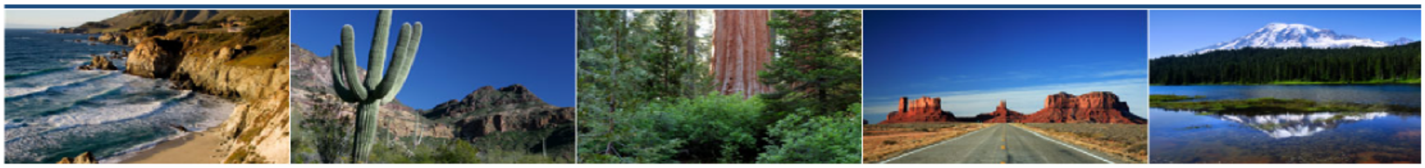
(1) The owner or operator shall measure the feedstock consumption rate daily ~~using methods that comply with the measurement accuracy provisions in WCI.2(g)~~.

(2) The owner or operator shall collect samples of each feedstock consumed and analyze each sample for carbon content using the methods specified in WCI.25(d). For natural gas feedstock not mixed with another feedstock prior to consumption, samples shall be

collected and analyzed once per month. For all other feedstocks, samples shall be collected and analyzed daily. The samples shall be collected from a location in the feedstock handling system that provides samples representative of the feedstock consumed in the hydrogen production process.

(3) Owners or operators shall measure the hydrogen produced daily. ~~using methods that comply with the measurement accuracy provisions in WCI.2(g).~~

(4) Owners or operators shall measure the CO_2 and CO collected daily ~~using methods that comply with the measurement accuracy provisions in WCI.2(g)~~.



§ WCI.150 IRON AND STEEL MANUFACTURING

§ WCI.151 Source Category Definition

Iron and steel manufacturing comprises four categories: primary facilities that produce both iron and steel, secondary steelmaking facilities, iron production facilities, and offsite production of metallurgical coke. These processes may occur together in an "integrated" facility or they may occur in separate offsite facilities.

§ WCI.152 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2 and CH_4 in metric tons at the facility level.

(b) CO_2 and CH_4 emissions from coke production (metric tons) and the following information:

(1) Quantity of coking coal consumed in coke production (metric tons)

(2) Quantity of other process materials (e.g., natural gas, fuel oil, etc.) consumed in coke production (metric tons)

(3) Quantity of blast furnace gas consumed in coke production (metric tons)

(4) Quantity of coke produced (metric tons)

(5) Quantity of coke oven gas transferred offsite (metric tons)

(6) Quantity of other coke oven by-products (e.g., coal tar, light oil, coke breeze, etc.) transferred offsite (metric tons)

(7) Carbon content of material inputs and outputs listed in (b)(1) through (b)(6) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(c) CO_2 and CH_4 emissions from iron and steel production (metric tons) and the following information:

(1) Quantity of coke consumed in iron and steel production (excluding sinter production) (metric tons)

(2) Quantity of on-site coke oven by-products (e.g., coal tar, light oil, coke breeze, etc.) consumed in blast furnace (metric tons)

(3) Quantity of coal directly injected into blast furnace (metric tons)

(4) Quantity of limestone directly injected into blast furnace (metric tons)

(5) Quantity of dolomite directly injected into blast furnace (metric tons)

(6) Quantity of carbon electrodes consumed in EAFs (metric tons)

(7) Quantity of direct reduced iron introduced to an EAF or BOF (metric tons)

~~(7)~~(8) Quantity of other carbonaceous or process material (e.g., sinter, waste plastic, etc.) consumed in iron and steel production (metric tons)

~~(8)~~(9) Quantity of coke oven gas consume in blast furnace (metric tons)

~~(9)~~(10) Quantity of steel produced (metric tons)

~~(10)~~(11) Quantity of iron production not converted to steel (metric tons)

~~(11)~~(12) Quantity of blast furnace gas transferred offsite (metric tons)

~~(12)~~(13) Carbon content of material inputs and outputs listed in (c)(1) through (c)(12~~1~~) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(d) Process CO_2 and CH_4 emissions from sinter production (metric tons) and the following information:

(1) Quantity of coke breeze (purchased and produced on-site) used for sinter production (metric tons)

(2) Quantity of coke oven gas consumed in blast furnace in sinter production (metric tons)

(3) Quantity of blast furnace gas consumed in sinter production (metric tons)

(4) Quantity of other process materials (e.g., natural gas, fuel oil, etc.) consumed in sinter production (metric tons)

(5) Quantity of sinter off gas transferred offsite (metric tons)

(6) Carbon content of material inputs and outputs listed in (d)(1) through (d)(5) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(e) Process CO_2 and CH_4 emissions from direct reduced iron production (metric tons) and the following information:

(1) Energy from natural gas used in direct reduced iron production (gigajoules [GJ])

(2) Energy from coke breeze used in direct reduced iron production (GJ)

(3) Energy from metallurgical coke used in direct reduced iron production (GJ)

(4) Quantity of direct reduced iron produced (metric tons)

~~(4)~~(5) Carbon content of material inputs listed in (e)(1) through (e)(3) (metric tons of C per GJ)

(6) Carbon content of direct reduced iron produced per e(4) (metric tons of C per metric ton of material [equivalent to wt% C/100])

(f) CO_2, N_2O, and CH_4 emissions from stationary combustion units as specified in WCI.20.

§ WCI.153 Calculation of CO_2 Emissions

(a) Process CO_2 emissions. Determine process CO_2 emissions as specified under either paragraph (1) or (2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).

(2) Calculation methodologies specified in paragraph (b) of this section.

[CEMS and mass balance approach are based on IPCC Tier 3 methods.)

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions using the following mass balance approach:

(b) Calculate the coke production CO_2 (either within integrated facilities or at offsite facilities) emissions using Equation 150-1 (if applicable):

$$E_{coke} = \left[(CC \times C_{CC}) + \sum_a (PM_a \times C_a) + (BG \times C_{BG}) - (CO \times C_{CO}) - (COG \times C_{COG}) - \sum_b (COB_b \times C_b) \right] \times 3.664$$

Equation 150-1

Where:

E_{coke}	=	Emissions of CO_2 from coke production (metric tons);
CC	=	Quantity of coking coal (metric tons);
PM_a	=	Quantity of other process material *a* (not included as separate terms), such as natural gas or fuel oil (metric tons);
BG	=	Quantity of blast furnace gas consumed in coke ovens (metric tons);
CO	=	Quantity of coke produced (metric tons)
COG	=	Quantity of coke oven gas transferred offsite (metric tons);
COB_b	=	Quantity of coke oven by-product *b* transferred offsite (metric tons);
C_x	=	Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664	=	Conversion factor from metric tons of C to metric tons of CO_2.

(c) Calculate the iron and steel production CO_2 emissions using Equation 150-2:

$$E_{iron,steel} = \left[(CO \times C_{CO}) + \sum_a (COB_a \times C_a) + (CI \times C_{CI}) + (L \times C_L) + (D \times C_D) + (CE \times C_{CE}) + (DRI \times C_{DRI}) + \sum_b (O_b \times C_b) + (COG \times C_{COG}) - (S \times C_S) - (IP \times C_{IP}) - (BG \times C_{BG}) \right] \times 3.664$$

[KES1]

Equation 150-2

Where:

$E_{iron,steel}$	=	Emissions of CO_2 from iron and steel production (metric tons);
CO	=	Quantity of coke consumed (excluding sinter production) (metric tons);
COB_a	=	Quantity of coke oven by-product *a* consumed in blast furnace (metric tons);
CI	=	Quantity of coal directly injected into blast furnace (metric tons);
L	=	Quantity of limestone consumed (metric tons);
D	=	Quantity of dolomite consumed (metric tons);
CE	=	Quantity of carbon electrodes consumed in EAFs (metric tons);
DRI	=	Quantity of direct reduced iron introduced to an EAF or BOF (metric tons)
O_b	=	Quantity of other carbonaceous and process material *b*, such as sinter or waste plastic (metric tons);
COG	=	Quantity of coke oven gas consumed in blast furnace (metric tons);

S	=	Quantity of steel produced (metric tons);
IP	=	Quantity of iron production not converted to steel (metric tons);
BG	=	Quantity of blast furnace gas transferred offsite (metric tons);
C_x	=	Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664	=	Conversion factor from metric tons of C to metric tons of CO_2.

(d) Calculate the sinter production CO_2 emissions using Equation 150-3 (if applicable):

$$E_{sinter} = \left[(CBR \times C_{CBR}) + (COG \times C_{COG}) + (BG \times C_{BG}) + \sum_a (PM_a \times C_a) - (SOG \times C_{SOG}) \right] \times 3.664$$

Equation 150-3

Where:

E_{sinter}	=	Emissions of CO_2 from sinter production (metric tons);
CBR	=	Quantity of purchased and onsite produced coke breeze used for sinter production (metric tons);
COG	=	Quantity of coke oven gas consumed in blast furnace for sinter production (metric tons);
BG	=	Quantity of blast furnace gas consumed for sinter production (metric tons);
PM_a	=	Quantity of other process material *a* consumed for sinter production (not included as separate terms), such as natural gas or fuel oil (metric tons);
SOG	=	Quantity of sinter off gas transferred offsite (metric tons);
C_x	=	Carbon content of material input or output *x* (metric tons C/metric tons of *x*);
3.664	=	Conversion factor from metric tons of C to metric tons of CO_2.

(e) Calculate the direct reduced iron production CO_2 emissions using Equation 150-4 (if applicable):

$$E_{DRI} = [(DRI_{NG} \times C_{NG}) + (DRI_{BZ} \times C_{BZ}) + (DRI_{CK} \times C_{CK}) - (DRI \times C_{DRI})] \times 3.664$$ [KES2]

Equation 150-4

Where:

E_{DRI}	=	Emissions of CO_2 from direct reduced iron production (metric tons);
DRI_{NG}	=	Energy from natural gas used in direct reduced iron production (GJ);
DRI_{BZ}	=	Energy from coke breeze used in direct reduced iron production (GJ);
DRI_{CK}	=	Energy from metallurgical coke used in direct reduced iron production (GJ);
DRI	=	Quantity of direct reduced iron produced (metric tons)
C_{NG}	=	Carbon content of natural gas (metric ton C/GJ);
C_{BZ}	=	Carbon content of coke breeze (metric ton C/GJ);
C_{CK}	=	Carbon content of metallurgical coke (metric ton C/GJ);
C_{DRI}	=	Carbon content of direct reduced iron produced (metric tons of C per metric ton of direct reduced iron)

3.664 = Conversion factor from metric tons of C to metric tons of CO_2.

(f) Calculate the total CO_2 emissions using Equation 150-5:

$$E_{CO2} = E_{coke} + E_{iron,steel} + E_{sinter} + E_{DRI}$$ **Equation 150-5**

Where:

E_{CO2} = Total CO_2 emissions (metric tons);
E_{coke} = Emissions from coke production (metric tons);
$E_{iron,steel}$ = Emissions from iron and steel production (metric tons);
E_{sinter} = Emissions from sinter production (metric tons);
E_{DRI} = Emissions from direct reduced iron production (metric tons).

§ WCI.154 Calculation of CH_4 Emissions

(a) Process CH_4 emissions. Determine process CH_4 emissions as specified under either paragraph (1) or paragraph (2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).

(2) Site-specific emission factors[KES3].

§ WCI.155 Sampling, Analysis, and Measurement Requirements

Measurements of carbon contents of the material balance input, output, and by-product materials shall be conducted as described below.

~~*Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the iron and steel industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.*~~

(a) Fuel Carbon Content Requirements. Fuel carbon contents should be monitored in the following manner (from § WCI.25):

(1) For coal and coke, solid biomass-derived fuels, and waste-derived fuels; use ASTM 5373-02 (Reapproved 2007).

(2) For liquid fuels, use the following ASTM methods: For petroleum-based liquid fuels and liquid waste-derived fuels, use ASTM D5291-02 (Reapproved 2007) “Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in

Petroleum Products and Lubricants", ultimate analysis of oil or computations based on ASTM D3238-95 (Reapproved 2005) and either ASTM D2502-04 or ASTM D2503-92 (Reapproved 200~~2~~7).

(3) For gaseous fuels, use ASTM D1945-03 or ASTM D1946-90 (Reapproved 2006).

(b) By-Product Carbon Content Requirements. Carbon contents of by-products (e.g., blast furnace gas, coke oven gas, coal tar, light oil, coke breeze, sinter off gas, etc.) from all iron and steel production processes should be monitored in the following manner:

[Methodology to be determined.]

(c) Flux Carbon Content Requirements. Carbon contents of fluxes (i.e., limestone and dolomite) from all iron and steel production processes should be monitored in the following manner:

(1) For limestone and dolomite, use ASTM C25-06.

(d) Electrode Carbon Content Requirements. Carbon contents of carbon electrodes used in electric arc furnaces (EAFs) should be monitored in the following manner:

(1) Vendor specifications of carbon content in EAF carbon electrodes.

(e) Finished Product Carbon Content Requirements. Carbon contents of finished products (i.e., steel, iron not converted to steel, and direct reduced iron) from all iron and steel production processes should be monitored in the following manner:

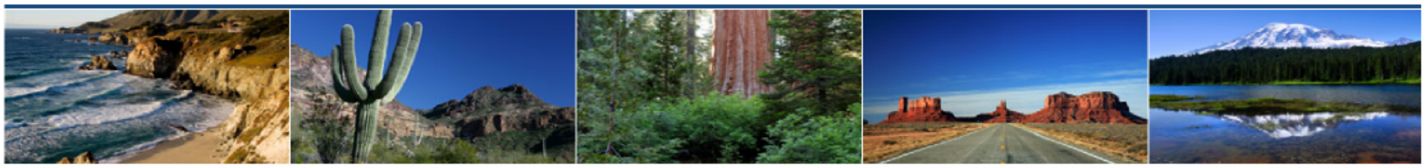
(1) For iron and steel, use ASTM E1019-08 or ASTM E351-93.

(f) Quantity Measurement Requirements. The quantities of process inputs, outputs, and by-products must be determined using the following methods:

(1) For solid process inputs, outputs, and by-products, quantities must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

(2) For liquid process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes.

(3) For gaseous process inputs, outputs, and by-products, quantities must be determined by direct volume measurement using the same plant instruments used for accounting purposes.



§ WCI.170 LIME MANUFACTURING

§ WCI.171 Source Category Definition

Lime manufacturing is comprised of all processes that are used to manufacture quick lime (i.e. calcium oxide or calcium-magnesium oxide). Lime is produced via the calcination of limestone or other highly calcareous materials such as dolomite, aragonite, chalk, coral, marble, and shell.

§ WCI.172 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of CO_2, CH_4, and N_2O in metric tons.

(b) CO_2 process emissions from quick lime production (metric tons) and the following information:

~~(1)Quick lime emission factor (kg CO_2/metric ton quick lime).~~

~~(A)Quantity of quick lime produced (metric tons).~~

~~(B)Total Calcium Oxide (CaO) content of quick lime (weight fraction).~~

~~(C)Total Magnesium Oxide (MgO) content of quick lime (weight fraction).~~

~~(D)Uncalcined CaO (weight fraction).~~

~~(E)Uncalcined MgO (weight fraction).~~

~~(2)Lime kiln dust (LKD) emission factor (kg CO_2/metric ton LKD).~~

~~(A)Quantity of LKD discarded (metric tons).~~

~~(B)Total Calcium Oxide (CaO) content of LKD (weight fraction).~~

~~(C)Total Magnesium Oxide (MgO) content of LKD (weight fraction).~~

~~(D)Uncalcined CaO content of LKD (weight fraction).~~

~~(E)Uncalcined MgO content of LKD (weight fraction).~~

(1) For lime production:

(A) The emission factor (kg CO_2/metric ton) for each lime type for each month.

(B) The quantity of lime produced (metric tons) each month.

(C) The calcium oxide (CaO) content (weight fraction) of each lime type for each month.

(D) The magnesium oxide (MgO) content (weight fraction) of each lime type for each month.

(2) For the production of calcined byproducts and wastes:

(A) The emission factor (kg CO_2/metric ton) for each calcined byproduct/waste type for each month.

(B) The quantity of each type of calcined byproduct/waste type produced each month.

(C) The calcium oxide (CaO) content (weight fraction) of each calcined byproduct/waste type for each month.

(D) The magnesium oxide (MgO) content (weight fraction) of each calcined byproduct/waste type for each month.

(c) CO_2, CH_4, and N_2O emissions from fuel combustion in all kilns combined, following the calculation methods and reporting requirements specified in WCI.173(c) (metric tons).

(d) CO_2, CH_4, and N_2O emissions from all other fuel combustion units combined (kilns excluded), following the calculation methods and reporting requirements specified in WCI.20 (metric tons).

(e) If a continuous emissions monitor is used to measure CO_2 emissions from kilns, then the requirements of paragraphs (b) and (c) of this section do not apply for CO_2. ~~Lime plants that measure CO_2 emissions using CEMS shall report fuel usage by fuel type for kilns.~~

(f) Operators of lime plants shall also comply with the reporting requirements for any other applicable source category listed at WCI.1(a), including but not limited to the following:

(1) Coal fuel storage as specified in WCI.100.

(2) Electricity generating as specified in WCI.40.

(3) Cogeneration systems as specified in WCI.~~XX~~42(f).

§ WCI.173 Calculation of greenhouse Gas Emissions from Kilns

(a) Determine process CO_2 emissions as specified under either paragraph (a)(1) or (a)(2) of this section.

(1) Continuous emissions monitoring systems (CEMS) as specified in WCI.23(d).

(2) Calculate the sum of CO_2 process emissions from kilns and CO_2 fuel combustion emissions from kilns using the calculation methodologies specified in paragraph (b) and (c) of this section**.**

(b) Process CO_2 Emissions Calculation Methodology. Calculate total CO_2 process emissions as the sum of emissions from quick lime production, using the method specified in paragraph (b)(1) of this section.

(1) CO_2 Process Emissions. Calculate CO_2 emissions from quick lime production from each kiln using Equation 170-1 and a plant-specific quick lime emission factor and a plant-specific lime kiln dust (LKD) emission factor as specified in this section.

$$CO_2 = \sum_{i}^{12} \sum_{j}^{y} \left[QL_{ij} \times EF_{QL_{ij}}\right] + \sum_{k}^{4} \sum_{l}^{z} \left[LKD_{kl} \times EF_{LKD_{kl}}\right]$$ **Equation 170-1**

Where:

CO_2 = CO_2 emissions in metric tones/yr.
QL = Monthly Quantity of quick lime produced, metric tons.
EF_{QL} = Monthly Quick lime emission factor, metric tons CO_2/metric ton quick lime computed as specified in paragraph (b)(2~~1~~)~~(A)~~ of this section.
LKD = ~~Monthly~~ Quarterly Quantity ~~LKD~~ of calcined byproduct/waste, including LKD, scrubber sludge and other calcined wastes, produced annually~~discarded (i.e., not recycled to the kiln)~~, metric tons.
EF_{LKD} = ~~Monthly~~ Quarterly ~~LKD~~ calcined byproduct/waste emission factor, computed as specified in paragraph (b)(3~~1~~)~~(B)~~ of this section.
i = Month.
j = Lime type.
k = Quarter.
l = Calcined byproduct/waste type.
y = Total number of lime types.
z = Total number of calcined byproduct/waste types.

~~(A)~~(2) Monthly Quick Lime Emission Factor. Calculate a plant-specific quick lime emission factor _(EF_{QL}) for each kiln and month based on the percent of measured CaO and MgO content in quick lime and using Equation 170-2.

$$EF_{QL} = (CaO\ \ content \times Molecular\ \ ratio\ \ of\ CO_2 / CaO) + (MgO\ \ content \times Molecular\ \ ratio\ \ CO_2 / MgO)$$ **Equation 170-2**

Where:

CaO Content (by weight) = Total CaO content of Quick Lime~~, including calcined and uncalcined (weight fraction)~~.
~~Uncalcined CaO (by weight) = Uncalcined CaO content of Quick Lime (weight fraction).~~
Molecular ratio of CO_2/CaO = 0.785.
MgO Content (by weight) = Total MgO content of Quick Lime~~, including calcined and uncalcined (weight fraction)~~.
~~Uncalcined MgO = Uncalcined MgO content of Quick Lime (weight fraction).~~
Molecular ratio of CO_2/MgO = 1.092.

~~(2)~~ Monthly LKD Emission Factor. If LKD is generated and not recycled back to the kiln, then calculate a plant-specific LKD emission factor for each kiln and month. The LKD emission factor shall be calculated using Equation 170-3.

(3)

$$EF_{LKD} = [(CaO\ content - uncalcined\ \ CaO) \times Molecular\ ratio\ of\ CO_2 / CaO] + [(MgO\ Content - uncalcined\ \ MgO) \times Molecular\ ratio\ of\ CO_2 / MgO]$$

Equation 170-3

Where:

EF_{LKD}	=	LKD emission factor.
CaO Content (by weight)	=	Total CaO content of LKD, including calcined and uncalcined (weight fraction).
Uncalcined CaO (by weight)	=	Uncalcined CaO content of LKD (weight fraction).
Molecular ratio of CO_2/CaO	=	0.785.
MgO Content (by weight)	=	Total MgO content of LKD, including calcined and uncalcined (weight fraction).
Uncalcined MgO	=	Uncalcined MgO content of LKD (weight fraction).
Molecular ratio of CO_2/MgO	=	1.092.

(c) Fuel Combustion Emissions in Kilns. Calculate CO_2, CH_4, and N_2O emissions from stationary fuel combustion emissions following the calculation methods specified in WCI.20. Operators of lime manufacturing plants that primarily combust biomass-derived fuels and combust fossil fuels only during periods of start-up, shut-down, or malfunction may report CO_2 emissions from fossil fuels using the emission factor methodology in WCI.23(a). "Pure" means that the biomass-derived fuels account for 97 percent of the total amount of carbon in the fuels burned.

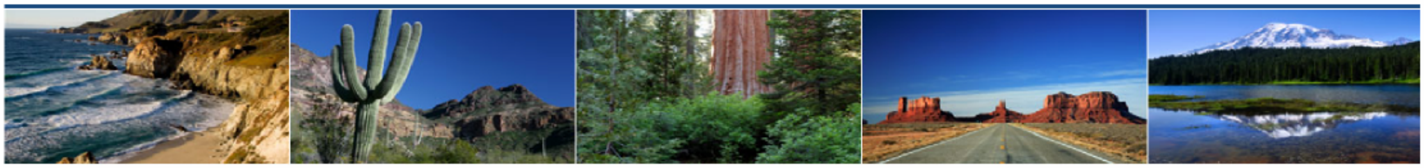
§ WCI.174 Sampling, Analysis, and Measurement Requirements

~~(a)Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the lime industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.~~Determine the chemical composition (percent total CaO and percent total MgO) of each lime type and each calcined byproduct/waste type by laboratory analysis on a monthly basis for each lime type, and a quarterly basis for each calcined byproduct/waste type. This determination must be performed according to ASTM Methods C25, C1301 or C1271. Samples for analysis of the calcium oxide and magnesium oxide content of each lime type and each calcined byproduct/waste type should be collected during the same month or quarter as the production data. At least one sample must be collected monthly for each lime type produced during the month and quarterly for each calcined byproduct/waste type produced during the quarter.~~Determine the plant-specific weight fractions of CaO, MgO, uncalcined CaO, and uncalcined MgO in quick lime from each kiln using (method to be determined). Determine the plant-specific fraction of CaO, MgO, uncalcined CaO, and uncalcined MgO in LKD not recycled to the kiln using (method to be determined). The monitoring must be conducted monthly for each kiln from samples drawn from bulk storage.~~

~~(b)~~(a) ~~The quantity of quick lime produced must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.~~The quantity of lime produced and sold is to be estimated monthly using direct measurements (such as rail and truck scales) of lime sales for each lime type, and adjusted to take into account the difference in beginning- and end-of-period inventories of each lime type. The inventory period shall be annual at a minimum.

~~(b)The quantity of LKD discarded must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.~~ The quantity of calcined byproduct/waste sold is to be estimated quarterly using direct measurements (such as rail and truck scales) of byproduct/waste sales for each byproduct/waste type, and adjusted to take into account the difference in beginning- and end-of-period inventories of each calcined byproduct/waste type. The inventory period shall be annual at a minimum. The quantity of calcined byproduct/waste not sold is to be determined no less often than quarterly for each calcined/byproduct waste type using direct measurements (such as rail and truck scales), or a calcined byproduct/waste generation rate (i.e. calcined byproduct produced as a factor of lime production).

~~(d)~~(b) ~~The quantity of raw materials consumed (i.e. limestone, dolomite, aragonite, chalk, coral, marble, and shell.) must be determined by direct weight measurement using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.~~



§ WCI.200 PETROLEUM REFINERIES

§ WCI.201 Source Category Definition

A petroleum refinery consists of all processes used to produce gasoline, aromatics, kerosene, distillate fuel oils, residual fuel oils, lubricants, asphalt, or other products through distillation of petroleum or through redistillation, cracking, rearrangement or reforming of unfinished petroleum derivatives.

WCI.202 Greenhouse Gas Reporting Requirements

The annual emissions report must contain the following information reported at the facility level:

(a) Catalyst Regeneration. Report CO_2 emissions.

(b) Process Vents. Report CO_2, N_2O, and CH_4 emissions.

(c) Asphalt Production. Report CO_2 and CH_4 emissions.

(d) Sulfur Recovery. Report CO_2 emissions.

(e) Stationary Combustion Units Other than Flares and Control Devices. Report CO_2, N_2O, and CH_4 emissions as specified in WCI.23.

(f) Flares and Other Control Devices. Report CO_2, N_2O, and CH_4 emissions.

(g) Above-Ground Storage Tanks. Report CH_4 emissions.

(h) Wastewater Treatment. Report CH_4 and N_2O emissions.

(i) Oil-Water Separators. Report CH_4 emissions.

(j) Equipment Leaks. Report CH_4 emissions.

(k) Feedstock Consumption: Report feedstock consumption by type for all feedstocks which result in GHG emissions in the reporting year (including petroleum coke) in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

(l) Fuel Consumption: Report fuel consumption by fuel type consumed in the reporting year in units of million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

WCI.203 Calculation of Greenhouse Gas Emissions

The operator shall calculate GHG emissions using the methods in paragraphs (a) through (i) of this section.

(a) Catalyst Regeneration. For units equipped with CEMS, operators shall calculate CO_2 process emissions resulting from catalyst regeneration using CEMS in accordance with WCI.20. In

the absence of CEMS data, the operator shall use the methods in paragraphs (a)(1) through (a)(3).

(1) The operator shall calculate process CO_2 emissions from the continuous regeneration of catalyst material in fluid catalytic cracking units (FCCU) and fluid cokers using Equations 200-1, 200-2, and 200-3.

$$CO_2 = \sum_{d=1}^{n} CR_d \times CF \times 3.664 \times 0.001 \qquad \textbf{Equation 200-1}$$

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
n	=	number of days of operation in the report year
CR_d	=	-daily average coke burn rate (kg/day)
CF	=	-carbon fraction in coke burned
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	-conversion factor – kg to metric tons

$$CR_d = \left[\sum_{i=1}^{n} [K_1 Q_r \times (\%CO_2 + \%CO) + K_2 Q_a - K_3 Q_r \times [\%CO/2 + \%CO_2 + \%O_2] + K_3 Q_{oxy} \times (\%O_{oxy})]_i \right] / n$$

Equation 200-2

Where:

CR_d	=	daily average coke burn rate (kg/day or lb/day)
K_1, K_2, K_3	=	material balance and conversion factors (K_1, K_2, and K_3 from Table 200-1
n	=	number of hours per day
Q_r	=	volumetric flow rate of exhaust gas before entering the emission control system (dscm/min or dscf/min)
Q_a	=	volumetric flow rate of air to regenerator as determined from control room instrumentation (dscm/min or dscf/min)
$\%CO_2$	=	CO_2 concentration in regenerator exhaust, percent by volume – dry basis
%CO	=	CO concentration in regenerator exhaust, percent by volume – dry basis
$\%O_2$	=	O_2 concentration in regenerator exhaust, percent by volume – dry basis
Q_{oxy}	=	volumetric flow rate of O_2 enriched air to regenerator as determined from control room instrumentation (dscm/min or dscf/min)
$\%O_{xy}$	=	O_2 concentration in O_2 enriched air stream inlet to regenerator, percent by volume – dry basis

$$Q_r = (79 \times Q_a + (100 - \%Q_{xy}) \times Q_{oxy}) / (100 - \%CO_2 - \%CO - \%O_2) \qquad \textbf{Equation 200-3}$$

Where:

Q_r = volumetric flow rate of exhaust gas from regenerator before entering the emission control system (dscm/min or dscf/min)
Q_a = volumetric flow rate of air to regenerator, as determined from control room instrumentation (dscm/min or dscf/min)
$\%Q_{xy}$ = oxygen concentration in oxygen enriched air stream, percent by volume – dry basis
Q_{oxy} = volumetric flow rate of O_2 enriched air to regenerator as determined from catalytic cracking unit control room instrumentation (dscm/min or dscf/min)
$\%CO_2$ = carbon dioxide concentration in regenerator exhaust, percent by volume – dry basis
%CO = CO concentration in regenerator exhaust, percent by volume – dry basis. When no auxiliary fuel is burned and a continuous CO monitor is not required, assume %CO to be zero
$\%O_2$ = O_2 concentration in regenerator exhaust, percent by volume – dry basis

(2) The operator shall calculate process CO_2 emissions resulting from periodic catalyst regeneration using Equation 200-4.

$$CO_2 = \sum_{i=1}^{n} CRR \times \left(CF_{spent} - CF_{regen}\right)_i \times 3.664 \times 0.001 \qquad \textbf{Equation 200-4}$$

Where:

CO_2 = CO_2 emissions (metric tons/yr)
CRR = mass of catalyst regenerated (mass/regeneration cycle)
CF_{spent} = weight fraction carbon on spent catalyst
CF_{regen} = weight fraction carbon on regenerated catalyst (default = 0)
n = number of regeneration cycles
3.664 = ratio of molecular weights, CO_2 to carbon
0.001 = conversion factor – kg to metric tons

(3) The operator shall calculate process CO_2 emissions resulting from continuous catalyst regeneration in operations other than FCCUs and fluid cokers (e.g. catalytic reforming) using Equation 200-5.

$$CO_2 = CC_{irc} \times (CF_{spent} - CF_{regen}) \times H \times 3.664 \qquad \textbf{Equation 200-5}$$

Where:

CO_2 = CO_2 emissions (metric tons/yr)
CC_{irc} = average catalyst regeneration rate (metric tons/hr)
CF_{spent} = weight carbon fraction on spent catalyst
CF_{regen} = weight carbon fraction on regenerated catalyst (default = 0)
H = hours regenerator was operational (hr/yr)
3.664 = ratio of molecular weights, CO_2 to carbon

(b) Process Vents. Except for process emissions reported under other requirements of this regulation, the operator shall calculate process emissions of CO_2, CH_4, and N_2O from process vents using Equation 200-6.

Equation 200-6

$$E_x = \sum_{i=1}^{n} VR_i \times F_{xi} \times (MW_x / MVC) \times VT_i \times 0.001$$

Where:

E_x	=	emissions of x (metric tons/yr), where x = CO_2, N_2O, or CH_4
VR_i	=	vent rate for venting event i (scf/unit time or m^3/unit time)
F_{xi}	=	molar fraction of x in vent gas stream during event i
MW_x	=	molecular weight of x (kg/kg-mole)
MVC	=	molar volume conversion (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole for STP of 60°F, and 1 atmosphere or (24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
VT_i	=	time duration of venting event i
n	=	number of venting events
0.001	=	conversion factor – kg to metric tons

(c) Asphalt Production. The operator shall calculate CO_2 and CH_4 process emissions from asphalt blowing activities using Equations 200-7 and 200-8.

Equation 200-7

$$CH_4 = (M_A \times EF \times MW_{CH4} / MVC) \times (1 - DE) \times 0.001$$

Where:

CH_4	=	CH_4 emissions (metric tons/yr)
M_A	=	mass of asphalt blown (10^3 bbl/yr)
EF	=	emission factor (EF = 2,555 scf $CH_4/10^3$ bbl or 72.35 m^3 $CH_4/10^3$ bbl)
MW_{CH4}	=	CH_4 molecular weight (16.04 kg/kg-mole)
MVC	=	molar volume conversion factor (849.5 scf/kg- mole, for STP of 20°C and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
DE	=	control measure destruction efficiency (DE = 98% expressed as 0.98)
0.001	=	conversion factor – kg to metric tons

Equation 200-8

$$CO_2 = (M_A \times EF \times MW_{CH4} / MVC) \times DE \times 2.743 \times 0.001$$

Where:

CO_2	=	CO_2 emissions (metric tons/yr)
M_A	=	mass of asphalt blown (10^3 bbl/yr)
EF	=	emission factor (EF = 2,555 scf $CH_4/10^3$ bbl or 72.35 m^3 $CH_4/10^3$ bbl)
MW_{CH4}	=	CH_4 molecular weight (16.04 kg/kg-mole)

MVC	=	molar volume conversion factor (849.5 scf/kg mole, for STP of 20°C and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
DE	=	control measure destruction efficiency (DE = 98% expressed as 0.98)
2.743	=	CH_4 to CO_2 conversion factor
0.001	=	conversion factor – kg to metric tons

(d) Sulfur Recovery. The operator shall calculate CO_2 process emissions from sulfur recovery units (SRUs) using Equation 200-9. For the molecular fraction (MF) of CO_2 in the sour gas, use either a default factor of 0.20 or a source specific molecular fraction value approved by [*insert jurisdiction*] and derived from source tests conducted at least once per calendar year under the supervision of [*insert jurisdiction*].

$$CO_2 = FR \times MW_{CO2} / MVC \times MF \times 0.001 \qquad \textbf{Equation 200-9}$$

Where:

CO_2	=	emissions of CO_2 (metric tons/yr)
FR	=	volumetric flow rate of acid gas to SRU (scf/year or m^3/year)
MW_{CO2}	=	molecular weight of CO_2 (44 kg/kg-mole)
MVC	=	molar volume conversion (849.5 scf/ kg-mole, for STP of 20°C and 1 atmosphere or 836 scf/kg-mole, for STP of 60°F, and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
MF	=	molecular fraction (%) of CO_2 in sour gas (default MF = 20% expressed as 0.20)
0.001	=	conversion factor – kg to metric tons

(e) Flares and Other Control Devices. [ERG1]

(1) The operator shall calculate and report CO_2, CH_4 and N_2O emissions resulting from the combustion of flare pilot and purge gas using the appropriate method(s) specified in sections WCI.20.

(2) The operator shall calculate and report CO_2 emissions resulting from the combustion of hydrocarbons routed to flares for destruction as follows:

(A) Use ~~using:~~ Equation 200-10 if the flare is equipped with a continuous flow and ~~higher heating~~high heat value monitors:

$$CO_2 = Flare_N \times HHV \times (0.001 \times EmF) \qquad \textbf{Equation 200-10}$$

Where:

CO_2	=	CO_2 emissions (metric tons/year)
$Flare_N$	=	volume of flare gas (m^3/yr)
HHV	=	~~Higher heating~~High heat value for refinery fuel or flare gas (MMBtu/MMscf or J/m^3)
0.001	=	conversion factor – kg to metric tons
EmF	=	default CO_2 emission factor (60 kg CO_2/MMBtu or 5.7 kg/kJ)

(B) Use Equation 200-11 if the flare is equipped with a continuous flow and carbon content monitors:

$$CO_2 = Flare_N \times CC_N \times (MW_n / MVC) \times 3.664 \times 0.001$$ **Equation 200-11**

Where:

CO_2	=	CO_2 emissions (metric tons/year)
$Flare_N$	=	volume of flare gas (m^3/yr)
CC_N	=	carbon content of flare gas (kg of carbon/kg of fuel)
MW_N	=	molecular weight of flare gas
MVC	=	molar volume conversion factor (849.5 scf/kg- mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole~~,~~ for STP of 60°F, and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

a. Use Equation 200-12 if the flare is not equipped with a continuous flow monitor and HHV or carbon content monitor~~.~~:

$$CO_2 = RFT \times EF_{NMHC} \times CF_{NMHC} \times 3.664 \times 0.001$$ **Equation 200-1~~0~~2**

Where:

CO_2	=	CO_2 emissions (metric tons/year)
RFT	=	refinery feed input (m^3/yr)
EF_{NMHC}	=	non-methane hydrocarbon emission factor (EF_{NMHC} = 0.002 kg/m^3 throughput)
CF_{NMHC}	=	conversion factor – NMHC to carbon (CF_{NMHC}= 0.6)
3.664	=	ratio of molecular weights, CO_2 to carbon
0.001	=	conversion factor – kg to metric tons

(3) The operator who uses methods other than flares (e.g. incineration, combustion as a supplemental fuel in heaters or boilers) to destroy low Btu gases (e.g. coker flue gas, gases from vapor recovery systems, casing vents and product storage tanks) shall calculate CO_2 emissions using Equation 200-13~~1~~. The operator shall determine CC_A and MW_A quarterly using methods specified in section WCI.20 and use the annual average values of CC_A and MW_A to calculate CO_2 emissions.

$$CO_2 = GV_A \times CC_A \times MW_A / MVC \times 3.664 \times 0.001$$ **Equation 200-1~~1~~3**

Where:

CO_2 = CO_2 emissions (metric tons/year)
GV_A = volume of gas A destroyed annually (scf/year or m^3/year)
CC_A = carbon content of gas A (kg C/kg fuel)
MW_A = molecular weight of gas A
MVC = molar volume conversion factor (849.5 scf/kg- mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole~~,~~ for STP of 60°F, and 1 atmosphere or 24.06 m^3/kg-mole for STP of 20°C and 1 atmosphere, or 23.67 m^3/kg-mole for STP of 60°F and 1 atmosphere)
3.664 = ratio of molecular weights, CO_2 to carbon
0.001 = conversion factor – kg to metric tons

(f) Storage Tanks. For above-ground storage tanks containing crude oil, asphalt, naphtha, and distillate oils that are not equipped with vapor recovery technology, the operator shall calculate CH_4 emissions using the U.S. EPA TANKS Model (Version 4.09D). For crude oil, naphtha, and distillate oils, use the default chemical databases for crude oil (RVP 5), distillate fuel oil No. 2, and jet naphtha (JP4), respectively. For asphalt, use the data in Table 200-4 to create an asphalt chemical database. The annual throughput for each storage tank must be distributed equally across the twelve months of the year and the single-component liquid option selected. The total VOC emission values generated by the model shall be converted to methane emissions using:

(1) A default conversion factor of 0.6 (CH_4 = 0.6 * VOC); or
(2) Species specific conversion factors determined by storage tank headspace vapor analysis using a sampling and analysis methodology approved by [*insert jurisdiction*].

(g) Wastewater Treatment.

(1) The operator shall calculate CH_4 emissions from wastewater treatment using Equation 200-14~~2~~.

$$CH_4 = [(Q \times COD_{qave}) - S] \times B \times MCF \times 0.001$$ **Equation 200-1~~2~~4**

Where:

CH_4 = emission of methane (tons/yr)
Q = volume of wastewater treated (m^3/yr)
COD_{qave} = average of quarterly determinations of chemical oxygen demand of the wastewater (kg/m^3)
S = organic component removed as sludge (kg COD/yr)
B = methane generation capacity (B = 0.25 kg CH_4/kg COD)
MCF = methane co~~nversion~~rrection factor for anaerobic decay (0-1.0) from Table 200-2
0.001 = conversion factor – kg to metric tons

(2) The operator shall calculate N_2O emissions from wastewater treatment using Equation 200-15~~3~~.

$$N_2O = Q \times N_{qave} \times EF_{N2O} \times 1.571 \times 0.001$$ **Equation 200-1~~53~~**

Where:

N_2O	=	emissions of N_2O (metric tons/yr)
Q	=	volume of wastewater treated (m^3/yr)
N_{qave}	=	average of quarterly determinations of N in effluent (kg N/m^3)
EF_{N2O}	=	emission factor for N_2O from discharged wastewater (0.005 kg N_2O-N/kg N)
1.571	=	conversion factor – kg N_2O-N to kg N_2O
0.001	=	conversion factor – kg to metric tons

(h) Oil-Water Separators. The operator shall calculate CH_4 emissions from oil-water separators using Equation 200-1~~6~~4. For the CF_{NMHC} conversion factor, operators shall use either a default factor of 0.6 or species specific conversion factors determined by analysis using a sampling and analysis methodology approved by [~~insert~~ *jurisdiction*].

$$CH_4 = EF_{sep} \times V_{water} \times CF_{NMHC} \times 0.001$$ **Equation 200-1~~6~~4**

Where:

CH_4	=	emission of methane (tons/yr)
EF_{sep}	=	NMHC (non methane hydrocarbon) emission factor (kg/m^3) from Table 200-3.
V_{water}	=	volume of waste water treated by the separator (m^3/yr)
CF_{NMHC}	=	NMHC to CH_4 conversion factor ~~(CF_{NMHC} = 0.6)~~
0.001	=	conversion factor – kg to metric tons

(i) Equipment leaks. The operator shall calculate CH_4 emissions for all components in natural gas, refinery fuel gas, and PSA off-gas systems as follows:

(1) Components shall be identified as one of the following classification types: valve, pump seal, connector, flange, open-ended line. Operators shall use the Component Identification and Counting Methodology and screening methods found in Method 3 in CAPCOA (1999) *[or the method in CCME EPC-73E for Canadian jurisdictions*], which ~~is~~are incorporated by reference in WCI.6. Operators shall conduct screenings at the frequency interval required by *[~~insert~~ jurisdiction].* Operators shall measure and record emissions using instrumentation capable of detecting methane.

(2) The VOC emissions shall be calculated using the following methods:

~~(A)~~(C) For components where the measured screening value (SV) is indistinguishable from zero when corrected for background, operators shall calculate VOC emissions using Equation 200-1~~5~~7:

$$E_{VOC-0} = \sum_{i=1}^{6} CC_i \times ZF_{i0} \times t$$ **Equation 200-1~~5~~7**

Where:

E_{VOC-0}	=	zero component VOC emission (kg/screening period)
i	=	component type (1 = valve, 2 = pump seal, 3 = other, 4 = connector, 5 = flange, 6 = open-ended line)
CC_i	=	number of i components where SV = 0
ZF_{i0}	=	zero VOC emission factor (kg/hr) for component i from Table 200-5
t	=	time (hours) since last screening

~~(B)~~(D) For leaking components, operators shall calculate VOC emissions using the following methods:

(i) For screening values between background and 9,999 ppmv, the operator shall calculate the VOC emissions using Equation 200-1~~6~~8.

$$E_{VOCL-C} = \sum_{i=1}^{6}\sum_{n=1}^{n}\left(\sigma_i \times SV_n^{\beta i}\right) \times t$$

Equation 200-1~~6~~8

Where:

E_{VOCL-C}	=	leaking components VOC emissions (kg/screening period)
i	=	component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open ended-line)
n	=	number of i components
σ_i	=	correlation equation coefficient for component type i from Table 200-5
SV_n	=	screening value for component n
βi	=	correlation equation exponent for component type i from Table 200-5
t	=	time (hours) component has been leaking – default value is time from last screening

(ii) For screening values greater than 9,999 ppmv, the operator shall calculate the VOC emissions using Equation 200-1~~7~~9.

$$E_{VOCP} = \sum_{i=1}^{6} CC_i \times PF_{iP} \times t$$

Equation 200-19~~7~~

Where:

E_{VOCP}	=	VOC emissions for components pegged over SV 9,999 ppmv (kg/screening period)
i	=	component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open-ended line)
CC_i	=	number of i components pegged over 9,999 ppmv
PF_{iP}	=	VOC emission factor (kg/hr) for component type i pegged over 9,999 ppmv from Table 200-5
t	=	time component has been leaking (hours) – default value is time since last screening

~~(C)~~(E) The operator shall calculate CH_4 emissions using Equation 200-~~18~~20. Operators shall use system specific determinations of gas composition and methane content (refinery fuel gas, natural gas, associated gas, flexigas, low Btu gas), where available, to determine a CF_{VOC} value. The sampling and analysis methodology must be approved by ~~the~~ [~~insert~~ jurisdiction]. When representative data is not available, operators shall use the default value of 0.6 for CF_{VOC}.

$$CH_4 = \sum_{1}^{n} \left(E_{VOC-0} + E_{VOC-LC} + E_{VOCP}\right)_n \times CF_{VOC} \times 0.001$$ **Equation 200-~~18~~20**

Where:

CH_4	=	methane emissions (metric tons/year)
n	=	number of screenings/year
E_{VOC-0}	=	zero component VOC emissions (kg/screening period)
E_{VOC-LC}	=	leaking component VOC emissions (kg/screening period)
E_{VOCP}	=	VOC emissions for components pegged over 9,999 ppmv (kg/screening period)
CF_{VOC}	=	VOC to CH_4 conversion factor (default CF_{VOC}=0.6)
0.001	=	conversion factor – kg to metric tons

WCI.204 Sampling, Analysis, and Measurement Requirements

(a) Catalyst Regeneration.

(1) For FCCUs and fluid coking units, the operators shall measure the following parameters: ~~using methods that comply with the measurement accuracy provisions in WCI.2(dg).~~

(A) The daily oxygen concentration in the oxygen enriched air stream inlet to the regenerator.

(B) Continuous measurements of the volumetric flow rate of air and oxygen enriched air entering the regenerator.

~~(C)Continuous measurement of the volumetric flow rate of exhaust gas leaving the regenerator.~~

~~(D)~~(C) Continuous or weekly periodic measurements of the CO_2, CO and O_2 concentrations in the regenerator exhaust gas, to be determined by individual jurisdictions.~~.~~

~~(E)~~(D) Daily ~~measurements~~determinations of the carbon content of the coke burned.

~~(F)~~(E) The number of days of operation.

(2) For periodic catalyst regeneration, the operators shall measure the following parameters ~~using methods that comply with the measurement accuracy provisions in WCI.2(gd)~~.

(A) The mass of catalyst regenerated in each regeneration cycle.

(B) The weight fraction of carbon on the catalyst prior to and after catalyst regeneration.

(3) For continuous catalyst regeneration in operations other than FCCUs and fluid cokers, the operators shall measure the following parameters ~~using methods that comply with the measurement accuracy provisions in WCI.2(dg)~~.

(A) The hourly catalyst regeneration rate.
(B) The weight fraction of carbon on the catalyst prior to and after catalyst regeneration.
(C) The number of hours of operation.

(b) Process vents. Operators shall measure the following parameters for each process vent ~~using methods that comply with the measurement accuracy provisions in WCI.2(dg)~~.

(1) The vent flow rate for each venting event.
(2) The molar fraction of CO_2, N_2O, and CH_4 in the vent gas stream during each venting event.
(3) The duration of each venting event.

(c) Asphalt Production. Operators shall measure the mass of asphalt blown ~~using methods that comply with the measurement accuracy provisions in WCI.2(gd)~~.

(d) Sulfur Recovery. The operator shall measure the volumetric flow rate of acid gas to the SRU. ~~using methods that comply with the measurement accuracy provisions in WCI.2(g).~~ If using source specific molecular faction value instead of the default factor, the operator shall conduct an annual test of the CO_2 content using methods approved by [insert jurisdiction]. The operator shall submit a test plan to the [~~insert~~ *jurisdiction]* for approval. Once approved, the annual tests shall be conducted in accordance with the approved test plan under the supervision of the [~~insert~~ *jurisdiction*].

(e) Flares and Other Control Devices. The operator shall measure the following:

(1) If using the method specified in WCI.203(e)(2)(a), monitor the flow rate and ~~higher heating~~high heat value of the flare gas using continuous monitors ~~that comply with the measurement accuracy provisions in WCI.2(d)~~.
(2) If using the method specified in WCI.203(e)(2)(b), monitor the flow rate and carbon content of the flare gas using continuous monitors ~~that comply with the measurement accuracy provisions in WCI.2(d).~~
(3) If using the method specified in WCI.203(e)(3), monitor the ~~The~~ volume of gas destroyed annually (determined to accuracy of ± 7.5%)~~.~~ ~~A~~and
~~(2) T~~the carbon content ~~using methods that comply with the measurement accuracy provisions in WCI.2(dg)~~.

(f) Storage Tanks. The operator shall measure the annual throughput of crude oil, naphtha, distillate oil, asphalt, and gas oil for each storage tank using flow meters ~~that comply with the measurement accuracy provisions in WCI.2(dg)~~.

(g) Wastewater Treatment. Operators shall measure the following parameters ~~using methods that comply with the measurement accuracy provisions in WCI.2(dg)~~.

(1) The daily volume of waste water treated.
(2) The quarterly chemical oxygen demand of the wastewater.
(3) The amount of sludge removed and the organic content of the sludge.
(4) The quarterly nitrogen content of the wastewater.

(h) Oil-Water Separators. Operators shall measure the daily volume of waste water treated by the oil-water separators using methods that comply with the measurement accuracy provisions in WCI.2(dg).

(i) Equipment Leaks. Operators shall measure screening values for each valve, pump seal, connector, flange, and open-ended line used in natural gas, refinery fuel gas, and PSA off-gas systems using the methods specified in CAPCOA (1999) Method 3: Correlation Equation Method *[or the method in CCME EPC-73E for Canadian jurisdictions]* and an instrument capable of detecting methane. Operators shall conduct screenings at the frequency interval required by *[~~insert~~ jurisdiction]*.

~~*Note: Comparability of the Canadian regulations to the leak detection and repair r regulations under 40 CFR 63, Subpart CC and 40 CFR 60, Subpart VV is under determination. These U.S EPA regulations require initially monthly monitoring for valves and pumps, which may be reduced to quarterly, semi-annual, or annual based on the percentage of leaking components.*~~

Table 200-1. Coke burn rate material balance and conversion factors

	(kg min)/(hr dscm %)	(lb min)/(hr dscf %)
K_1	0.2982	0.0186
K_2	2.0880	0.1303
K_3	0.0994	0.0062

Table 200-2. Default MCF Values for Industrial Wastewater			
Type of Treatment and Discharge Pathway or System	**Comments**	**MCF**	**Range**
Untreated			
Sea, river and lake discharge	Rivers with high organic loading may turn anaerobic, however this is not considered here	0.1	0 - 0.2
Treated			
Aerobic treatment plant	Well maintained, some CH_4 may be emitted from settling basins	0	0 – 0.1
Aerobic treatment plant	Not well maintained, overloaded	0.3	0.2 – 0.4
Anaerobic digester for sludge	CH_4 recovery not considered here	0.8	0.8 – 1.0
Anaerobic reactor	CH_4 recovery not considered here	0.8	0.8 – 1.0
Anaerobic shallow lagoon	Depth less than 2 meters	0.2	0 – 0.3
Anaerobic deep lagoon	Depth more than 2 meters	0.8	0.8 – 1.0

For CH_4 generation capacity (B) in kg CH_4/kg COD, use default factor of 0.25 kg CH_4/kg COD.

The emission factor for N_2O from discharged wastewater (EF_{N2O}) is 0.005 kg N_2O-N/kg-N.

MCF = methane ~~correction~~conversion factor ~~–~~(the fraction of waste treated anaerobically).
COD = chemical oxygen demand (kg COD/m^3).

§ WCI.210 PULP AND PAPER MANUFACTURING

§ WCI.211 Source Category Definition

The pulp and paper manufacturing source category consists of facilities that produce pulp either at stand-alone pulp facilities or integrated pulp and paper mills.

§ WCI.212 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions report must contain the following information:

(a) Annual biogenic CO_2 process emissions from all recovery furnaces and kilns in metric tons, as specified in WCI.213.

(b) Annual fossil CO_2 process emissions from all recovery furnaces and kilns in metric tons, as specified in WCI.213

~~(b)~~(c) CO_2, N_2O, and CH_4 emissions from stationary combustion units in metric tons, as specified in WCI.23.

~~(c)~~(d) Annual consumption of carbonate in metric tons.

~~(d)~~(e) Annual black liquor production in metric tons.

~~(e)~~(f) Under consideration: Annual N_2O, and CH_4 emissions from onsite wastewater treatment plants in metric tons, as specified in WCI.200(g).

§ WCI.213 Calculation of GHG Emissions

(a) ~~You must c~~Calculate biogenic CO_2 process emissions from recovery furnaces and kilns using Equation 210-1:

$$CO_{2,biogenic} = \sum_{i=1}^{12}(BL_i \times CC_i \times 3.664) \qquad \textbf{Equation 210-1}$$

~~[A1]~~Where:

$CO_{2,biogenic}$	=	Biogenic CO_2 process emissions from recovery furnaces and kilns (metric tons/year).
BL_i	=	Black liquor produced in month i (metric tons/month).
CC_i	=	Carbon content of the black liquor (~~percent by~~ weight ~~expressed as a decimal~~ fraction).
~~RM_j~~	~~=~~	~~Amount of carbonate j consumed in month i (metric tons/month).~~
~~EF_j~~	~~=~~	~~Carbonate content of carbonate material j for month i (percent by weight, expressed as a decimal fraction as CO_2)~~.
3.664	=	Ratio of molecular weights, CO_2 to carbon.

(b) ~~You must c~~Calculate fossil CO_2 process emissions from make-up carbonates used in the recovery furnace and kiln system using Equation 210-2:

$$CO_{2,\,fossil} = \sum_{i=1}^{12} \left(\sum_{j=1}^{n} RM_j \times EF_j \right)_i \qquad \textbf{Equation 210-2}$$

Where:

$CO_{2,\,fossil}$ = Fossil CO_2 process emissions from recovery furnace and kiln systems (metric tons/year).
RM_j = Amount of make-up carbonate j consumed in month i (metric tons/month).
EF_j = Carbonate content of carbonate material j for month i (weight fraction as CO_2).
3.664 = Ratio of molecular weights, CO_2 to carbon.

§ WCI.214 Monitoring Requirements

~~*Note: The sampling, analysis, and measurement procedures will be standardized for each calculation input to reduce variation between facilities within the pulp and paper industry. Material sampling frequency and technique is distinct from material analysis conducted in a laboratory. The WCI is seeking stakeholder feedback on this topic and is specifically interested in proposals from stakeholders with expertise in this industry related to sampling, analysis and measurement procedures already in use at these facilities for the material quantities and/or concentrations listed below. Those proposing procedures should include sampling frequency and technique, indicate the uncertainty associated with the procedures, and describe the application of the procedure at a facility.*~~

(a) Measure the quantity of black liquor produced each month. ~~using methods that comply with the measurement accuracy provisions in WCI.2(g)~~

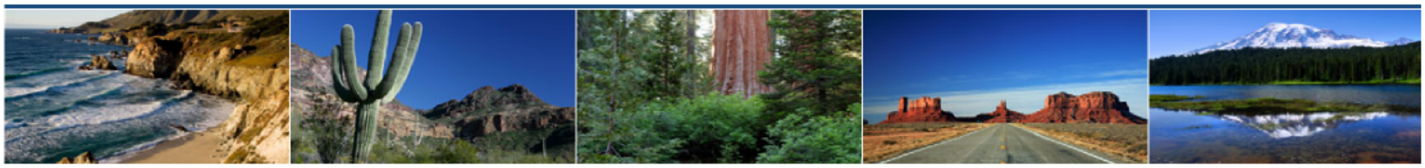
(b) Collect monthly samples of black liquor and analyze each sample for carbon content using ASTM D5373-08 Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Laboratory Samples of Coal.~~ASTM [*To be determined*].~~

(c) For the amount of carbonate material consumed, ~~you must~~ either use records provided by the material supplier or monitor carbonate material consumption using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders. ~~using methods that comply with the measurement accuracy provisions in WCI.2(g).~~

(d) For the carbonate content of each carbonate material consumed, ~~you must~~ either use carbonate content data provided by the supplier, the appropriate default factor from Table 1, or collect monthly samples of each carbonate material consumed and analyze each sample for carbonate content using ASTM Methods C25, C1301 or C1271 ~~[*To be determined*]~~.

Table 1: Formulae, Formula Weights, and Carbon Dioxide Emission Factors for Common Carbonate Species.

Carbonate	Mineral Name	Formula Weight	Emission Factor (metric tons CO_2/metric ton Carbonate)
$CaCO_3$	Calcite	100.1	0.4397
$CaMg(CO_3)_2$	Dolomite	184.4	0.4773
Na_2CO_3	Soda ash (sodium carbonate)	106.0	0.4149



§ WCI.230 SODA ASH PRODUCTION

§ WCI.231 Source Category Definition

The soda ash production source category consists of facilities that produce soda ash by calcining sodium carbonate bearing ore or brine.

§ WCI.232 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions report must contain the following information:

(a) Annual CO_2 process emissions from all soda ash calcining kilns combined, as specified in WCI.233 (metric tons).

(b) CO_2, N_2O, and CH_4 emissions from combustion of fuels in the calcining kilns, as specified in WCI.20 (metric tons).

(c) Annual consumption of trona ore or sodium carbonate-rich brine (metric tons).

(d) Annual soda ash production (metric tons).

(e) Annual mass of waste material output from calcining kilns (metric tons).

(f) For plants recycling the CO_2 generated from calcination for use in the carbonation towers, report annual CO_2 recycled within the process (metric tons).

§ WCI.233 Calculation of GHG Emissions

(a) You must calculate CO_2 emissions using the methods in either paragraphs (a)(1) or (a)(2) of this section.

(1) **Continuous Emission Monitoring Systems.** The owner or operator may measure CO_2 emissions using CEMS, as specified WCI.23(d).

(2) **Feedstock Material Balance.** The owner or operator may estimate CO_2 process emissions using Equation 230-1 and the measured carbon content and feedstock input of the trona ore or carbonate-rich brine.

$$CO_2 = \sum_{j=1}^{12} (3.664)[(Ci_j \times Ti_j) - (Cs_j \times Ts_j) - (Cw_j \times Tw_j)] \qquad \textbf{Equation 230-1}$$

Where:

CO_2 = CO_2 process emissions from soda ash production (metric tons/year).
Ci_j = Carbon content of feedstock (trona ore or carbonate-rich brine) input (percent by weight, expressed as a decimal fraction).
Ti_j = Weight of feedstock (trona ore or carbonate-rich brine) input (metric tons/month).
Cs_j = Carbon content of soda ash output (percent by weight, expressed as a decimal fraction).
Ts_j = Weight of soda ash output (metric tons/month).
Cw_j = Carbon content of waste material output from the kiln (i.e. kiln dust collected in control devices and not combined with the soda ash product) (percent by weight, expressed as a decimal fraction).
Tw_j = Weight of waste material output from the kiln (i.e. kiln dust collected in control devices and not combined with the soda ash product) (metric tons/month).
3.664 = Ratio of molecular weights, CO_2 to carbon.

(b) If you operate a soda ash production facility in which CO_2 generated in calcining kilns is recycled to carbonate towers for brine pre-treatment, you must calculate recycled CO_2 using Equation 230-2.

$$CO_2 = \sum_{j=1}^{12} (3.664)[(Ci_j \times Ti_j) - (Cb_j \times Tb_j)]$$ **Equation 230-2**

Where:

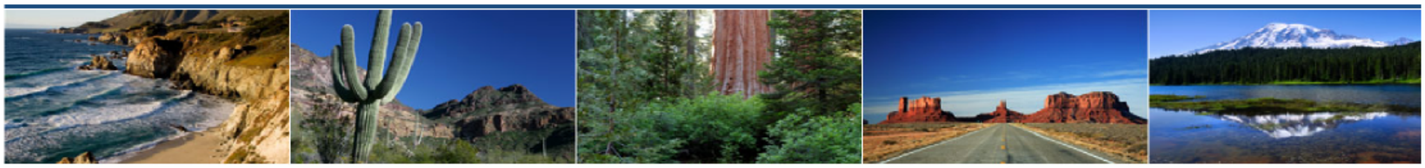
CO_2 = Recycled CO_2 from the ore calcining kiln (metric tons/year).
Ci_j = Carbon content of ~~ore~~ bicarbonate kiln input (percent by weight, expressed as a decimal fraction).
Ti_j = Weight of bicarbonate kiln~~ore~~ input (metric tons/month).
Cb_j = Carbon content of sodium carbonate-rich brine input (percent by weight, expressed as a decimal fraction).
Tb_j = Weight of sodium carbonate-rich brine input (metric tons/month).
3.664 = Ratio of molecular weights, CO_2 to carbon.

§ WCI.234 Monitoring Requirements

Owners and operators using the mass balance method must comply with the following monitoring requirements:

(a) Measure the quantity of ore, soda ash, waste material, and carbonate-rich brine (as applicable) by direct measurement using the same instruments used for accounting purposes.

(b) Collect monthly samples of ore, soda ash, waste material, and carbonate-rich brine (as applicable) and analyze each sample for carbon content. For the carbon content of the brine ore and carbonate-rich brine, use a total organic carbon analyzer according to the ultraviolet light/chemical (sodium persulfate) oxidation method in ASTM D4839-03. Use method ASTM E359-00(2005) for the carbon content of trona ore, soda ash, and waste material.



§ WCI.300 PETROCHEMICAL MANUFACTURING

§ WCI.301 Source Category Definition

The petrochemical manufacturing source category consists of any facility that manufacturers petrochemicals, including acrylonitrile, propylene, ethylene, ethylene dichloride, ethylene oxide, or methanol, from feedstocks derived from petroleum, or petroleum and natural gas liquids.

§ WCI.302 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions report must contain the following information:

(a) CO_2, N_2O, and CH_4 emissions from combustion of fuels in the stationary combustion unit in metric tons, as specified in WCI.20.

(b) CO_2, N_2O, and CH_4 emissions from flares and other oxidizers in metric tons, as specified in WCI.303(a).

(c) CO_2, N_2O, and CH_4 emissions from process vents in metric tons, as specified in WCI.303(b).

(d) CH_4 emissions tons from equipment leaks in metric, as specified in WCI.303(c).

(e) Annual consumption of feedstock by type for all feedstocks that result in GHG emissions in million standard cubic feet for gases, gallons for liquids, short tons for non-biomass solids, and bone dry short tons for biomass-derived solid fuels.

§ WCI.303 Calculation of GHG Emissions

(a) **Flares and Other Oxidizers.** You must calculate GHG emissions from flares and oxidation control devices as follows:

(1) Calculate CO_2, CH_4 and N_2O emissions resulting from the combustion of flare pilot and purge gas using the appropriate method(s) specified in WCI.20.

(2) Calculate CO_2 emissions for each gas destroyed in a flare or other oxidation control device using Equation 300-1.

Equation 300-1

$$CO_2 = \sum_{i=1}^{n} GV_i \times CC_i \times MW_i / MVC \times 3.664 \times 0.001$$

Where:

CO_2 = CO_2 emissions (metric tons/year).
GV_i = Volume of gas *i* destroyed annually (scf/year).
CC_i = Average annual carbon content of gas *i* (kg C/kg fuel).
MW_i = Average annual molecular weight of gas *i*.

MVC	=	Molar volume conversion factor (849.5 scf/kg- mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole, for STP of 60°F, and 1 atmosphere).
3.664	=	Ratio of molecular weights, CO_2 to carbon.
0.001	=	Conversion factor, kg to metric tons.
n	=	Number of gases destroyed.

(b) **Process Vents.** Except for process emissions calculated pursuant to WCI.303(a) or (c), you must calculate process emissions of CO_2, CH_4, and N_2O from process vents using Equation 300-2.

$$E_x = \sum_{i=1}^{n} VR_i \times F_{xi} \times (MW_x / MVC) \times VT_i \times 0.001$$ **Equation 300-2**

Where:

E_x	=	Emissions of x (metric tons/yr), where x = CO_2, N_2O, or CH_4.
VR_i	=	Vent rate for venting event i (scf/unit time).
F_{xi}	=	Molar fraction of x in vent gas stream during event i.
MW_x	=	Molecular weight of x (kg/kg-mole).
MVC	=	Molar volume conversion (849.5 scf/kg-mole for STP of 20°C and 1 atmosphere or 836 scf/kg-mole for STP of 60°F, and 1 atmosphere).
VT_i	=	Time duration of venting event i (same units of time used for VR_i).
n	=	Number of venting events.
0.001	=	Conversion factor, kg to metric tons.

(c) **Equipment Leaks.** You must calculate CH_4 emissions for each valve, pump seal, connector, flange, open-ended line, and other components in natural gas, fuel gas, and off-gas systems as follows:

(1) Identify and screen each valve, pump seal, connector, flange, open-ended line, and other components in natural gas, fuel gas, and off-gas systems using the monitoring method in WCI.304. Components identified as “other” components include instruments, loading arms, pressure relief valves, vents, compressors, dump lever arms, diaphragms, drains, hatches, meters, and polished rods stuffing boxes.

(2) Use the results of the component screening and the following equations to calculate VOC emissions:

(A) For components where the measured screening value is equal to zero when corrected for background, calculate VOC emissions using Equation 300-3 and the appropriate default emission factors from Table 300-1:

$$E_{VOC-0} = \sum_{i=1}^{6} CC_i \times ZF_{i0} \times t$$ **Equation 300-3**

Where:

$E_{VOC\text{-}0}$ = Emissions from components with a screening value equal to zero, when corrected for background (kg/screening period).

i = Component type (valve, pump seal, other, connector, flange, open-ended line).

CC_i = Number of i components where the screening value is 0.

ZF_{i0} = Default zero factor for component i from Table 300-1 (kg/hr).

t = Time since last screening (hours/screening period).

(B) For components where the measured screening value, corrected for background, is between 0 and 10,000 ppmv, calculate VOC emissions using Equation 300-4 and the appropriate default factors from Table 300-1:

$$E_{VOCL-C} = \sum_{i=1}^{6} \sum_{n=1}^{n} \left(\sigma_i \times SV_n^{\beta i} \right) \times t$$ **Equation 300-4**

Where:

$E_{VOCL\text{-}C}$ = Emissions from components with screening values, corrected for background, between 0 and 10,000 (kg/screening period).

i = Component type (valve, pump seal, others, connector, flange, open ended-line).

n = Number of *i* components.

σ_i = Correlation equation coefficient for component type *i* from Table 300-1.

SV_n = Screening value for component *n.*

βi = Correlation equation exponent for component type *i* from Table 300-1.

t = Time component has been leaking (default value is time from last screening) (hours/screening period).

(C) For components where the screening value, corrected for background, is greater than or equal to 10,000 ppmv, calculate VOC emissions using Equation 300-5 and the appropriate default factors from Table 300-1:

$$E_{VOCP} = \sum_{i=1}^{6} CC_i \times PF_{iP} \times t$$ **Equation 300-5**

Where:

E_{VOCP} = Emissions from components with screening values, corrected for background, greater than or equal to 10,000 ppmv (kg/screening period).

i = Component type (1=valve, 2=pump seal, 3=others, 4=connector, 5=flange, 6=open-ended line).

CC_i = Number of *i* components with screening values greater than 9,999 ppmv.

PF_{iP} = VOC emission factor for component type *i* pegged over 9,999 ppmv from Table 300-1 (kg/hr).

t = Time component has been leaking (default value is time since last screening) (hours/screening period).

(3) Calculate CH_4 emissions using Equation 300-6 and either a default factor of 0.6 for CF_{VOC} or a site-specific conversion factor calculated from the composition and methane content of the gas.

$$CH_4 = \sum_{1}^{n} \left(E_{VOC-0} + E_{VOC-LC} + E_{VOCP}\right)_n \times CF_{VOC} \times 0.001 \qquad \textbf{Equation 300-6}$$

Where:

CH_4	=	CH_4 emissions (metric tons/year).
n	=	Number of screenings/year.
E_{VOC-0}	=	Emissions from components with a screening value equal to zero, when corrected for background (kg/screening period).
E_{VOC-LC}	=	Emissions from components with screening values, corrected for background, between 0 and 10,000 (kg/screening period).
E_{VOCP}	=	Emissions from components with screening values, corrected for background, greater than or equal to 10,000 ppmv (kg/screening period).
CF_{VOC}	=	VOC to CH_4 conversion factor (default $CF_{VOC} = 0.6$).
0.001	=	Conversion factor (kg to metric tons).

§ WCI.304 Monitoring Requirements

(a) Flares and Other Oxidizers. You must measure:

(1) The volume of each gas destroyed annually determined to an accuracy of ± 5 percent.

(2) The carbon content and molecular weight of each gas quarterly using the methods specified in WCI.25 and calculate the annual average values for carbon content and molecular weight for each gas destroyed.

(b) Process **Vents.** You must measure the following parameters for each process vent:~~, using methods that comply with the measurement accuracy provisions in WCI.2(g):~~

(1) The gas flow rate for each venting event.

(2) The molar fraction of CO2, N2O, and CH4 in the vent gas stream during each venting event.

(3) The duration of each venting event.

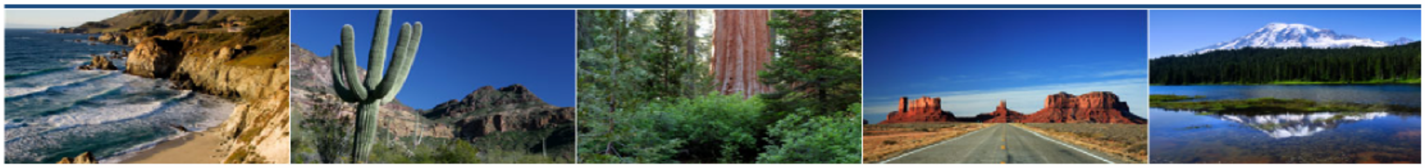
(c) **Equipment Leaks.** You must screen each valve, pump seal, connector, flange, and open-ended line used in natural gas, fuel gas, and off-gas systems using the methods specified in CAPCOA (1999) Method 3: Correlation Equation Method and an instrument capable of detecting methane. Screenings must be performed at the frequency interval required by [*insert jurisdiction*]. The instrumentation used for screening must be capable of detecting methane.

(d) **Feedstock Consumption.** You must measure the feedstock consumption ~~using methods that comply with the measurement accuracy provisions in WCI.2(g).~~ using the same plant instruments used for accounting purposes, such as weigh hoppers or belt weigh feeders.

Table 300-1. Fugitive Emissions from Gas Service Components

Component Type / Service Type	Default Zero Factor (kg/hr)	Correlation Equation (kg/hr)	Pegged Factor (kg/hr)
	(SV = 0) Zf_{i0}	(SV > 0 and < 10,000) σ_i and β_i	(SV ≥ 10,000) PF_{iP-10}
Valves	7.8×10^{-6}	$2.27 \times 10^{-6}(SV)^{0.747}$	0.064
Pump seals	1.9×10^{-5}	$5.07 \times 10^{-5}(SV)^{0.622}$	0.089
Others[a]	4.0×10^{-6}	$8.69 \times 10^{-6}(SV)^{0.642}$	0.082
Connectors	7.5×10^{-6}	$1.53 \times 10^{-6}(SV)^{0.736}$	0.030
Flanges	3.1×10^{-7}	$4.53 \times 10^{-6}(SV)^{0.706}$	0.095
Open-ended lines	2.0×10^{-6}	$1.90 \times 10^{-6}(SV)^{0.724}$	0.033

[a] The "other" component type should be applied to any component type other than connectors, flanges, open-ended lines, pump seals, or valves. The "other" component type includes: instruments, loading arms, pressure relief valves, vents, compressors, dump lever arms, diaphragms, drains, hatches, meters, and polished rods stuffing boxes.



§ WCI.XX0 ADIPIC ACID MANUFACTURING

§ WCI.XX1 Source Category Definition

Adipic acid ($HOOC(CH_2)_4COOH$) is a dicarboxylic acid used in the production of a large number of products including synthetic fibers (primarily nylon 6,6), coatings, plastics, urethane foams, and synthetic lubricants. Adipic acid is produced by oxidizing a mixture of cyclohexanone ($(CH_2)_5CO$) and cyclohexanol ($(CH_2)_5CHOH$) with nitric acid in the presence of a catalyst; nitrous oxide (N_2O) is formed as an unwanted by-product.

§ WCI.XX2 Greenhouse Gas Reporting Requirements

In addition to the information required by WCI.3, the annual emissions data report shall contain the following information:

(a) Total emissions of N_2O at the facility level (metric tons)

(b) Total quantity of adipic acid production (metric tons)

(c) Facility-specific N_2O emission factor derived from periodic emissions monitoring or irregular emissions sampling (metric tons N_2O per metric ton of adipic acid)

(d) Destruction factor for facility-specific abatement technology (e.g., catalytic destruction, thermal destruction, nitric acid recycling, adipic acid recycling, etc.)

(e) Abatement system utilization factor for facility-specific abatement technology

(f) CO_2, N_2O, and CH_4 emissions from stationary combustion units as specified in WCI.20

§ WCI.XX3 Calculation of N_2O Emissions

(a) Process N_2O emissions. Determine process N_2O emissions as specified under either paragraph (1) or (2) of this section.

(1) Continuous emissions monitoring systems (CEMS).

(2) Calculation methodologies specified in paragraph (b) of this section.

(b) Process N_2O Emissions Calculation Methodology. Calculate total N_2O process emissions using the following equation:

$$E_{N2O} = EF \times AAP \times \left(1 - DF \times ASUF\right)$$

Equation XX0-1

Where:

E_{N2O}	=	Emissions of N_2O from adipic acid production (metric tons);
EF	=	N_2O emission factor (metric tons N_2O/metric ton of adipic acid produced) derived from periodic emissions monitoring or irregular emissions sampling;
AAP	=	Adipic acid production (metric tons);
DF	=	Destruction factor (dimensionless);
ASUF	=	Abatement system utilization factor (dimensionless).

§ WCI.XX4 Sampling, Analysis, and Measurement Requirements

The following measurement methods shall be used.

(a) Facility N_2O emissions tests. All facilities must conduct testing using:

(1) U.S. EPA Method 320 (40 CFR part 63, Appendix A) or ASTM D6348-03; or

~~(This is a possible change for WCI based on §98.54 of the Mandatory Reporting Rule);~~

(2) Continuous emissions monitor system (CEMS) to determine either the uncontrolled emissions to derive an emission factor (for use with the documented abator destruction efficiency), or the controlled emissions. The CEMS shall be operated in accordance with quality assurance and quality control program approved by the [jurisdiction].

(b) Adipic acid production rates. Production rates may be determined through sales records, or through direct measurement using flow meters or weigh scales.

ANNOUNCEMENT CONCERNING
FIRST JURISDICTIONAL DELIVERER APPROACH

July 15, 2009

The *Design Recommendations for the WCI Regional Cap-and-Trade Program* describe the point of regulation for electricity imported into a WCI jurisdiction as the First Jurisdictional Deliverer (FJD). An FJD is defined as "the first entity that delivers… electricity [imported from non-WCI jurisdictions] over which the consuming partner WCI jurisdiction has regulatory authority."

Stakeholders in the electricity sector expressed concern about this approach—referred to as the "individual boundary" approach–because the compliance obligation changes as power moves across the WCI Partner jurisdictions. As a result, the WCI Electricity Committee worked with stakeholders to craft an alternative "common boundary" approach that proposed to impose the compliance obligation on electricity importers at the first point of entry in any WCI Partner jurisdiction, regardless of where the electricity was consumed in the WCI.

The Electricity Committee and Partners from the WCI jurisdictions carefully considered the practical and administrative aspects of both approaches, as well as their enforcement implications. Several problems were identified while continuing to work on this issue. There were serious questions regarding whether the common boundary approach would be workable and enforceable. The electricity could be coming into a WCI jurisdiction but the importer may not have any "presence" in that jurisdiction. The ability of a WCI Partner jurisdiction to require allowances for electricity that is not produced or consumed in its jurisdiction also raised questions of enforceability. It would also be possible that a given Partner could be required to cover the costs of monitoring and enforcing electricity that was generated and consumed outside that jurisdiction.

As a result of these issues, the WCI Partners determined that even with its shortcomings, the individual boundary option will be the approach used in the WCI region. The Partners identified an administrative variation where instead of directly regulating electricity importers, a state or province may directly retire allowances associated with those emissions. This may be a particularly useful approach for those states and provinces that have a small amount of imported power. The details of this approach have yet to be worked out. The WCI Electricity Committee will discuss this option with stakeholders in the following weeks. In addition, the eastern Canadian provinces are examining if it is feasible to have a sub-region with a common boundary by combining their efforts. For all of these approaches, the goal, as recommended by stakeholder feedback, is to apply a consistent price signal that treats imported and domestic electricity on a level playing field.

The WCI Partners appreciate the work that stakeholders and the Electricity Committee have put into developing approaches to including emissions from imported electricity in the cap-and-trade program scope. This has proven to be a particularly difficult issue to resolve, but the lessons we have learned will be useful in our on-going work on WCI and with the U.S. federal proposals. The Partners are committed to continue working with stakeholders to develop strategies that maintain a consistent price signal in the implementation of the individual boundary cap-and-trade program.

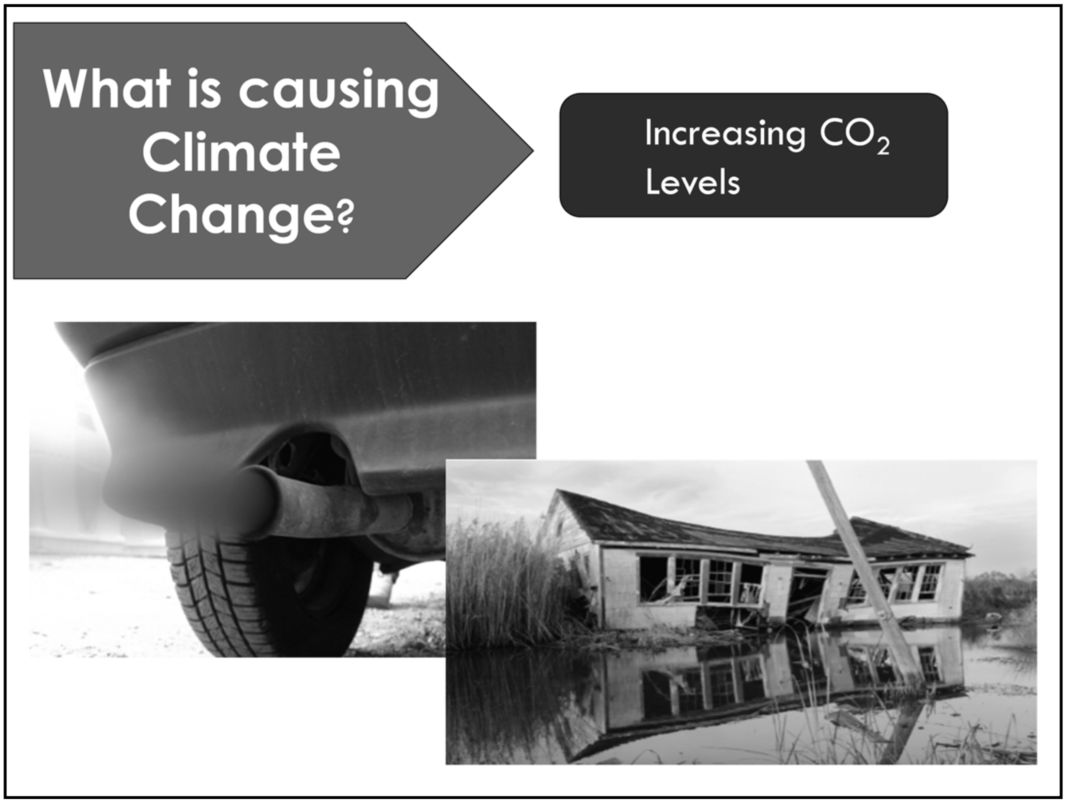
WCI Forest Stakeholders Meeting

Portland, Oregon

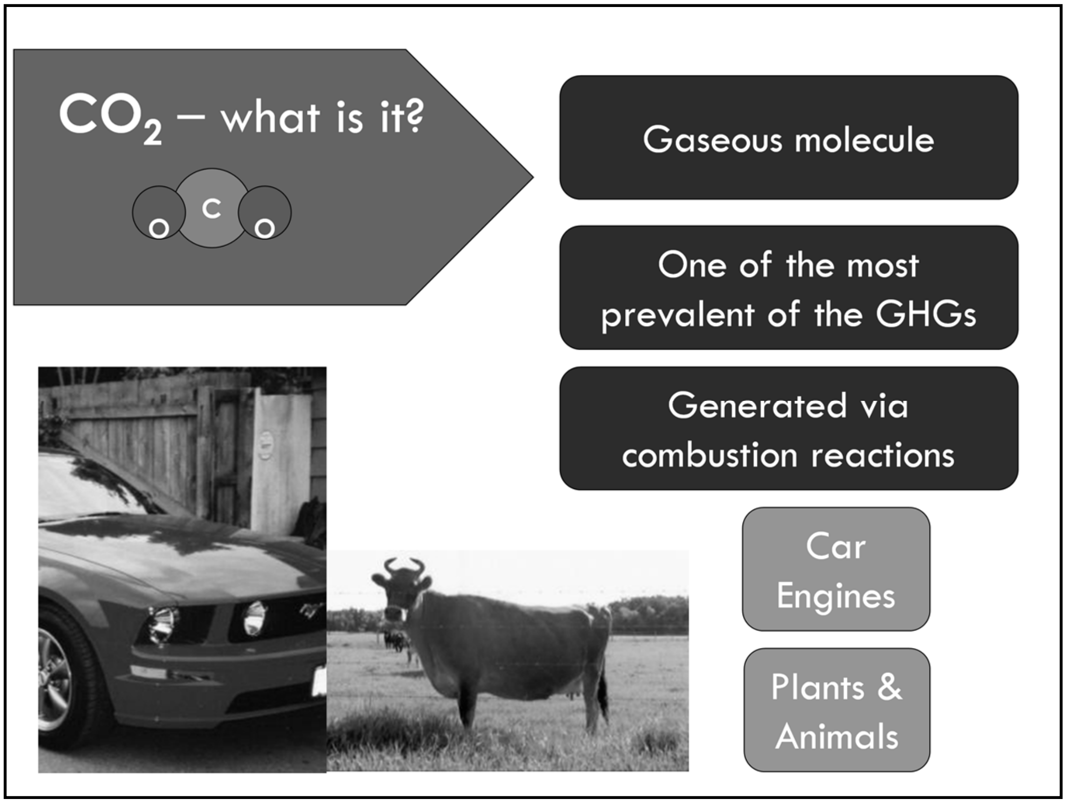
July 22, 2009



Carbon dioxide (CO_2) is one of the most prevalent greenhouse gases in the Earth's atmosphere. Prior to the industrial revolution, the concentration of CO_2 was stable for millions of years. But in the last 100 years, we have seen the concentration increase by 35%.

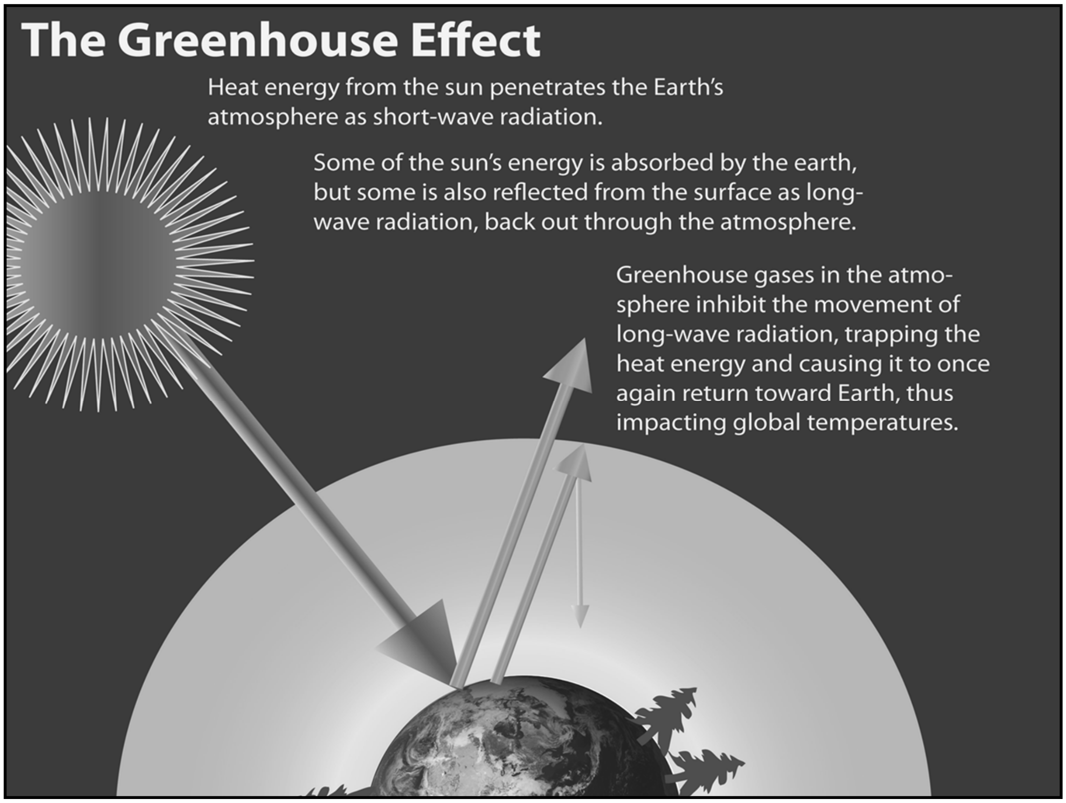
What is causing this increase in CO_2 levels?

We are! Through industrialization in the developed world and deforestation in developing regions. (define deforestation).



Carbon dioxide is a common gas in the air around us. It is produced when organic compounds such as fuels are burned in the presence of oxygen – we call this combustion. Combustion reactions take place in the engine of your car, in machinery required to run our manufacturing facilities, and it even takes place in our own bodies, when we break down food to produce the energy we need to move and grow.

Humans—through their personal and industrial activities—emit close to eight billion tonnes of CO_2 every year, which accounts for more than 75 per cent of total greenhouse gas emissions.



All that accumulated carbon dioxide, along with other greenhouse gases create what is called The Greenhouse Effect in our outer atmosphere.

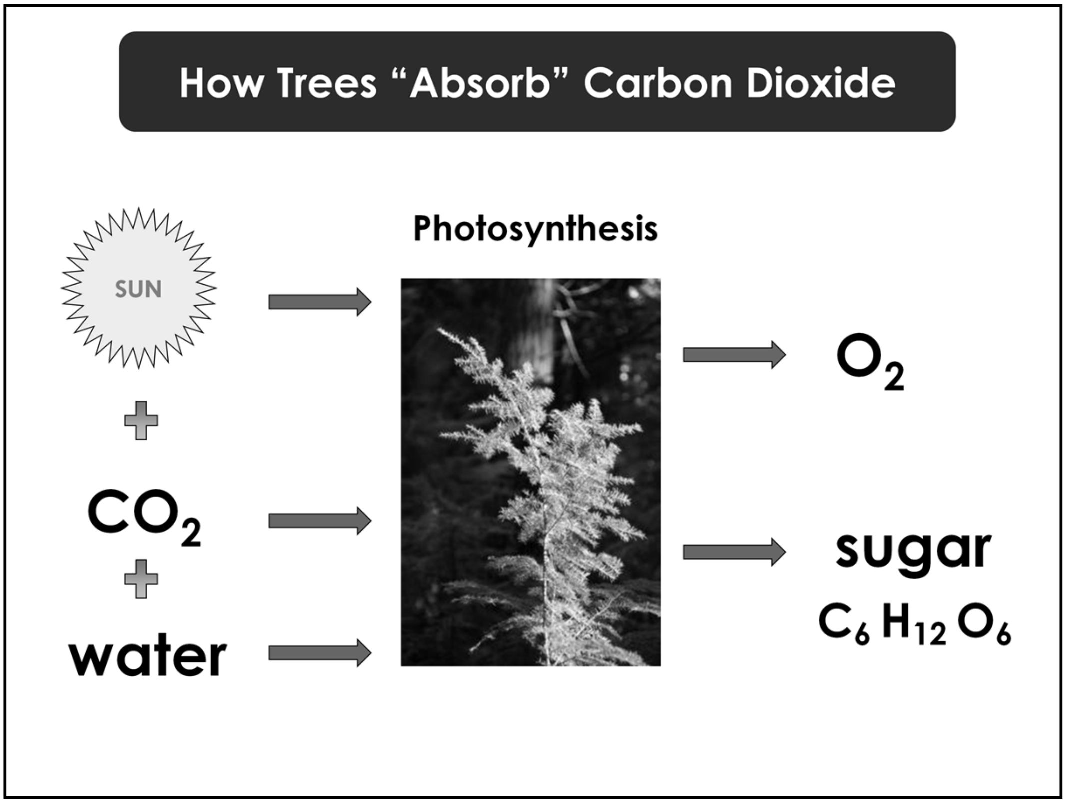
This is how it works. Our earth is heated from energy radiating from the sun. This energy is typically called short-wave radiation, and it has no problem passing through our planet's atmosphere and hitting the surface of the earth. However, not all the sun's heat energy is absorbed by the surfaces that it hits, some is reflected back into the atmosphere once again. But, in the process this energy is converted from short-wave radiation, into long-wave radiation.

When the long-wave radiation reaches in outer layer of the atmosphere, where the greenhouse gases are held by our gravitational field, this energy is trapped. It does not easily penetrate the concentrated gases, and is instead, reflected yet again, back toward the earth. Thus accounting for increases in the temperature in our atmosphere.

How can we reduce all this CO2?

CO2
CO2
CO2
O2
CO2 STORAGE

Trees are the climate change heros!

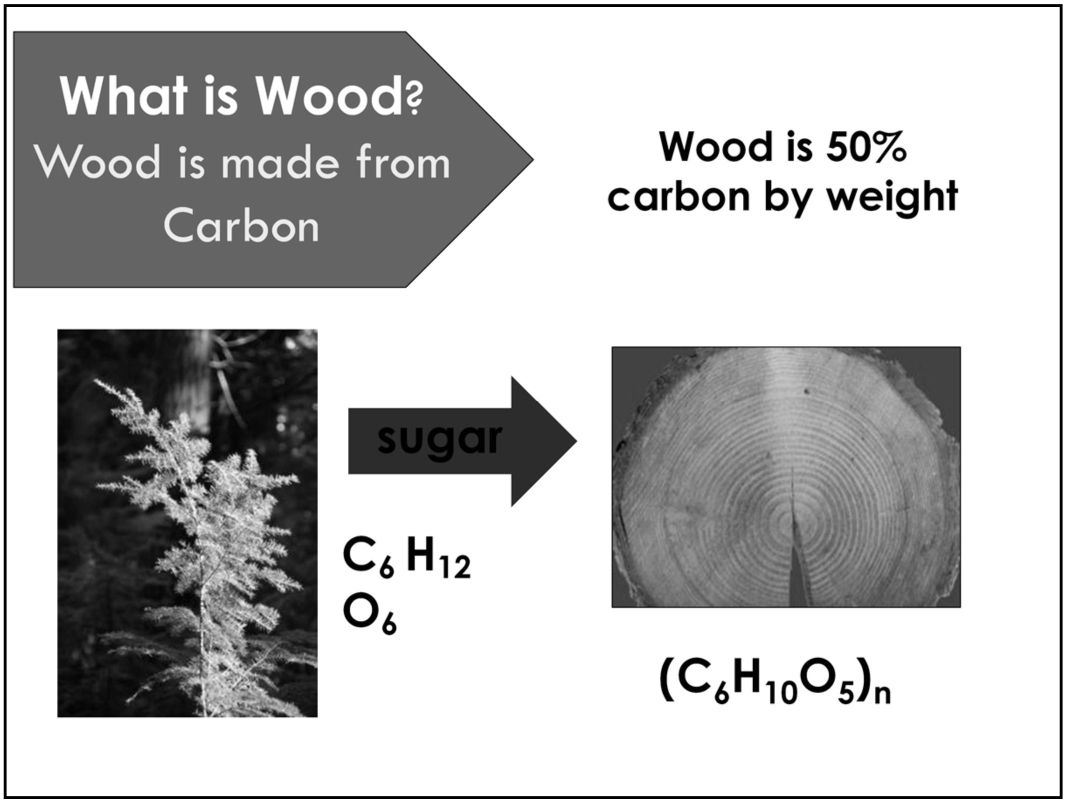


If you remember back to your high school biology classes – you will remember that plants and in particular trees, absorb CO_2 from the atmosphere, and using the energy of the sun, complete a complex chemical transformation that converts carbon dioxide and water vapour, into oxygen and sugar molecules. This is the process of photosynthesis.

The oxygen is released as a gas and diffuses out of the leaves, but the sugar remains in the tree. Why are trees so keen on making sugar – what do they do with all this sugar?

They use it to grow - it is their food source. Trees eat sugar, they make their own food. They can't chase down prey, they can't order large fries at McDonalds, trees are primary producers, they make their own food – and this food is a glucose or sugar molecule formed from carbon dioxide and water.

What happens when trees eat lots and lots of sugar? They grow, and produce wood.



WHAT IS WOOD?

Wood is a complex solid made up of fibres, or wood cells, which are in turn made primarily of cellulose, and cellulose is a carbon based complex carbohydrate made from carbon. That exact same carbon that was once part of a carbon dioxide molecule floating in our atmosphere.

[Hold up a piece of wood]. Wood is 50% carbon by mass. 50% of this wood is carbon, carbon that was in our atmosphere – contributing to global warming – and is now physically converted into a solid form that we call wood.

When I harvest a tree – is this carbon released back into the atmosphere? No – it is no longer a gas, it is a solid component of the wood.

How could I release this carbon back into the atmosphere?

Wood carbon is stored indefinitely

When wood is made into solid wood products like the lumber for your home, furniture for your office, books for your library, the carbon in those products is stored indefinitely. Think of it as making a deposit into your carbon bank account. Every wood product you use is a long-term savings account, accumulating carbon, and keeping it from returning to the atmosphere in the form of carbon dioxide.

This is such a popular and supported scientific concept, that whole new forms of economic trade are being developed around the concept of carbon credits, which helps to further reduce carbon emissions, while at the same time encourages more forest development and research into more ways we can use wood, and keep making deposits into our carbon bank account.

WCI Regional Emissions Database Options White Paper Overview

The Climate Registry

Christine Condit

Director Registry Information Systems

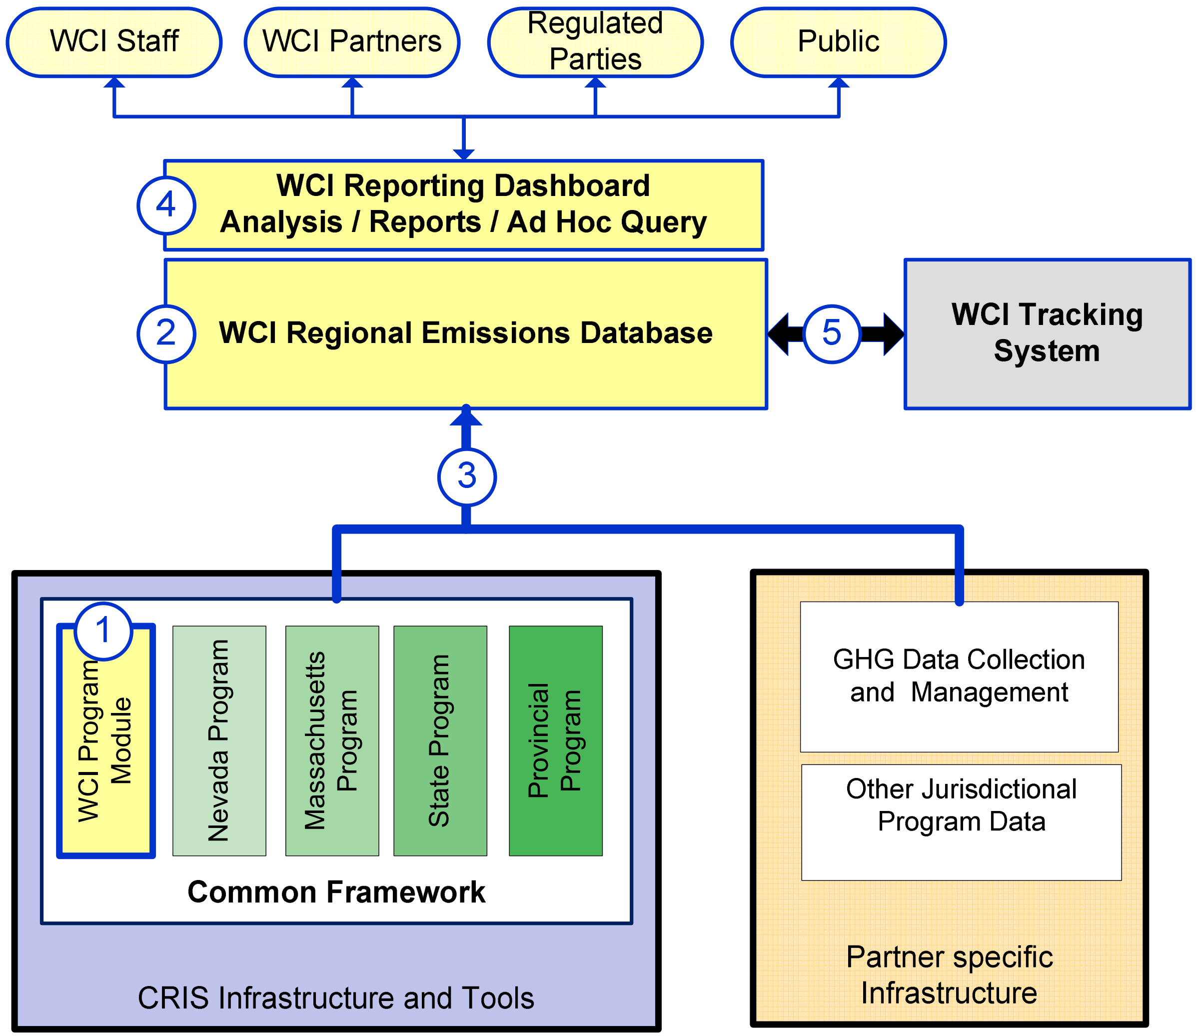
The Climate Registry

July 28th, 2009

Options White Paper Overview

- Purpose and Background
- Assumptions and Principles
- Options for the Regional Emissions Database
  - WCI Common Framework Program Module
  - Regional Emissions Database
  - Data Collection from Partner jurisdictions
  - Analysis, Report Preparation and User Interface Tools
  - Integration with the Tracking System
  - General Considerations
- White Paper Summary
- Public Stakeholder Feedback

Regional Emissions Database Components



The Climate Registry

WCI Common Framework Program Module:

- A module in The Registry's Common Framework that enables reporting for WCI's Essential Reporting Requirements
- Individual Partners adopt, configure and customize the module according to jurisdictional requirements
- Reporters with facilities in different jurisdictions use the same interface to report
- Infrastructure development is streamlined
- Implementation cost is shared across participating Partners

Regional Emissions Database

- Emissions Data is aggregated from all Partners into a centralized Database
- The data model supports analytical processing to respond to different user categories
- Platform Security provides a high level of data protection and user authentication
- Internationalization provides multiple languages, currencies etc.
- Operational support is centralized

Data Collection from Partner Jurisdictions

- Data is transferred from WCI Partner Modules in the Common Framework and Partner specific systems to the Regional Emissions Database
- Data Communications are standardized to simplify processing
- A common data schema is shared by all Partners
- Data is transported on a secure communications network

Analysis, Report Preparation and User Interface Tools

- Data analysis will be developed to accommodate the needs of WCI Staff, Partners, Regulated Parties and Public Stakeholders including:
  - Geographical Analysis
  - Sector Analysis
  - Entity and Facility Analysis
  - Analysis for each GHG
  - Threshold Analysis
  - Support for determining allowances
  - And others as needed
- Standard Reports for each user category

Integration with the Tracking System

- Data in the Regional Emissions Database will be transferred to the tracking system at appropriate time intervals
- As the tracking system evolves other requirements will be defined

Cover Letter

July 24, 2009

The Western Climate Initiative (WCI) Partner jurisdictions have released the following white paper on Offset Definition and Eligibility Criteria. The Offsets Committee is working toward recommending the design and operation of an offset system as outlined in the WCI 2009/10 Workplan released February 2009.

This white paper is the first stage in developing a definition of a WCI emissions offset and related eligibility criteria for offset projects. The process is to:

1. Identify options for a definition of a WCI emissions offset and related eligibility criteria for offset projects
   - White paper released July 24, 2009 for stakeholder input
2. Analyze options and stakeholder input
   - Draft Recommendations paper released September 2009 for stakeholder input
3. Finalize recommendation with stakeholder input and any further analysis required
   - Final Recommendations paper released December 2009

The white paper examines options for defining an offset, as well as options for each of the offset criteria required by the WCI Program Design Recommendations: real, additional, verifiable, and permanent. The Offset Committee provides in this white paper an overview of approaches that other systems have taken in defining them, an evaluation of the policy and operational considerations, and a discussion of implementation options of the criteria.

The Offset Committee is soliciting stakeholder feedback on the options presented in this white paper to help inform its recommendations to the WCI Partner jurisdictions. In addition to general feedback, the Offsets Committee is interested in stakeholder responses to the following questions:

- What has been your experience with the offset system examples cited in this paper? What have been the advantages and disadvantages to their approaches?
- Are the appropriate criteria listed?
- Does the paper include the appropriate options for each criteria?
- Are the implications of the options appropriately covered?

The Offset Committee looks forward to stakeholder input on this white paper. Written comments will be received through the WCI website until August 21, 2009. Stakeholders may also provide comment during a conference call on July 30, 2009 from 9:30 to 10:30 a.m. Pacific time, during which this white paper will be presented and discussed. To join this call, dial 1-800-868-1837 toll free in the U.S. and Canada (1-404-920-6440 for outside the U.S. and Canada), participant code 659537#.

9 Conclusion 43

1 Executive Summary

This paper examines options for defining an offset and options for each of the offset criteria required by the WCI Program Design Recommendations. This paper is the first step in developing the offset definition and criteria that will be recommended to the WCI Partner jurisdictions. One goal of this aspect of the Offset Committee's efforts is to enable each of the WCI Partner jurisdictions to adopt a common offset definition and criteria for program implementation. By achieving this goal, the WCI Partner jurisdictions can help assure the quality of the offsets within the program and enable offsets to be tradable throughout the region.

This paper approaches the topic within the framework defined in the WCI Program Design Recommendations. In particular the Design Recommendations require that the criteria ensure offsets result in a GHG reduction, removal, or avoidance that is real, additional, verifiable, and permanent.[1] The WCI Partner jurisdiction's design principles also require that offsets must be enforceable by the WCI Partner jurisdictions.[2]

To identify and describe options that may be considered within the WCI framework, the Offsets Committee reviewed 11 offset systems:

- Alberta-based Offset Credit System
- British Columbia Emission Offset Regulation
- California Global Warming Solutions Act of 2006 (AB 32)
- Clean Development Mechanism (CDM)
- Gold Standard
- ISO 14064-2; 14064-3; 14065
- Offsets Quality Initiative (OQI)
- Oregon Offset Standard
- Regional Greenhouse Gas Initiative (RGGI)
- Voluntary Carbon Standard (VCS 2007)
- World Business Council for Sustainable
- Development and World
- Resources Institute
- (WBCSD/WRI) GHG Protocol for Project Accounting

As discussed in this paper, these systems provide examples of how others have addressed the issues necessary to define an offset and its criteria.

Offset Definition: Options for defining an offset are framed in terms of the level of detail or specificity required and the manner in which the definition is represented in regulatory language. The Offsets Committee has identified the following parameters or requirements that could be considered as part of the definition of a WCI offset:

---

[1] WCI. 2009. Design Recommendations for the WCI Regional Cap-and-Trade Program. September 23, 2008; revised March 13, 2009. p. 10 Available at: http://www.westernclimateinitiative.org/ewebeditpro/items/O104F21252.pdf.

[2] WCI. 2007. WCI Workplan. October 27, 2007. p. 3 Available at: http://www.westernclimateinitiative.org/ewebeditpro/items/O104F13792.pdf

- Offset Measurement: specifying that offsets are generated in units of metric tons of carbon dioxide equivalent (CO_2e) with each offset representing one metric ton CO_2e.
- WCI Specified Criteria: specifying that offsets must be GHG emission reductions, removals or avoidances that are real, additional, permanent, verifiable and enforceable.
- Offset Projects: specifying that offsets are generated from registered projects through individual project activities that reduce GHG emissions outside the cap.
- Verification and Certification: specifying that offsets represent reductions that are verified and/or certified in a defined manner (e.g., a numbering system, verification statement, or other recognition requirements).
- Issuance and Fungibility: specifying that offsets are issued by an authority in recognition of verified reductions and become fungible compliance units with tracking numbers.

Real: The WCI Design Recommendations state that emission reductions or removals must be real in order to assure that they actually occurred. The Offsets Committee has identified the following considerations for purposes of defining "real": quantification; uncertainty and accuracy; conservativeness; and leakage. Examples from other systems show a range of methods are used to apply these concepts to demonstrate that emission reductions or removals are real.

Additional: The concept and application of the criterion of "additionality" has been among the most controversial and difficult implementation issues in offset systems. The purpose of requiring additionality has generally been recognized as the desire to only credit reductions that would not have otherwise occurred in the absence of the offset project. There are many factors that affect whether a project is additional. As a result creating an operational definition for this criterion is a challenge.

The Offsets Committee summarized how "additional" is implemented in the other systems. The Offsets Committee identified "baseline," "eligbility date," and "crediting period" as potentially important in determining additionality. The Offsets Committee also identified examination of regulations, access to financing and other investment issues, technological and other barriers to market entry, and assessment of common practices as potentially assisting in evaluating projects for additionality. These concepts could be combined in different ways and applied to the WCI offset system. Several options have been identified for consideration:

- <u>Option A - Project Specific</u>: The additionality of each individual project activity is scrutinized through application of specific additionality tests.
- <u>Option B - Performance Standard</u>: For each sector or project type a performance standard is established where projects meeting or exceeding the standard are considered to be additional. Performance standards may be uniform among the WCI Partner jurisdictions or differentiated by jurisdiction to reflect regulatory and economic differences.
- <u>Option C - Protocol Specific Approach</u>: The approach to additionality assessment may vary by protocol, seeking to adopt the best approach for each sector or class of activities.
- <u>Option D - Hybrid Approach</u>: A combination of Options A, B and C; a hybrid approach would set a performance standard but still include some aspects of a project-specific additionality analysis and may vary by protocol. A single

approach may limit project types and inhibit innovation. A hybrid approach may be better able to cover more possibilities.

Permanent: Permanence refers to the duration of an emission reduction. It may be defined based on the reduction being maintained through a given period of time, for instance a 100-year standard. A permanence requirement helps to ensure equivalency of emissions reductions across all sectors and project types.

Based on the examples reviewed in other systems, the Offsets Committee suggests that implementing a permanence requirement generally means addressing the risk of reversal. Two approaches have been identified for addressing this risk:

- *Ex ante* obligations establish an up-front commitment by the project proponent to permanently maintain transacted tons and is achieved through a legally recorded and binding instrument prior to the project.
- An *ex post* permanence mechanism provides assurance in the case of failure of permanence and is achieved through replacement of lost transacted tons.

Under both options, policy considerations include establishing, regulating and enforcing liability for permanence along a chain of offset custody.

Verifiable: The Offsets Committee examined the requirement that offsets be verifiable subject to defining a process for verification. The Essential Requirements (ER) for Mandatory Reporting developed by the Reporting Committee provide one example of a detailed approach to verification, which is defined in the ER as "the process used to ensure that an operator's emissions data report is free of material misstatement and complies with WCI's reporting procedures and methods for calculating and reporting GHG emissions."

Based on the work of the Reporting Committee and a review of the examples from other systems, the concepts identified by the committee for consideration as part of the verification process include:

- Project Validation: the assessment of a project document and its conformity with project protocol.
- Enforcement: regulatory oversight by partner jurisdictions.
- Materiality: a threshold where differences above that number in reported emissions/reductions would make a verifier suspect the reliability of an entire project.

WCI Partner jurisdictions have recommended third-party verification of emissions reports. A similar use of accredited third party verifiers is an option for consideration as part of the process for offsets as well.

In addition to these primary criteria, the Offsets Committee identified several factors from its review of other systems that may be considered, including: transparency of program implementation; co-benefits; and assessment of environmental or social impacts. Options for addressing these factors are discussed.

The Offset Committee is soliciting stakeholder feedback on the options presented to help inform its recommendations to the WCI Partner jurisdictions through the release of this paper. In addition to general feedback, the Offsets Committee is interested in stakeholder responses to the following questions:

- What has been your experience with the offset system examples cited in this paper? What have been the advantages and disadvantages to their approaches?
- Are the appropriate criteria listed?
- Does the paper include the appropriate options for each criteria?
- Are the implications of the options appropriately covered?

The Offset Committee looks forward to stakeholder input on this white paper.

2 Introduction

The Western Climate Initiative (WCI) is a comprehensive regional effort by the governors and premiers of seven U.S. states and four Canadian provinces to reduce greenhouse gas emissions to 15 percent below 2005 levels by 2020, promot environmental sustainability and ensure economic growth.[3] It would cover nearly 90 percent of the region's emissions, including those from electricity, industry, transportation, and residential and commercial fuel use. Together, the seven states and four provinces represent over 70 percent of the Canadian economy and 20 percent of the U.S. economy.

The first phase of the cap-and-trade program begins on January 1, 2012, covering emissions from electricity (including imported electricity), industrial combustion at large sources and industrial process emissions for which adequate measurement methods exist. The second phase begins in 2015, when the program expands to include other sources. The WCI cap-and-trade program will include a rigorous offsets system. The primary role of the offsets system is to reduce the compliance costs for the cap-and-trade program while ensuring the environmental integrity of the cap. The system should be designed to encourage emission reductions, innovation, and technology development in sectors not covered by the cap-and-trade program.

The purpose of the Offset Committee is to make recommendations to the WCI Partner jurisdictions on the design and operation of the offset system as part of the WCI cap-and-trade program, including the criteria necessary for offset projects to be used to meet compliance obligations within the regional program. The Offsets Committee workplan has been subdivided into four task groups. This white paper serves as the first deliverable under Task 1. Deliverables for all Offsets Committee tasks are outlined in Table 2.0.

Table 2.0 Offsets Committee Workplan

Task Number	Offsets Committee	Deliverables
Task 1	Offset System Essential Elements	Recommend and define the essential elements for the offsets system, including the necessary rules and infrastructure, to create and operate the offset system as part of the cap-and-trade program.
Task 2	Offsets and Allowances from Systems Other than the WCI	Recommend standards and a process for accepting offsets from other GHG trading programs and recognizing emission allowances from other GHG trading systems.
Task 3	Offset Protocols	Coordinate the joint review, development, and approval of offset protocols and initiate the establishment of a process to coordinate the review and recommendation of protocols proposed by project developers.

[3] WCI. U.S. States, Canadian Provinces Announce Regional Cap-and-Trade Program to Reduce Greenhouse Gases. September 23, 2008. Available at: http://www.westernclimateinitiative.org/ewebeditpro/items/O104F19871.PDF

Task Number	Offsets Committee	Deliverables
Task 4	Offset Supply Analysis	In conjunction with any further economic modeling, provide input to the Economic Modeling Team on projected offset supply (tonnes CO_2e/year) and costs.

This white paper is the first stage in developing a clear definition of a WCI greenhouse gas (GHG) offset and the detailed eligibility criteria for GHG offset projects used for compliance purposes as identified in the WCI 2009/10 Workplan released February 2009. Environmental integrity and a system designed to encourage offset projects are critical outcomes for the Offset Committee to consider in recommending criteria for offsets used to meet a compliance obligation. The WCI included in its September 2008 Design recommendations that the criteria ensure offsets result in a GHG reduction, removal, or avoidance that is real, additional, verifiable, and permanent.[4] The design of the offsets system must also ensure that the quantification of the GHG reduction, removal, or avoidance is accurate and not double-counted. According to the WCI's design principles, reductions from offsets must also be enforceable by the WCI Partner jurisdictions.[5]

For each of the aforementioned essential offset criteria (real, additional, verifiable, and permanent), this white paper provides an overview of approaches that other offset systems have taken in:

a. defining them;
b. evaluation of the policy and operational considerations resulting from different definitions; and
c. discussion of implementation options for the criteria.

The systems discussed in this white paper were choosen to provide examples of different approaches, some for a compliance approach and others for a voluntary approach. While the cited examples may not be directly comparable, they offer important insights into system design. To keep this white paper to an appropriate length, the Offsets Committee selected a subset of systems to be included. Table 2.1 provides a brief synopsis of each system cited in this paper. For each of the WCI criteria examined in the following sections of this white paper, definitions from each of the systems listed in Table 2.1 are presented for comparison.

Table 2.1 Offset system examples cited in this paper

Offset System	Description
Alberta-based Offset Credit System[6]	Unlimited compliance mechanism for entities regulated under the province's mandatory GHG emission intensity-based regulatory system.
British Columbia Emission Offset Regulation[7]	Sets out requirements for GHG reductions and removals to be recognized for the purposes of fulfilling the provincial government's commitment to a carbon-neutral public sector by 2010 under the BC Greenhouse Gas Reduction Target Act, which came into force in January 2008.
California Global Warming Solutions Act of 2006 (AB 32)[8]	Establishes a statewide GHG cap for 2020 in California. Offsets serve as a limited compliance mechanism for capped sources regulated under AB 32.
Clean Development Mechanism (CDM)[9]	A project-based GHG offset mechanism under the Kyoto Protocol. The scheme aims to assist Annex-I parties (industrialized countries with binding emission reduction targets) to meet their Kyoto compliance obligation by allowing them to invest in offset projects in non-Annex I parties (developing countries without binding targets).
Gold Standard[10]	A voluntary carbon offset standard for renewable energy and energy efficiency projects that can be applied to voluntary offset projects and to CDM projects. It was developed under the leadership of the World Wildlife Fund (WWF), with a focus on offset projects that provide lasting social, economic and environmental benefits.

Offset System	Description
ISO 14064-2; 14064-3; 14065[11]	A policy-neutral, GHG project accounting standard that provides specification with guidance at the organizational level for quantification, monitoring and reporting of greenhouse gas emission reductions and removal enhancements. It was developed by the International Organization for Standardization (ISO). ISO 14064-2 provides general process guidance and does not prescribe specific program requirements. Specific requirements are left to be defined by the GHG program (voluntary or mandatory) that uses ISO 14064-2. This standard is used as the framework standard for the Canadian offsets system design, Climate Action Reserve, BC Emission Offsets Regulation and many other voluntary and mandatory North American programs. Training in ISO 14064-3 provides framework and tools for validation and verification of offset projects. In addition, ISO 14065 provides specifications for accreditation and other forms of recognition of validation and verification service providers.
Offsets Quality Initiative (OQI)[12]	A collaborative, consensus-based initiative of its six nonprofit member organizations: the Climate Trust, the Pew Center on Global Climate Change, the California Climate Action Registry, the Environmental Resources Trust, the Greenhouse Gas Management Institute and The Climate Group. OQI was founded in November 2007 to provide guidance on greenhouse gas offset policy and best practices.
Oregon Offset Standard[13]	Energy facilities in Oregon must meet mandatory CO_2 emissions standards. Regulated facilities have the option of meeting their emission reduction obligations through the purchase of eligible offsets.
Regional Greenhouse Gas Initiative (RGGI)[14]	A multi-state mandatory cap and trade program to reduce CO_2 emissions from electricity generation, which went into effect in January of 2009 with 10 participating US states. Under the RGGI program, offsets serve as a limited alternative compliance mechanism for regulated facilities.
Voluntary Carbon Standard (VCS 2007)[15]	A full-fledged carbon offset standard for the voluntary offset market including standards for accounting, monitoring, verification, certification, as well as registration and enforcement systems. It focuses on GHG reduction attributes only and does not require projects to have other environmental or social benefits.

Offset System	Description
World Business Council for Sustainable Development and World Resources Institute (WBCSD/WRI) GHG Protocol for Project Accounting[16]	An offset accounting protocol for quantifying and reporting GHG emission reductions from GHG mitigation projects. It does not focus on verification, enforcement or co-benefits.

This paper also examines additional principles and technical considerations that are important in establishing offsets criteria as set out in the WCI Design Recommendations.[17] Each of these principles and technical considerations are nested under the related essential criteria or included in Section 7 entitled "Other considerations." These principles and technical considerations include ownership, use of approved protocols, and geographic limits (Section 2); quantification, uncerntainty and accuracy, conservativeness, and leakage (Section 3); additionality tests, baseline, eligibility date, and crediting period (Section 4); validation, enforcement, and material under verifiable (Section 6); and transparency and co-benefits/impacts (Section 7).

3 Definition of an offset

This section considers how to best define an offset within the WCI program. The definition of an offset should establish the tradability of offsets and provide guidance about their fungibility within the WCI program. If these aspects of an offset system are not appropriately defined, then emitters may not be able to realize the reduced costs from offsets. The WCI offsets criteria should address fundamental questions about how offsets are generated[18] and recognized. As stated in the WCI Design Recommendations, all offsets in the WCI program will be required to meet criteria specified by the WCI Partner Jurisdictions to ensure that offset projects result in a GHG reduction, removal, or avoidance that is real, additional, permanent, verifiable, and enforceable.

3.1 Policy and operational considerations in defining an offset

The offset definition may not need to include all specific details regarding offsets. Instead the definition may reference a specific part of the essential elements or further provisions or requirements of the offset system that are outside the definition itself.

Table 3.0 below illustrates how several different existing programs have chosen different levels of detail to include within the offset definition itself. RGGI and CDM

[16] www.ghgprotocol.org

[17] Western Climate Initiative. September 23, 2008; revised March 13, 2009. Design Recommendations for the WCI Regional Cap-and-Trade Program, http://www.westernclimateinitiative.org/ewebeditpro/items/O104F21252.pdf.

[18] The "generation" of offsets is not a technical term. Rather, it is a short-hand to describe the multi-step process which includes how projects are approved, reductions occur, and the appropriate credit is issued. These steps will be described in more detail in the second white paper from the WCI Offsets Committee Task 1 work.

systems do not specify all offset requirements within their offset definition but instead refer to requirements or provisions of the offset system that are defined elsewhere in the regulation or program design. Alternatively many of the other systems, including the BC Emission Offset Regulation and Oregon Offset Standard, include specified criteria within the definition itself, including defining an offset as a reduction/removal of GHG emissions CO_2e. A WCI offset definition could, for example, include a specification that offsets must meet all WCI requirements (such as is done in the RGGI and CDM definition), or include the WCI specified criteria for offsets within the definition.

Table 3.0 Definitions of a greenhouse gas offset

Offset System	Definition
Alberta-based Offset Credit System	A "emission offset" means a reduction in the release of specified gases, expressed in tonnes on a CO_2e basis, that meets the requirements of section 7(1), but does not include an emission performance credit
British Columbia Emission Offset Regulation	A "Greenhouse gas reduction" is (a) a reduction of GHG emissions, or (b) an enhancement of GHG removals. Section 8 - A greenhouse gas reduction is recognized as an equivalent amount of emission offsets for the purposes of the Act if (a) the GHG reduction is equal to the project reduction in a project verified in accordance with this regulation, (b) the proponent of the project has transferred any title the proponent has in the GHG reduction to the Pacific Carbon Trust, and (c) the GHG reduction has not previously been recognized as an emission offset under the Act or other another emission-offset recognition scheme or for the purposes of another voluntary or mandatory greenhouse gas reduction program.
California Global Warming Solutions Act of 2006 (AB 32)	Not defined
Clean Development Mechanism (CDM)	A "Certified Emission Reduction" or CER is a unit issued pursuant to Article 12 and requirements there under, as well as the relevant provisions in the CDM modalities and procedures, and is equal to one metric tonne of carbon dioxide equivalent, calculated using global warming potentials defined by decision 2/CP.3 or as subsequently revised in accordance with Article 5 of the Kyoto Protocol.
Gold Standard	(Glossary) A unit of GHG emissions reduction equal to one ton of CO_2e in one part of the world that offsets an equivalent amount of GHG emissions in another part of the world. Offsets by themselves do not lead to a net reduction in global emissions although they can prevent the rate of emissions from increasing.
ISO 14064-2	Not defined

Offset System	Definition
Offsets Quality Initiative (OQI)	An offset represents the reduction, removal or avoidance of GHG emissions from a specific project that is used to compensate for GHG emissions occurring elsewhere...The essential promise of an offset is the achievement of a real and verifiable reduction in global GHG emission levels beyond what would have otherwise occurred that is equally effective as on-site emission reductions by regulated entities.
Oregon Offset Standard	"Offset" means an action that will be implemented by the applicant, a third party or through the qualified organization to avoid, sequester or displace emissions of carbon dioxide.
Regional Greenhouse Gas Initiative (RGGI)	A "CO_2 offset allowance" is awarded to the sponsor of a CO2 emissions offset project pursuant to section XX10.7 and is subject to the relevant compliance deduction limitations of section XX6.5(a)(3).
Voluntary Carbon Standard (VCS 2007)	Not defined
WBCSD/WRI GHG Protocol for Project Accounting	A "GHG Reduction" is a decrease in GHG emissions or an increase in removal or storage of GHGs from the atmosphere, relative to baseline emissions. Primary effects will result in GHG reductions, as will some secondary effects. A project activity's total GHG reductions are quantified as the sum of its associated primary effect(s) and any significant secondary effects (which may involve decreases or countervailing increases in GHG emissions). A GHG project's total GHG reductions are quantified as the sum of the GHG reductions from each project activity.

3.2 Supporting principles and technical considerations

There are several supporting principles and technical considerations which can further define a WCI offset. This section briefly discusses why clarification of ownership issues, use of approved protocols, and georgraphic limits may be included within the definition of a WCI offset.

3.2.1 Ownership Issues

Establishing clear ownership of an emission reduction is important prior to the issuance and acceptance of offsets in the WCI program. By establishing ownership it provides a measure of certainty that offsets are only counted once for compliance purposes. Ownership of an emission reduction is often established through a contract. The WCI should consider whether it is necessary to explicitly require a contract or type of contract, or to require other specific documentation or registration of documents that evidence ownership. Establishing clear ownership of an offset once it is created relies on a means of registering and tracking offsets[19] which could include the tracking of ownership, trades, and retirement.

[19] The "registration" of offset projects, as well as the tracking of offsets, is a process that will be described in more detail in the second white paper from the WCI Offsets Committee Task 1 work.

3.2.2 Use of Approved Protocols

WCI Partner jurisdictions will adopt protocols that will be detailed specific instructions for project developers that describe standard approaches, equipment, procedures and requirements for projects. The protocols will apply to all aspects of the project life cycle, including: development, operation, monitoring, calculation, reporting and verification. Protocols must meet the criteria and requirements that are adopted by the WCI Partner jurisdictions.

3.2.3 Geographic Limits

Establishing a geographic limit places restrictions on offsets from a particular geographic area. WCI jurisdictions will recognize offsets meeting the agreed upon criteria in the WCI Design Document (September 23, 2008). Offsets issued[20] by any WCI Partner jurisdiction must be equivalent and fungible throughout the WCI.

As part of work under Task 2, The Offsets Committee will recommend standards for evaluating and (if appropriate) accepting tradable units (offsets and allowances) from programs other than the WCI cap-and-trade program.

3.3 Implementation options

The Offsets Committee has formulated three options for defining an offset, all with distinct policy and operational considerations. These options differ in whether the system requirements are specified in the offset definition itself or referred to in other parts of the regulation(s) or program design.

- Option A: specific parameters or requirements in the definition;
- Option B: general parameters or requirements with specific requirements elsewhere; and
- Option C: specific parameters or requirements with the condition that additional requirements specified in the WCI offset system must be met.

Options B and Cmay provide more flexibility for program design and future refinement by referring to specific WCI parameters or requirements but not specifying all of them in the offset definition itself,. Defining a set of offset system parameters or requirements in the offset definition itself could result in unintended consequences as WCI further develops policies and designs key elements of the cap-and-trade program. As the management and administration of the offset system develops over time, option C may allow the most flexibility to refine the system as needed.

Options A and Cmay provide a clear signal about how offsets are generated and traded, as well as their use in the WCI program, by defining a set of specific offset system parameters or requirements in the offset definition itself,. After reviewing how other emission reduction programs have defined an offset, the Offsets Committee has developed the following parameters or requirements that could be included in the definition of a WCI offset:

[20] The “issuance” of offsets is a process that will be described in more detail in the second white paper from the WCI Offsets Committee Task 1 work.

- Offset Measurement: specifying that offsets are generated in units of metric tons of carbon dioxide equivalent (CO_2e) with each offset representing one metric ton CO_2e
- WCI Specified Criteria: specifying that offsets must be GHG emission reductions, removals or avoidances that are real, additional, permanent, verifiable and enforceable
- Offset Projects: specifying that offsets are generated from registered projects through individual project activities that reduce GHG emissions outside the cap
- Verification and Certification: specifying that offsets represent reductions that are verified and/or certified in a defined manner (e.g., a numbering system, verification statement, or other recognition requirements)
- Issuance and Fungibility: specifying that offsets are issued by an authority in recognition of verified reductions and become fungible compliance units with tracking numbers

The list above provides some examples of clauses that may be included within the definition of a WCI offset. Some of the examples may provide greater clarity in an offset definition, such as defining the units of an offset in CO_2e metric tons. Additional parameters could be included in the offsets definition, but this could adversely affect the fungibility of offsets. For this reasonit will be important to identify which criteria are useful to include in the definition and which criteria are best referenced as part of the offset program requirements if the WCI decides to use Option C to define an offset,.

4 Real

This section considers criteria to define reductions as "real". The WCI Design Recommendations state that emission reductions or removals must be real, in order to assure that they actually occurred. Robust accounting methods are essential to an offsets program because inaccurate or incomplete accounting could lead to crediting reductions that did not actually occur. Ensuring that reductions are real is critical for ensuring the integrity of the cap-and-trade program, as WCI offsets may be used in place of emissions reductions in capped sectors.

4.1 Policy and operational considerations in defining real

Table 4.0 outlines approaches from other programs in defining real: including specifying that emission reductions represent "actual emission reductions" (OQI) or "all the GHG emission reductions and removals … must be proven to have genuinely taken place" (VCS 2007).

Table 4.0 Definitions of real in other offset systems

Offset System	Definition
Alberta-based Offset Credit System	Required – an offset project must have specific and identifiable actions that reduce or remove GHGs. The project cannot simply result in emissions moving to another part of the facility or operation. The project must also demonstrate that it causes a net reduction of all greenhouse gases involved in the project.
British Columbia Emission Offset Regulation	Not included

Offset System	Definition
California Global Warming Solutions Act of 2006 (AB 32)	Required - Not defined
Clean Development Mechanism (CDM)	Not defined
Gold Standard	Required - Not defined
ISO 14064-2	From 5.4 - In developing the baseline scenario, the project proponent shall select the assumptions, values and procedures that help ensure that GHG emissions reductions or removal enhancements are not over-estimated.
Offsets Quality Initiative (OQI)	Project-based offsets should represent actual emission reductions and not simply be artifacts of incomplete or inaccurate accounting.
Oregon Offset Standard	Not included
Regional Greenhouse Gas Initiative (RGGI)	Required - Not defined
Voluntary Carbon Standard (VCS 2007)	All the GHG emission reductions and removals and the projects that generate them must be proven to have genuinely taken place.
WBCSD/WRI GHG Protocol for Project Accounting	Not included

The policy considerations for assuring that reductions are real are closely related to other criteria of the offsets program such as permanent (i.e. not reversible), verifiable and quantifiable. Permanence is discussed in Section 5, verification in Section 6, and quantification later in this section. Principles and technical considerations that may be useful for defining real, such as conservativeness, accuracy, uncertainty, and leakage, are also considered in this section.

In order to ensure that offsets are real they must be quantifiable and measurable. It is important to be able to verify that emission reductions or removals actually took place through a rigorous verification process that includes physical inspection of the project. Similarly, the potential leakage of emissions due to the implementation of a project and the uncertainty associated with the methodologies used to measure reductions need to be accounted for when determining the number of offsets to be credited to a project.

It is important that reductions claimed as reducing a ton of CO_2e in the WCI program are not being double counted within the cap-and-trade system and not being simultaneously claimed in other GHG trading programs regardless of whether that program is of a regulatory or voluntary nature. There must be appropriate mechanisms in place to register, track, and retire offsets to prevent double counting. Enforcement penalties could also be applied to target project developers attempting to sell reductions as offsets more than once. The WCI could also consider allowing for some explicit linkage between GHG emissions reduction registries to circumvent potential double counting issues. For example, there is currently a link between the European Union Emissions Trading Scheme (EU ETS) and the CDM electronic registries to allow transfers of offsets to occur and be updated in both systems as requirred.

4.2 Supporting principles and technical considerations

It is useful to consider several supporting principles and technical considerations in the context of defining real. The principles of "uncertainty," "accuracy," and "conservativeness" and the technical considerations that account for "leakage" may be included as a part of what the WCI considers to be a "real" reduction or removal. If such terms are included, the WCI will need to define and clarify what is meant by these terms. The WCI Offsets Committee recognizes that some of the principles such as accuracy and conservativeness will be factors in other WCI criteria (e,g., additionality). Discussion of these terms in the context of the criteria "real" is not meant to imply that they are limited in scope.

4.2.1 Quantification

The notion that emissions reductions, removals or avoidances must be quantifiable comes from the need to ensure that offsets represent real reductions and that the reductions can be converted into a common currency (i.e., offsets) that accurately reflect a project's environmental benefits. The Design Recommendations for the WCI Program also specify that criteria for the offsets program need to "ensure that the quantification of the GHG reduction, removal or avoidance is accurate and not double counted."

The concept of quantifiable can be thought of in two ways. First, sound methods to measure and quantify GHG reductions must exist for each project type. There should be sufficient scientific research and expert review to support the use of a given methodology and monitoring. Furthermore, measurement techniques must be capable of tracking GHG emissions and/or sequestration within the project's boundary. Second, these methods must be sufficiently accurate. There may be quantification methodologies that are not accurate enough for crediting offsets. For example, a relatively simple methodology for calculating a forest carbon inventory based on reasonable assumptions and some field data may be only accurate enough to make an order of magnitude calculation. A more detailed method would likely be necessary for calculations in support of issuing offsets. Accuracy is discussed further below.

Quantification methods for project types should be subject to periodic review to ensure that they reflect the latest science and GHG accounting practices. This implies that the WCI will need a mechanism for regularly and periodically reviewing and updating the GHG quantification. This review is particularly important in cases where additionality performance standards or guidance on developing baselines exists in protocols, as the regulatory and economic conditions that were used to develop them can change over time.

It is also useful to have uniformity among quantification and monitoring procedures across project types to the extent feasible. There is obviously a trade off in terms of flexibility for project developers. However uniformity in quantification methodologies could decrease the administrative burden for methodological review and could help prevent project developers from shopping around for the most favorable methodologies. Quantification methods in protocols should still be capable of taking local conditions into account that may affect GHG offset calculations. Variations based on local conditions are likely to be especially important for projects involving biological sinks where species compositions or other local factors affect carbon sequestration.

4.2.2 Uncertainty and accuracy

The greater the uncertainty in calculating emission reductions from project activities, the less confidence there will be that all offsets generated by a project are real. For this reason, when defining what makes an offset real, it is important to consider how uncertainty should be addressed in the program and in each project specific protocol. Uncertainty in emission reductions or removals may result from uncertainty in baseline calculations, as well as uncertainty in calculating, modeling, or measuring emission reductions or removals. Uncertainty may also be greater for some project types than others. For example, there is likely to be greater inherent uncertainty in calculating carbon stored in biological sinks or reservoirs than in calculating emissions from fossil fuel combustion.

Uncertainty may be factored into the design of offset programs and protocols and assessments of uncertainty may also be required of individual project developers. Several examples of how uncertainty is addressed are shown in Table 4.1. British Columbia's offset regulation must include results of an assessment of uncertainty associated with the estimation of the GHG reduction to be achieved by carrying out an offset project. The Gold Standard requires affirmation that there is no uncertainty related to data sets used. Several other programs state that uncertainty should be taken into account, including ISO 14062-2 and VCS. The OQI recommends the adoption of conservative quantification methodologies to reduce uncertainty.

Table 4.1 Approaches to managing uncertainty in offset systems

Offset System	Approach
Alberta-based Offset Credit System	Managed through use of accepted quantitification protocols, use of national inventory data, and use of good practice guidance.
British Columbia Emission Offset Regulation	Requires an uncertainty assessment and a description of the procedures use to conduct the assessment.
California Global Warming Solutions Act of 2006 (AB 32)	Not mentioned
Clean Development Mechanism (CDM)	Not specified
Gold Standard	Affirmation that there is no material uncertainty over the numerical data sets applied is a required element of the Gold Standard conservative approach.
ISO 14064-2	Defined as: parameter associated with the result of quantification which characterizes the dispersion of the values that could be reasonably attributed to the quantified amount. Quantification of GHG emissions/removals shall take into account the quantification uncertainty.
Offsets Quality Initiative (OQI)	Methodological selection should be conservative to ensure that offsets are not overestimated and uncertainties are reduced as far as practicable.
Oregon Offset Standard	Not mentioned

Offset System	Approach
Regional Greenhouse Gas Initiative (RGGI)	Uncertainty factored in to design of offset program. (addressed in document analyzing offset limits)
Voluntary Carbon Standard (VCS 2007)	Project proponent shall select or develop GHG emissions or removal factors that take account of the quantification uncertainty.
WBCSD/WRI GHG Protocol for Project Accounting	Not addressed - beyond scope of project protocol

The discussion of uncertainty is closely connected with the concept of accuracy. Accuracy relates to how close a measured or calculated quantity is to the true value. Given that all measurements are estimates, the more accurate a method is, the less uncertainty there will be. There will often be tradeoffs between increasing the accuracy of measurements and the time and resources involved in making the measurements. An offset program should strive for methods that are as accurate as possible while taking into account that there will always be some degree of uncertainty.

Several programs strive to balance accuracy and practicality in the quantification of offset project benefits. ISO defines accuracy in order to "reduce bias and uncertainty as far as is practical." The IPCC Good Practice and Guidance and Uncertainty Management in National Greenhouse Gas Inventories defines accuracy as a relative measure of the exactness of an emission or removal estimate. Alberta's-Based Offset Credit System acknowledges that there are different levels of accuracy associated with different measurements, stating: "the more accurate the data measurement, the better; however, this must take into consideration costs and other practicalities of measurement." The WBCSD/WRI GHG protocol for project accounting states that acceptable levels of uncertainty will depend on the objectives for implementing a GHG project and the intended use of quantified GHG reductions. It recommends that where accuracy is sacrificed, that data and estimates used to quantify GHG reductions should be conservative.

To ensure accuracy, offset programs require detailed documentation, monitoring and verification of a project's anticipated benefits. British Columbia's program requires project developers to include an assertion that selected sources, sinks and reservoirs ensures that the total of the emission reduction and removals enhancement is an accurate and conservative estimation of GHG reduction. Methodology is also considered in determining accuracy under British columbia's program. RGGI requires detailed monitoring and verifications for offset projects to ensure accuracy. The New South Wales Greenhouse Gas Abatement Scheme (NSW GGAS) requires emissions calculations for certain projects to include a confidence factor reflecting accuracy of the engineering study completed. The confidence factor is higher if calculations are based on accurate records and lower if assessment is based on estimated data.

The use of standard calculation and measurement methods, as detailed in project protocols, would be useful for ensuring the reproducibility of measurements and calculations. However, it is also important that these methods be sufficiently accurate by minimizing inherent uncertainty. To improve quality, each offset project could have an individual monitoring plan that clearly defines technical methods such as how, when, and who collects data and quantifies emissions.

4.2.3 Conservativeness

Several offset systems have adopted a principle of conservativeness to address uncertainty and ensure that emission reductions are real. The premise is that when uncertainty exists, it is best to only credit reductions where there is high confidence that the reductions actually occurred. This is distinct from imposing an arbitrary discount factor. While both potentially result in less offsets being credited for a project, an approach based on conservativeness directly relates the degree of discounting to uncertainty. If uncertainty is reduced by improved measurements, then there would be less discounting.

Conceptually, when there is a range of possible values (from baseline assumptions to emission reduction calculations), a principle of conservativeness would imply using values at the lower end of the range so that there is higher confidence that all credited reductions are real. Embedded in the concept of conservativeness is the understanding that - the lower the number that is claimed, the higher the certainty that the true value is at least that much. Conservativeness could also involve statistical confidence factors or uncertainty-based discount factors. This contrasts with using values that represent the "most-likely" outcome which have a greater risk of overestimating reductions when uncertainty exists. If adopted as a principle, it would be important to define or explain what is meant by conservative, as there can be varying interpretations of the term in practice. Conservative assumptions can increase the probability that a project will over-perform and that the overall emission trading system will achieve even more reductions for a given target or cap level.

4.2.4 Leakage

Leakage of emissions occurs when there is an increase of emissions outside a project boundary as a result of project activity inside the project boundary. Essentially, emissions are displaced from one area to another with no net decrease in emissions. The risk for leakage differs among project types. For example, leakage may be more of a concern for a forestry project than in a coalmine methane project because altering forestry practices in one area may affect land use in other areas and because timber is a global commodity. Alternately, projects capturing methane may be less likely to shift activities and result in increased emissions from other activities outside the project boundary. However, affecting the economics of coal production in one jurisdiction, could potentially result in a shift of coal production (and methane emission) to/from another jurisdiction.

If an offset project results in an increase in emissions outside of the project boundary, then these emissions must be accounted for to ensure that all offsets generated by the project represent real emission reductions. Even within a project's boundary, increases in emissions that indirectly result from project activities should be accounted for. In this sense, the term real can be interpreted broadly because if the full effect of a project's activities on greenhouse gas emissions is not considered, then the reductions claimed as a result of an offset project would not all be truly real. Leakage outside of a project's boundary can be difficult to assess in practice. In the context of defining real, it may be sufficient to require that leakage and indirect effects on emissions be accounted for in offset projects to the extent possible.

Some offset programs define and address leakage broadly, while others distinguish between types of leakage. California's AB32 defines "Leakage" as a reduction in emissions of greenhouse gases within the state that is offset by an increase in emissions of greenhouse gases outside the state. The state plans to minimize leakage through regulations adopted to implement AB32. The CAR's forestry protocol differentiates between two types of leakage – activity shifting and market leakage. Activity shifting leakage is a displacement of activities from within the project's physical boundaries to locations outside of it and reporting of this type of leakage is required. Market leakage occurs when the project activity affects an established market for goods, causing substitution or replacement of goods from elsewhere with a corresponding increase in GHG emissions elsewhwere and reporting is strongly encouraged. ISO uses a similar definition, and states that the project proponent is responsible for leakage. NWS GGAS incorporates impacts of offset projects on other operations into the amount of offsets issued for a project.

Several options could be considered to address leakage in offset projects. One option would be to require that each approved protocol have a method to account for potential leakage in emission reductions, removals or avoidance calculations specific to that project type. A second option would be to have a project validator provide an opinion on whether there is a leakage risk associated with the project by providing a leakage assessment. This method would require further elaboration, including what the implications of the validator's opinion would be. Other options for assessing leakage include standard algorithms and methods for leakage quantification (as done for some CDM methodologies), and requiring an initial de minimis assessment to state whether a leakage assessment is recommended or not

4.3 Implementation options

Elaborating the requirements of what constitutes real emission reductions, removals or avoidances will provide a reference point when setting other criteria and evaluating protocols. Ensuring that offsets meet the requirements of "real" may involve requirements such as that conservative estimation methods be employed, that monitoring is conducted at adequate frequencies, that verification and enforcement requirements are sufficiently stringent, and that potential leakage is accounted for. Further clarification would likely be needed as to the details of supporting criteria such as conservative methods and accounting for leakage and indirect effects.

5 Additional

This section discusses the criteria that offset reductions be additional. Additionality has generally been the most controversial criteria in the implementation of other offset systems. Not coincidentally, this is the longest section in this paper.

How the WCI chooses to define additionality and evaluate whether a project is additional will play a critical role in ensuring the integrity of WCI offsets. This section considers the issues related to defining additionality for the WCI offset system and options for its implemention. It will also consider policy issues surrounding several concepts related to additionality such as types of additionality tests, baselines, crediting periods, and eligibility dates.

The purpose of requiring additionality in the WCI offsets system is the desire to only credit projects that would not have otherwise occurred in the absence of an offsets mechanism. Because there are many factors that affect whether a project is additional, operationalizing additionality is a challenge.

5.1 Policy and operational considerations in defining additional

An important question to consider in defining additionality is how specific the definition should be and what specific evaluations or other criteria to include in the definition. A definition could be general, such as requiring that emission reductions are additional to any GHG emission reduction that would otherwise occur as a result of business-as-usual activities or regulatory requirements. The definition could also be more specific. For example, stating specific requirements in the definition that must be met, such as passing certain additionality tests or proving that the express purpose of implementing the project was to generate GHG offsets. If additionality is defined prescriptively it would provide direction to the stringency and type of additionality tests that may be included in the evaluation. However, a more prescriptive definition would not necessarily provide direction on how to evaluate additionality in practice. Table 5.0 provides several examples of additionality requirements from other select offset programs.

Table 5.0 Additionality requirements in offset systems

Offset System	Requirements
Alberta-based Offset Credit System	Not explicitly defined, by requires that emissions reductions "must be from an action taken that is not otherwise required by law at the time the action is initiated".
British Columbia Emission Offset Regulation	Not explicitly defined, but requires "an assertion by the proponent that there are financial, technological or other obstacles to carrying out the project that are overcome or partially overcome by the incentive of having a GHG reduction recognized as an emission offset under the Act, and a justification for the assertion" S3(k)
